In order to detect a submarine that has enmeshed with the net during the night, the float devices have suitable illuminating means which are easily set into operation by electric current. The float chamber contains a storage battery or other source of current connected in circuit with lamps adapted to be illuminated when the circuit is closed, by a special time-clock device connected with the release mechanism of the buoys. At the same time that the signal lamp circuit is closed in the floats, by means of the time-clock arrangement, an aërial bomb or rocket is projected into the air as shown in the accompanying illustration, this bomb being arranged in a barrel having at its lower end a charge of explosives, which is ignited by a spark plug connected up with an electric battery and spark coil circuit within the float. The bomb is fitted with a fuse which will cause it to be exploded when it reaches a certain height. A red light or flare may be produced on the floats when the bomb is projected. For this purpose a charge of *red light* or other signal powder is arranged in a compartment within the float chamber.

ELECTRIC SHIP WELDING SUPERIOR.

The displacement of riveting by electric welding in ship construction is being considered in English insurance circles, with regard to possible reduction in rates. It is claimed that welded plates stand the impact test as well as riveted plates, but underwriters require further information on the question of the results of stranding and collision. The cost of electric welding is stated to be much below that of riveting, and if similar insurance rates may be secured will undoubtedly supplant riveting to a great extent.

A New Cam Regulator for Auto Dynamos

(*Continued from page* 415)

A number of voltage regulators have been developed, but of these only two—the bucking-winding system and the third-brush system—have been generally used. To these has been recently added a third, the Cam-Regulator System.

This system is very different from the usual systems both in principle and in operating characteristics. Some of the chief advantages claimed for it are as follows: The voltage is held more nearly constant than is the case with the other systems. Ideal battery-charging conditions are provided, since the amount of current delivered to the battery is large when the battery is discharged, and small when the battery is full. The battery is not necessary to the proper operation of regulator. Hence, in an emergency the generator can be operated with the battery disconnected, and in some cases the battery can be dispensed with altogether.

The generator for this system is of the simple *shuntfield* type, and voltage regulation is effected by *inserting resistance in the field circuit.* This principle is the same as that employed in ordinary power-generator service, but the method of application is quite different.

In power service the voltage of a generator is kept constant by increasing or decreasing the *amount* of resistance in series with the shunt field as the voltage tends to rise or fall. With the cam-regulator, however, a fixt amount of resistance is always used but the voltage is regulated by varying the *length of time* during which this resistance is in the field circuit. How this is accomplisht can be best understood by referring to the diagram of the cam-regulator.

This device consists of four main parts—a magnet coil and core, a set of contacts, a cam mounted on the generator shaft, and a resister. The resister is so connected that it is *short-circuited* when the contacts are *closed,* and *in series* with the shunt field of the generator when the contacts are *open.* The arm carrying the lower contact rests on the cam and is moved up and down with every revolution of the generator shaft. The upper contact is mounted on a pivoted arm, and when the generator is not in operation, it is prest against the lower contact by a spring finger.

With the engine running at low speed, as in starting, the contacts are together and the resistance short-circuited. When, however, an increase in the engine speed brings the voltage of the generator up to the operating point (7 volts), then the magnet comes into play.

The coil of this magnet is connected across the brushes of the generator, and when the voltage rises above 7 volts, it has sufficient strength to draw the upper contact away from the lower, thus inserting the resistance in series with the generator field. Immediately the voltage starts to fall, and the magnet drops the upper contact, closing the points and cutting out the resistance. This increases the voltage again, and the magnet picks up the contact, only to drop it immediately afterwards. Since the strength of the magnet's pull depends upon the voltage of the generator, the higher the voltage the longer the upper contact will be held, and the fewer will be the number of closings per minute. This is equivalent to an increase in the amount of resistance.

The operation of opening and closing the contacts takes place so rapidly that the eye can not follow it, nor can the variations in voltage be noted on a voltmeter. In practice the regulator is adjusted to hold the voltage at approximately 7 volts at all operating speeds and under normal loads.

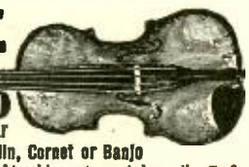
DRAWING
Big Pay—Easy Pleasant Work

Draftsman earn $150.00 to $300.00 a month. The work is pleasant and the hours are short.
You can get this big pay too. All you need is the new 1919 edition of the Cyclopedia of Drawing and a little of your spare time. The cost is only 7 cents a day, and we give a year's consulting service free. See the FREE examination offer below.

Cyclopedia of DRAWING
4 big volumes each 6½x8¾ in., bound in genuine American Morocco and trimmed in gold 1578 pages and more than 1000 illustrations plates, diagrams and blue prints.

The only books that thoroughly cover Mechanical, Structural and Architectural Drafting in a non-technical way. You don't have to know anything about the subject to understand them. They begin at the beginning and tell you everything about Blue print Reading—Mechanical Drawing—Machine Design—Machine Drawing—Structural Drafting—Architectural Drawing and Lettering—Shades and Shadows—Perspective Drawing—Freehand Drawing—Pen and Ink Rendering—Typographical Drafting—Drawing Instruments and Their Uses and hundreds of other things connected with the work.

Use One WEEK FREE!



You can have these books for a whole week free without sending one cent. Just send the coupon below and all 4 volumes will come to you at once by express collect. Use them as if they were your own—go through them thoroughly and send them back at our expense if you don't want to keep them. If you do keep the books send us only $2.00. You can send the balance of our special introductory price—only $13.80 the same way—$2.00 each month.
Remember you don't take any chances. The risk is all ours and the benefits will all be yours—Send the coupon today

American Technical Society

SALES COMPELLING LITERATURE

1073 Sanford Ave. Irvington, N. J.

July 17, 1919

ELECTRICAL EXPERIMENTER,
N. Y. City.

Attention, Mr. DeMott.

Gentlemen:—Herewith two small ads. for next issue of your two magazines. We also expect one along in a day or so from a Cartoon School out in Pennsylvania, but he is making a drawing for same and no doubt this is what is delaying it. As soon as we receive it we will rush it right over to you.

Your magazines are pulling good for us and it all seems to be a good class of trade, which indicates your readers are wide awake and answer ads.

Very truly yours,

H. JACOBUS.

Cameras, Supplies—Photo Developing.

Clean, Neat, Perfect Kodak Finishing at the lowest prices. Work returned the same day received. Send film for sample print and copy of catalogue on developing, printing, enlarging and hand coloring, also copy of Photo Craft Magazine, which will help you make better pictures. Photo Craft Co., Box 69, Ann Arbor, Mich.

For 15c we will develop and furnish prints from one, six or eight exposure film or enlargement 8x10, your favorite negative, 20c to show quality and service. Associated Photo Company, Sta. A 12, Cincinnati, Ohio.

Roll Film Developed, 6c. Prints, 2c up. Send for price list. The Blad Photo System, Wareham, Mass.

Mail us 15c with any size film for development and six velvet prints. Or send six negatives any size and 15c for six prints. Or send 35c for one 8 x 10 mounted enlargement. Prompt, perfect service. Roanoke Photo Finishing Co., 255 Bell Ave., Roanoke, Va.

Exchange Ads.

Exchange, Buy, Sell. Wireless, electrical goods, etc. Large list 6c. State what you have and want. Zehrbach, Box 250, Hiram, O.

Wanted Tribune light car or parts. State lowest cash price and full particulars. Van Deurs, 325 Beta Place, Glendale, L. I.

Photographs wanted of Autolite and Hoyt (Gray-Davis) automobile Ammeters. Also speedometers. Will pay $1.00 each. Write Victor Todd, Rainbow Lake, New York.

Amateurs! Complete Audiotron regenerative cabinet, $18.50. Write for photo and particulars. H. Springfels, 70 E. Utica St., Buffalo, N. Y.

Let's swap! What'ye got? What d'ye want? Free Advertising. Three months, dime. Swap Bulletin, Wayne Congress, Detroit.

Sell—Gilbert's $10 Electrical Set. Tank developing outfit. Fine condition. Write. James Raiford, Route 1, Bessemer, Alabama.

2-$4.00 3-slide tuning Coils, sell for $2.50 each. 1-Murdock Loose Coupler, cost $8.00, sell for $5.00. Instruments used only 2 months. Prepaid. Sidney Kronengold, 5508—5th Ave., Brooklyn, N. Y.

For Sale—DeForest audion on panel, Oscillation Transformer and sending, receiving switch, $8. Also I.C.S. Electric Lighting Course, $20. Stamp for particulars. Eldred Hall, Solvay, N. Y.

Sell; Curtiss 3-ft. Biplane, $8.50. Guaranteed to fly. Complete arc light, $8.00. Send for photos. Merlin F. Harrod, New London, O

5000 Meter Coupler and other instruments for sale. Write quick. Ritchey Hume, University, Mississippi.

For Sale—Transmitting set, including 2" coil, helix, condenser key and gap, $15.00. Also Knapp dynamo-motor, $4.00. H. Hilton, 20 Jewett St., Amsterdam, N. Y.

Amateurs. Write me for list of Radio Apparatus for sale at big bargains. All in good order; closing my station. Wendell Holst, 3619 N. St. Louis Ave., Chicago.

65 Chemical Set, $5.00. Bricktor, $4.00. Lionel Gates, Coalport, Pa.

Sell 1/20 H.P., 110 volt, 60 cycle continuous duty induction motor, $7; 40 watt dynamo, $4.50; 20 watt dynamo, $2.25; volt and ammeter, $1.25. Adolph Gedeon, 3296 W. 50th St., Cleveland, Ohio.

For Sale or Exchange—$40 Hawaiian Guitar outfit, $25. Write. Arthur Ellwein, Wrightsville, Pa.

Chemical Laboratory for Sale. 100 Chemicals—50 pieces of apparatus, cheap. Louis Dotte, 205 West St., West Hoboken, N. J.

Must Sell. Send stamp for list of electrical goods. Earl Cook, Benardston, Mass.

Bargain. 1 K.W. Thordarson transformer, brand new, $21.00. Crawford, 13 Ten Broeck St., Albany, N. Y.

For Sale. Blue prints for connecting A.C. motors. See ad under "Blueprints." Charles Chittenden.

Sell—Valuable electrical Stereopticon. First money order gets it. Thompson, 36 John St., Worcester, Mass.

Exchange! Over 100 "American Boys," also other Magazines for something electrical, letters answered. W. Leslie, Oak Hill, Ohio.

Trade—Moving Picture Camera, 150 ft. capacity; for small lathe. Ora Coppock, Tipton, Ind.

For Sale—Nickel plated; short model Valve Trombone. Ralph D. Kors, Humboldt, Neb.

For Sale—Audion, complete, except bulb, $6.50; Walnut case, no bulb or battery, $3.50; Blitzen, ¼ K. W. transformer, mounted, $10.00; Audion coil, $1; 55 galvanized pole steps, $1.00; Double variometer, $2.50; Telegraph outfit, $1.00; 30 Algier stories, $2.50. Rule D. Egbert, Tiffin, Ohio.

Will Exchange 5 H.P. gasoline engine for shot gun. Schmelzers, 90 St. Marks Place, New York.

Sell—Electrical apparatus. Thompson, 36 John St., Worcester, Mass.

Sale—22 Remington Rifle $5.00. Two telegraph sets $4.00. No. 6 Erector $5.00. Electric Miroscope $4.00. W. Grus, 505 Clinton Ave., Oak Park, Ill.

Electrical Supplies & Appliances.

Battery Charging pays big profits with HB Equipment. Electric Light Generators and Motors can also be furnished on easy payments. Full information free. Hobart Brothers, Troy, Ohio.

Storage Batteries. Make the plates yourself, we will tell you how. Sample plate 40c. Windsor Specialty Co. (not incorporated), 5419 Windsor Ave., Chicago, Ill.

Castings, Blueprints, Engines—Gas and Steam, ⅛ H.P. up. Gears, Pulleys, Pumps, Fittings, Small Boilers. Complete circulars for stamp. Latest models. Universal Gas Motor Co., 364 Monadnock Block, Chicago.

Storage Batteries charged by alternating current. Inexpensive, Simple and Efficient; Instructions and Print $1. K. & S. Engineering, Box 124, Sewickley, Pa.

Magnets: Large Horseshoe Magnets. Will lift 12 lbs. Mail $1, stamps or Money Order. Parcel Post Prepaid to all parts of U. S. or Canada. West Side Novelty Co., Drawer No. 8 Wabash P. O., Pittsburgh, Pa.

Motor Winders. See ad under "Blueprints." Charles Chittenden.

100 induction motor winding diagrams, 1, 2, 3 phase, star delta. 2 to 12 poles inclusive. Postpaid, $5.00. W. Glass, 2108 South Broad St., Philadelphia, Pa.

Electrical Workers and all others who are interested in Electrical Work in the Reconstruction that is taking place. To send us their name and receive descriptive literature of our Modern Blue Print Chart Method of Electrical Wiring. Souvenir information card included. Electrical Wiring Diagram Co., Box C. 173, Altoona, Pa.

Lava Insulation is not molded but individually sawn, lathe turned, milled, drilled, threaded. No limitation on form, only on size. Kilned at two thousand degrees. Hard, strong, accurate, fire, acid proof. Ask for book. American Lava Insulator Company, Chattanooga, Tenn.

Chemicals.

Radioactive and Rare Metal Salts. An opportunity for experimenters to become acquainted with radioactivity and rare metals. Ten salts in neat tubes—Thorium, beryllium, unranium, cerium, and others. Price only $1.75. Radio Chemical Supply Co., 915 Westcott St., Syracuse, N. Y.

Chemicals—We have the best chemicals at the lowest prices. Write for circular. Jos. Simpson, 3880 Windsor Place, St. Louis, Mo.

Experimenters—August list and 10 formulae—5c. Chemicals and laboratory apparatus for analytical and experimental work. Do your reactions ever go wrong? Our chemicals for analytical work are guaranteed c.p. C. C. Frane, Eureka, Ill.

For Advertisers.

Jacobus Ads. Are Business Builders. Booklet Free. Jacobus Advertising Service, 1073 Sanford Ave., Irvington, N. J.

"Quick-Action Advertising—How it is Building Business for the Progressive Advertisers of America"; A little story of results told by the advertisers themselves—not the publisher. You will be interested in reading this little booklet which we have prepared for prospective advertisers, a copy of which will be gladly mailed to you upon request. It tells you how to talk business with 1,000,000 intelligent, interested and responsive Americans every month—men who know what they want and who have the money to buy it. Write for particulars and rates today. Douglas Wakefield Coutlee, 225 West 39th St., New York.

Advertise—24 words in 100 magazines, $1 lists Free. Stanford Co., 308 Hostetter Bldg., Pittsburgh, Pa.

Personal.

Are You Self-Conscious, embarrassed in company, lacking in self-control? These troubles overcome. C. E. Veritas, 1400 Broadway, New York City, N. Y.

Get Vital Strength. Retain youthful vigor. Wonderful results. Intensely interesting booklet free. Winslow H. Chase, Washington, D. C.

The Salesman Wins. Thousands of positions open. We teach traveling salesmanship by mail and guarantee offer of position or refund tuition. For interesting particulars, address Kansas Vocational Bureau, Miltonvale, Kansas.

Novelties

Here Boys! Make a Toy Aeroplane. See our Nifty ad., page 454.

Wanted to Buy

Cash for Old False Teeth. We pay up to $35.00 per set (broken or not). Also buy discarded gold jewelry, gold crowns, bridges, platinum, diamonds, watches and silver. Send now. Cash by return mail. Package held 5 to 10 days for sender's approval of our offer. U. S. Smelting Works, Dept. 73. Chicago, Ill.

Formulas.

Whiskey. I will not sell a million formulas for $1.00. My little book of selected formulas will put you wise. Every formula has been carefully selected and plainly printed. Tells you how to make excellent whiskey or Beer with a good Kick at small cost. A few good formulas are worth a million bad ones. Complete book and formulas $1.00 bill. I'm prompt too. Frank Ward, Box 503, Baltimore, Md. Dept. D.

500 Successful money-making formulas and trade secrets. Postpaid 25c. Charles Dynes, Winchester, Ind.

Motors, Engines & Dynamos.

Small Motors and Generators from bankruptcy and receivers' sales. Motors for all phases of current. Immediate delivery. Less than one-half regular prices. See display ad on page 459. Johnston, West End, Pittsburgh, Pa.

For Men.

Send us your dull razor blades. We re-edge them Good as New, any kind, 2½c each. Prompt service and satisfaction guaranteed. Dealers wanted. Keenedge Company, Inc., 184 Washington St., Chicago, Ill.

Detectives Earn Big Money. Travel. Great demand. Experience unnecessary. We train you. Write for free particulars. American Detective System, 1968 Broadway, N. Y.

Dredge's Necktie Valet removes wrinkles (without ironing) from neckties. Sample 25c. Dept. E, 190 Pilgrim, Highland Park, Mich.

Wireless.

Radio Apparatus of Quality. Manufactured to your own specifications. Radio Engineering Company, Baltimore, Md.

Switch Points. Binding posts, switch levers, and small parts, send 2c. for catalogue describing these and other goods. A. W. Bowman & Co., 23 Church St. (Harvard Square), Cambridge, Mass.

Wireless, improved switch-knob lever, complete, 25c; brass switch points with screws, 25c dozen; Magnet wire, 22-24, 50c, 26-28, 60c half pound, postpaid prices. Amateur parts our specialty. Electro-Novotoy Shop, 2100 Fifth, Charlotte, N. C.

Panel Wireless Sets and Parts. Heavy rubber Knobs. $1.10, post extra. Klaus, Eureka, Ill.

"Bargains"—6000 ¾" Spark coils without vibrators must be sold at once. Send 40c and 12c postage. Also ¾" Spark coils with vibrators, at 85c and postage. A. Dubs, 1534 Pitkin Ave., Brooklyn, N. Y.

10,000 feet strandcd aerial cable, seven strands number 22 pure copper. The need of the hour. 1 cent per foot, $9.00 per thousand. L. A. Bates, 8 Moen St., Worcester, Mass.

For Inventors.

Inventors join National Institute of Inventors, 118 Fulton St., New York City; membership society 1,900 strong; will help protect, develop, finance and market your invention. Absolutely no charge. Write for booklet.

"Sell or Finance Inventions." Read Money Talks Magazine. Send for free sample copy. 70-B Park Place, Newark, New Jersey.

Inventors. Protect yourselves. Record your idea before exposing it to anyone, even to me. Paul E. Klein, M.E., Consulting Engineer, Registered Patent Attorney, 21 Park Row, New York.

600 Mechanical Movements, also illustrations and explanations of 50 perpetual motions. My book, Inventors' Universal Educator, 4th edition, tells how to procure and sell a patent for your new invention. Government and other costs. Covers the matter from A to Z. 140 pages elegantly bound. Contains noted Court decisions on Patent cases. Mechanical Movements greatly assist inventors—suggest new ideas that might prove of great aid in perfecting inventions. Tells how to select an attorney. Has valuable information regarding Patent Sharks, Selling Agents and Brokers. Price $1. Postage free. Fred G. Dieterich, 603 Ouray Bldg., Washington, D. C.

Inventions Wanted. Cash or royalty for ideas. Adam Fisher Mfg. Co., 205 St. Louis, Mo.

Inventors write me about patents. My fees payable monthly. Booklet free. Frank Fuller, Washington, D. C.

Business Opportunities.

Enter a New Business. Earn $3,000 to $6,000 yearly in professional fees making and fitting a foot specialty, openings everywhere with all the trade you can attend to; easily learned by anyone at home in a few weeks at small expense; no further capital required; no goods to buy; job hunting, soliciting or agency. Address Stephenson Laboratory, 18 Back Bay, Boston, Mass.

Make Your Own Phonograph. Particulars free. DeSelO-PhonE, P. O. Box 720, Attica, Indiana.

GREATEST TOY SENSATION OF THE DAY!

FIGHTING DREADNAUGHT

SENSATIONALLY REALISTIC!!!

Here is a model of Uncle Sam's fighting monsters. Eight big guns, each of which flashes, at correct intervals, from twelve to twenty times. Extra ammunition always obtainable. Absolutely harmless.

Can be operated indoors or out. Now boys! Here's your chance to see a battleship in action, and the best of it is you can OWN the ship and command the fleet yourself! By having two or more battleships, you can arrange EXCITING NAVAL BATTLES in your own home. Price of Warship and Ammunition, 15c, three for 40c, or a fleet of 12 ships for $1.50 postpaid. Extra Ammunition, 5 cents per doz.

TOOTH-ACHE STOP

EASY TO USE

Stops the Pain; Stops the Tooth

Squeeze a little in hollow of tooth; the Ache Stops Instantly; the paste hardens, forming an antiseptic Filling. Absolutely harmless. Have it ready for the next bad attack. 25c per tube, postpaid.

Mysterious Ghost

This is not a pretty object, but there is fun in it for people who like practical jokes. The Ghost, when displayed in a perfectly dark place, glows with a ghastly cold bluish radiance, very apt to give one a "creepy" sensation. Once you know all about it, but a regular startler for those who come upon it, unexpectedly. A great joke to play on your mother-in-law. Price only 15 cents each, or three for 40 cents.

"SAFETY 1st" PINS

A clever novelty. The National "Safety First" Movement has made them very popular. Wear one and show your sympathy with the movement. Also handy for wearing at amateur theatricals and the like. Two sizes, ¾ in. (gold plated) and 1¼ in. (nickel-plated) 6c each, two for 10c p. pd.

INKLESS PEN

WRITES with WATER 500 words every time you dip. Makes its own ink. Writes fashionable violet color. Better and cheaper than fountain pens. Writes a long letter with one dip in plain water. No trouble—no bother—no muss. A pleasure to use. With Nickel Plated Reversible Holder 10 CENTS. 6 for 25c

SIMPLEX TYPEWRITER ONLY $2.50

Cheap But Good. So Simple a Child Can Use It. We Guarantee the Writing.

Though so marvelously cheap, this machine is a thoroughly practical Typewriter. We positively guarantee it to produce writing equal in every respect to that of any $1.00 machine. It does not seem possible at the price, but let us send you a specimen of its work and you will be convinced. With reasonable care it will last a lifetime. It is so simple that a child just able to read can write with it. You can learn all there is to know about it in five minutes, and an hour's practice will make you an expert operator. Every business man must have a typewriter. Illegible can writing is unbusinesslike and creates the impression that the firm is a no-account and slow-going concern. We assure you that the Practical Typewriter fully deserves its name as it is fit to do the correspondence of any business or profession, and to suit well. You should not miss this chance of securing a bargain. The letters of the alphabet, the numerals 1 to 10, and punctuation marks are so grouped that the letters most used are before the operator most of the time, enabling him to write rapidly. The rollers hold the paper in position while writing and at the end of each line a slight turn of the roller moves the tracker bar which makes a click and forces the paper forward, giving the proper line spacing, so that the lines are all an equal distance from each other, making a neat letter writing. Each typewriter packed in a strong box, with full printed instructions for use. Price complete, $2.50 sent by mail postpaid.

Johnson Smith & Co., Dept. E11, 3224 N. Halsted St., Chicago

SQUIRT RING

You may have a lot of fun with this Sparkling Gem Squirt Ring. It consists of a handsome-ly plated ring, attached to a rubber ball, so arranged that the latter is quite out of view when the ring is in the proper position. Such an attractive looking ring as this cannot fail to be the center of attraction. While the victim is absorbed in getting a clear view, you just squeeze the rubber ball and the observer experiences a very great surprise. PRICE 20 CENTS. three for 50 cents, postpaid. J. S. & Co.

Wonderful X-Ray Tube

A wonderful little instrument producing optical illusions both surprising and startling. With it you can see what is apparently the bones of your fingers, the lead in a lead pencil, the interior opening in a pipe stem, and many other peculiar illusions. A mystery that no one has been able to satisfactorily explain.

Price 10 cents; 3 for 25 cents; 1 dozen, 75 cents. Sent by mail, postpaid.

Sneezing Powder

Place a very small amount of this powder, the back of your hand, and blow it into the air, and everyone in the room or car will begin to sneeze without knowing the reason why. It is most amusing to hear their remarks, as they never suspect the real source, but think they have caught it one from the other. Before the laughing and sneezing you yourself will be having the time of your life. For parties, political meetings, car rides, or any place at all where there is a gathering of people it is the greatest joke out. Price 12c or 3 for 30c. By Express Only

STAGE MONEY

With a bunch of these bills, it is easy for each possessor of them to appear prosperous. By flashing a roll of these bills at a crowd, and the passing off of a genuine bill or two from the outside of the roll, the effect created will be terrific. Try it and see what is desired. Prices, postpaid: 15 Bills 10c; 50 Bills 25c; 125 for 50c, or $1.00 thousand.

NEW BOOK ON ROPE SPLICING

USEFUL KNOTS, HITCHES, SPLICES, ETC.

How Different Knots Are Made and What They Are Used For. Knots to Use and Knots to Avoid.

A most practical handbook giving complete and simple direction for making all the most useful knots, hitches, rigging, splices, etc. Over 100 illustrations. All about wire rope attachments, lashing, blocks, tackles, etc. 37 Heraldic Knots illustrated. Of great value to mechanics, riggers, campers, boatmen. Price 20c p. pd.

Johnson Smith & Co., Dept. E11, CHICAGO

LUMINOUS PAINT

Make Your Watches, Clocks, Etc., Visible by Night The very latest discovery in the scientific world, whereby, at a reasonable cost, practically unobtainable except at an exorbitant price, we have at last succeeded in producing this remarkable LUMINOUS PAINT, which, applied to the surface of any article, emits rays of white light, rendering it perfectly visible in the dark. THE DARKER THE NIGHT, THE MORE BRILLIANT IT SHINES. Quite simple to use. Anyone can do it. A little applied to the dial of your watch or clock will enable you to tell the time by night. You can coat the push buttons or switch plates of your electric lights, match boxes, door knobs, and other articles; make your own Luminous Crucifixes, Luminous Rosaries, etc. Bottle containing sufficient to coat several small articles. Price 25c. Larger sizes 50c and $1 postpaid. Johnson Smith & Co., Dept. E11

MUSICAL KAZOO

With the Musical Kazoo you can, without any previous practice whatsoever, play any tune right off, imitate any bird or animal, bagpipe, snare drum, Punch and Judy, etc. No holes to finger. It is simplicity itself. Produces excellent music. You do not blow into it, but sing, speak, laugh or make any desired imitation. Used with astonishing results at society meetings, home, club or church entertainments, dances, serenades, picnics, outings, excursions. Just the thing for choruses and shows, bicycle and marching clubs, etc. Excellent for vocal or instrumental accompaniments, either with or without other musical instruments. Price 15c. 3d.

MAGIC FLUTE

Wonderfully Sweet Toned and Musical

A marvelous musical instrument. No other instrument can produce sweeter music, whether it be the joyous notes of the quickstep or the solemn strains of a church hymn—in fact, any class of music can be played upon the Humanatone without practice and it is almost a self-playing instrument. When played with a piano accompaniment, or any other musical instrument, the effect is charming. Full printed instructions for playing sent with each instrument.

MOVING PICTURE MACHINE

Uses Standard Films same as the larger machines. Very easily managed. Simply turn the handle. Good Variety of Films always obtainable

PRICE Complete ONLY $2.65 Postage 15c, extra including Film.

Extra Films, 15c each postpaid

THIS IS A GENUINE MOVING PICTURE MACHINE and the motion pictures are clear, sharp and distinct. The Moving Picture Machine is finely constructed, and carefully put together by skilled workmen. It is made of Russian Metal, has a beautiful finish, and is operated by a finely constructed mechanism. The projecting lenses are carefully ground and adjusted, triple polished, standard double extra reflector, throwing a ray of light many feet, and enlarging the picture on the screen up to three or four feet in area. The light is produced by a gasoline carbide generator, such as is used on the largest automobiles. This throws a dazzling white light on the screen.

It is a solidly constructed and durable Moving Picture Machine. The mechanism is exceedingly simple and is readily operated by the most inexperienced. The pictures shown by this marvelous Moving Picture Machine are not the common, crude and lifeless Magic Lantern variety, but are life-like photographic reproductions of actual scenes, places, and people which never tire its audiences. This Moving Picture Machine has caused a rousing enthusiasm wherever it was used.

JOHNSON SMITH & CO.

Dept. E 11 3224 N. HALSTED ST., CHICAGO

ANARCHIST BOMBS

Consists of a little glass vial containing in liquid form a chemical which will produce a most horrible odor. Dropped in a room full of people will cause more consternation than a lumbermen's picnic. The smell will entirely disappear in a short time. 3 Boxes for 25c, shipped by express only with a Dollar's worth of other merchandise.

ITCHING POWDER

This is another good practical joke; the intense discomfiture of your victims is enjoyed by everyone but themselves is thoroughly enjoyable. All that is necessary to start the scratching is to place a little of the powder on a person's hand and the powder can be relied upon to do the rest. The result is a vigorous scratch, then some more scratch, and still some more. 3 Boxes for 25c. Sent only by express. (Must order at least One Dollar's worth of other merchandise.)

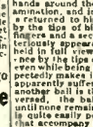
INVISIBLE INK

The most confidential messages can be written with this ink, and the writing MAKES NO MARK. Cannot be seen unless you know the secret. Invaluable for many reasons. Keep your business and other private memorandums away from prying eyes. Great fun for playing practical jokes. Only 15c Bottle

LOVE LETTER INK

Writing written with this remarkable ink vanishes entirely in a few weeks (sooner if desired), leaving the paper QUITE BLANK. 15c p. pd.

LUMINOUS INK



Writing can be READ ONLY IN DARK ROOM. writing shines like fire. Quite invisible at daytime. Very remarkable. 15c bottle; 3 for 40c postpaid.

JOHNSON SMITH & CO.

MULTIPLYING BILLIARD BALLS

The Best Feat of its Kind

This trick is as effective as it is surprising. The performer hands around the ball for examination, and immediately it is returned to him he rolls it by the tips of his thumbs and fingers and a second ball mysteriously appears. These are held in full view of the audience a few times, and then the performer rolls both balls down the length of the left hand, and even while being placed in position, another ball unexpectedly makes its appearance. Final y the magician apparently suffers from some kind of spasm and yet another ball is the result. The feat can then be reversed, the balls disappearing one after another until none remains. It is a very interesting trick that is quite easily performed by following the directions that accompany the apparatus. PRICE, 25 CENTS, POSTPAID. JOHNSON SMITH & CO.

GOOD LUCK RING

Quaint and unusual. A VERY striking and decorative ring, made of gunmetal. Skull and crossbone design, set with brilliant flashing gems appearing out of the eyes. A never failing object of interest. It is said by many to bring Good Luck to the wearer, hence its name Good Luck Ring, a wish we will not positively guarantee that it is certainly a very unique ring that you will take a pride in wearing. These are made to sell at 50 cents, but as a special bargain we will supply them to customers mentioning this paper, at HALF PRICE, viz., ONLY 25 CENTS, POSTPAID. JOHNSON SMITH & CO.

LOADED CIGARETTES

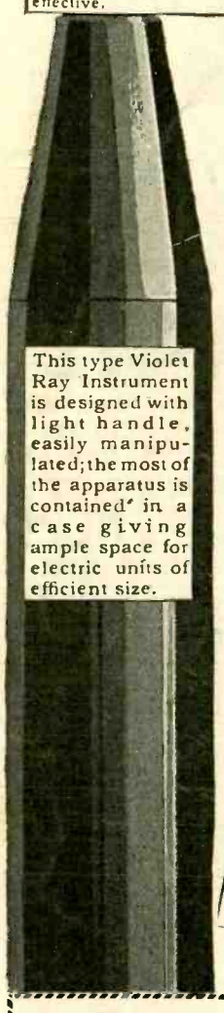
Just Like Ordinary Cigarettes, Sold Both Boxed and Loose

A box containing ten apparently genuine Cigarettes. They contain a trick which causes the smoker to suddenly be smosed. They smoke real, and afford as good a smoke (while they last) that the victim is taken entirely by surprise. In every respect they are entirely harmless. Price, box of ten, 10 cents, postage 2c extra.

Johnson Smith & Co., Dept. E11

THE "LITTLE GIANT" TYPEWRITER

A First Class Writing Machine For $1.25



A per fect little typewriter for $1.25. There are thousands of persons who would like to own a typewriter but whose needs and business do not warrant the expense at actual cost to the purchase and there are many persons who would be glad to operate a machine if it could be had for a mere trifle. Such a machine is the "Little Giant" typewriter. It is a perf

Regain Your Health Thru Renulife VIOLET RAY Treatments at Home

Unequaled for neuritis and rheumatism

More Than 25,000 Volts
No pain, shock or muscular contraction. Entirely harmless — powerfully effective.

This type Violet Ray Instrument is designed with light handle, easily manipulated; the most of the apparatus is contained in a case giving ample space for electric units of efficient size.

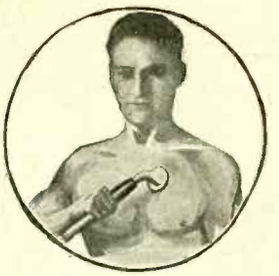
There is no "quackery" or uncertainty about *Renulife Violet Ray*. It is not claimed to be a "Cure All," but it has proved in thousands of cases a practical health-producing, revitalizing agent—powerful in restoring normal physical conditions—yet gentle, soothing and perfectly safe. *You* can treat yourself. Get full information regarding uses shown on coupon below.

Users Get Wonderful Results

(Voluntary Testimonials)

"The Renulife Violet Ray High Frequency Generator is superior in efficiency because of its perfect character and control of current, compactness and perfect insulation. The smallness and lightness of Electrode holder is also a great advantage." "The doctor told me that the trouble was hardening of the arteries. I wish I had got it a year ago. I would not be without it for all the money in the world." "I cannot recommend it too highly." "I have been using mine now for a week for Sciatica and I am highly pleased with results." "I think it is one of the best little machines that was ever invented." "I have used it with excellent results for the restoration of hair and stiff and sore rheumatic finger joints." "Am well pleased with the Generator, and the kind treatment received from your Company." "My Generator has stopped my neuritis." "Every house should have a Renulife Violet Ray High Frequency Generator, for the treatment of Neuralgia, Neuritis, Sore Throat, Kernels in Neck, Cramps, Headache, Stiff Neck, Muscular Soreness, Rheumatism, Paralysis—in short, pains of all kinds."—M. D. "I have been much relieved by the use of your Violet Ray Generator." "It is fine for Insomnia." "I find it such a help in nervousness." "I would not part with it for five times the price. It is sure a little wonder." "I am more than pleased with the Generator; the whole family are using it." "A neighbor lady was suffering from lumbago and could not move, and my wife brought over the Generator and in less than ten minutes the lady was greatly relieved." "Your Generator is just the thing for me. That tired feeling has left me, and I feel like myself again." "It has relieved me of the nervousness and also it has helped me a great deal in using it for the treatment of rheumatism."

How Renulife Benefits



Science has demonstrated a strange relation between electricity and life cells. This instrument harnesses a tremendous current of electricity and applies in the form of Violet Rays so that the body welcomes and responds to it in a marvelous manner—no pain—shock or the slightest harmful effects. A few seconds of Renulife Violet Ray gives more benefit than hours of the old time battery methods—because a thousand times as much voltage is made use of.

The irresistible, revitalizing powers of *Renulife Violet Ray* reach every nerve cell, fibre and part of body. Blood is enriched and purified by a flood of oxygen, giving added vitality and strength. Assimilation and digestion improved—functions retored to normal—extra supply of fresh blood quickly brought to area treated, removing congestion and supplying nourishment. While relieving pains and aches, the manifest results of disorders, it removes the deep seated cause, combines the benefits of electricity, vibration, exercise, stimulation and oxidation.

Get Book "Health via Violet Ray"

The price goes up

Your last chance to procure a complete electrical education at as low a price as $16, payable $2 per month.

The price of the CROFT LIBRARY OF PRACTICAL ELECTRICITY must go up. We have fought against this increase as long as we could. You have, however, one more chance to purchase at the old price.

In fairness and justness to the readers of this paper, we desire to give everyone notice of the change in price before it goes into effect.

Know electricity as experts know it

No other library or course on the practical side of electricity adheres so closely to actual electrical work as the Croft Library of Practical Electricity. No other set of books or course is more modern, complete, or more easily understood. This Library, with its mine of working details, enables you to master electricity quickly, and to know it as experts do.

The standard in America

Terrell Croft has had twenty years' experience in electrical practice. He started as wireman's helper. Later he became trouble shooter, then draftsman, then electrical engineer for the Westinghouse Co. His twenty years' experience is boiled down to eight flexibly-bound pocket books which are now accepted as the standard in America.

Nothing better at any price

No matter how much you may pay for electrical literature, nor how much you spend on educating yourself in the finer points of practice, you cannot get more reliable, more authoritative, more detailed information than is contained in the Croft Library. It is an innovation in the world of electricity, as a ten-minute examination will prove.

Ten days' free trial
NOT ONE CENT IN ADVANCE

In order to receive advantage of the old price on these books, just fill out the coupon and return to us. Keep the books ten days and examine them thoroughly, putting their usefulness to every imaginable test. Then if they are not satisfactory, return at our expense.

Should they come fully up to your expectations, send us $2 per month for eight months.

McGraw-Hill Book Co., Inc.
239 West 39th Street New York

Meet Terrell Croft

Be guided in your study of electricity by an experienced electrical engineer of high professional standing, a man who gained his knowledge with his sleeves rolled up, and has met your problems in advance. He tells in plain, understandable language how to proceed by the best and most practical methods to the higher position.

FREE EXAMINATION COUPON

After November 29th, price of the set $20

McGraw-Hill Book Co., Inc.,
239 W. 39th St., New York.

Gentlemen:—Please send me the Library of Practical Electricity (shipping charges prepaid), for 10 days' free examination. If satisfactory I will send $2 in ten days and $2 per month until $16 has been paid. If not wanted, I will write you for return shipping instructions.

EDITORIAL

The Elusive Martian Canals

IN 1877 Schiaparelli, in his *Memoria,* published the first maps of the planet Mars, on which were shown for the first time *canali*—the now famous—or infamous—Martian canals. In Italian this word does not mean canal, but channel, and it is due mainly to this erroneous conception that the word canal was introduced into the English, French and German languages. Just the same it stuck from the beginning, altho Schiaparelli did not at first take his "channels" to be "canals," as we understand the term. For canal with us always means an artificial waterway, and this Schiaparelli did not claim.

From 1877 down to Lowell and Pickering, astronomers and scientists have waged one of the most remarkable scientific battles in history. Books by the dozens, pamphlets by the hundreds were printed and are printed this very minute, discussing the *pros* and the *cons* of the mysterious canals. The one camp—the largest by far—believes absolutely in the existence of the Martian canals, be they artificial or natural. Hundreds of astronomers have seen the net-like lines, criss-crossing the face of our sister planet by the hundreds in all directions.

The other camp—the minority—flatly denies all existence of these lines. Their contention is that what the other fellow sees is nothing more than an optical illusion. The followers of this theory have never been able to see the fine lines on Mars, or if they really did glimpse them they have been unconvinced, stoutly maintaining their belief that what they saw was, of course, an optical illusion. They follow up the argument with the triumphant "proof" that the photographic plate, which always tells the truth, has never been able to record any one of the Martian canals.

This sounds like a good argument, *for there is no clear record* of an actual photograph showing the canals on Mars.

It is true that the Lowell observatory actually *did* photograph some of the more prominent canals, but these show up exceedingly faint, and would not be considered evidence by non-believers.

Plausible as this argument is, it can only deceive laymen; the astronomer, however, will smile at it, for it is preposterous.

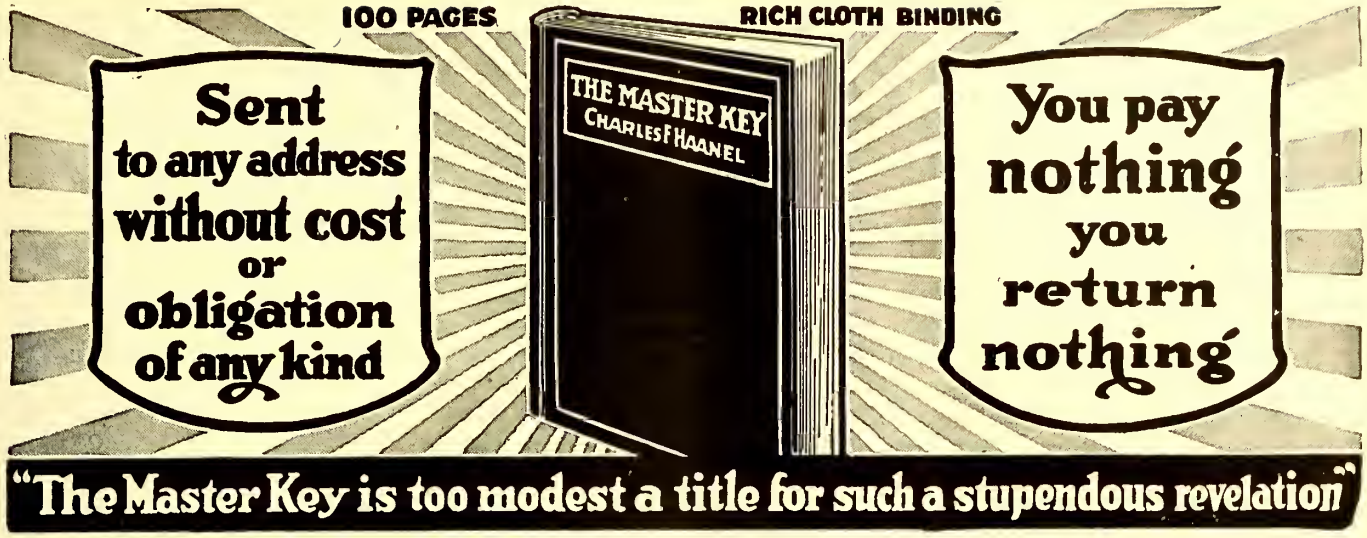
And here are the reasons: When we look at the Martian canals, the light rays pass thru two atmospheres, that of Mars and our own. The terrestrial atmosphere is about thirty-five miles thick and very dense. The air of Mars is thin and passes the light rays easily. Unless Mars is exactly overhead—and it is far from that when nearest to the earth—we would view it thru thirty-five miles of air. But we never do. More often, because Mars is many degrees from zenith, we view it thru hundreds of miles of air. And this is what makes all the trouble. The air is nearly always in motion—very seldom the "seeing," as astronomers call it, is perfect. So when we attach a camera to our telescope the fine lines become blurred, due to the distortion, and consequently do not register on the plate. But there are several other reasons why we cannot photograph the canals. One is because the grain in the photographic plate is too coarse to show such exceedingly fine lines. Take a silk sewing thread and stretch it across your yard. You can see it readily in bright sunlight thirty or forty yards away, but the best photographic snapshot will not be able to register a trace on the sensitized plate.

Another important reason why we cannot photograph the canals is, because we cannot take instantaneous pictures for the reason that the light received from Mars is rather weak, and if we take a short-time exposure the moving atmosphere tends to blur the picture.

H. GERNSBACK.

The ELECTRICAL EXPERIMENTER is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions. Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. A green wrapper indicates expiration. No copies sent after expiration.

All communications and contributions to this journal should be address to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.



ELECTRICAL EXPERIMENTER. Monthly. Entered as second-class matter at the New York Post Office under Act of Congress of March 3, 1879. Title registered U. S. Patent Office.

SOME men and women seem to attract success, power, wealth, health and attainment with very little conscious effort; others conquer with great difficulty, still others fail altogether to reach their ambitions, desires and ideals.

Why is this so?

"The Master Key" will tell you why. No one can read it and not be a changed man or woman. None but who will emerge from its magic pages with a firmer grasp of the future—a surer understanding of what he can do.

"The Master Key" is a key with which many are converting loss into gain, fear into courage, despair into joy, hope into fruition.

A copy of this magnificent, richly bound 128 page book will be sent to you, without cost or obligation of any kind, if you address

Charles F. Haanel, 203 Howard Bldg., St. Louis, Mo.

You should send for a Master Key.

You benefit by mentioning the "Electrical Experimenter" when writing to advertisers.

Wireless Operators Wanted—At once

Calls Coming in Steadily, for National Radio Institute Graduates, from all Parts of the Country. Learn Commercial Wireless, by Mail, in Ten Weeks

Commercial Radio has arrived and thousands of positions are now open in the Merchant Marine, Commercial Land Radio Service, Railroads, Radio Supply Factories, Lake and Ocean Steamship Lines, Telegraph Companies and Aerial Mail Service. We are now receiving requests for more National Radio Institute Gradutes than we can furnish.

Salaries Up to $250 a Month

With exceptional opportunity for promotion to Radio Mechanic, Electrician, or Engineer. No previous experience or training is necessary. You can Learn Wireless the National Radio Institute way, in Ten Weeks, by mail, right in your own home. With our help you can quickly qualify for a good position at big pay. Many of our students secure positions before completing the course, because it is based on actual practice and teaches what is needed to make a big success of Wireless work.

Get Your Instructions from the Nation's Capital

(Our Course is Endorsed by the U. S. Government Officials)

The National Radio Institute, headed by authorities who have been closely allied with government training of students, was established in 1914 and is the first school in America to successfully teach Wireless by Mail. The work is under the direction of J. E. Smith, E.E., director of the Radio Department, Howard University, and E. R. Haas, formerly of the Radio Division of Yale University.

We now have students throughout the world. Our location in the Nation's Capital, together with the standing of our officers and their wide acquaintance among government officials connected with Wireless activities, places us in position to give our students the best instructions obtainable and to be of the utmost help in assisting them to secure good paying positions.

Travel If You Want To

If you want to travel and see the world, go to foreign countries and increase your knowledge of world affairs, Wireless offers you the chance of a lifetime. However, you are not obliged to travel, but may secure a permanent position at one of the big Land Stations, Railroad, Telegraph or Steamship Companies if preferred.

Pay as You Learn

Our plans of payment bring a wireless education within the reach of anyone who desires to learn. A small payment down on our convenient payment plan, and small following payments, enables you to earn the cost of your tuition while actually learning to be a wireless operator.

Free Instruments to Every Student

In addition to five text books—35 special Lessons and 18 Personal Examinations—we send you, while taking our course, a Standard Automatic Wireless Transmitting and Receiving Set for sending and receiving messages. These fine instruments are Free only to National Radio Institute Students.

Oldest Wireless School in America

In addition to being the oldest and largest Wireless School in America, our location in the Nation's Capital enables our Students' Employment Department to keep in close touch with the best openings for our graduates. A Post Graduate Course is Given Free to every graduate.

FREE

Our booklet, "Wireless the Opportunity of Today," gives you complete information in regard to our course, the quick and easy methods by which you can master wireless, and other important facts you should know. It is free. Just mail the coupon. No obligation whatever on your part.

Mail This Coupon Today

National Radio Institute,
Department 131, Washington, D. C.

Send me, free of charge, your booklet "Wireless The Opportunity of Today", with full particulars regarding your famous 10 weeks' Home Study Course and your Special FREE INSTRUMENT OFFER.

The Coupon Saves You $43

And you may pay for your Oliver at the rate of only $3 per month

For $57 you can now obtain the identical Oliver Typewriter formerly priced at $100. Thus you save nearly half. You get the finest typewriter we have ever built, our latest model, the No. 9. If any typewriter is worth $100, you will agree that it is this splendid, speedy Oliver.

With the coming of the new price, not the slightest change has been made in the machine. In every way it is exactly what we formerly priced at $100.

SEP 22 1919 U. S. PATENT OFFICE

As a man is known by the company he keeps, so is an Oliver

Among its 700,000 purchasers are such distinguished concerns as;

Columbia Graphophone Co.
Baldwin Locomotive Works
National City Bank of N. Y.
Boston Elevated Railways
Hart, Schaffner & Marx
U. S. Steel Corporation
New York Edison Co.
American Bridge Co.
Diamond Match Co.
and others of great rank

Our reason for a Lower Price

Men wonder how we have effected such a remarkable reduction in price without changing the Oliver.

Let us explain. During the war we learned many lessons in economical distribution, ways of saving.

We found that it was unnecessary to have great numbers of traveling salesmen and numerous, expensive branch houses throughout the country.

We were able to discontinue many other superfluous sales methods. As explained further in our booklet, "The High Cost of Typewriters — The Reason and the Remedy."

Old-time, extravagant methods had to go during the war. And our new plan was so successful that we are continuing it. We hope never to go back to a $100 price, which was the standard for so many years.

Free Trial—Send No Money

Our new plan is simple. It permits you to be your own salesman. You may order a free-trial Oliver directly from this advertisement, via coupon.

Note that the coupon brings either an Oliver or further information.

When you receive the Oliver, use it as if it were your own. Give it every test. Compare it.

If you agree that it is the finest typewriter at any price, and wish to keep it, then pay us at the rate of $3 per month.

If you want to return it, ship it back, express collect. We even refund the out-going transportation charges.

During the free trial, you can be your own judge, with no one to influence you.

You need not feel under the slightest obligation to buy. Let merit decide.

No Need to Wait

With such a liberal offer, made by a $2,000,000 concern, no one need be without a typewriter now. The low price removes the old-time barrier. And our easy payment plan makes it possible to have an Oliver while paying.

Mail the coupon now for EITHER a free trial Oliver or further information, including illustrated catalog.

Canadian Price, $72

The Oliver Typewriter Co.
677 Oliver Typewriter Bldg. Chicago, Ill

Was $100
Now $57

Save $43

THE OLIVER TYPEWRITER COMPANY
677 Oliver Typewriter Building, Chicago, Ill.

☐ Ship me a new Oliver Nine for five days free inspection. If I keep it, I will pay $57 at the rate of $3 per month. The title to remain in you until fully paid for.

My shipping point is.....
This does not place me under any obligation to buy. If I choose to return the Oliver, I will ship it back at your expense at the end of 5 days.

☐ Do not send a machine until I order it. Mail me your book—"The High Cost of Typewriters—The Reason and the Remedy," your de luxe catalog and further information.

"I was astounded at my new power over men and women. People actually went out of their way to do things for me, they seemed EAGER TO PLEASE ME"

The Secret of Making People Like You

"Getting people to like you is the quick road to success—it's more important than ability," says this man. It surely did wonders for him. How he does it—a simple method which anyone can use instantly.

ALL the office was talking about it, and we were wondering which one of us would be the lucky man.

There was an important job to be filled — as Assistant-to-the President. According to the general run of salaries in the office, this one would easily pay from $7,000 to $10,000 a year.

The main requisite, as we understood it, was striking personality and the ability to meet even the biggest men in their offices, their clubs, and their homes on a basis of absolute equality. This the firm considered of even more importance than knowledge of the business.

You know just what happens when news of this sort gets around an office. The boys got to picking the man among themselves. They had the choice all narrowed down to two men—Harrison and myself. That was the way I felt about it, too. Harrison was big enough for the job, and could undoubtedly make a success of it. But, personally, I felt that I had the edge on him in lots of ways. And I was sure that the firm knew it, too.

Never shall I forget my thrill of pleasure when the president's secretary came into my office with a cheery smile, looked at me meaningly, handed me a bulletin and said, "Mr. Frazer, here is the news about the new Assistant-to-the-President." There seemed to be a new note of added respect in her attitude toward me. I smiled my appreciation as she left my desk.

At last I had come into my own! Never did the sun shine so brightly as on that morning, and never did it seem so good to be alive! These were my thoughts as I gazed out of the window, seeing not the hurrying throngs, but vivid pictures of my new position flashing before me. And then for a further joyous thrill I read the bulletin. It said, "Effective January 1, Mr. Henry J. Peters, of our Cleveland office, will assume the duties of Assistant-to-the-President at the home office."

Peters! Peters!—surely it *couldn't* be Peters! Why, this fellow Peters was only a branch-office salesman. . . . *Personality!* Why, he was only five feet four inches high, and had no more personality than a mouse. Stack him up against a big man and he'd look and act like an office boy. I knew Peters well and there was nothing to him, nothing at all.

January the first came and Peters assumed his new duties. All the boys were openly hostile to him. Naturally, I felt very keenly about it, and didn't exactly go out of my way to make things pleasant for him—not exactly!

But our open opposition didn't seem to bother Peters. He went right on with his work and began to make good. Soon I noticed that, despite my feelings against him, I was secretly beginning to admire him. He was winning over the other boys, too. It wasn't long before we all buried our little hatchets and palled up with Peters.

The funny thing about it was the big hit he made with the people we did business with. I never saw anything like it. They would come in and write in and telephone in to the firm and praise Peters to the skies. They insisted on doing business with him, and gave him orders of a size that made us dizzy to look at. And offers of positions! why, Peters had almost as many fancy-

www.americanradiohistory.com

figure positions offered to him as a dictionary has words.

What I could not get into my mind was how a little, unassuming, ordinary-to-look-at-chap like Peters could make such an impression with everyone—especially with influential men. He seemed to have an uncanny influence over people. The masterly Peters of today was an altogether different man from the commonplace Peters I had first met years ago. I could not figure it out, nor could the other boys.

One day at luncheon I came right out and asked Peters how he did it. I half expected him to evade. But he didn't. He let me in on the secret. He said he was not afraid to do it as there was always plenty of room at the top.

"People would come in and write in and telephone in and praise Peters to the skies . . . he was showered with offers of fancy figure positions."

What Peters told me acted on my mind in exactly the same way as when you stand on a hill and look through binocular glasses at objects in the far distance. Many things I could not see before suddenly leaped into my mind with startling clearness. A new sense of power surged through me. And I felt the urge to put it into action.

Within a month I was getting remarkable results. *I had suddenly become popular.* Business men of importance who had formerly given me only a passing nod of acquaintance, suddenly showed a desire for my friendship. I was invited into the most select social circles. People—even strangers—actually went out of their way to do things for me. At first I was astounded at my new power over men and women. Not only could I get them to do what I wanted them to do but they actually anticipated my wishes and seemed eager to *please me.* But let me tell you some of my experiences.

One of our biggest customers had a grievance against the firm. He held off payment of a big bill and switched to one of our competitors. I was sent to see him. He met me liked a cornered tiger. A few words and I calmed him. Inside of fifteen minutes he was showering me with apologies. He gave me a check in full payment, another big order, and promised to continue giving us all his business.

For certain reasons it became necessary for the firm to obtain a signed letter from a prominent public man. Three of our men had tried, and failed. Then I was given the job. I felt I had been made the "goat." But I got the signed letter, and with it an inside tip which enabled us to land a prize order about which our competitors are still guessing and wondering.

Then trouble sprang up at one of our factories. Then men talked strike. Things looked ugly. I was sent to straighten it out. On the eve of a general walkout, I pacified the men and headed off the strike. And not only this, but ever since then this factory has led all our other plants in production.

I could tell you dozens of similar instances, but they all tell the same story—the ability to make people like you, believe what you want them to believe, and to do what you want them to do. I take no personal credit for what I have done. All the credit I give to the method Peters told me about. We have told it to lots of our friends, and it has enabled them to do just as remarkable things as Peters and I have done.

Which reminds me: One of my wife's close friends moved to another town where she was a stranger. My wife of course knew of my method. She told it to her friend with the idea that it might be of assistance to her in meeting new people. It helped her so wonderfully that in a very short time she won the close friendship of many of the "best families" in the town. Every one wonders how she did it. But WE know.

But you want to know what method I used to do all these remarkable things. It is this: You know that every one doesn't think alike. What one likes another dislikes. What pleases one offends another. And what offends one pleases another. Well, there is your cue. You can make an instant hit with any one if you say the things they want you to say, and act the way they want you to act. Do this and they will surely like you, and believe in you, and will go miles out of their way to PLEASE YOU.

You can do this easily by knowing certain simple signs. Written on every man, woman and child are signs, as clearly and as distinctly as though they were in letters a foot high, which show you from one quick glance exactly what to say and to do to please them—to get them to believe what you want them to believe—to think as you think—to do exactly what you want them to do.

In knowing these simple signs is the whole secret of getting what you want out of life—of making friends, of business and social advancement. Every great leader uses this method. That is why he IS a leader Use it yourself and you will quickly become a leader—nothing can stop you. And you will want to use it for no other reason than to protect yourself against others.

What Peters told me at luncheon that day was this: "Get Dr. Blackford's 'Reading Character at Sight.'" I did so. This is how I learned to do all the remarkable things I have told you about.

You have heard of Dr. Blackford, the Master Character Analyst. Many concerns will not employ a man without first getting Dr. Blackford to pass on him. Concerns such as Westinghouse Electric and Manufacturing Company, Baker-Vawter Company, Scott Paper Company and many others pay Dr. Blackford large annual fees for advice on dealing with human nature.

So great was the demand for these services that Dr. Blackford could not even begin to fill all the engagements. So Dr. Blackford has explained the method in a simple seven-lesson course entitled "Reading Character at Sight." Even a half hour's reading of this remarkable course will give you an insight into human nature and a power over people which will surprise you.

Such confidence have the publishers in Dr. Blackford's course, "Reading Character at Sight," that they will gladly send it to you on approval. Send no money. Merely fill in and mail the coupon. The complete course will go to you instantly, on approval, all charges prepaid. Look it over thoroughly. See if it lives up to the claims made for it. If you do not want to keep it, then return it, and the transaction is closed. And if you decide to keep it—as you surely will—then merely remit Five Dollars in full payment.

Remember, you take no risk, you assume no obligation. The entire course goes to you on approval. You've everything to gain—nothing to lose. So mail the coupon NOW, while this remarkable offer remains open.

"In a very short time she won the close friendship of many of the 'best families' in town"

The MOUNTAINS COME TO YOU

YOU know how invigorating and healthful mountain air is — how beneficial it is to the lungs. It is doubly invigorating right after a thunderstorm. Then the air is highly charged with ozone produced by lightning discharges thru the air. The exhilarating twang is the mixture of this ozone with diffused pine needle oil from the pines.

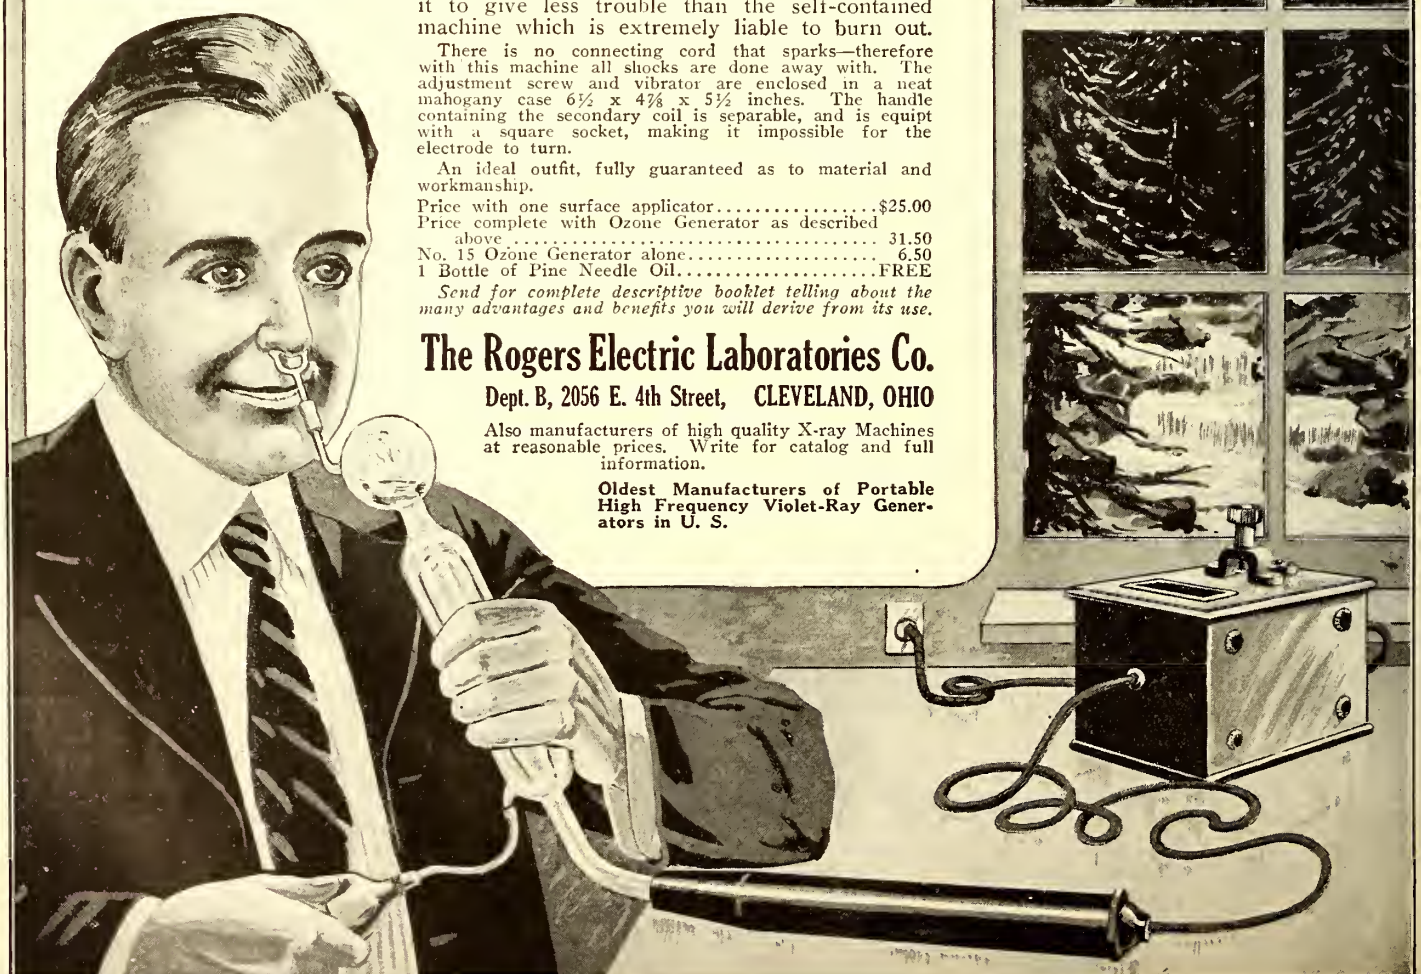
It is now possible for you to get exactly the same effect artificially and without leaving your home, by means of the

ROGERS OZONE GENERATOR

The Ozone Generator, figuratively speaking, brings the mountains to you, because it produces a heavy flow of ozone combined with vaporized pine needle oil. To inhale the fumes of this generator is like a trip to the most famous mountain health resorts of the country, and you can have the treatment at practically no cost, at any time you desire. For lung and bronchial troubles, especially for hay fever, catarrh, colds, etc., it gives remarkably quick relief.

Our Ozone Generator can be used with any high frequency violet-ray machine, but it is specially built for our own make as illustrated. Made entirely of glass and can be used by anyone.

In connection with this machine we recommend our Type D Violet Ray, High Frequency Generator



This is a powerful machine of very substantial construction, and the range of adjustment is very wide. We recommend this machine, because we have found it to give less trouble than the self-contained machine which is extremely liable to burn out.

There is no connecting cord that sparks—therefore with this machine all shocks are done away with. The adjustment screw and vibrator are enclosed in a neat mahogany case 6½ x 4⅞ x 5½ inches. The handle containing the secondary coil is separable, and is equipt with a square socket, making it impossible for the electrode to turn.

An ideal outfit, fully guaranteed as to material and workmanship.

Price with one surface applicator.....$25.00
Price complete with Ozone Generator as described above..... 31.50
No. 15 Ozone Generator alone..... 6.50
1 Bottle of Pine Needle Oil.....FREE

Send for complete descriptive booklet telling about the many advantages and benefits you will derive from its use.

The Rogers Electric Laboratories Co.

Oldest Manufacturers of Portable High Frequency Violet-Ray Generators in U. S.

Why Some Foods Explode in the Stomach

And How 48 Hours Makes New Stomachs from Old

By R. S. THOMPSON

A MAN'S success in life depends more on the co-operation of his stomach than on any other factor. Just as an "army moves on its stomach" so does the individual. Scientists tell us that 90% of all sickness is traceable to the digestive tract. Yet in a surprisingly large number of cases even chronic stomach trouble can be remedied in from 48 to 72 hours.

Physical efficiency is the back-bone of mental efficiency. Unless our stomachs are effectively performing their functions in the way Nature intended, we can't be physically fit. And unless we're physically fit, we can't be thoroughly successful.

As Dr. Orison Swett Marden, the noted writer, says, "the brain gets an immense amount of credit which really should go to the stomach." And it's true — keep the digestive system in shape and brain vitality is assured.

Of course, there are successful men who have weak digestions, but they are exceptions to the rule. They succeeded *in spite* of their physical condition. Ten times the success would undoubtedly be theirs if they had the backing of a strong physique and a perfect stomach. There are a thousand men who owe their success in life to a good digestion to every one who succeeded in spite of a poor digestion and the many ills it leads to.

The cause of practically all stomach disorders — and remember, stomach disorders lead to 90% of all sickness —is wrong eating.

Food is the fuel of the human system, yet some of the combinations of food we put into our systems are as dangerous as dynamite, soggy wood and a little coal would be in a furnace—and just about as effective. Is it any wonder that the average life of man today is but 39 years — and that diseases of the stomach, liver, and kidneys have increased 103% during the past few years!

The trouble is that no one has, until recently, given any study to the question of food and its relation to the human body. Very often one good harmless food when eaten in combination with other harmless foods creates a chemical reaction in the stomach and literally explodes, giving off dangerous toxics which enter the blood and slowly poison our entire system, sapping our vitality and depleting our efficiency in the meantime.

And yet, just as wrong food selections and combinations will destroy our health and efficiency, so will the right foods create and maintain bodily vigor and mental energy. And by right foods we do not mean freak foods — just good, every-day foods properly combined. In fact, to follow Corrective Eating it isn't even necessary to upset your table.

Not long ago I had a talk with Eugene Christian, the noted food scientist, and he told me some of his experiences in the treatment of disease through food. Incidentally Eugene Christian has personally treated over 23,000 people for almost every non-organic ailment known, with almost unvaried success. An enviable record when one considers that people nearly always go to him after every other known method has failed. And the remarkable part of it all is that Eugene Christian's methods often remedy chronic cases of stomach trouble in 48 hours.

One case which interested me greatly was that of a young business man whose efficiency had been practically wrecked through stomach acidity, fermentation and constipation, resulting in physical sluggishness which was naturally reflected in his ability to use his mind. He was twenty pounds under weight when he first went to see Christian and was so nervous he couldn't sleep. Stomach and intestinal gases were so severe that they caused irregular heart action and often fits of great mental depression. As Christian describes it, he was not 50 per cent efficient either mentally or physically. Yet in a few days, by following Christian's suggestions as to food, his constipation had completely gone, although he had formerly been in the habit of taking large daily doses of a strong cathartic. In five weeks every abnormal symptom had disappeared—his weight having increased six pounds. In addition to this he acquired a store of physical and mental energy so great in comparison with his former self as to almost belie the fact that it was the same man.

Another instance of what proper food combinations can do was that of a man one hundred pounds overweight whose only other discomfort was rheumatism. This man's greatest pleasure in life was eating. Though convinced of the necessity, he hesitated for months to go under treatment, believing he would be deprived of the pleasure of the table. He finally, however, decided to try it out. Not only did he begin losing weight at once, quickly regaining his normal figure, all signs of rheumatism disappearing, but he found the new diet far more delicious to the taste and afforded a much keener quality of enjoyment than his old method of eating, and he wrote Christian a letter to that effect.

But perhaps the most interesting case that Christian told me of was that of a multi-millionaire—a man 70 years old, who had been traveling with his doctor for several years in a search for health. He was extremely emaciated, had chronic constipation, lumbago, and rheumatism. For over twenty years he had suffered from stomach and intestinal trouble which in reality was super-aciduous secretions in the stomach. The first menus given him was designed to remove the causes of acidity, which was accomplished in about thirty days. And after this was done he seemed to undergo a complete rejuvenation. His eyesight, hearing, taste, and all of his mental faculties became keener and more alert. He had had no organic trouble—but he was starving to death from malnutrition and decomposition—all caused by the wrong selection and combination of foods. After six months' treatment this man was as well and strong as he had ever been in his life.

These instances of the efficacy of right eating I have simply chosen at random from perhaps a dozen Eugene Christian told me of, every one of which was fully as interesting, and they applied to as many different ailments. Surely this man Christian is doing a great work.

I know of several instances where rich men and women have been so pleased with what he has done for them that they have sent him checks for $500 or $1,000 in addition to the amount of the bill when paying him.

There have been so many inquiries from all parts of the United States from people seeking the benefit of Eugene Christian's advice and whose cases he is unable to handle personally that he has written a course of little lessons which tell you exactly what to eat for health, strength and efficiency. This course is published by The Corrective Eating Society of New York.

These lessons, there are 24 of them, contain actual menus for breakfast, luncheon, and dinner, curative as well as corrective, covering every condition of health and sickness from infancy to old age and for all occupations, climates, and seasons, including special summer menus which enable you to withstand the heat and retain winter's vigor.

Reasons are given for every recommendation based upon actual results secured in the author's many years of practice. Technical terms have been avoided —every point is explained so clearly that there can be no possible misunderstanding.

With these lessons at hand it is just as though you were in personal contact with the great food specialist, because every possible point is so thoroughly covered that you can scarcely think of a question which isn't answered. You can start eating the very things that will produce the increased physical and mental energy you are seeking the day you receive the lessons and will find that you secure results with the first meal. And if you suffer from acid stomach it is quite likely that your trouble will successfully be overcome in from 48 to 72 hours.

If you would like to examine these 24 Little Lessons in Corrective Eating, simply write The Corrective Eating Society, Inc., Dept. 16410, 443 Fourth Avenue, New York City. It is not necessary to enclose any money with your request. Merely ask them to send the lessons on five days' trial, with the understanding that you will either return them within the time or remit $3.00, the small fee asked.

The reason that the Society is willing to send the lessons on free examination without money in advance is because they want to remove every obstacle to putting this knowledge in the hands of the many interested people as soon as possible, knowing full well that a test of some of the menus in the lessons themselves is more convincing than anything that can possibly be said about them.

Please clip out and mail the following form instead of writing a letter, as this is a copy of the official blank adopted by the Society, and will be honored at once.

CORRECTIVE EATING SOCIETY, INC.
Dept. 16410, 443 Fourth Ave., New York City

You may send me prepaid a copy of Corrective Eating in 24 Lessons. I will either remail them to you within five days after receipt or send you $3.

"THE 100% WIRELESS MAGAZINE"

Partial CONTENTS OF OCTOBER ISSUE:

Arc Undampt Transmission.
By Ensign P. H. Boucheron, U.S.N.R.F.

Developing Audions for the Amateurs.
By E. T. Jones, Associate Editor.

Cascade Amplification at Radio Frequencies.
By Thomas Benson.

Save Your Old Coupler.
By M. B. Lowe.

Audion Protective Device.
By Edgar Terrain Johnstone.

Selector Switch for "Rogers" Underground Antenna.
By Stanley J. Brown.

How to Make A Good Variable Condenser.
By A. Warr.

A New Radio Dynamic Controlling System.
By Lieut. W. R. Coventry.

Long Wave Receiving.
By H. L. Beedenbender.

Magnet Control for Vacuum Tubes.
By Herbert Webb.

An Amateur's Retrospect.
By Scott E. Vance.

A Short Wave Receiving Transformer.
By Raymond Evans.

Improved "B" Battery Construction.
By J. G. Reed.

An Undampt Transmitter of the De Forest Type.
By E. Dynner.

What "Radio Amateur News" Is:

With its fourth issue RADIO AMATEUR NEWS holds the field undisputedly as the greatest radio magazine in print today. In point of circulation, number of articles, illustrations, RADIO AMATEUR NEWS now leads all other wireless magazines. Take for instance the September issue with its fifty-six pages; there were fifty-one separate purely radio articles and 112 illustrations. *Over twenty-five thousand copies were printed and circulated.*

Each issue of the RADIO AMATEUR NEWS now contains 56 pages (or more) and an artistic cover in two colors. The illustrations average 125 every month and there are from 40 to 50 up-to-date articles, some by our biggest radio scientists, in every issue.

RADIO AMATEUR NEWS is the greatest and biggest radio magazine in print today.

RADIO AMATEUR NEWS is the only INDEPENDENT monthly wireless magazine in existence. It caters to no commercial interests—it has no boss save its readers. It is "different"—it has the latest radio news. It is a scientific magazine but it caters largely to the RADIO AMATEUR—it is by and for the Amateur. It is publisht by the publishers of the ELECTRICAL EXPERIMENTER, but there will be no duplication of articles in the two magazines. Both are entirely different—but both together will give you ALL the radio news of all the world. Whether you are a professor or an Amateur, get a sample copy or order it from your Newsdealer today.

Junior Radio Course By E. T. JONES Associate Editor

A distinctly new feature began with the September issue in our new **Junior Radio Course.** In the October issue Lesson No. 2 will appear complete. This course is intended for the beginner and everything presented will be in plain English—even the merest tyro in radio will find no trouble in understanding and assimilating the knowledge. The series is a very important one and nothing like it has ever appeared in print before. Everyone owes it to himself in this new age to know something about wireless and this course will enlighten all laymen. Profusely illustrated with pictures that anyone can understand.

In one way or another your whole income is staked upon your memory every day!

A Simple Test To Measure Your Memory

Could You Get By With This Big Employer Who Judges His Men On What Their Minds Retain? Try It.

NOT long ago a large eastern concern was looking for a man to fill an important position as district manager.

Several hundred applications for the job were received. The choice finally narrowed down to four names, and from these the successful candidate was to be selected.

Before the decision was made these four men were asked to do what seemed to them a most unusual thing. They were put through a test such as they had never before heard of, and each man understood that he would be judged, to a large extent, on the showing he made.

The job was filled at last and the man who won out was probably more surprised at his success than any of the others would have been had they gotten it. He knew that his experience was far less than that of two of the applicants, he was younger than any of them and it had seemed to him all along that his case was anything but hopeful. He determined to find out just why the firm put so much reliance on the simple test that each man had been asked to take.

"That little device is one of our most valuable aids in finding the men we want as employees", an officer of the company told him. "We apply it to every person who seeks a position with us from office boys up to high priced executives. The result is that our whole organization is a great deal more efficient than in the old days.

David M. Roth

"We borrowed the test from the works of David M. Roth, the memory expert, and it is our experience that one of the surest ways to know a man's mental power is to measure his memory. The fellow with a good memory has the qualities that go with a good memory and those are the things we pay big salaries for."

THIS firm had installed in a special room a replica of a store show-window facing into the room as a real store window faces the street. Behind its glass were arranged perhaps fifty different articles which were manufactured by the company itself and formed a part of their regular line. The window was well lighted and every article in it was something familiar to all.

Each man who takes the test is permitted 30 seconds to observe and memorize the objects in the window. Then he is required to leave the room and write down as many as he can remember. The proportion of them that he is able to recall determines his memory rating and, largely, his chances for getting the job.

You can measure your memory at home by means of this same test. Have someone select and arrange twenty-five articles of ordinary household use on a table. Let those who are taking the test observe them in silence for 15 seconds. Then let each person go into another room and write down the names of as many of the articles as he can remember. The result will reveal a surprising state of affairs. It will dismay you to find how quickly and absolutely the names of familiar articles, some of which perhaps you see and use every day, will slip out of your mind and refuse to return.

But the most interesting part of this test is the way it exposes the tremendous handicap you are struggling under in your daily work.

When you find what a small number of the articles on the table you are able to name after the most intense effort to impress them on your mind you begin to realize how many facts of value, how much useful knowledge, how many names, faces and figures that would make you a better man in your job drop out of your mind and are gone, leaving you in point of knowledge and experience barely ahead of where you were the month before or the year before.

Do you wonder at the importance of the memory test in hiring men for high-salaried permanent positions? Can you doubt the tremendous money value of a trained, dependable memory in business and the professions?

A STRIKING instance of this very thing came to light recently.

Forty years ago in the state of Virginia a boy of thirteen was forced to quit school and go to work when his father died. He became an apprentice in a blacksmith shop.

Today he is Vice President in charge of Production of the American Locomotive Company and one of the biggest executives in the country. He is C. K. Lassiter and his job is one of the hardest in all the range of American business. He keeps six plants with thousands of employees running smoothly. He knows every detail of the machinery in every one of these plants. He has to see that the company's locomotives are turned out on schedule time, and that each one reaches its buyer in good condition and working order.

In an interview with Mr. Lassiter appearing in the **American Magazine** for May, 1919, he says:

"My memory is today my greatest asset in business. . . . I learned to work for knowledge and to hold on to what I gained."

Such testimony is the usual thing from big leaders in all lines of work. It is because a good memory is so much more than the mere ability to recall the name of the man you met last week or the telephone number which you neglected to write down. These are merely the smaller conveniences of a good memory—the daily advantages that make you more efficient.

But in its larger phases, power of memory is power of judgment, power of foresight, power of knowledge. It matters very little what you learn today if the benefit of your experience is not with you tomorrow, or a year from tomorrow. Your judgment is only as good as your memory, because all sound decisions must be based on something learned in the past. Otherwise they are mere guesses, —gambles.

Foresight,—that quality which marks the most successful men everywhere—is nothing more nor less than applied memory. We can only foresee what **may** occur from our experience of what **has** occurred in the past. A simple matter of memory.

And all knowledge itself exists only through the ability to remember things that have been learned, information gained through experience, facts that have come to our attention at one time or another, ideas that have reached us from all sources and the knowledge of others expressed to us in speech or in printed words.

SO it is that the words "I forgot", and all these words stand for, have come to be regarded by men generally as a confession of needless weakness and an admission of failure.

And it has been David M. Roth who has showed the world just how needless a poor memory is. He has given to the public the secret of how to improve even a poor memory in a single evening. By the Roth Method hundreds of thousands of people all over the country have discovered for themselves that it is easy to have a sure-fire memory. And they have gained clearer thinking powers, stronger leadership and better self-possession along with their better memories.

One man not long ago wrote to Mr. Roth:

"You should have said that any person can improve their memory in two hours."—Charles A. Horan, 1541 W. Lehigh Ave., Philadelphia, Pa.

and another:

"The Roth Memory Course has been worth hundreds of dollars to me already."—L. D. Smith, Buffalo, Okla.

Such letters come in by the hundreds from men and women who asked to see the seven lessons of the Roth Memory Course while half in doubt about its simplicity, usefulness and power to build a leakproof memory. They have become as enthusiastic as you will be when you find that a better memory is so easy to have and so close at hand.

PROVE it? Mr. Roth, through his publishers, The Independent Corporation, gladly assumes that burden.

Send no money whatever. Simply put it up to him to show you that the Roth Course will improve your memory in a single evening's reading and give you a 100% better memory inside of a week. He is so sure of it that he will leave all argument to the seven easy lessons which comprise the course. They will be sent you all charges prepaid as soon as you give us your name and address. Use the coupon below. If the course does not satisfy you simply return it any time within five days and you owe nothing. Fair enough, isn't it?

But unless you are different from hundreds of thousands who have accepted this offer before, you'll know that you want to own the course inside of thirty minutes after you open the first lesson. When you decide to keep it, send only $5 in full payment.

Yes, it is worth finding out about. Very much so.

Free Examination Coupon

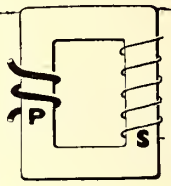
Electricity
taught by a practical man!

Home Study Courses of Definite Value
For Experienced Men and Beginners



PERSONALLY CONDUCTED

by a man who has long experience as a consulting electrical engineer and who has developed the ability to impart his knowledge to others.

RIGHT in your own home, if you are ambitious, you can fit yourself for an electrical position and graduate forever from the ranks of those who are held back because of lack of technical knowledge. I don't make any false statements about the wonderful salaries you will command. But I do promise, if you are in earnest, to give you unusually valuable service that has enabled many others to increase their earnings greatly.

Each Lesson Meant for You

My method is different from others. It is based upon my years of practical experience. It leads the student quickly over fundamentals right up to practical information, such as is experienced in everyday work. You get my personal attention. It's really a class where you who want to learn and I who know the angles of the electrical industry from experience, get together. This method has been so successful that my students are sending others to me and a number of concerns require their employees to take my course.

Advancement

is made possible to any ambitious man—whether a beginner or experienced in electrical work—who will conscientiously devote his spare time to my course of study.

Tough Problems Made Simple

There isn't a problem that can't be solved if you have the proper foundation of knowledge. There is no limit to what you can achieve with the aid of the practical electrical information supplied in my course. It's up to you. I can't tell you much in this little space. Let me send you my catalog.

RESULTS OF MY SERVICE

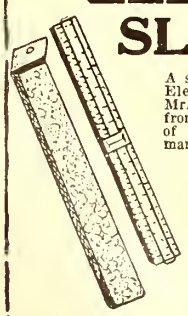
Practical Electricians Recommend My Course to Others.
My Students Are Invariably Promoted and Get Better Salaries.
Over 65 Per Cent. of My Students Are Engaged in the Electrical Business.
Over 11 Per Cent. of My Present Enrollment Came Through Satisfied Students.
Beginners Get Employment in Electrical Work After Taking My Course a Short While.

The Right Way to Pay

You pay me a small amount each month. You may stop any time and your payments will then stop. I don't want your money if I'm not teaching you satisfactorily.

Apparatus Supplied

Electrical material, charts, electrical apparatus, drafting material, etc., are furnished with the course without charge.



Write me frankly about yourself—what you are doing now and what you hope to do. Let's get together on your problems.

SEND FOR MY BOOK which clearly tells you how the work is handled, what I have done for others and the benefits you can expect to receive.

YORKE BURGESS, Superintendent

BURGESS ELECTRICAL SCHOOL, 745 E. 42nd Street, Chicago, Illinois

Instructions on the
ELECTRICAL SLIDE RULE

A set of concise lessons on the use of the Electrical Slide Rule has been prepared by Mr. Burgess in response to many requests from those who desire to take up the use of this instrument which is invaluable to many electrical men.

A High Grade Slide Rule

in a leather case and the COMPLETE COURSE OF INSTRUCTION will be supplied at a VERY REASONABLE COMBINATION PRICE. We have selected the rule best adapted for the purpose and the lessons will enable you to thoroughly understand its use. Write for full information.

Burgess Electrical School
745 E. 42nd St., Chicago, Ill.

BURGESS BLUE BOOK
ELECTRICAL MEN AND STUDENTS

A pocket hand-book for ELECTRICAL MEN and STUDENTS. Contains over 200 CALCULATION FORMULAS and worked-out problems showing their use. Also DRAWINGS of ELECTRICAL APPARATUS and DEVICES of which the *inside connections* are clearly shown. ALTERNATING CURRENT CALCULATIONS and dozens of everyday problems are covered. Recommended by electrical men all over the country. Used in technical schools. Purchased by electrical concerns for employees and customers. There is no other book like it.

PRICE $1.00

A $1.00 bill brings the book. We refund your money if you are not fully satisfied.

We give information on electrical subjects, design and perfect electrical devices and apparatus. Power plants, electric railway and operation and railway signals a specialty. Write us your needs and let us furnish data and advise you. Our service is prompt, reliable and satisfactory.

BURGESS ENGINEERING CO.

Yorke Burgess, President
Consulting Electrical Engineering

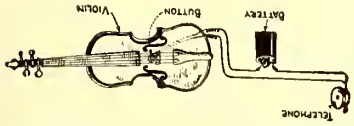
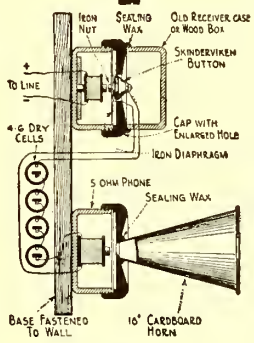
SKINDERVIKEN TRANSMITTER BUTTON



MOST SENSITIVE MICROPHONE

FOR $1.00

YOU can easily make a highly sensitive detectophone by using a Skinderviken Transmitter Button to collect the sound waves. You can build your own outfit without buying expensive equipment. Think of the fun you would have with such an instrument! It's very simple, too, and inexpensive.

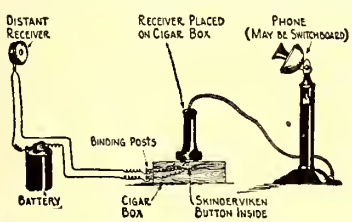


You can install an outfit in your home and hear the conversation being held all over the house. You can connect up different rooms of a hotel. *This outfit was used by secret service operatives during the War. It is being used on the stage.*

Actual size.

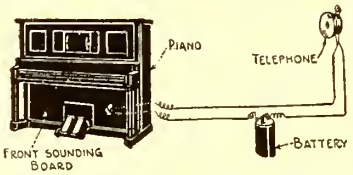
So much for its commercial adaptations! *You* can procure apparatus of the same type.

One of the main advantages of the Skinderviken Transmitter Button lies in its ultra-sensitiveness. You can place it in any position you like. It is the greatest invention in micro-phones and has won recommendations from men of high standing in the scientific world. It is being used all over the world. You can mount it most anywhere. Card board boxes, stove pipes, stiff calendars and hundreds of other places will suggest themselves to you. The buttons cannot be seen by any one in the room as they are so small and light. Only a small brass nut is exposed to the view.



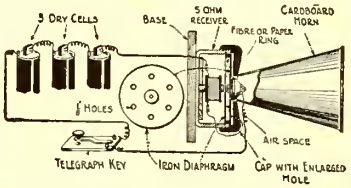
Full directions for connecting up the button for use as a detectophone are given in booklet which is sent with each button.

The only instruments needed to complete a detectophone outfit, in addition to a Skinderviken Transmitter Button are a receiver, battery, and, if desired, an induction coil.



AMONG electrical experimenters the button has created a sensation. It is not uncommon to receive unsolicited letters like these: "I received transmitter button today and I wish to inform you that it works great and is *the best I have ever seen or heard of for the price.* I will certainly recommend it to my friends. I wish to thank you for your good service."

"I have been using one of these transmitter buttons, and it has proved to be worth more than its value in my experimenting." "I received one (Transmitter Button) some time ago, and they are just O. K. for experimenting." "I have been using one of these transmitter buttons for experimental work and it certainly lives up to all you say for it *and then some.*"



Mr. H. Gernsback, editor of this magazine, who is the dean of electrical experimenters, said: "In the writer's opinion, obtained by actual elaborate tests, the Skinderviken Transmitter Button is probably the most efficient device of its kind on market today, due to its simplicity and other outstanding features. Should have a great future."

The same circuit connections apply to all experiments, regardless of how the transmitter button is mounted.

The Skinderviken Transmitter Button operates on one or two dry cells. It often happens that two cells produce too much current and the sounds are deafening. We recommend either one fresh cell or two worn out cells.

We have the utmost faith in this transmitter button. We guarantee satisfactory service or we will refund the purchase price. Boys—Young and old—send in a dollar bill RIGHT NOW! You can't lose. If you're not satisfied, you receive your dollar back. Isn't that fair?

OFFER No. 1

Wireless Course

The most comprehensive Wireless Course ever printed. Contains 160 pages, 350 illustrations. Size of book 6¾"x10". Very fine flexible cloth cover.

FREE with a year's subscription.
Add 5c for postage

OFFER No. 2

Experimental Electricity Course

This masterpiece contains 160 pages, 400 illustrations. Size of book 5"x9". Printed on extra thin paper, so book can be slipped into pocket. Handsome flexible cloth cover.

FREE with a year's subscription. Add 5c postage

OFFER No. 3

How to Make Wireless Sending Apparatus
By 20 Radio Experts

How to Make Wireless Receiving Apparatus
By 20 Radio Constructors

These books are by far the most successful wireless books on the market. Size of each book 5"x7", well bound on good book paper. Covers in two colors. We really cannot praise these books too highly. Each book contains 100 pages and from 88 to 90 illustrations. **BOTH** books **FREE** with a year's subscription. Add 5c for postage

This is a very limited offer. It may be withdrawn at any time, due to the tremendous cost of paper, which IS JUST DOUBLE WHAT IT WAS ONE YEAR AGO. We have only a limited supply of these fine books on hand; after they are gone we cannot reprint the books until conditions become normal again. **Now is your chance.**

The publishers of this journal have earned an enviable reputation of giving more than 100 cents' worth for each dollar spent with them. Profit by this liberal opportunity NOW; it may never be made again.

HERE'S THE OFFER

Subscribe to the ELECTRICAL EXPERIMENTER for one year, at the regular subscription price of $2.00 per year (Canada, foreign and N. Y. C. $2.50) and we will send you either books shown in one of the above offers. If you subscribe for two years, two offers will be given, etc.

If you are a subscriber at present take advantage of this wonderful opportunity anyway. If you do, we will extend your present subscription.

This Offer Limited. ***Act Now.***

You can be a Graduate
ELECTRICAL ENGINEER

YOUR DIPLOMA

We trained over 1,000 men last year for the U. S. Government

Our methods of teaching saves you time and money in becoming a graduate, practical, Electrical Engineer—at Big Pay.

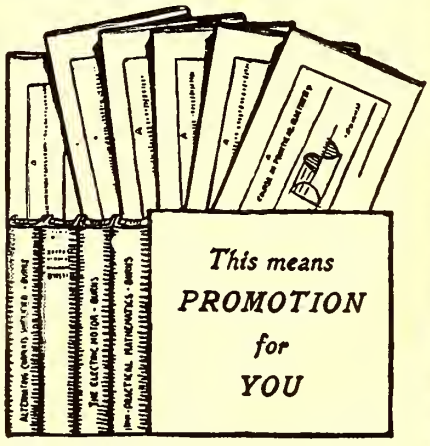
There is a large and constantly increasing demand for Graduate Electrical Engineers. Our Diploma is accepted as evidence of a competent, trained electrician. Hundreds of our Graduates are now big, successful Electrical Engineers. They will tell you what we have done for them. We can do the same for you—in your *spare time at home.* Read how these results are accomplished.

Your object in taking a correspondence course is to *Increase your Earning Power.* To learn exactly what you need and not waste your time and efforts on superfluous matter, is the shortest means to that end. The *Joseph G. Branch School of Engineering* specializes in equipping you with the *practical* and *usable* knowledge that enables you to qualify as an Electrical Engineer in the shortest time, yet our course is practical and complete. *This we definitely guarantee.*

You Get Intensive, Selected, Personal Instruction

Our courses are simple, practical and easily understood. Everything is made clear. You do not become involved in difficult technical matter of no practical value, and which is so discouraging to the student, but you go straight into the principles of the subject and the application of these principles. Every one of our students gets *personal* instruction, so that his progress is steady and sure. *You can't fail* with this course if you will simply follow our very clear directions. One of our students says: "Your course is strong for the Engineer. It gives him the vital working knowledge of the subject which makes him a competent Electrical Engineer in a very short time and at a very moderate cost." Many Electricians earn

$2,500 to $7,500 a Year



The course in Electrical Engineering covers the installation and operation of all kinds of modern electrical machinery and appliances, including power plant work, viz.: Practical Electricity, Alternating Currents, the Electric Motor, Practical Mathematics and Electrical Wiring. Under Practical Electricity both direct and alternating currents, high potential and high frequency currents are covered.

You get *everything* that will make you a proficient, *practical* Electrical Engineer—without the loss of time spent on endless theory and difficult technical work of other methods. This has been made possible by the thirty years of practical experience of Mr. Joseph G. Branch, B.S., M.E., in the engineering field. This is now presented to you in compact, usable and easily learnable form. There is no course which will put you on a big salary basis in so short a time.

SEND FOR COMPLETE CATALOG, TESTIMONIALS AND LIST OF POSITIONS SECURED

Complete, Practical Correspondence Courses in

Electrical Engineering
Mechanical Engineering
Stationary Engineering
Mechanical Refrigeration

Ingenieria Electrica (Spanish course)
Marine Engineering

THESE BOOKS FREE!

With the Electrical Engineering course you get, FREE, these splendid text books—all *Standard Works.* These books alone are worth more than the price of the course. Each book by a recognized authority:

Practical Electricity — *The Electric Motor*
Alternating Currents Simplified
Electric Wiring — *Practical Mathematics*

You need this Electrical Library. Here is your chance to get it *free.*

Due to Mr. Branch's long experience in and close contact with the engineering field the courses embrace such questions as are usually asked by the various Boards of Examining Engineers throughout the country. Our graduates will testify to the ease with which they were able to pass these examinations, and the cooperation received from us in helping them get positions.

A Diploma from the Branch School of Engineering is a sure step to a better position and a larger salary. You can soon have your Diploma—without interfering with your present work.

SPECIAL OFFER

The price of the course is extremely low and just now we are making a Special Limited Offer to those who reply to this advertisement. This remarkable offer reduces the cost of the complete course to a very low figure. You will be astonished to find how little this tremendously valuable training will cost you. Mail coupon at once for full particulars and Special Terms. Jos. G. Branch School of Engineering, Dept. E, 542 Dearborn Street, Chicago.

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,500 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Special Automobile Ignition Course

We have just installed a special automobile ignition course for auto mechanics, garage men and owners. The course covers completely ignition, starting, lighting and other electrical equipment in connection with automobiles, motor boats, etc.

Let us explain our complete courses to you in person. If you can't call, send now for 64-page book—it's FREE to you.

New York Electrical School
29 W. 17th St., New York, N. Y.

Please send FREE and without obligation to me your 64-page book.

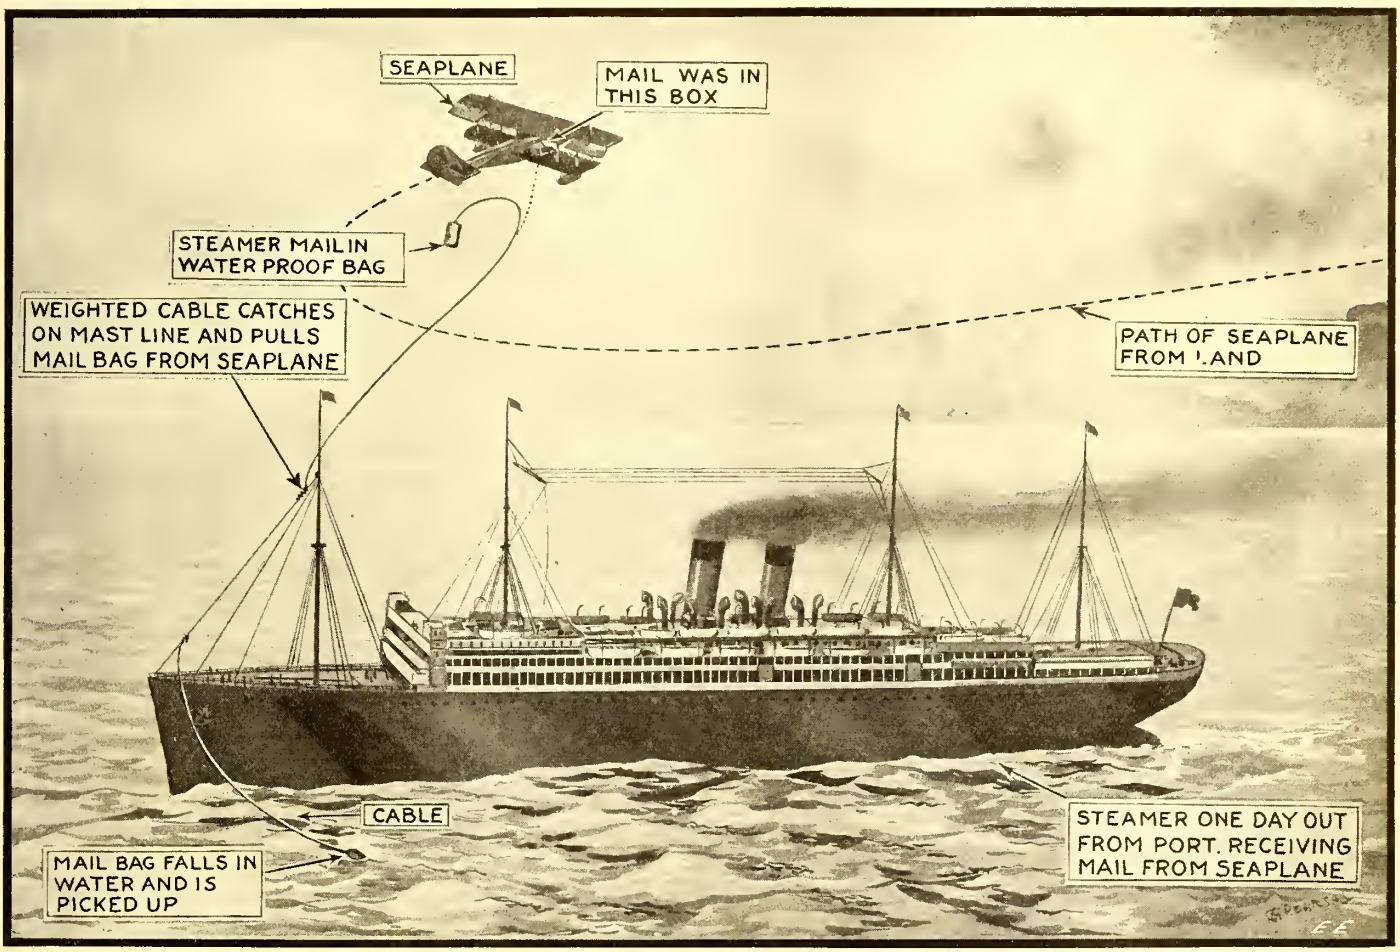
ELECTRICAL EXPERIMENTER

H. GERNSBACK – EDITOR
H. W. SECOR – ASSOCIATE EDITOR

Vol. VII. Whole No. 78 OCTOBER, 1919 No. 6



Seaplane Delivers Ship Mail at Sea

OCEAN travelers on the S.S. *Adriatic*, the sailing of which on August 15th marked the reopening of the White Star Line's service to Cherbourg and Southampton, witnest the successful attempt of the Post Office Department to use aircraft for the first time in delivering European mail to a steamer. Congratulatory messages were sent by passengers to Postmaster Thomas G. Patten and officials of the Acromarine Plane and Motor Corporation, who were responsible for the demonstration.

The hydroaeroplane, piloted by C. J. Zimmerman with Richard Geisinger as mechanic, left the surface of the Hudson River off Eighty-sixth Street, New York, at 1:30 P. M., an hour and a half after the Adriatic had sailed. Before the mail pouch was placed on board the plane Zimmerman, the pilot, was sworn in by Daniel E. Jordan, Assistant Superintendent of Mail, as an employe of the Post Office Department.

Overtaking the Adriatic at Ambrose Channel the plane flew for a distance ahead of the steamer and then, turning around, flew directly toward her. As the plane past over the Adriatic at a height of about 50 feet above masthead, a specially devised weighted cable with shock absorbers was released, catching and wrapping itself around a cable which ran from the masthead to the deck, as shown in the accompanying illustration. The mail pouch, which was contained in a pocket constructed of laminated wood on the forward right fuselage, was pulled out when the cable contracted, dropping into the water. The pouch, also specially constructed to insure its being waterproof, was then hauled on board.

The achievement was witnest by Postmaster Patten, Inglis M. Uppercu, President of the Aeromarine Plane and Motor Corporation, and a party of guests who went down the bay on the yacht *Lounger*. The passengers on the steamer cheered as the seaplane glided away.

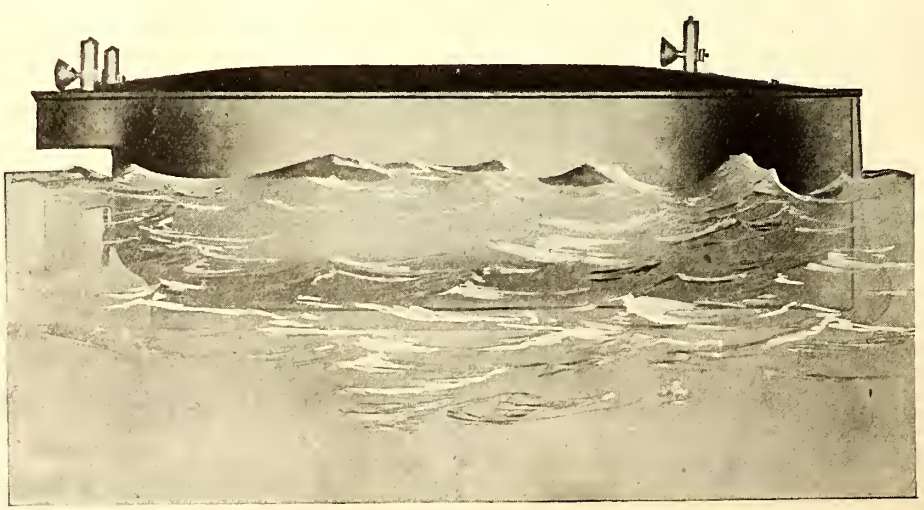
My Inventions

By Nikola Tesla

VI. THE ART OF TELAUTOMATICS

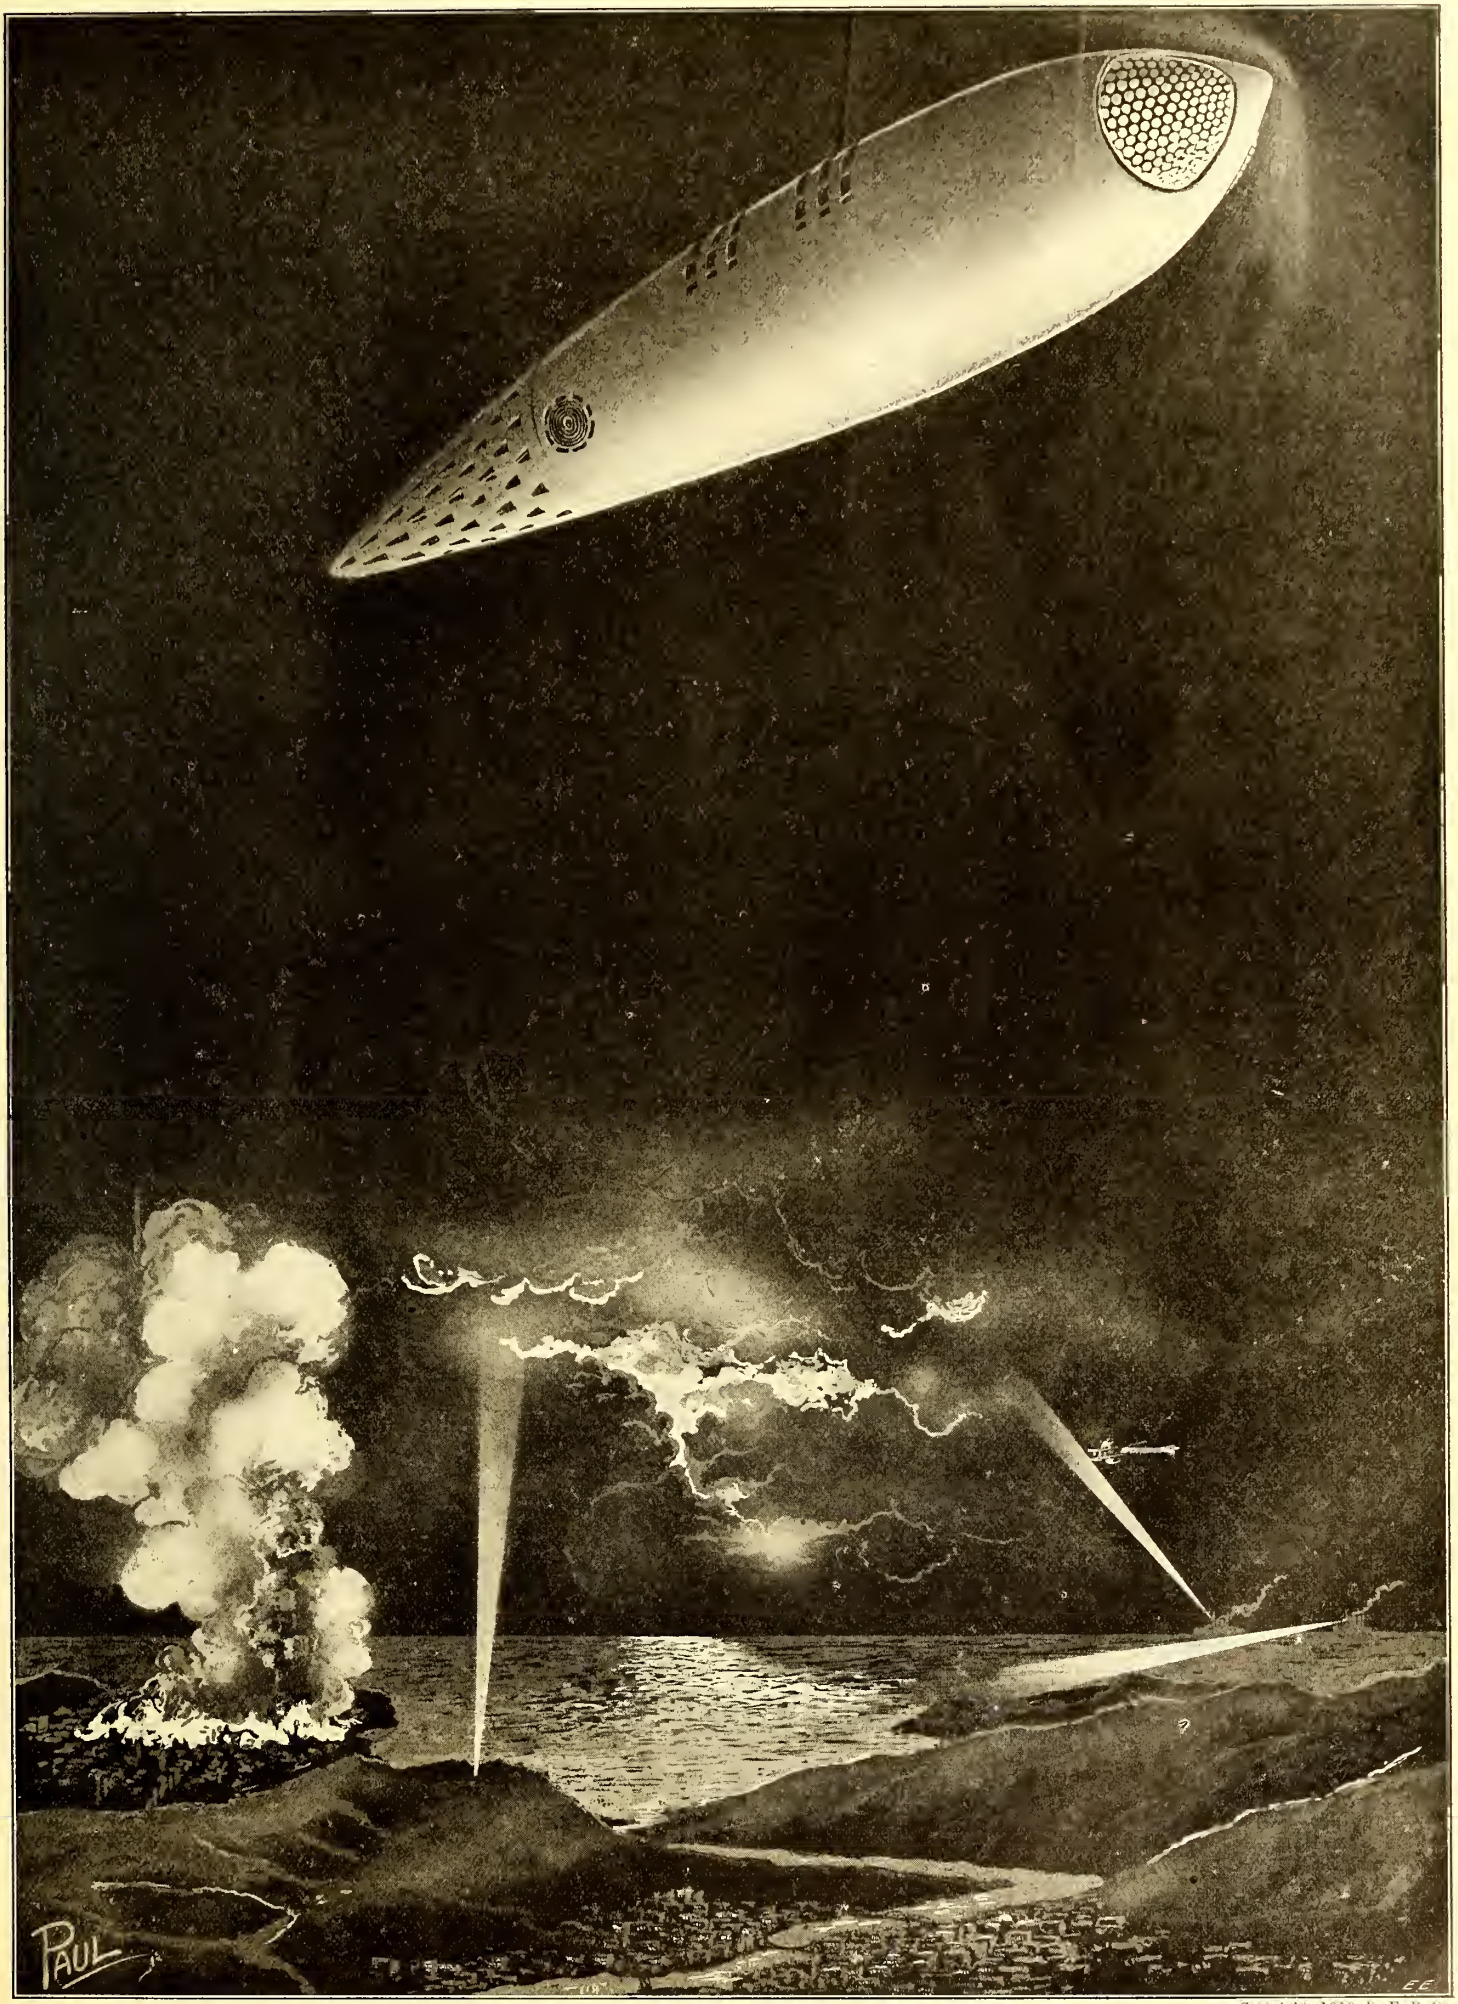
How Tesla's Mind Recuperates.



NO subject to which I have ever devoted myself has called for such concentration of mind and strained to so dangerous a degree the finest fibers of my brain as the system of which the Magnifying Transmitter is the foundation. I put all the intensity and vigor of youth in the development of the rotating field discoveries, but those early labors were of a different character. Although strenuous in the extreme, they did not involve that keen and exhausting discernment which had to be exercised in attacking the many puzzling problems of the wireless. Despite my rare physical endurance at that period the abused nerves finally rebelled and I suffered a complete collapse, just as the consummation of the long and difficult task was almost in sight. Without doubt I would have paid a greater penalty later, and very likely my career would have been prematurely terminated, had not providence equipt me with a safety device, which has seemed to improve with advancing years and unfailingly comes into play when my forces are at an end. So long as it operates I am safe from danger, due to overwork, which threatens other inventors and, incidentally, I need no vacations which are indispensable to most people. When I am all but used up I simply do as the darkies, who "naturally fall asleep while white folks worry." To venture a theory out of my sphere—the body probably accumulates little by little a definite quantity of some toxic agent and I sink into a nearly lethargic state which lasts half an hour to the minute. Upon awakening I have the sensation as though the events immediately preceding had occurred very long ago, and if I attempt to continue the interrupted train of thought I feel a veritable mental nausea. Involuntarily I then turn to other work and am surprised at the freshness of the mind and ease with which I overcome obstacles that had baffled me before. After weeks or months my passion for the temporarily abandoned invention returns and I invariably find answers to all the vexing questions with scarcely any effort. In this connection I will tell of an extraordinary experience which may be of interest to students of psychology. I had produced a striking phenomenon with my grounded transmitter and was endeavoring to ascertain its true significance in relation to the currents propagated through the earth. It seemed a hopeless undertaking, and for more than a year I worked unremittingly, but in vain. This profound study so entirely absorbed me that I became forgetful of everything else, even of my undermined health. At last, as I was at the point of breaking down, nature applied the preservative inducing lethal sleep. Regaining my senses, I realized with consternation that I was unable to visualize scenes from my life except those of infancy, the very first ones that had entered my consciousness. Curiously enough, these appeared before my vision with startling distinctness and afforded me welcome relief. Night after night, when retiring, I would think of them and more and more of my previous existence was revealed. The image of my mother was always the principal figure in the spectacle that slowly unfolded, and a consuming desire to see her again gradually took possession of me. This feeling grew so strong that I resolved to drop all work and satisfy my longing. But I found it too hard to break away from the laboratory, and several months elapsed during which I had succeeded in reviving all the impressions of my past life up to the spring of 1892. In the next picture that came out of the mist of oblivion, I saw myself at the *Hotel de la Paix* in Paris just coming to from one of my peculiar sleeping spells, which had been caused by prolonged exertion of the brain. Imagine the pain and distress I felt when it flashed upon my mind that a dispatch was handed to me at that very moment bearing the sad news that my mother was dying; I remembered how I made the long journey home without an hour of rest and how she passed away after weeks of agony! It was especially remarkable that during all this period of partially obliterated memory I was fully

IN this article, Dr. Tesla dwells on the future possibilities of his magnifying transmitter, especially in connection with the art of Telautomatics, which was first conceived by him and doubtless constitutes one of his most brilliant gifts to the world.

Tesla was the first to build and successfully operate Automata in the form of boats steered and otherwise controlled by tuned wireless circuits and agents ensuring reliable action despite of all attempts to interfere.



But this was only the first step in the evolution of his invention. What he wanted, was to produce machines capable of acting as though possessed of intelligence. It will be readily perceived that if Dr. Tesla has practically realized his conception, the world will witness a revolution in every field of endeavor. In particular will his inventions affect the art of warfare and the peace of the world.

Dr. Tesla dwells eloquently on a number of topics agitating the public mind, and this article of his is perhaps the most brilliant and absorbing he has written.

One of the Telautomatic Boats (Submersible) Constructed By Tesla and Exhibited By Him in 1898. Controlled By Wireless Without Aerials.

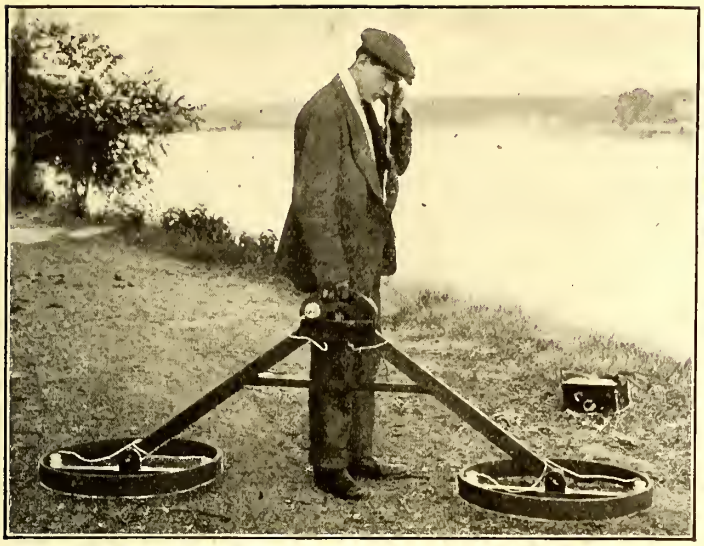
Tesla's New Self-Propelled Aerial Tel-Automaton. Devoid of Propeller, Sustaining Wings and All Other Means of External Control. Can Attain a Speed of 350 Miles Per Hour, and Will Reach a Predetermined Point a Thousand Miles Away Accurately Within a Few Feet.

www.americanradiohistory.com

alive to everything touching on the subject of my research. I could recall the smallest details and the least insignificant observations in my experiments and even recite pages of text and complex mathematical formulae.

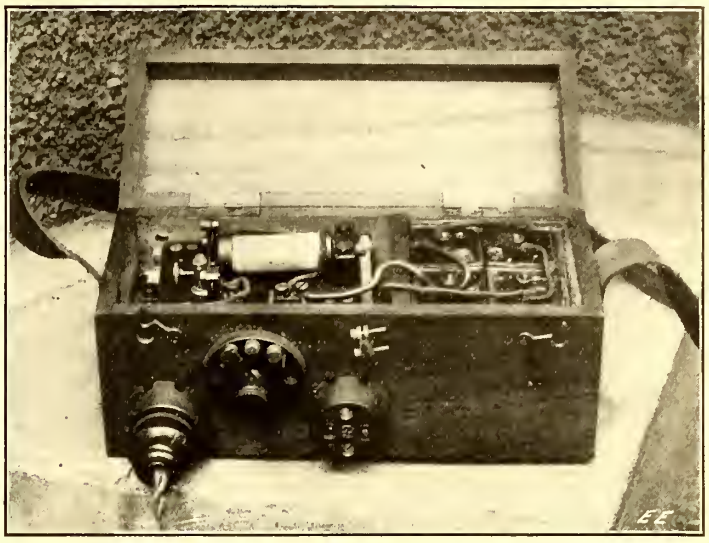
My belief is firm in a law of compensation. The true rewards are ever in proportion to the labor and sacrifices made. This is one of the reasons why I feel certain that of all my inventions, the Magnifying Transmitter will prove most important and valuable to future generations. I am prompted to this prediction not so much by thoughts of the commercial and industrial revolution which it will surely bring about, but of the humanitarian consequences of the many achievements it makes possible. Considerations of mere utility weigh little in the balance against the higher benefits of civilization. We are confronted with portentous problems which can not be solved just by providing for our material existence, however abundantly. On the contrary, progress in this direction is fraught with hazards and perils not less menacing than those born from want and suffering. If we were to release the energy of atoms or discover some other way of developing cheap and unlimited power at any point of the globe this accomplishment, instead of being a blessing, might bring disaster to mankind in giving rise to dissension and anarchy which would ultimately result in the enthronement of the hated regime of force. The greatest good will come from technical improvements tending to unification and harmony, and my wireless transmitter is preeminently such. By its means the human voice and likeness will be reproduced everywhere and factories driven thousands of miles from waterfalls furnishing the power; aerial machines will be propelled around the earth without a stop and the sun's energy controlled to create lakes and rivers for motive purposes and transformation of arid deserts into fertile land. Its introduction for telegraphic, telephonic and similar uses will automatically cut out the statics and all other interferences which at present impose narrow limits to the application of the wireless. This is a timely topic on which a few words might not be amiss.

Dr. Tesla is Rapidly Becoming Younger. Judge for Yourself from His Latest Photograph.



Tesla Raps "Static" Men Vigorously.

During the past decade a number of people have arrogantly claimed that they had succeeded in doing away with this impediment. I have carefully examined all of the arrangements described and tested most of them long before they were publicly disclosed, but the finding was uniformly negative. A recent official statement from the U. S. Navy may, perhaps, have taught some beguilable news editors how to appraise these announcements at their real worth. As a rule the attempts are based on theories so fallacious that whenever they come to my notice I can not help thinking in a lighter vein. Quite recently a new discovery was heralded, with a deafening flourish of trumpets, but it proved another case of a mountain bringing forth a mouse. This reminds me of an exciting incident which took place years ago when I was conducting my experiments with currents of high frequency. Steve Brodie had just jumped off the Brooklyn Bridge. The feat has been vulgarized since by imitators, but the first report electrified New York. I was very impressionable then and frequently spoke of the daring printer. On a hot afternoon I felt the necessity of refreshing myself and stepped into one of the popular thirty thousand institutions of this great city where a delicious twelve per cent beverage was served which can now be had only by making a trip to the poor and devastated countries of Europe. The attendance was large and not over-distinguished and a matter was discussed which gave me an admirable opening for the careless remark: "This is what I said when I jumped off the bridge." No sooner had I uttered these words than I felt like the companion of Timotheus in the poem of Schiller. In an instant there was a pandemonium and a dozen voices cried: "It is Brodie!" I threw a quarter on the counter and bolted for the door but the crowd was at my heels with yells: "Stop, Steve!" which must have been misunderstood for many persons tried to hold me up as I ran frantically for my haven of refuge. By darting around corners I fortunately managed—through the medium of a fire-escape—to reach the laboratory, where I threw off my coat, camouflaged myself as a hard-working blacksmith, and started the forge. But these precautions proved unnecessary; I had eluded my pursuers. For many years afterward, at night, when imagination turns into spectres the trifling troubles of the day, I often thought, as I tossed on the bed, what my fate would have been had that mob caught me and found out that I was not Steve Brodie!



Now the engineer, who lately gave an account before a technical body of a novel remedy against statics based on a "heretofore unknown law of nature," seems to have been as reckless as myself when he contended that these disturbances propagate up and down, while those of a transmitter proceed along the earth. It would mean that a condenser, as this globe, with its gaseous envelope, could be charged and discharged in a manner quite contrary to the fundamental teachings propounded in every elemental text-book of physics. Such a supposition would have been condemned as erroneous, even in Franklin's time, for the facts bearing on this were then well known and the identity between atmospheric electricity and that developed by machines was fully established. Obviously, natural and artificial disturbances propagate through the earth and the air in exactly the same way, and both set up electro-motive forces in the horizontal, as well as vertical, sense. Interference can not be overcome by any such methods as were proposed. The truth is this: In the air the potential increases at the rate of about fifty volts per foot of elevation, owing to which there may be a difference of pressure amounting to twenty, or even forty thousand volts between the upper and lower ends of the antenna. The masses of the charged atmosphere are constantly in motion and give up electricity to the conductor, not continuously but rather disruptively, this producing a grinding noise in a sensitive telephonic

This New French Inductive Water Pipe Locater Can Be Used by Either One or Two Men.

A Close-up of the "Chanoit" Electric Water Pipe Locating Apparatus. A Battery and Induction Coil Are Used.

Paris Letter

By JACQUES BOYER
Paris Correspondent "Electrical Experimenter."

ENGINEER CHANOIT has conceived the idea of using a new electrical induction balance invented during the war by Prof. Gutton for the location of non-exploded shells, to locate underground water terminals of the waterpipe distribution system.

The new apparatus is a little different in form, but the principle is the same. This induction balance "Alpha" (Model 1919) consists of two flat coils mounted in series in the same circuit, and in which alternating current induces currents in two neighboring coils. In these coils the wire is wound in such a way that the electromotive forces are reversed every instant. The coils measure 70 centimeters in diameter; the wire is wound at the rate of 20 turns on the primary and only 10 turns on the secondary. As to the armature, sieve chassis are used. A wooden traverse mounted across the diameter insures the rigidity of these drums, covered by a rubber tissue to protect the wire wound on the same. Attached to the traverses are two wooden uprights mounted at an angle toward each other, and supporting at their junction a special regulating system.

Induction Balance Locates Water Pipes

If both pair of coils are exactly identical, the electro-motive forces would be compensated and a telephone connected in circuit would remain silent. But in view of the impossibility of obtaining a perfect similarity between these two pair of coils, a variable inductive regulator is added, enabling the neutralization of the mutual induction of the two primary and secondary circuits. All that is necessary is to mount in each of the circuits a small coil with four turns of wire, which is illustrated in the photograph herewith, in the center of the instrument underneath the handle; one of these coils moving inside, the other around the common center. This rotation in modifying the mutual induction of the two circuits, permits the regulation of the "Alpha" balance instrument at the moment of use.

When a mass of iron is in the neighborhood of one of the pair of coils, it creates an asymmetry which wards off the compensation. The 'phone will then give forth a sound. Moreover, in a portable box there is mounted with a condenser a battery of four cells, or a storage battery, which excites a vibrator. The electro-motive forces of self-induction in the coil of the vibrator, charge and discharge the condenser periodically, realizing in this manner the primary excitation.

When the employees of the Water Department want to proceed, they attach the apparatus to their backs, mount their bicycles, and ride toward the pipe line which they want to explore. Once upon the grounds, they mount the apparatus and connect the wires. Usually two work together, but one man alone can do the work satisfactorily. If working in pairs, the observer goes along the road with the balance, holding the same at a little distance over the ground, his assistant following with the box containing the battery, condenser and vibrator. If working alone, the man puts his box on the ground and moves it as he goes along. When passing over a buried waterpipe up to a depth of one yard, the 'phone will indicate by its characteristic buzz the exact location of the same.

New Hospital Call Switch

Most modern hospitals are equipt with *hospital call systems*, which, in many instances give fairly satisfactory service, but one trouble often arises from their use because a great majority of them employ some form of standard electrical device which the patient uses to signal the nurse. The device usually consists of a pendant type of push button fastened to a flexible conductor which is hung over the head of the bed. These standard wiring devices are not intended for such service, and there is considerable wear and tear on the cord, and as a result the cord frequently becomes worn, thus making the signal inoperative.

A new device called a Hospital Call Switch has just been developed. It is made for a standard switch outlet box, and the wiring for it does not extend beyond the box. No flexible conductors or pendant switches are required for its use, and consequently, the annoyance of having these parts worn or broken is eliminated. It is so constructed that the patient can only complete the circuit to signal the nurse, and she can push it "off" only at the bed-side.

A New Hospital Call Switch. Individual Indication At Each Bed Is Effected. The Nurse Cannot Ignore It.

The accompanying illustration shows one of these new switches installed in the wall near the patient's bed. A pull chain, to which a linen cord is attached, is used to pull the switch "on." The push-button, located above the horn, thru which the pull chain extends, is used by the nurse to push the switch "off." In a ward, where two or more switches are used on the same signal, the protruding button indicates to the nurse which patient called. The signal remains "on," therefore, until the nurse comes to the bed to push the switch "off." Hence there is no excuse for the patient's call not being observed and answered.

What the X-Rays Show

Scientific and Industrial Applications of X-Rays in War and Peace

THE X-ray to most of us conjures up visions of white robed nurses, surgeons, and hospital operating rooms. But today the X-ray, discovered by Wilhelm Conrad Röntgen in 1895, gives promise of becoming one of the world's greatest and most useful accomplishments. No longer is the X-ray confined alone to hospital and physicians' diagnostic requirements, but it has been used in the past few years, especially during the World War, for many hitherto undreamt of purposes. In fact, one could write a book on the industrial applications of X-rays which would read like a romance. How they helped to foil the German conspirators in America who tried to plant infernal machines and contraband rubber and nickel into bales of cotton; how steel needles and other metal objects were actually placed into bags of powder in U. S. Government arsenals by pro-German workers; how defects were allowed to pass in shells, other ammunition and guns, and dozens of other dangerous practices, as well as interesting scientific developments —all of these are a matter of history now.

Figure 1 of the accompanying illustrations shows a large X-ray machine being used to detect the presence of contraband rubber or metal placed in bales of cotton. A number of these X-ray machines were used at the leading cotton shipping ports of the South during the war. Infernal machines timed to go off at sea were often detected in this way, altho little or nothing was ever said about these discoveries for very good reasons. If these discoveries on the part of Uncle Sam's secret service and shipping experts had been made public at the time, naturally the perpetrators of such crimes would have directed their energies to other ways and means of attaining their objects.

More romantic perhaps is the application of the X-ray for discovering the presence of pearls or the nuclei of pearls starting to grow in oysters. Figure 2 shows the X-ray apparatus in use for this purpose. Previously, many thousands of oysters were annually obliterated by being opened in an effort to determine the presence of pearls or pearl nuclei. All of this is now obviated, thanks to the X-ray, and if Mr. Oyster does not show up with a pearl nuclei, he is replanted in his natural habitat, the water, once more. Here it develops to maturity. If an undeveloped pearl is detected by the X-ray pearl expert, then the oyster is at once laid aside for further treatment.

Bullets and shell have been examined by thousands, as shown in Figure 3, by powerful X-rays. The X-ray in this case shows the amount of powder in the shell, how it is loaded, et cetera, and the same is true also for bullets. A different shadow is cast on the X-ray plate or fluoroscope for each different material, so that differentiation between each substance is readily possible. Defects in the loading and assembling of shell were frequently detected in this way at the great shell factories and arsenals during the war, thus preventing misfires and premature explosions, with a possible large loss of life.

Concrete ships have been rapidly coming to the fore in the past few years, and were developed to quite a large extent during the war, many being built in this country and abroad. No matter how expert the inspectors on such hulls may be, they cannot tell in any case how the interior of the concrete structure looks, especially the steel reinforcement bars, which may have become bent or misplaced during the pouring process.

Figure 4 gives an idea of how valuable the special portable X-ray outfits prove in finally checking up the hulls of such vessels before they are launched. A bent or misplaced steel reinforcement or an air-pocket, either of which would constitute a serious altho unnoticeable weakness in the hull, can be quickly detected by the X-ray. For such large area X-ray examinations a fluoroscope is invariably used, and not the photographic plate.

How many railroad accidents have been caused by defective car wheels? Many of them, if the truth were known. And why is this? Simply because the iron wheels appeared to be all right, and withstood possibly a fair mechanical test, but inherently they possest a weakness, perhaps in the form of air pockets or invisible cracks caused by strains in cooling when they were cast, etc., etc.—defects which only the X-ray can and does detect at once in a minimum of time.

For such purposes an X-ray is used in the manner here illustrated at Figure 5. The X-ray tube together with exciting spark coil, batteries, et cetera, are placed in a portable carrying case, which can be placed behind the car wheel or other object. The fluoroscope, or, in special places, the X-ray plate in its light-proof holder, is placed before the car wheel or other object. A few seconds' exposure to the X-ray gives a *skiagraph* or X-ray photograph on the plate, which is afterward developed and printed, or the image may be, and usually is, examined on the negative itself, no print being made. Of course, if the fluoroscope is used for directly viewing the object under examination, then the object is seen clearly at once, and various parts of it examined by moving the fluoroscope over the surface.

Many lives have been lost due to the explosion of anarchists' bombs and infernal machines, not only when they happened to explode in locations where they were *planted,* but also when they have been under the process of examination by bomb experts of various city police departments. The examination of bombs and infernal machines now bids fair to presently become as concrete and specific a procedure as weighing a pound of coal. The X-ray has already been used with marked success in determining the structure of such dangerous devices beforehand, which is of course a great stride in advance of the erstwhile method of "yanking" the bomb apart and "waiting to see what would happen." See Figure 6.

Even the field of Art, including cubist paintings, has been invaded by the mechanistic X-ray tube with its prying eyes, the discerning powers of which will not be denied. To the Scientist and his X-ray tube must come the Artist or the Art Connoisseur with his ancient and almost priceless Rembrandt, Van Dyke, Corot or Blakelock, the *authenticity* of which may be in question. A number of notable forgeries in supposedly valuable paintings have been detected by the scrutinizing X-ray. Figure 7 shows the X-ray being used to determine the authenticity of old paintings.

Another fruitful field in which the X-ray has proven its value many times is in the examination of large diamonds and other precious stones. Instead of X-raying the diamond to determine its value as a diamond, another application in this same field lies in its use at one of the large South African diamond mines for the purpose of detecting the presence of a diamond within the body. This may sound somewhat startling at first, but there have been cases where diamond miners have even "swallowed" diamonds in order to smuggle them out of the mines. Therefore, at this particular mine all of the miners undergo an X-ray examination, as shown in the accompanying illustration, Figure 8, before they leave the mine at the end of the day's work.

The modern Dentist has found that the X-ray is the only means whereby he can be sure that he is properly diagnosing the ailment of his patient. As pointed out in an exhaustive article by Dr. Henry A. Cotton, Medical Director of the New Jersey State Hospital, Trenton, N. J., in the August issue of this journal, defective teeth are sometimes due to *abscesses* and other growths forming at the roots, whch are not visible in any other way by physical examination, except by the X-ray. Such abscesses are the cause of serious organic and systemic disorders and ailments, such as rheumatism, neuralgia, stomach and intestinal troubles, and many other ills which would

WHAT THE X-RAYS SHOW

(FULL DESCRIPTION ON OPPOSITE PAGE)

www.americanradiohistory.com

Copyright, 1919, by E. P. Co.

As Our Front Cover Illustration Shows, this New Invention for Locating Sunken Ships Can Be Operated Without the Aid of Divers or Diving Machines. It is Based on the Hughes Induction Balance, Where a Slight Change in the Induction Between Four Balanced Coils Causes a Sound to Be Heard in One of the Circuits.

Treasure Ships Located Electrically

By H. GERNSBACK

THE salvage of 440 vessels and the recovery of property valued at $250,000,000 is the record in four years of the British Admiralty Department, which under Rear-Admiral Philpotts has been conducting salvage operations in home and foreign waters.

Thus reads a recent newspaper clipping. But the $250,000,000 worth of property recovered represents only a very small percentage of the ships that had been sunk during the present war as well as during the past century.

The ocean is dotted with sunken ships containing such fabulous treasures that it is difficult for the mind to grasp the enormous figures. It runs way up into the billions, and while we do not pretend to claim that all of this property, even if recovered, would be of value, there still remain many billions' worth of sunken treasures which can be salvaged today.

When a ship with a cargo sinks, that cargo is not always valuable if recovered. For instance, it might have had on board grain or other perishable goods, which, even if salvaged, would be found useless. But many other ships containing mixed cargoes, such as metal, coal, bullion, certain chemicals, etc., do not deteriorate even if they have been on the bottom of the ocean for years, and the great majority of sunken ships contain at least a large part of their cargo, which is quite imperishable.

Then, too, if a vessel is raised within one or two years after it has been sunk, it can in many cases be refitted and will do service just as good as new, after it has been overhauled. Here the ship whose intrinsic value is quite high is well worth salvaging, if there is a possibility of us doing so.

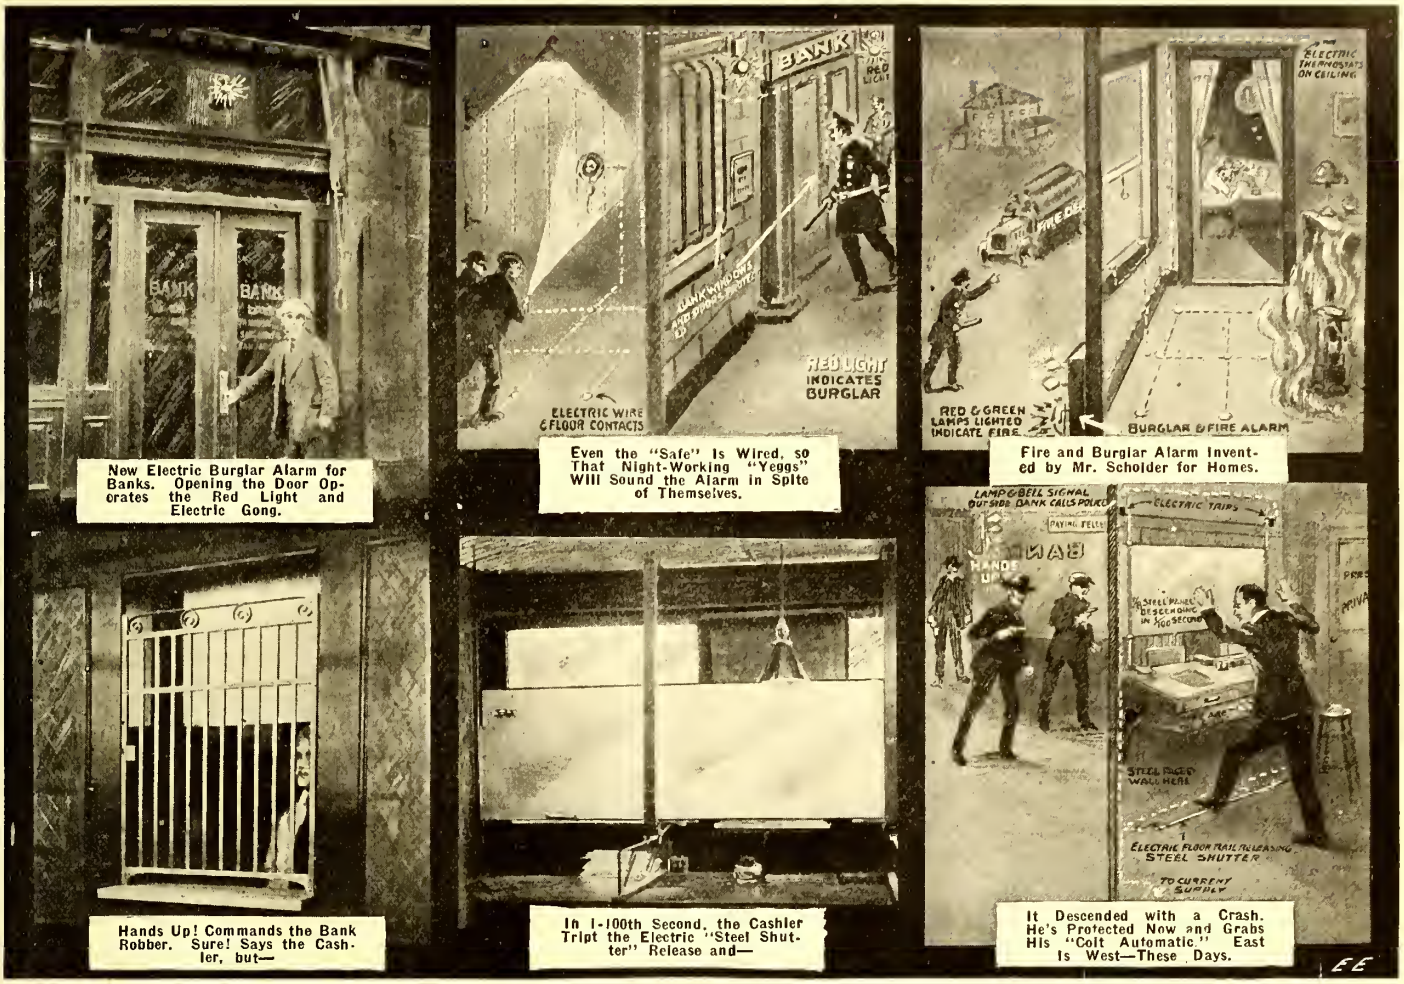
The main trouble in the past has not been so much in actually salvaging the ship, but in *accurately locating it* so that divers or the diving apparatus can be brought into action. It is one thing to know the *approximate* position where a ship has been sunk, but it is quite another matter to know the *exact spot*. In other words, tho we have a chart which gives the spot on which a ship has been sunk, *this spot may measure five square miles or more,* and if the ship is located in any channel or such parts of the ocean where there are heavy undercurrents, such a ship will soon be covered over with sand, moss, barnacles, etc., which effectively hide the ship and make it very difficult for the divers to locate it.

Many a salvaging company has found to its regret that it is one thing to obtain a commission to raise a sunken ship and quite another to actually locate it in order to start the salvaging operation. How then are ships located?

We have several means at hand. One of the simplest is to send down divers, using powerful under-water searchlights, and then make a systematic search in order to find the wreck. This is not only a lengthy and difficult procedure, but when the ship lies at a great depth the high water pressure makes it impossible for the divers to reach the bottom.

The next method is to use grappling irons or anchors, which may be termed the "fishing" method. This, perhaps, is the least satisfactory as it takes a long time and does not always bring results. It is at most a long and weary procedure, and very expensive on account of the enormous time losses involved.

We still have another method which, while not new, is not known as well as it deserves. It is a purely electrical method in locating sunken ships. It is very efficient, and the cost is negligible as long as we own a ship or a submarine on which to install the apparatus. The writer advances the idea of using the submarine in a peaceful mission to raise the ships wantonly sunk by its war sisters during the world war.



In order to detect the sunken hulls, use is made of the induction balance invented by Hughes in 1881. The insert in our illustration on this page shows the basic principle of the apparatus. Two wooden or hard rubber cups about four inches high and one and a quarter inches in diameter are turned out. Upon each of these cups we now wind 150 yards of single silk copper wire No. 32, which gives us a spool about a quarter of an inch high. Each wooden cup has two such windings, as will be noted from the illustration. These two wooden cups now form the pans of the thus constructed induction balance. The connections are made as in the illustration; the two lower windings connecting with an ordinary telephone receiver, while the other two spools are in series with a microphone and three dry cells. We now have an instrument of extraordinary sensitivity. In the position shown in the illustration, if you pick up the telephone receiver no sound is heard because the two parts of the balance are in equilibrium. If, however, we drop into one of the cups a piece of metal, no matter how small, the electrical compensation will be disrupted, due to the difference of resistance thus created, and we now hear the clock ticking in the telephone.

This instrument is so extraordinarily sensitive that even if two equal coins are dropt, one in each cup, the telephone will sound just the same because these two coins are not *exactly* of the same weight nor of the same alloy. The slightest chemical difference will thus be shown in the induction balance. For that reason this instrument has been used a good deal for exploration work, and the idea to use the induction balance for finding sunken vessels is by no means a new one. It has been used successfully for a number of years.

Our illustration shows how it is accomplished. If we fit out a submarine as shown, which has two induction balances lowered into the water and which are trailed from underneath, the telephone receiver on board located in the control station will give forth no sound as long as the two balances move thru the water. But the minute one of them comes within the vicinity of a wreck, say within five hundred feet or more, the electrical balance will be disturbed immediately, and the telephone will sound its warning to the operator. The nearer the balance comes to the wreck the louder the sound will be. It is thus a

Electricity Foils Bank Robbers

BANK robberies being so prevalent at the present day induced a very ingenious inventor, Mr. Scholder, of New York, to try out a new invention after he had had it patented. In the Bronx, New York, there is a small bank, entirely too small for the business it is doing, which decided that the only way to safeguard itself, its employees and its patrons was to install an electric Burglar Alarm, which would not have the disadvantages of other alarms, and at the same time work more efficiently than any such device yet perfected. Accordingly a contract was given to the inventor, and the device was promptly installed. A demonstration showed its utmost reliability in every respect. The device is now installed in the Cosmopolitan Bank, Prospect Avenue, Bronx.

It consists of various applications of alarm and signaling systems, original and patented by the inventor. Should a burglar attempt to enter the bank, an alarm is immediately sounded in the form of a large gong and a red lamp flashes; this lamp is so protected outside of the bank that neither the gong nor the flashers can be tampered with, as shown in the photographs. The gong is enclosed in a perforated steel box, of which there are four, one at either entrance of the bank, one in the basement and one in the bank proper. Should one of the gongs thru any chance be destroyed, the other three gongs will immediately set up an alarm, reinforced by the red light flashes, which attract passers-by or any policeman on beat. A special novelty of this protective system is that installed at the tellers' windows. These are equipt with steel drops 1/8" thick, which are held in place by electric latches, one at each end, the drops running the entire length of the window and high enough to protect those behind from any trouble or misfortune. Should any system of robbery such as has been tried in other banks be attempted here, and the robber enter, levelling his gun with a cry of "Hands Up!" a *slight* foot movement on the part of the teller will immediately release the drop with a terrific bang, as this steel curtain (which effectively protects him from being shot) drops down. Immediately, both inside and out, alarms and electrical flashes announce the hold-up, preventing the killing, accidentally or purposely, of any of the employees and the loss of property as well. The bank is so protected that no burglar can enter the premises thru doors, windows or any other opening; even should he attempt to tunnel into the bank and tear a portion of the wall down, he would be instantly detected. As far as safes and safety vaults are concerned, it is impossible for even an experienced safecracker to touch anything from the inside, whether the outside door is opened by knowing its combination, or by dynamiting the safe, inasmuch as an insert of the safe consisting of a fiber frame, lined with web-like wires, will cause an instant alarm.

Now a word about the device. This consists of a double contact or 2-way relay, which will prevent either cutting, short-circuiting or interference in any way with the wires, this relay actuating an automatic drop. This drop is connected with flashers and well-concealed wires running to the bell and lights, so that any attempt to cut or destroy the signaling devices will set off the alarms in other parts of the building and at other exits. The bank is thoroly wired, and an attempt of breaking thru the walls would be immediately frustrated. Thermostatic fire alarms thruout the building are arranged in a like manner, and wired to a distinct annunciator, which warns of any conflagration by means of the intermittent or continuous bell alarm, and flashes of both red and green lights, the two together indicating *fire,* and the red alone indicating burglary. The approach to the safe itself is thoroly wired. The alarm can be arranged in such a way as to notify the Police Headquarters, at the same time attracting the attention of all those about. The writer has seen an actual demonstration of the device, and in which attempts were made to force open the door. Another scene demonstrating the "hands-up" attempt to make the teller "fork over" met the response on the part of the teller by a prompt lifting up of his hands. Immediately a steel curtain dropt down with a terrific crash (in about 1/100 second), hiding the teller from view and protecting him from all harm. The release of the curtain, together with the crash and alarm is enough to scare any yeggman, no matter how bold he may be.

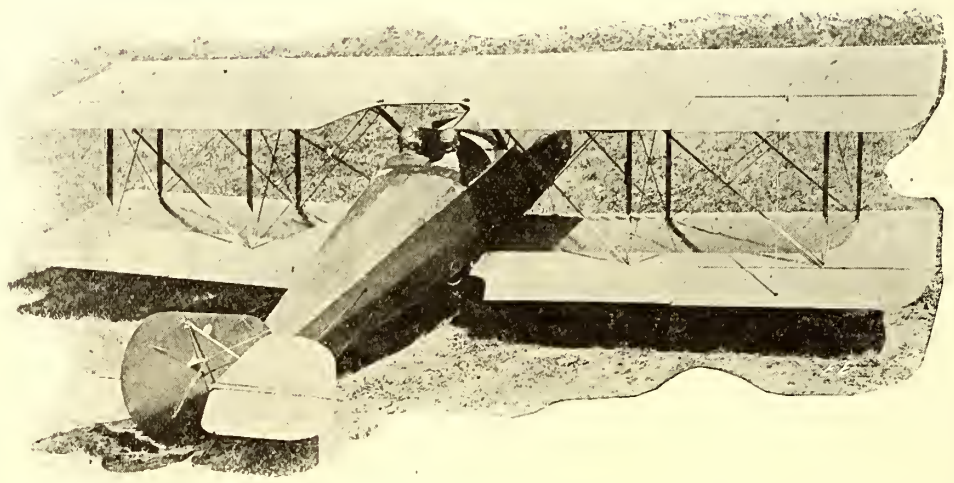
To Europe in Three Hours

By H. WINFIELD SECOR

ASSOCIATE MEMBER AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS



SEVERAL attempts have recently been made to improve on the high altitude flight records, the highest point so far reached being that attained by the French flier, Adjutant Casale, who unofficially reached a height of 33,136 feet. A few weeks ago Mr. Roland Rohlfs, chief test pilot for the Curtiss Engineering Corporation, established a new official altitude record at Mineola, L. I., N. Y., when he soared to a height of nearly 31,000 feet (30,700 feet Unhomologated). Some of the experiences of Mr. Rohlfs, as well as those of Major R. W. Schroeder, A. S. A., who held the best previous American altitude record of 28,900 feet, made on September 18th, 1918, are given elsewhere in this article.

AIR PRESSURE RAPIDLY DECREASES AT HIGH ALTITUDES

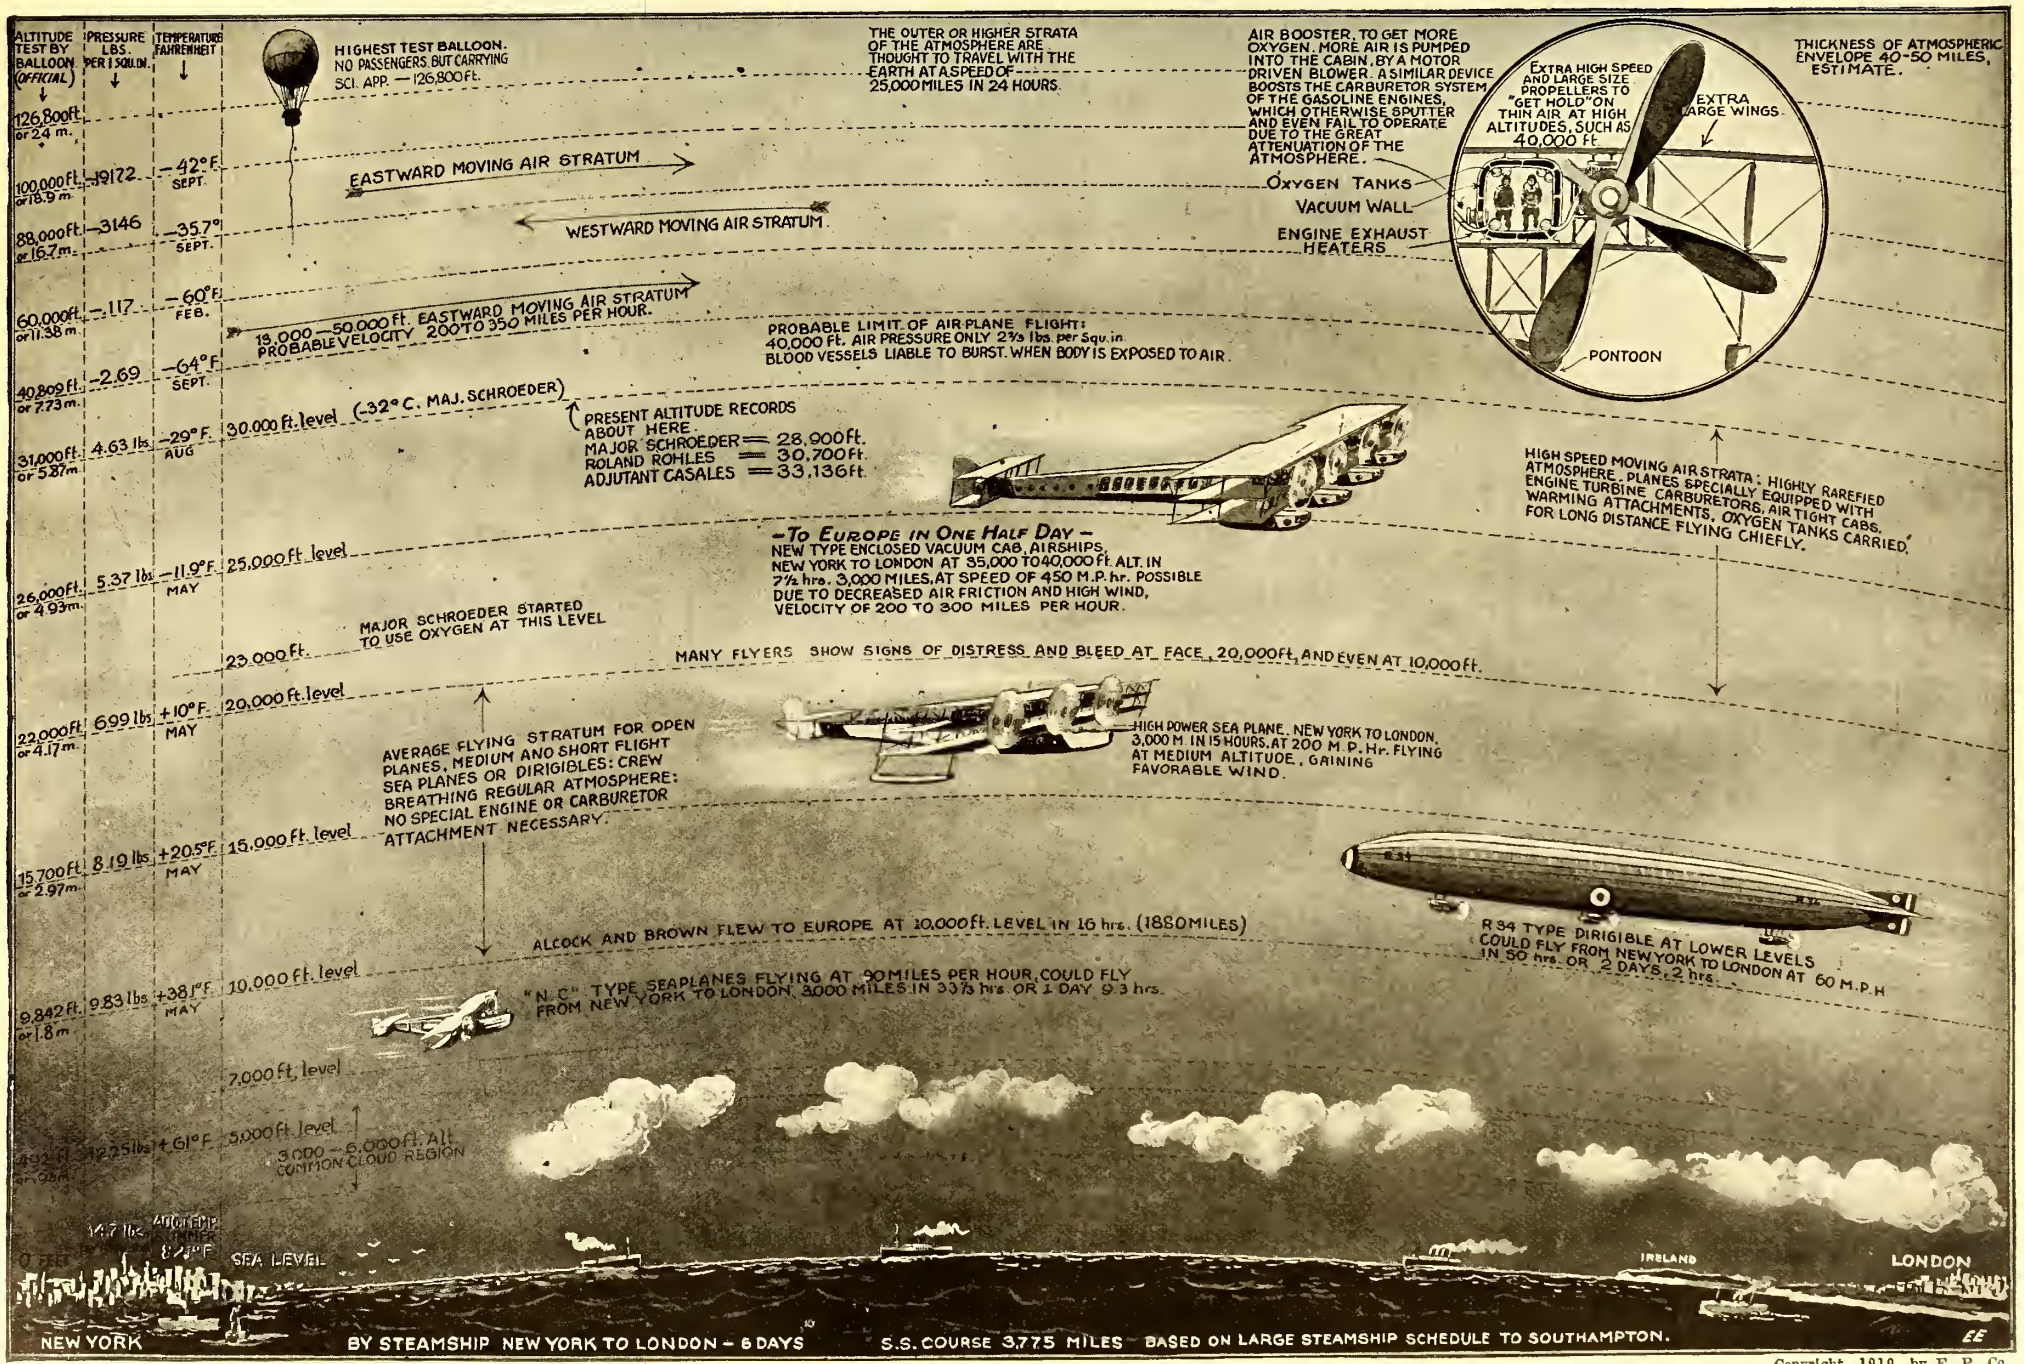
It is undoubtedly a common belief that the only requisites necessary in ascending to a great height in an airplane are great stamina and a one hundred per cent physique on the part of the flier, a good plane and engine and devices arranged so as to overcome the effects of the severe cold felt at the higher altitudes, such as 25,000 to 30,000 feet. There are many other factors, however, which come to bear on this important matter of flight in the upper rarefied air strata, one of the most important of which is the rapid reduction in the atmospheric pressure on the body at such altitudes as 30,000 feet and above. Before going further, it should be said that there naturally must be a limit to the permissible reduction of this air pressure in order to live. If we reduce this pressure to a very small fraction of the normal pressure at sea level, which is 14.72 pounds for every square inch of the body surface, then it becomes evident that the pressure of the blood as it is pumped thru the veins by the heart will burst them. If a frog is placed under a glass bell and the air exhausted, the frog will blow to pieces, due possibly for one reason to the air trapt in the lungs, which bursts these tissues when the external pressure is removed from the body, and due to a second and very important reason—that so long as the heart keeps pumping the blood thru the veins of the body this pressure, which is considerable indeed, will cause these vessels to burst. Persons often ask, "How high will our birdmen, with every possible airplane refinement, be able to fly, and if, generally speaking, there is no limit, provided planes and engines can be built which will operate properly in the upper rarefied air strata?" The answer is—that there is certainly and most decidedly a "limit," and we would state here that it is our belief that unless specially arranged engines and carburetor systems, fitted with the new atmospheric compressor and enclosed cabs, possibly *vacuum bottle* cabs, to protect the crew are used, then when flying in an ordinary machine where he will have to breathe the air direct from the atmosphere (even with the aid of oxygen), he cannot hope to ascend to a greater height than 38,000 to 40,000 feet.

The Physics of the Upper Atmosphere. How High Can We Fly and Why?

The author became particularly interested in this matter and went to the trouble of taking up this subject with the New York branch of the U. S. Weather Bureau, and desires here to give thanks to the courtesy of Mr. J. H. Kimball of that Bureau, who kindly looked up records on some wonderful pilot balloon tests and observations made by the U. S. Weather Bureau Service. Figures for the air pressure and temperature at various altitudes are presented in the illustration herewith, where some interesting speed figures are given for various types of aircraft as well as steamships. It is interesting to note at this juncture that the amount of increased speed for the future is all with the airplane or dirigible—and *not* with the ocean-going steamship. Ocean-going steamships have about reached their highest speed, due to several engineering reasons. Such a vessel displaces constantly a very large amount of water, and the laws governing this are very well known, and have been worked out by technicians to a very high degree in the past ten to fifteen years. It is doubtful if we shall ever see a steamship which can cross the ocean in a shorter time than *three days*, unless an unreasonably large amount of horse-power is consumed for the purpose, which, of course, is diametrically opposed to the high efficiency standards demanded of all such transportation carriers today.

The Thomas-Morse Airplane that Established a new Gliding Record of 35 Miles. A Glide of 35 Miles with a Dead Motor was Recently Made by R. C. Marshall, Test Pilot for the Thomas-Morse Aircraft Corporation. It Is Said that this is a World's Record for Gliding. "Tex" Marshall, as He is Called, Flew from Ithaca to the Head of Cayuga Lake, a Distance of 35 Miles, and Then Flew Upward Until He Reached a Height of 17,500 Feet. He Then Cut Off His Motor and Glided Toward Ithaca. When He Reached the City, It Is Stated, He was Still at a Height of More than a Mile, and Might Have Glided Fifteen Miles Further.

The airship, on the other hand, has the advantage that as it ascends to higher altitudes it meets with less resistance, and not only this, but another wonderful phenomenon of nature occurs—the higher air strata are known, as tests have shown, to be moving at a very high velocity, and so it is readily seen that if an airplane ascends to an altitude of 20,000 to 30,000 feet, or even less, that it may strike a strata of air traveling eastward, or perhaps westward, having a velocity of 200 miles an hour or more. Hence, if the airplane can travel at 100 miles an hour, then its net velocity in a given direction will be 300 miles an hour!



It is believed that the successful pioneer transatlantic flight of Messrs. Alcock and Brown, totaling 1,880 miles, which was made in sixteen hours, at an average speed of 116 miles an hour, was due to the fact that they ascended to a height of 10,000 feet, where they found an air current traveling Europeward with a high velocity. Such is the belief of Mr. Roland Rohlfs, the Curtiss pilot who has just made a new altitude record of 31,000 feet, and who expects to ascend to 33,000 feet or higher in a new flight.

The rarefaction of the atmosphere increases rapidly once an altitude of 30,000 feet is reached, and several writers on the subject have in recent years mentioned that for this reason particularly they do not believe that aviators will ever ascend higher than 40,000 feet in an open-type machine, where they have to breathe the ordinary atmosphere, even with the aid of oxygen supplied from a tank. This belief has been voiced by Mr. Harry E. Dey, a well-known American engineer, in an article which appeared some time ago in *Aeronautics*. He gives several other reasons therein for his faith in this belief. As the figures show in the accompanying illustration, the air pressure has been reduced about 60 *per cent at a height of 26,000 feet,* or 4.9 miles above sea level. Here we find the air pressure has dropt to 10.9 inches on the barometer, equivalent to 5.37 pounds per square inch. Such a marked reduction as this, as proven in all altitude flights so far attempted, have a very strong and undesirable effect on the flier. It affects the pulse or heart beat, the respiration, and in fact every part of the body, causing in some cases severe nausea, and at times fainting spells, when the pilot cannot tell whether he is flying upside down, sidewise, or in normal position. Major Schroeder, the American army flier, had all these sensations and more in his 105-minute ascending and 20-minute descending trip at Dayton, Ohio.

Let us look at the air pressure and temperature at 31,000 feet, or 5.8 miles. An official test made by the U. S. Weather Bureau at Huron, S. D., in the month of August shows an air pressure of 4.6 pounds per square inch, or a reduction of 68 per cent in the pressure found at sea level, where the aviator started to rise, probably no longer than an hour previously. Imagine

To Europe in one-half day and possibly in three hours—that sounds almost preposterous and impossible to say the least, does it not? But a scientific study of the peculiar atmospheric conditions existing in the higher altitudes, such as thirty thousand to forty thousand feet, gives great promise, as several authorities have pointed out, of giving us airplanes of to-morrow which will so far surpass the present aircraft that there will be no comparison. In the first place, the upper air strata is known to travel at a very high velocity, which will carry a plane at from three to four times its sea-level speed. Besides all this, the rapid decrease in air friction would enable the plane to go much faster than at lower levels where the air is denser. "Vacuum cab" airships will undoubtedly have to be used to fly at the higher altitudes with extra large wings and propellers to support the craft in the thin air.

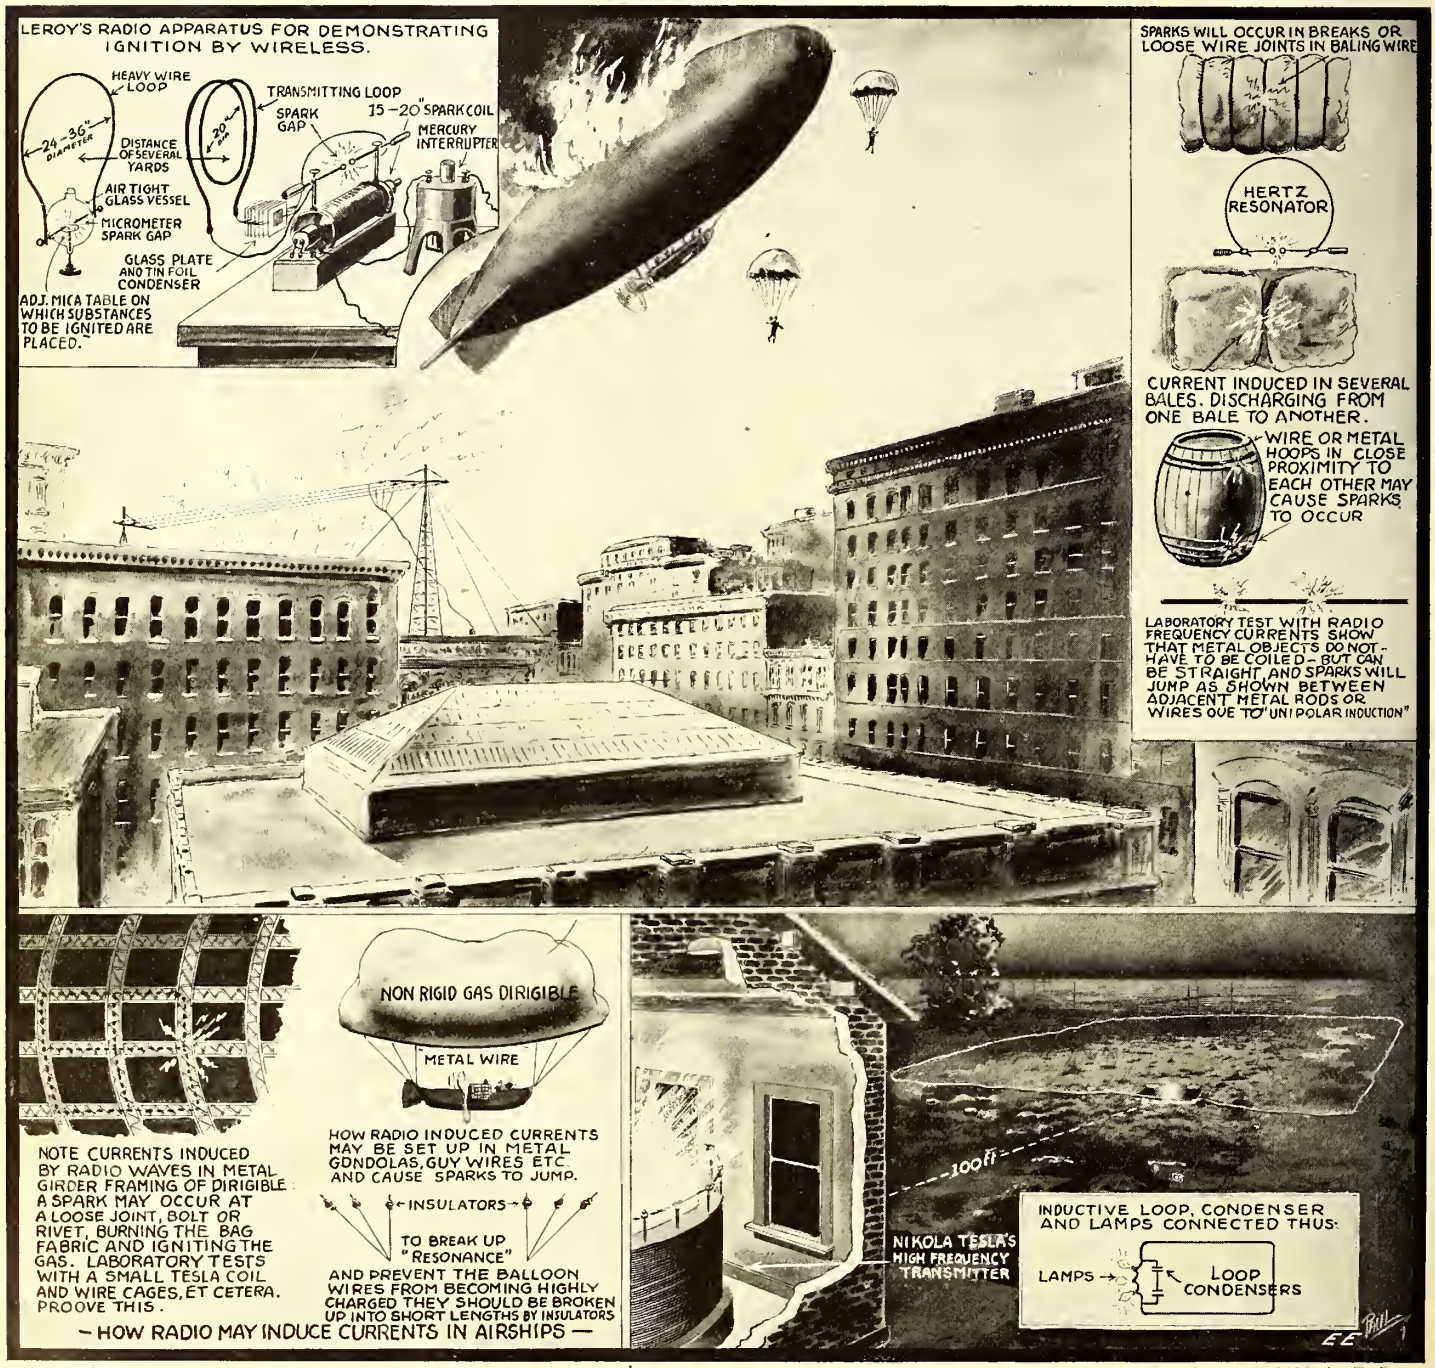
Can Radio Ignite Balloons?



The Opinions of Nikola Tesla and Other Radio Experts

AS a result of the newest theory, that powerful induced currents emanating from the Naval Radio Station in Chicago produced the spark that ignited the Goodyear dirigible airship which plunged in flames thru the roof of a bank building in that city, resulting in death for thirteen persons and injury to twenty-seven others, naval communication officers will aid the authorities in fixing responsibility for the disaster. It was ascertained that technical experts had suggested *this* theory, because the big ship sailed over or near the Transportation building, from the roof of which are projected the antennae of the Naval Radio Station. The building thru the skylight of which the blazing dirigible fell was the Illinois Trust and Savings Bank.

Lieut. F. S. Mason, of the Great Lakes Naval Training Station, district communication service officer, while refraining from agreeing with the theory, said he would cooperate with the investigating officials. Pilot John Boettner, of the ill-fated dirigible, said he had not been aware of the location of the naval radio station. H. M. Byllesby, head of a large engineering corporation and foreman of the coroner's jury of technical men, said experts had suggested the *radio theory* to him.

Col. J. C. Morrow, chief air officer of the central department of the army, the principal witness at the inquest, was a passenger in the dirigible on a trip preceding the fatal one. At that time he said the ship was in safe condition. The pilot he considered competent. He thought the possibility of sparks from the exhaust igniting the gas bag very remote, but said he had not formed an opinion as to the cause of the accident.

"Piped Cold"—Prof. Bell Has It

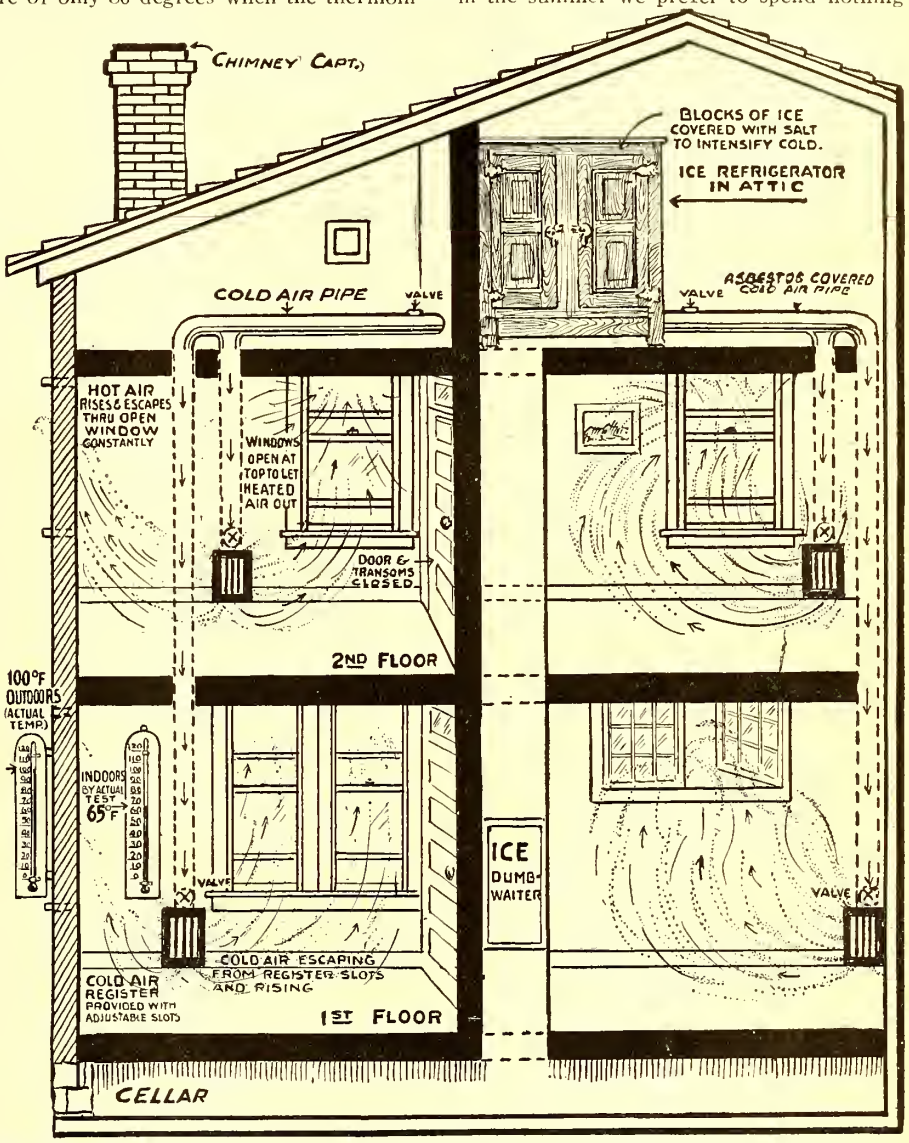
IN the July issue of the ELECTRICAL EXPERIMENTER, the Editor advocated the *piping of cold air* to various parts of dwellings and office buildings, using, if possible, the wintering steam piping systems and radiators. Well, great minds, etc. Here comes prolific Dr. Alexander Graham Bell, inventor of the telephone, airships, and ship salvage schemes, with an actual working installation of "piped cold." This idea occurred to Dr. Alexander Graham Bell when the Washington weather became extremely sizzling. Former President Taft, when he was in the White House, had a refrigerating device put in the offices, which since has fallen into disuse, but Dr. Bell believes he procured better results by his "home made" cooling arrangements in his Connecticut Avenue residence. In a communication to the *National Geographic Society*, Dr. Bell describes how he tricked the thermometer out of some 35 degrees—and you can try this out in your own home if you are "handy" about the house. Says Dr. Bell:

I have found one radical defect in the construction of our houses that absolutely precludes the possibility of cooling them to any great degree. You will readily understand the difficulty, when you remember *that cold air is heavier than warm air.* You can take a bucket of cold air, for example, and carry it about in the summer time and not spill a drop, but if you make a hole in the bottom of your bucket, then, of course, the cold air would run out.

I began to think that it might be possible to apply the bucket principle to at least one room in my Washington home, and thus secure a place of retreat in the summer time. It seemed to be advisable to close up all openings near the bottom of the room to prevent the escape of cold air and open the windows at the top to let out the heated air of the room.

Now, it so happens that I have in the basement of my house a swimming tank, and it occurred to me that since this tank holds water, it should certainly hold cold air; so I emptied the water out to study the situation. The tank seemed to be damp and the sides felt wet and slimy.

I reflected, however, that the condensation of moisture resulted from the fact that the sides of the tank were cooler than the air admitted. Water vapor will not condense on anything that is warmer than itself, and it occurred to me that if I introduced air that was very much colder than I wanted to use, then it would be warming up in the tank and becoming dryer all the time. It would not deposit moisture on the sides and would actually absorb the moisture there.



I therefore provided a refrigerator, in which were placed large blocks of ice, covered with salt, to intensify the melting and freezing action of the ice. This was placed in another room at a higher elevation than the tank, and a pipe, *covered with asbestos paper,* was employed to lead the cold air into the tank.

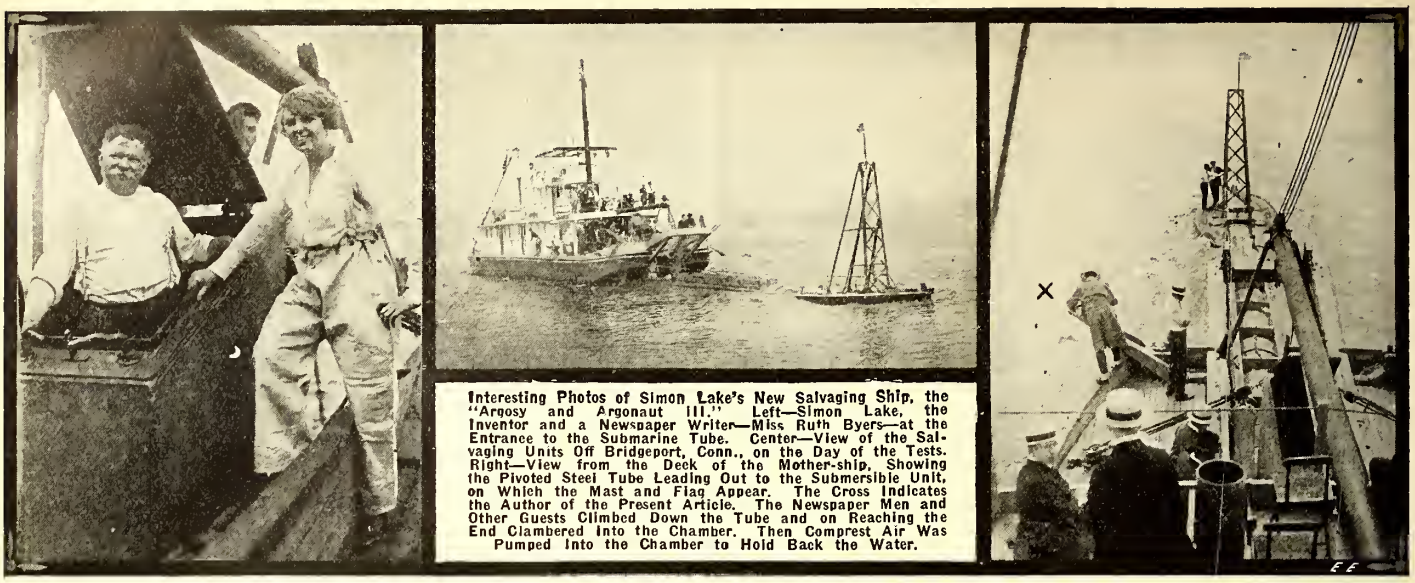
The first effect was the drying of the walls, and then I felt the level of the cold air gradually rising. At last it came over my head. The tank was full, and I found myself immersed in cool air. I felt so cool and comfortable that it seemed difficult to believe that Washington stood sizzling outside. I climbed up the ladder in the swimming tank until my head was above the surface, and then found myself breathing a hot, damp, muggy atmosphere. I therefore speedily retreated into the tank, where I was perfectly cool and comfortable.

Guided by this experience, I tried another experiment in my house. I put the refrigerator in the attic (see drawing herewith) and led the cold air downward thru a pipe covered with asbestos into one of the rooms of the house. The doors were kept shut and the windows were opened at the top. The temperature in that room was perfectly comfortable, *about* 65 *degrees!*

Some time ago the papers were speaking of an ice plant that had been installed in the White House, and congratulated the President, then Mr. Taft, upon a temperature of only 80 degrees when the thermometer showed 100 degrees outside. Under similar conditions (100° F. outside), I enjoyed in my home a temperature of 65 degrees (the ideal temperature), with a delicious feeling of freshment in the air.

The system proposed by Prof. Bell occupies very little space. In fact, it could be placed very easily in tenement houses utilizing the area between the ceiling and the roof, as all houses have at least a three-foot clearance between these two points. No doubt in the future, owners of houses will be compelled to install cooling systems.

"Piped Cold"? Sure! Why Not? Said Prof. Alexander Graham Bell, Inventor of the Telephone. In His Washington, D. C., Residence He Installed a Refrigerator in the Upper Story as Here Shown. The Cold Aid Descends Thru the "Pipes," and Chases the Heated Air Out Thru the Open Window Tops. 100° F. "Outside" and 65° F. "Inside"—Tells the Story. It Works!



ORIGINAL EDITORIAL BY H. GERNSBACK IN THE JULY ISSUE

One of the most profound annual summer mysteries of the twentieth century—at least to the writer—is our hot office or our hot home. We would not think of an unheated house or office in the dead of winter with the temperature near the zero point, but curiously enough we allow ourselves to suffer cruelly from the heat in the summer time when the temperature rages up in the nineties. Is it not a most curious world in which we live?

We think nothing of spending fabulous sums in the winter for our coal supply in order to keep warm and comfortable. But in the summer we prefer to spend nothing and suffer untold misery in consequence. Babies and grown up sick folk die like flies by the thousands on account of the heat, while we stand by helpless, or rather as if we were devoid of all intelligence, while the totally unnecessary slaughter goes on incessantly. How our grandchildren will read with astonishment that for decades human beings had their houses piped for heat, but had not enough sense to run a freezing solution or other freezing agent thru the self-same pipes in the torrid summer days!

There might be an excuse for our criminal negligence if we had not the means at hand to keep us cool and comfortable in summer. But we really have all the means, all the apparatus; in fact, everything—including: (*Continued on page* 550)

By JOSEPH H. KRAUS

Walking on the Ocean's Bed Without a Diving Suit—Simon Lake's Newest Invention

A LETTER.

"We expect to have our first press trial of the 'Argosy and Argonaut' on Friday morning, August 1st.

"Very truly yours,

"SIMON LAKE.

"Dictated but not signed."

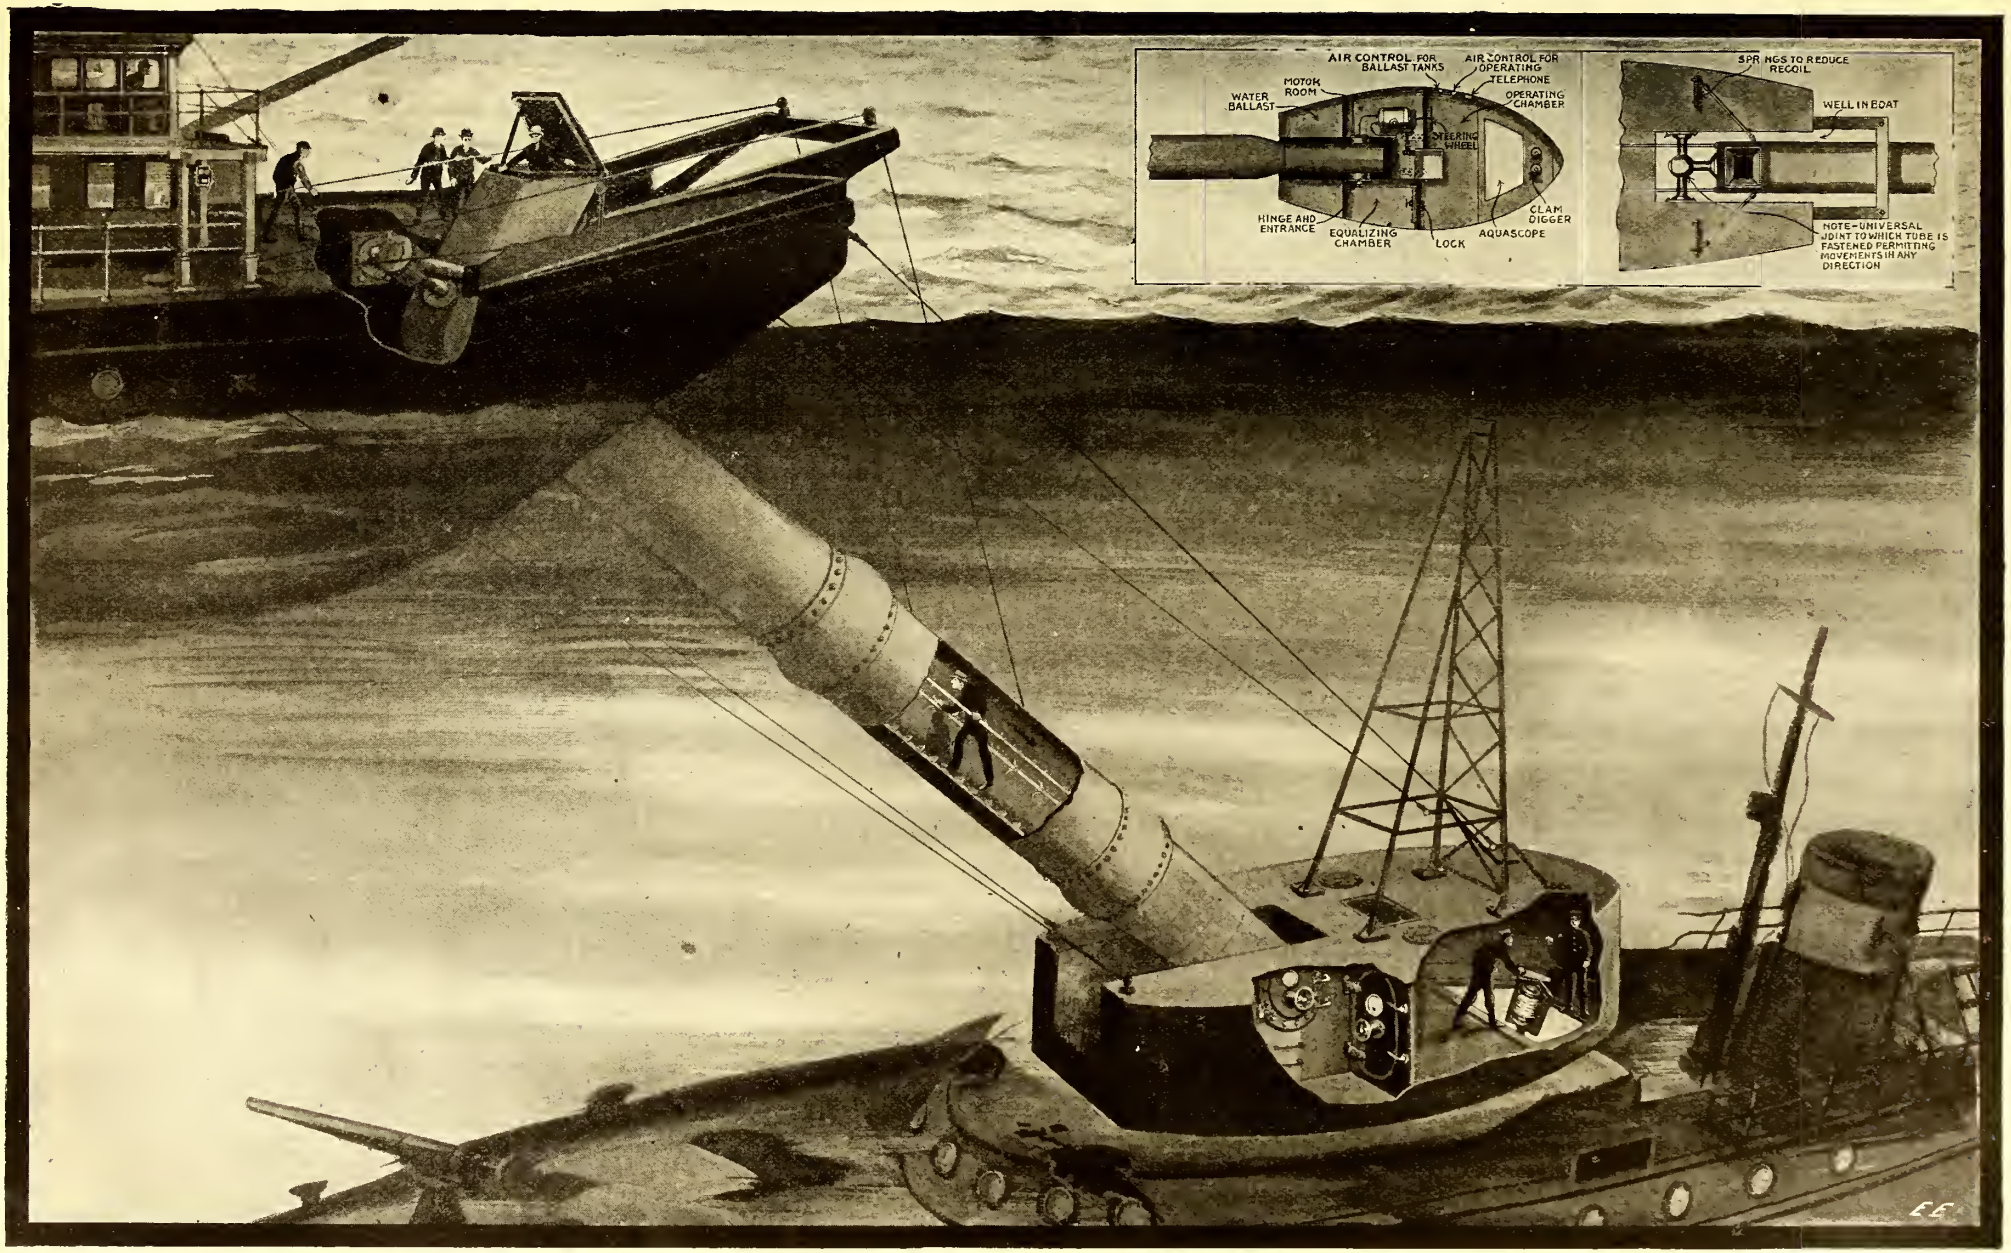
THIS was a portion of the letter from the inventor of the modern submarine which greeted me not so long ago. With August 1st coming on the next day, it meant hustle and get out. So the two of us, my camera and I, departed for Bridgeport. The next morning found me at the Stratford Hotel with a party of about forty editors and cameramen, representing newspapers, photograph agencies and motion picture concerns, all there bright and early awaiting our trip to the salvage ships. Not very long afterward a short walk brought us to the pier to which one of Mr. Lake's vessels was moored. A little joking while the refreshments were being placed on board, the blow of a whistle and we departed for the open sea. About one-half hour's ride brought us to the good ship *Argosy and Argonaut.* This is a combination of two ingenious devices used for ship salvaging and wreck recovering. The "mother ship," about 100 feet long, has a 65-foot tube connected to it in a little *well* in the forward part of the ship. At the end of the tube is the submarine, which is hinged directly with it so that entrance may be effected thru the tube while the submarine is at the bottom of the water. A few trips around the vessel while the cameramen ground out hundreds of feet of "movie" news film and the submarine going thru maneuvers, demonstrated to us the ease and safety with which the device would work.

The launch which was taking us around soon pulled up alongside of the salvage vessel. We clambered on board once more, all ready for the descent, a demonstration of which was to be given in a very short time. Mr. Lake then singled out the parties, four or five of which went down into the tube at a time, and each group had some of the most interesting stories to tell. Altho before starting down I thought songs like "Nearer, My God, to Thee" or "Asleep in the Deep" would have been very appropriate for the occasion, no one even as much as hummed them. We were all too engrost in the surroundings and awed by the masterful engineering spectacle around us.

THE DESCENT.

A hatchway measuring about 3 by 4 feet opens into the 65-foot tube, which latter tube is well lighted by electric lamps, the current for which is supplied from the mother ship. Current is likewise provided to actuate all the mechanisms in the submarine. The tube, 4½ feet in diameter, has struts across the bottom. These struts are 6 inches apart and assist in getting a foothold in the tube. A rail on each side helps to hold you in a "hunchback" position. It is necessary, in order to descend in this tube, to stoop over, and for safety's sake to go down backward, as a "bump on the bean," as someone called it, is not such a pleasant thing to get, and there is less chance of "bumping" in walking down backward than in attempting to go down the other way. Furthermore, the body would not have to be bent at such a great angle descending backward. Soon the tube narrowed, and instead of the rail on each side, a large number of steel ribs greeted our clutching fingers. Mr. Lake being first, directed us to wait a while, and started to release the air pressure in the diving chamber. A hiss of escaping air and dense clouds of mist filled the lower end of the tube completely. Shortly a massive iron door opened, just large enough to admit a person's body. "All in!" and we filed thru the opening, or rather crawled thru it. We now entered the equalizing chamber, about 5 feet long and 3½ to 4 feet wide. Swinging the door closed again, Mr. Lake opened the valve which admitted air, so that the pressure in this chamber would be the same as that in the operating chamber.

"Should you feel deafening in your ears, swallow," were Mr. Lake's words. Well—we swallowed! It reminded me more of "evolution" than anything else in my life. Have you ever been to the aquarium, and noticed the way some of the big fishes gulp water so as to oxygenate their blood? Well, that was *us.* The door into the operating chamber now permitted its being opened as the air chamber was equal in pressure.



This room is about 9 feet long and 8 feet wide at its broadest point, and sort of triangular in shape. What immediately attracted our attention was a hole in the floor of this chamber. There in front of us was a sheet of water about 6 inches deep, perfectly smooth on top with glistening white sand beneath. It seemed as tho it had been smoothed out and the sand cleaned for our reception. A signal, and the submarine moved forward, the water under us passing in slight ripples, and the sand moving away quite rapidly. Some of the most wonderful seaweed and shells were past, which could be seen easily with the use of no lights whatsoever, the water being of a beautiful translucent green (it's mighty hard to keep a swimmer out of water of that nature). A short time down in the operating chamber completed our visit to Father Neptune, and we again past thru the air-lock in order to give some of the others a chance to see this most wonderful spectacle.

HOW THE SALVAGE SHIP WORKS.

Now a word about the apparatus. The *Argonaut,* which is the mother ship, is 100 feet long with a beam of about 45 feet. It is driven by two 75 horse-power gasoline engines. These drive two propellers each, one forward and one aft. The propellers are so arranged that the forward pair may be disconnected, whence each engine drives the ship by means of the rear propeller. A very complex system of signalling is used on this vessel. The devices work by electricity or manually, by means of which the officer on deck can signal the engineer below in the engine room. In this engine room also is a 125-volt generator driven by an independent engine coupled to it. The energy derived from it is used to charge storage batteries, which supply the 110-volt D.C. for the lights and motor appliances used in the "sub." An air pump operating constantly supplies the air pressure for the "sub" and maintains a pressure of 75 to 80 lbs. per square inch at all times.

There is another extremely ingenious idea which Mr. Lake has incorporated in his salvage work. The device referred to is a semaphore arrangement on the masts of the salvaging ship. This semaphore consists of two arms, which are operated

Simon Lake's New Salvage Machine for Reclaiming Sunken Vessels

Hundreds of millions of dollars' worth of cargo and ships lie sunken in the ocean and in coastal regions, which can be salvaged either partly or in whole, when the proper engineering means have been provided. It appears that the new salvaging vessel recently perfected by Captain Simon Lake, of submarine fame, will perform such operations in a very expeditious and efficient manner; and this belief is all the more strengthened by the successful tests made during the past August in Long Island Sound in the vicinity of Bridgeport, Conn. Captain Lake made successful explorations of the bottom of Long Island Sound at depths up to 50 feet and over. The principle of the device is as follows: A mother ship of fairly large proportion carries a pivoted steel tube at one end as the illustration above herewith shows. The lower end of this steel tube which forms a passage-way for the salvaging crew, is fitted by means of a large pivot joint to a "submarine" as it is called, and which in fact it really is. When one climbs down thru the tube, he finds himself in a rear chamber of the "submarine" and directly he passes thru an air-lock door, shown in the plan view above, into the forward air-lock. In this forward compartment air at high pressure is constantly forced in thru a pipe passing down thru the pivoted tube. This air pressure keeps the water down to the level of the floor. There is an opening in the floor as shown and the crew may walk on the sand of the bottom as the submarine is pushed along by the mother vessel. The present illustration shows two men sawing off the starboard light on the sunken "Mary Alice", an armored yacht.

www.americanradiohistory.com

from the deck, by means of which signals are transmitted to the two smaller vessels which accompany the *Argonaut*. These smaller vessels are known as *wreck-finding vessels*, much speedier than the salvage ship (*Argonaut*), and at the same time smaller in size. They are likewise equipt with semaphores for replying to signals. In this way Mr. Lake can guide the course of the wreck-finding vessels without the use of wireless. The submarine proper is 22 feet long and divided into a motor room, opening into the left hinge, and an equalizing chamber, opening at the right hinge, thru which we had to pass in order to reach the operating chamber up forward. On each side and to the rear are two ballast tanks; also one midway between and below these. A large 110-volt motor actuates the wheels under the submarine proper. This motor is controlled from the operating chamber, i. e., the forward-most chamber of the submarine, and is likewise steered from this latter chamber. By its means the *Argosy*, or submarine proper can rest on the bottom of the ocean. These traction wheels under the submarine may be steered in any direction, and the mother vessel may, by this means, be drawn along by the action of the submarine itself, the submarine having the mother ship in tow, so to speak. Entering the right equalizing chamber from the tube, there is a massive iron door (which seems strong enough for a safe) with heavy latches. The door in the equalizing chamber is closed and comprest air is admitted slowly so as to allow the body to become accustomed to the increase in atmospheric pressure. When this is done gradually there is no grave risk.

A Remarkable "Pre-War" Caviar Map of the World's Greatest Ship Graveyard. The Wrecks Pictured Have All Occurred During a Period of Fifteen Years. This Great Loss of Shipping Was One of the Principal Causes Leading Up to the Construction of the Kiel Canal. This Chart Was Prepared, Before the War, by the German Hydrographic Office. Captain Lake's Submarine Salvaging Scheme, Which He Has Successfully Demonstrated, Represents an Invention that Is Expected to Reclaim 75 Per Cent of the $6,000,000,000 Worth of Ships and Cargo Lost During the War. Altho Simon Lake, the Inventor of What for a Better Name Might Be Called a "Salvaging Submarine," Gave His Demonstration Off Penfield Reef, Near Bridgeport Harbor, Conn., He Declared that It Would Be Just as Successful Where the Waters Were 300 Feet Deep. Tests Have Been Successfully Made at a Depth of Fifty Feet. The Salvaging Submarine Really Consists of Two Boats, the Argosy and the Argonaut. The Argonaut Is the Mother Ship and the Argosy the Submarine Attachment or Submarine Tube that Can Be Lowered or Raised by Means of Powerful Engines on the Mother Ship. A Larger Vessel with a Tube 300 Feet Long Is Being Planned for Use in Deeper Waters. One of the First Vessels to Be Salvaged Will Be the Bark "Hussar," Which Was Sunk in Hell Gate, N. Y., During the Revolutionary War with a Treasure of $5,000,000 in Gold on Board.

Some notion of what a difference in air pressure may make can easily be understood when one realizes that every foot below the water level there is an increase of .43 pound on every square inch of the body surface, which means an increase of 1,376 pounds for the entire body. Under normal conditions, the body is subject to a pressure of 14.7 pounds per square inch, which is atmospheric pressure. At a depth of 150 feet the pressure is more than four times that to which we are accustomed, and is an additional 64½ pounds per square inch, or 32,250 pounds increase on body over atmospheric pressure. Under these circumstances the blood is driven back from the surface of the body, the veins become deplete of blood, and a greater amount of blood is forced into the arteries, hence causing the heart action to be of necessity a good deal stronger in order to force the blood thru the contracted arteries. For much the same reason, a deafening sound is produced. This is due to the fact that air pressure on the diafram of the ear (tympanic membrane) causes an inward depression of the diafram

The Eustachian tube which connects the middle ear with the buccal cavity, normally closed, opens a slight fraction of a minute during each swallow, and by this means allows for an equalization of the air pressure on both sides of the tympanic membrane. That is the reason Mr. Lake gave us orders to swallow on opening the valves, which would increase the pressure to that of the water at that depth. Even at depths of 40 to 45 feet the sudden *descent* may prove dangerous, and a too hasty *ascent* may be followed by intense bleeding of the nose and ears, and perhaps a more dangerous hemorrage in the body. All troubles of this nature are due, as we have said, to hasty ascent or descent. There are several pathological reasons for death, which may result from causes such as these, but as that is more a matter for the medico, it will not be discust in detail here.

THE OPERATING CHAMBER.

This chamber is divided up into a forward portion and the controlling portion. Up forward is the *Aquascope*, or underwater telescope, by means of which one can see out into the water. That is to say, the Aquascope is a large glass door, which will allow a person to look thru it or open it and get out and walk, so to speak. There is a depth of 6 inches of water from the interior of the chamber to the bottom of the ocean or deck of the vessel when the submarine is in position, so it's just as easy to walk here without getting any wetter than if wading in a brook. In this chamber likewise is a telephone, which communicates with the deck of the "mother vessel," as are likewise controls for all operations, such as derricks, degrees of air pressure and signals. In the aft portion of the submarine are three air tanks, which are placed one at each side, and one in the center and below the other two. It is only necessary to allow the water to pass into these containers, and the increase in weight will carry the submarine to the bottom, or anywhere midway between. It may likewise be forced out and the submarine made to rise to the surface.

The tube itself is hinged in such a manner that an up and down motion does not materially affect the submarine, neither does the side to side motion of the mother ship have any effect. A sort of universal joint, very powerfully constructed, holding the tube in position, while ropes connected to the pulley blocks on the deck prevent the tube from rocking either way to a great extent, due to the fact that these blocks in turn connect to springs.

Is salvage practical commercially? Well, let us quote a few cases. *La Lutine*, an old hulk of a British frigate, sailed from Yarmouth Roads for Hamburg on October 9, 1799, carrying a large amount of treasure in the form of gold and silver bars and coin. She struck a sand bank at the entrance of the Zuyder Zee and was lost. The minimum estimate of the coin on board is valued at $2,085,335. All attempts to recover the treasure have been futile, or nearly so (only $500,000 having been reclaimed), altho its location is exactly known. Inasmuch as the position in which she lies is an exposed place, divers have been unable to recover the cargo. Vessels around Hell Gate and other treacherous Atlantic ports can be easily salvaged—or at least their cargoes salvaged.

As for salt water spoiling cargoes, Mr. Lake has recovered cotton which has been submerged from two to five years, nothing but a very slight portion having been spoiled. Silk has likewise been recovered. Hardly any article decreases in value, even tho lying at the bottom of the ocean for a long period of time. Not only may cargoes of this nature be recovered, but also coal, a special device being utilized in this case. It will be noted in one of the photographs that a well runs down thru the center of the submarine. In this well is placed a hose running to a centrifugal pump, located on the deck of the mother ship. Nor does this pipe call for the services of a diver, as it can be brought into position by means of either an electric winch, or by lowering the submarine over the space where the coal is to be pumped. Mr. Lake's present vessel is, of course, by no means a large salvaging ship, nor will its operation be as cheap as a much larger vessel capable of doing much more work. Coal has been recovered from the bottom at an actual cost of less *than* 5 *cents a ton*, 15 *tons having been recovered in a minute*. It has been said that coal submerged in salt water is a good deal better than coal which has been left in the open, inasmuch as it burns away almost entirely, leaving a pure soft white ash. Hence many housewives sprinkle salt over their fires to make them brighter.

A very wonderful method of salvaging sunken ships has also been conceived and worked out by Mr. Lake.

Investigating "Psychical Phenomena" With Scientific Instruments

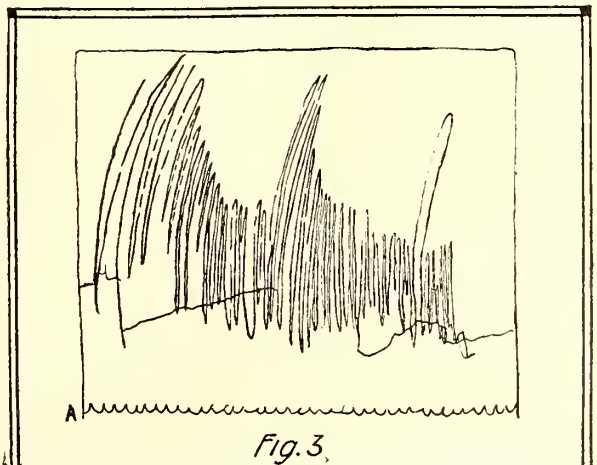
By HEREWARD CARRINGTON, Ph. D.

An Account of Some Recent Researches In This Field of Inquiry

IT is generally conceded that Aristotle possest the greatest single intellect the world has ever known; yet any school-boy today knows more of the structure of our universe than did Aristotle! The reason for this is that Science has more fully penetrated the secrets of Nature, and we now know approximately the constitution of matter and a good deal concerning life and mind. How has this progress been possible? Only in one way. Improvement in the *mechanical instruments* by means of which we study Nature. We might "speculate" as to the constitution of matter for a thousand years, but we should never have arrived at our present positive *knowledge* had it not been for the delicate and sensitive instruments which are today in the hands of the physicist and the chemist, and employed by him in his laboratory.

In a Series of Séances Conducted in Naples, the Apparatus Here Shown Was Used to Investigate the Psychic Phenomena. The Psychic "Power" Successfully Prest the Key, Thru a Cover, and Caused the Magnet Needle to Record on the Revolving Drum.

Doubtless much the same law will be found to apply in the realm of "psychics." Until we can apply definite "laboratory methods," and study psychical phenomena by means of physical instruments far more delicate than our senses, it is probable that the present state of things will continue to exist; but it is my firm belief that, were a laboratory fitted up with physical and electrical apparatus, suitable for this work, and if we could by their aid study a promising case of "psychic" or "mediumistic" phenomena, we should (within ten years or so) arrive at some definite conclusions! We should then know something about the *laws* and conditions under which telepathy, clairvoyance, telekinesis (the movement of objects without contact), et cetera, operate, and not until this is done, I believe, will such positive conclusion be reached.

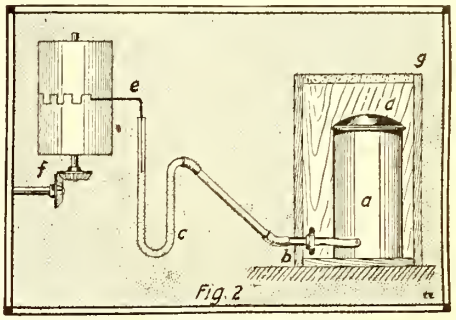


Of course the reader may object, just here, that I am assuming such phenomena to be *true*—while the tendency of many present-day scientists is to regard them as unreal, hallucinatory, and the result of fraud. I cannot spare the time in the present article to argue the point. While I admit freely that a very large percentage of such phenomena *are* so produced, and while I freely admit that probably 98 per cent of so-called "mediums" are fraudulent; I am equally emphatic in declaring that a residuum of genuine phenomena exists—that supernormal manifestations *do* occur, and that everyone who investigates *carefully enough* and *long enough* will find them. This has been not only my own experience, but that of every person who has investigated this subject with an impartial mind for any length of time. As Sir Oliver Lodge said, in writing of this very question:

"The result of my experience is to convince me that certain phenomena, usually considered abnormal, *do* belong to the order of Nature, and as a corollary from this, that these phenomena ought to be investigated and recorded by persons and societies interested in natural knowledge."

Based on this conviction, Sir Oliver Lodge wrote, as far back as 1894, in a paper entitled "On Some Appliances Needed for a Psychical Laboratory":

"If the investigations are to go on easily and well, special appliances must be contrived and arranged conveniently for use, precisely as is done in any properly fitted laboratory. It has already doubtless been realized that one of the needs of the future is a *psychical laboratory*, specially adapted for all kinds of experimental psychology and psychophysics. . . ."



Sir Oliver Lodge suggested at the time, among other necessary appliances, a delicate registering balance,—so adjusted that it would record the medium's weight, unknown to her, at all times during the séance—the fluctuations in weight, if any, to be recorded on a revolving drum. Means ought also to be provided for studying the temperature, pulse, muscular exertion, breathing, etc, etc. The lighting of the room should be carefully attended to and capable of the slightest gradation. Means should be provided for obtaining moving pictures of the séance from without the room, unknown to the medium. Were the sittings held in complete darkness, these photographs could be obtained by means of ultra-violet light, with which the room might be flooded. In addition to these devices, we may add others—such as X-ray tubes, high-frequency currents and a delicate field of electric force,—while instruments for testing the ionization of the air (if it exists) in the immediate vicinity of the medum, during a séance, should also be employed,—together with the more strictly psychical instruments and devices which have been utilized of late years.

A Sample of the Tracings Obtained By Psychic Powers Acting On the Apparatus Shown At Fig. 2.

Electrical apparatus *has*, in fact, been utilized on several occasions to test so-called "psychical mediums" in the past. Italian investigators, particularly, have excelled in this. In a series of séances conducted in Naples, the following apparatus was employed. (Fig. 1.)

A telegraphic key (b) was connected by wires (a,a) to a battery (d) and to two screws, connecting them with an electro-magnet (e) to the opposite end of which was attached a needle. The point of the needle touched a revolving drum (f), with a smoked surface, driven by two interlacing, cogged wheels. The whole of this registering apparatus was enclosed under a glass bell-jar (g). The telegraphic key itself (b) was covered by a cardboard box (c). The "powers" manifesting were asked to press the telegraphic key *without* tearing the cardboard box (that is, *thru* it). When the key was deprest, this would be instantly communicated to the electro-magnet, and cause the needle to oscillate,—these oscillations being marked upon the smoked surface of the revolving drum. A number of successful tests were conducted by means of this apparatus.

Another Form of Psychic Force Recorder. Here the Pressure Exerted On the Rubber Cap "d", Thru the Cloth "g", Caused the Liquid in Cylinder "a" to Move Downward and Actuate the Manometer Needle "e", Which Traced the Variations On a Revolving Drum "f".

A variation of this was then employed (Fig. 2). A cylinder filled with water (a) was connected by means of tubing (b) to a U-tube, or manometer (c), filled with mercury. Upon the further side of this tube floated a bent wire (e) inserted into a small cork. The point of this wire, again, was so adjusted as to come into contact with the smoked surface of a revolving drum (f), driven as before. The top of the cylinder (a) was covered with a rubber cap (d), and this whole apparatus was inserted under a wooden box (g) having a cloth top.

Now, if the rubber covering (d) were prest upon, this would force some of the water, in a, along the tube, b, and the added air-pressure would depress the column of mercury in the manometer, causing the floating needle to rise on the opposite side, and scratch upon the revolving drum. Fig. 3 shows some of the tracings which were obtained in this way—the force acting thru the cloth top, g.

The instruments thus recorded a *definite physical, intelligent force.*

It may interest my readers to know that, at the time of his death, M. Curie,—who had been completely

How the Telephone Talks

ALMOST all of you use a telephone constantly and give very little thought as to the actual working of it. Just how many people know what happens when you throw your voice into the transmitter of the modern telephone? Very few, I'll warrant. By means of the drawings, the transmitter is very clearly shown in detail, and the voice may be traced from the time it leaves the mouth until it goes into the line thru the transmitter. The whole operation, of course, takes place almost instantly.

Fig. 1 is the detailed construction of the transmitter. A is the mouthpiece; B is a very sensitive iron or mica diafram; C a carbon button and disc attached to the diafram B; D is a small box filled loosely with carbon granules.

When you speak, the resulting air waves set up by your voice impinge against the diafram B, which vibrates in exact tune with the air waves. The carbon disc C, being attached to B, also vibrates in syntony with the air vibrations, and therefore the contact between the carbon granules and the carbon disc varies in proportion to the force of the air waves striking against the diafram. As a consequence of this action, the electrical resistance between the carbon disc and the carbon granules varies with the strength of the air waves.

"How the Telephone Talks" Is Here Illustrated in Diagram and Picture. This Shows, of Course, Only a Few of the Actions Occurring in "Telephoning"—In Fact the Action Here Taking Place Occupies But a Fraction of a Second.

Consider Fig. 1, which shows schematically the telephone transmitter or mircrophone as well as the receiver, reproducing the spoken word, and which was employed in the manner shown by the Bray Studios in making an animated film story entitled "How the Telephone Talks."

Fig. 1 shows the exact instant that the mouth starts to open when a vocal air wave is set up as indicated by the curved dotted lines. The air waves tend to expand spherically whenever possible, and the vibrations or rings representing the air waves expand rapidly (the velocity of sound thru air being about 1,100 feet per second), and, as will be evident, the expanding air wave will, in the fraction of a second, reach the tightly stretched microphone diafram just inside the mouthpiece, to which is attached one of the carbon electrodes forming the carbon granule chamber. This stage of events in the story of the telephone is illustrated at Fig. 2. Here the first ripple of the expanding air wave propagated from the vocal organs and mouth of the speaker, is just impinging against the diafram and causes it to bend inward as shown. When the mouth first starts to open, Fig. 2, the air waves are quite weak. The movement of the microphone diafram and the carbon electrode attached to it is consequently slight, as well as the change in the current thruout the circuit to the receiver at the other end of the line. At this stage it is well to look at the receiver, Fig. 2, in which we see that the diafram has been attracted inward, or toward the electro-magnet core, by the increased strength of current caused by the reduction in the resistance of the carbon granules in the microphone. Simultaneously an air wave corresponding in frequency and pitch to that originated by the speaker at the transmitter end of the circuit, is thus produced by the movement of the receiver diafram. As becomes evident, the strength of the reproduced sound or air waves which eventually leave the receiver diafram, causing the mechanism of the ear to respond in the well-known physiological manner, will be exactly proportionate to the strength of the original sound or sounds at the transmitter.

At Fig. 3, the speaker's mouth has, a few seconds later, opened wider and the speech waves are louder and more powerful. These stronger air waves strike the microphone diafram thru the mouth-piece and cause it to move in a still stronger manner, which in turn causes a greater compression of the carbon grains, as shown in Fig. 2, and the receiver diafram is attracted or repelled with proportionately greater effect. If a medium strength sound is produced by the speaker at the transmitter end of the circuit, then the sound reproduced at the listening end would be a medium strength sound also.

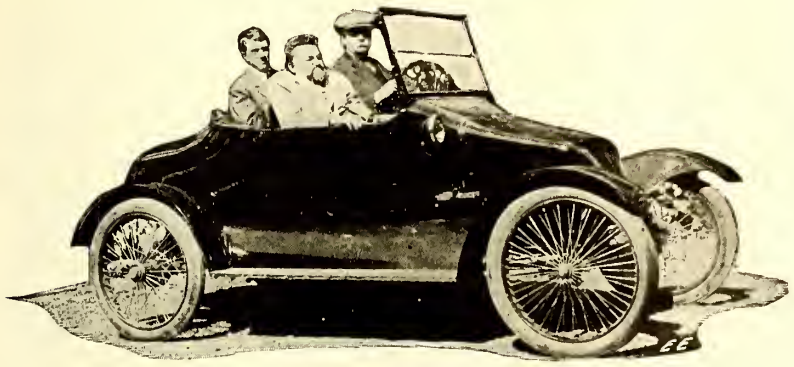

Fig. 4 shows one case of a full, loud voice condition on a telephone circuit. The full vocal power air waves set up by the speaker opening his mouth to the normal maximum strike the microphone as shown. The carbon grains are in turn compress to a greater extent, more so than in Fig. 3, and the current in the circuit is now intensified decidedly, owing to the porportionately greater change in the resistance of the carbon grains, and the receiver interprets these changes very faithfully. The greater variations of the current in the transmitter-receiver circuit affect the receiver magnet by passing around the coil of wire wound on the end of the magnet as shown, and these powerful changes are instantly communicated to the diafram, attracting it with great vigor, so that it almost touches the magnet poles in some cases. The diafram now vibrates back and forth with maximum movement, giving forth sonorous air waves corresponding to the waves originated at the transmitter. The human ear held close to the receiver interprets the air wave vibrations in the well-known manner, and thus we hear once more the voice of the speaker transmitted perhaps over several hundred or several thousand miles of telephone wire, reproduced in our very presence, mysteriously—yet very simple, when you know how it is done.

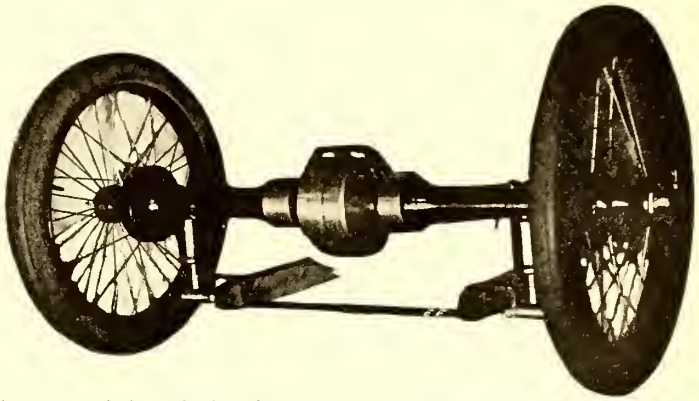
A New Era Electric Auto

A New Combination Gas-Electric Car

THE new Dey Electric Automobile here illustrated created a mild sensation some time ago, and in an interview with Dr. Charles P. Steinmetz, the latter made the statement that Mr. Dey had solved the problem of the

The New Gasoline-Electric Automobile Which Its Inventor—Harry E. Dey, Seen at the Wheel,—Expects to Sell at $500.00. At the Left—Dr. Charles P. Steinmetz, the Famous Electrical Engineer, Who Believes Mr. Dey has the Best Idea Yet in Electric Automobiles. The Storage Battery Is Charged While Running.

$500.00 electric automobile. This car has many points of novelty over other vehicles. It naturally follows that such must be the case in order to cut the weight and cost of the lightest and cheapest electrics now on the market in half; and at the same time not reduce the factor of safety, or the size of the car, which has the same dimensions as the Ford.



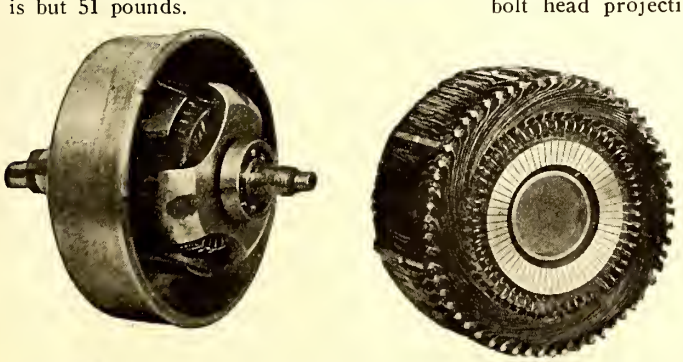
Its most revolutionary feature is the motor, which has *both its armature and field magnet rotatable;* one element connecting with one driving wheel thru a pair of reduction gears, while the other element connects in a similar manner to the other wheel. This arrangement produces a perfect *differential* substitute; and, in addition to saving the cost and weight of this complicated piece of mechanism, *it increases the capacity of the motor* 100 *per cent* for a given rotative speed, for the parts revolving in opposite directions *cut the magnetic lines twice as fast,* thus producing the results of a motor of double the velocity; besides this also adds to the electrical efficiency. The weight of this motor is still further reduced by turning it inside out, as it were; the armature, which is a toothed Gramme ring, encloses its field which has six poles, all energized from one coil. The field design is ideal for low field losses and light weight; its total weight, with shaft, being less than 20 pounds. Its iron portion is well adapted for drop forging. The total weight of the motor, which has a capacity equal to the standard automobile motors weighing 150 pounds, and upward, is but 51 pounds.

The motor is centered on the center line of the axle. An eccentric, of 7/32 inch throw, is fixt to the outer end of each shaft; an internal gear is carried by, and rotates upon, the field shaft eccentric, a roller bearing taking care of the friction. An external gear, concentric with the shaft, is keyed fast to the stationary housing and meshes with the internal gear; the latter connects by means of a flexible jointed shaft, practically a floating axle, to the wheel hub. It will be noted that only one of the gears is rotatable, the other one being held absolutely rigid. At the armature shaft end the construction differs by mounting the external gear, instead of the internal one, upon the eccentric, and keying the internal one to the housing. From this point the construction duplicates the other end. When the internal gear is the rotative element, as at the field shaft end, the direction of rotation remains unchanged between the motor and the wheel; but with the external gear as the rotating member, as used at the armature end, the direction is reversed. The opposing directions of the armature and field magnet are thus rectified without recourse to intermediate gears. The internal gears are 3½ inches pitch diameter and the external 3 1/16; this gives a reduction ration of 7½ to 1.

This car can well be termed the *nutless* car, there being so few used in its construction; all the surfaces are free of any bolt head projections. As the current is taken into the motor by means of slip rings there is no necessity of disconnecting wires when removing motor.

The experimental car was designed with a hand operated control and wheel steering. It was found in testing this out in heavy traffic, however, that hand control and wheel steering do not make a desirable combination, for in an emergency both hands are required upon the wheel; and in addition there is a time element involved in shifting the hand from the wheel lever that cannot be permitted. In the latest design the control is very similar to that of a gas car, with the shifting of gears left out. For speed variation a foot lever is used in a manner identical with that of the clutch lever; when the foot is removed the car runs at full normal speed; a slight pressure inserts resistance, producing the equivalent of a slipping clutch; as the pressure is increased resistance is added by infinitesimal steps, until finally the current is completely shut off; further movement converts the motor into an electric brake, and an extreme movement applies the mechanical brake. There is besides an additional emergency brake and also the ability to reverse the motor, thru resistance, for that purpose. An accelerator pedal, acting upon the field, increases the speed to 30 miles per hour, or more. Another lever provides "Forward," "Reverse" and "Neutral"; it is interlocked with the speed control, so as to shift only when there is resistance in the circuit or the motor is entirely cut off. The ability to reverse while the power is still on (thru resistance) provides quick manipulation for "seasaw" work.

On down grades the motor will recharge into the battery at speeds as low as eight miles per hour; and the car speed will automatically *slow down* as the grade increases; thus making the driving unusually safe. An increase of speed may be obtained at any time, however, by means of the accelerator.



The Rear Axle and Electric Motor Propelling the New "Dey" Electric Vehicle. It is Twice as Efficient as the Ordinary Electric Auto, Owing to the Fact That Mr. Dey has Designed His Motor to Have the Field and Armature Both Rotate. This Doubles the "Torque Speed" and Reduces the Weight of the Motor. Also the Storage Battery Is Smaller Than in Any Other Machine.

The storage battery is carried beneath the floor, attached to the truss rod posts. This permits the body to be used exclusively for passengers and luggage; and also avoids all troubles due to spilled electrolyte. The method of suspension is such that the battery can be readily lowered to the floor by one person, and the top is accessible for adding water by lifting a trap door in the floor. This location is ideal for small power consumption, and gives a very low center of gravity that conduces to an easy riding and safe car.

While light weight has always been a hobby with the inventor, he does not believe in obtaining it at the expense of reliability or a limited sphere of action. One-half of the total weight of a car should be charged against the battery; this will provide power in excess of 100 miles per

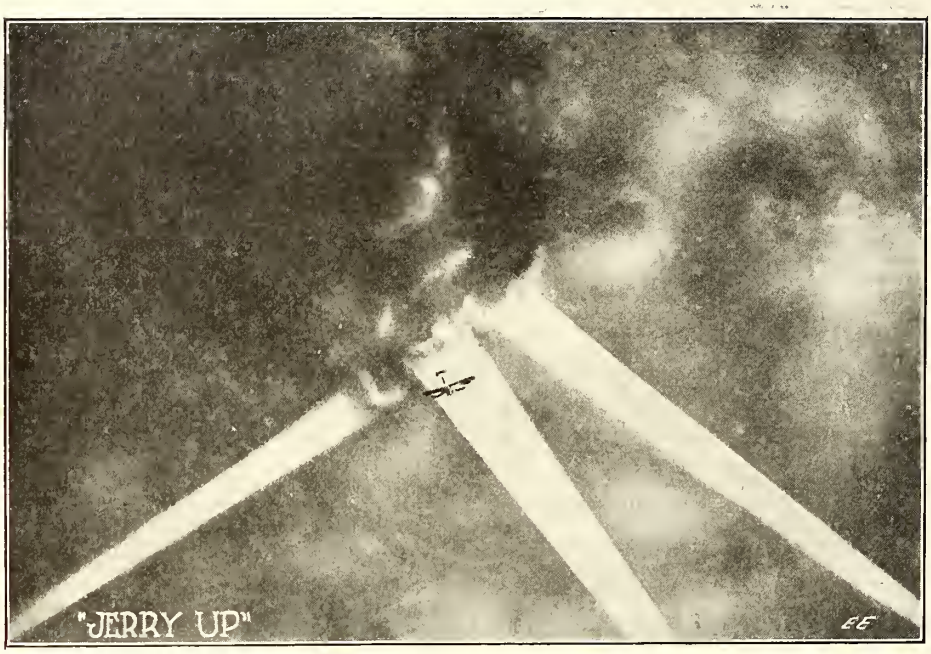
"Jerry Up"

By CHARLES K. FANKHAUSER, JR.

Late of the 56th Regiment of Engineers, U. S. A., Only Searchlight Regiment in the A. E. F.

THE author wishes to state that the following is an account of some of his personal experiences with the 56th Searchlight Engineers during six months of active service in Flanders.

After the usual cross-country tour of France *à la box cars* (always labeled 8 *chevaux*, 40 *hommes*, meaning 8 horses, 40 men), and a week's pleasant (?) sojourn in a rest (?) camp, Co. F. arrived at Champigny, near Langres. It was here that we were to receive our training in the gentle art of bagging Hun 'planes. Our searchlight "training" was merely a continuation of "squads east and squads west," punctuated at frequent intervals with the refreshing (?) pastime of manicuring France with pick and shovel.



But there is an end to all things. One fine afternoon early in August, 1918, found me, with six others from Co. F., at S.3., S.3 being the official title of one of a series of English searchlights strung along the "India rubber" line near Lille. There we learned what a searchlight really was for. We couldn't help it.

That evening, shortly after dusk, "Jerry" started over in his giant bombing 'planes to get the big steel plant just behind us. We wanted to leave the immediate vicinity *"toute suite,"* but no! We were informed by the hilariously amused "Tommies" in charge that we not only had to stay there, but had to shine a big sixty centimeter light right on "Jerry." We protested that he could hit us quite easily enough without our "advertising" our location. But once again—no! We had it all wrong. The sergeant ordered us to take action. We got the light on a big Gotha and immediately down came six bombs! Wang-o!! and then some. The jar of the first blew the arc out in the light and the rest blew out all our ambition and desire to be "defenders of Democracy."

After our first scare it wasn't so bad. We learned that a searchlight is a very poor target, even tho it is somewhat conspicuous. After that it was just a thrilling game. "Jerry" was an awful coward when it came to the limelight stuff. He preferred to work in the dark. Just as soon as we got him into the beam he invariably dropt his presents and made tracks for home. That is, he tried to. He did not always succeed. Our three-inch A.A.'s sometimes interfered. (A.A. in plain United States means "anti-aircraft.")

The three-inch guns were another little diversion for us. We had frequent practical illustrations of the law of gravity much in the same manner that Newton first observed it. Only our apples were made of *steel.* Said apples being originally intended for "Jerry." He being directly over our heads, and aforesaid steel failing to reach its objective, it returned to us by the shortest possible route. A straight line. (Business of digging out tin lids in a hurry.)

Did the German Airplanes Like the Allies' Searchlights? Yes They Did—NOT!

Actual Photograph of a German Bombing 'Plane Caught in the Shafts of Allied Searchlights. This Photo Was Taken From an Allied 'Plane. "Jerry" Was Tickled Silly to Have His Path Illuminated; Yes, He Was—and Showed It by Dropping 100-Pound "Forget-Me-Nots" on the Searchlight Crews—Fine, Only They Made Such an Awful Noise When They Landed.

Our parabaloid sound locators would tell us when a 'plane was coming and give us the bearing, then I, being wheel man, would send the long finger of light searching out into the blackness, looking for "Jerry."

The alarm was always given "Jerry up," and when we heard that, there was "action" and lots of it. I'll say so.

Each light had quite an elaborate telephone system, with lines running to several "spotting" posts and connected with all the other lights and gun sections thru a central telephone exchange.

This telephone system was a fine idea. The only thing wrong with it was the fact that the French farmers had a strange fondness for double-strand, cotton covered field telephone wire, and we never could convince them that we did *not* put the wire down for them to play with or build fences with. Otherwise the system was fine, and gave us many hours of diversion repairing it. Especially after a line had been plowed, harrowed and scraped for an afternoon or so.

The third night out I bumped up against the real English alphabet. I was on duty at the 'phone board. S.4 rang in and this is what I got: "Esses 3? Message to Lieutenant ——. Ac-ac-esses 4. Eight pip-emma, eight oblique fifteen oblique eighteen. Esses-e-n-don emma-e-esses-esses-ac-g-e t-a-ac-don-j-u-t-e-n-t——"

That was enough for me. I thought the whole B.E.F. was shell-shocked. I went for help. My mistake. It was only the usual "Pip Emma" system. The system of spelling used in all telephone communications in the B.E.F. Certain letters that are apt to be confused with others are given a special pronunciation as, s is pronounced "esses," p is "pip," m is "emma," d is "don," b is "beer," a is "ac."

I finally got the main idea of the thing, but never used it. When we "Yanks" used the 'phone we talked United States, not English.

But taking it as a w(hole) an A.A.S.S. emplacement isn't half bad—providing it doesn't rain and there are no rats and no cooties, and you don't mind sleeping in mud and—oh, well, if you like that sort of thing and don't care particularly whether you sleep or not.

SEARCHLIGHTS AND SOUND DETECTORS IN THE A. E. F.—A CORRECTION.

We publish herewith a correction from the War Department, office of the Chief of Engineers, Washington, D. C., concerning our article on page 310 of the ELECTRICAL EXPERIMENTER for August, 1919, entitled "Locating Airplanes in Night Fighting." To quote Captain James O. Jensen, Corps of Engineers, U. S. A., in his communication: In the third column it goes on to say:

These powerful searchlights, besides being available for enemy spotting, are also much used as a means of signalling. This is one branch of **the Signal Corps'** *work which has proven one of the big factors in helping to win the war.*

The particular work described in the article is a function of the Corps of Engineers, and was not and is not handled by the Signal Corps.

The 56th Regiment of Engineers constituted all the searchlight personnel in the A. E. F., and was the only organization engaged in using searchlights and sound detectors to combat enemy night flying 'planes.

EX-SOLDIERS, ATTENTION!

We want to publish some more articles similar to that appearing on this page by Mr. Charles K. Fankhauser, Jr., describing personally some first-hand experiences with the American Expeditionary Forces. Of course such articles intended for publication in the ELECTRICAL EXPERIMENTER should deal with more or less scientific phases of military life in France. Not only do we extend this invitation to all ex-military men, but also to the sailors of the sea. There is many a good tale to tell based on facts, we are certain, from the many personal experiences we have heard related by our friends who went overseas from time to time.

www.americanradiohistory.com

Good Day! Mr. Mars, said Prof. Todd

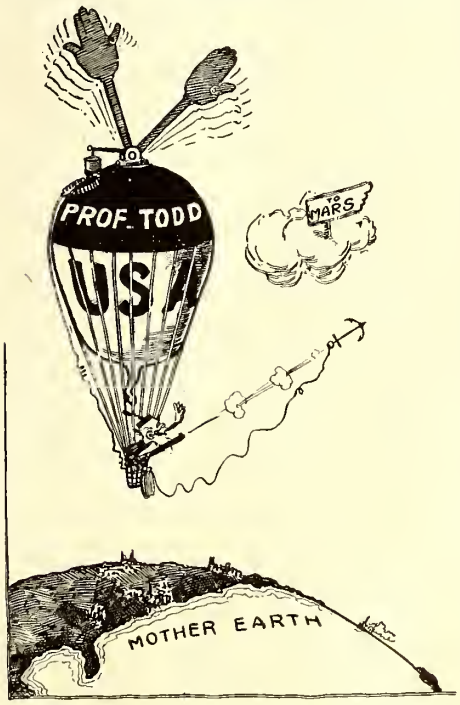
A SERIOUS attempt to get into communication with the planet Mars was made at Fort Omaha on Sunday, July 13, when Prof. Avis Todd of Amherst, accompanied by Capt. Leo Stevens, head instructor of the balloon service of the War Department, tried to send a balloon to the highest point ever reached. Capt. Stevens holds the world's record of 29,500 feet, made at Franklin, Pa., in 1912.

Prof. Todd has perfected instruments upon which he has been working for years, is the report from Fort Omaha, and with these he hoped to get into communication with the people of Mars, providing he could get far enough away from the earth's attraction.

Six years ago Capt. Stevens took Prof. Todd to a height of 22,000 feet, but his effort then to communicate with Mars failed. Five years ago Prof. Todd went to the Andes in South America for the same purpose but failed again.

One of the Government's big spherical balloons was used.

WHAT SIR OLIVER LODGE SAYS.



Communication with other planets by wireless telephone is not regarded by Sir Oliver Lodge, one of Britain's most eminent scientists, as a possibility too fantastic to be summarily dismist by savants.

Projection of a stream of electrons across the spaces of infinity by employing the vacuum relay or "audion" and utilizing ultra-violet light or the X-ray—these and other equally marvelous visions are conjured up by Sir Oliver in an article in *The Mail,* of London, under the caption of "Shall We Talk to Other Planets?"

Sir Oliver Lodge is inclined to believe that some simpler and more direct mode of transfer of ideas will be developed, but he does not censure William Marconi for his enthusiasm as to the possibility of interplanetary communication by wireless telephony.

"The wonders of wireless telegraphy and wireless telephony," says Sir Oliver, "are the outcome of researches in pure science which were originally initiated and pursued with no thought of practical application.

"By combining all that was known about oscillating electric circuits and about the emission of electric waves in accordance with Maxwell's theory, the problem of tuned or selective wireless telegraphy was solved, let us say, in 1897. Researches initiated by Crookes, and others, and developed by J. J. Thomson, have been prest into the service; and, first by Professor Fleming and then by others, have greatly improved the receiving capacity to wireless stations, so that it is possible in America, with quite a small receiving area, to hear the great high powered radio stations in Europe. And recondite mathematical investigations have proved that hearing at the Antipodes is far from theoretically impossible.

Prof. Todd, U. S. A., Sailed Martian-ward Some Moons Ago in a Large Army Balloon, in Order to Try Out Some of His Newest American-Marsotonian Wigwags on the Inhabitants of that Planet—

THE EFFICIENT AUDION FOR INTER-PLANETARIAN RADIO.

"In free space there are no such disabilities as are met with in the cramped space of a submerged cable, and speech, said to be of remarkable distinctness, can be reobtained from electric oscillations which have encountered nothing more perturbing than the air. Air does not help—so far as it acts it hinders; vacuum would be better, but the ether is sufficiently forcible to overpower minor obstructions, and it is found capable of transmitting securely and squarely whatever is ingeniously given to it and still more ingeniously received.

"The main instrument made use of for this purpose is the vacuum relay (audion); and the essential power which has been harnest both for sending and for receiving, is the extraordinary mobility and tractability of the little electric units or *electrons* which are given off by matter under certain conditions in great numbers, which fly with incredible speed approaching the velocity of light, and which in a sufficiently high vacuum are beautifully amenable to control.

"Electrons in motion constitute an electric *current* and a stream of them can be deflected either by a magnet or by an electric charge brought near them. Suppose, then, that an oscillating electric charge, oscillating in correspondence with the vibrations of the human voice, is brought into the neighborhood of a stream of electrons, this stream can be made to vibrate in unison. It can be laterally deflected or waved to and fro if that is what is wanted; or it can be alternately encouraged or retarded if that is preferable. It responds to every impulse, and it responds instantaneously.

ELECTRONS FROM A HOT WIRE.

"To get such a stream of electrons many ways might be employed. Ultra-violet light falling on a metal is one method. The X-ray is another. But the simplest plan is to employ a hot wire. A suitable wire can be kept hot by an electric current, and it can be made one of the poles of a battery so that a stream of electrons constantly emerges from it. This stream can then be controlled, as has already been vaguely indicated, by a multitude of devices, some of which have been already described and used—used very effectively—but none of which is as yet likely to have reached perfection.

"That is the principle. The rest is detail. *Fine and ingenious detail,* but detail which can take many forms; and those forms are more suitable for description in the technical press. Suffice it to say that such a device if talked into can supply a current varying with all the tones of the voice; and this varying current can be used to transmit electric waves after the usual methods adopted in wireless telegraphy.

"Then at the other end an ordinary wireless collector can receive them, can reproduce feebly the varying electric currents which originated them, and can then hand them over to a vacuum relay supplied with local energy, where they will modify an electron stream in the way above indicated. The feeble received current can, in fact, so control the stronger electric current which the relay is emitting from a local battery that every fluctuation can be imparted to that stronger current. This electron derived current, relayed again if desired, can then be applied so as to be heard in an ordinary telephone—the marvelously simple and familiar instrument that translates varying electric currents into articulate sound and applies it to the human ear.

—But History Does Not Recordeth What the "Martians" Thought of the Yankee Professor's Signs. Perhaps They Don't Believe in Signs Up There; Anyway, You Probably Locate the Nearest "Near-Beer" Sky Garden by a Mental Telepathic Wave Shot Out Broadcast by the Enterprising "Bevo" Dispenser.

"What the ultimate outcome of this power of long-distance telephoning may be I will not attempt to prophesy.

"The ether waves, once generated, are quite independent of matter. Matter is employed at the sending and at the receiving end, but in all the space between the efficient and necessary transmitting medium is vacuum, ether, the space between the worlds.

"I do not wonder that Mr. Marconi, in his enthusiasm of the power of speech-transmission which is thus coming into being, speaks of possible communication with other planets. Every one, including himself, must foresee immense difficulties about that; and for myself, I venture to anticipate that science will recognize a simpler and more direct mode of interchange of thoughts and ideas, tho perhaps not with dwellers, if there be any, in other planets, before a physical process of transmission from world to world, in the complicated code called *language* is feasible."

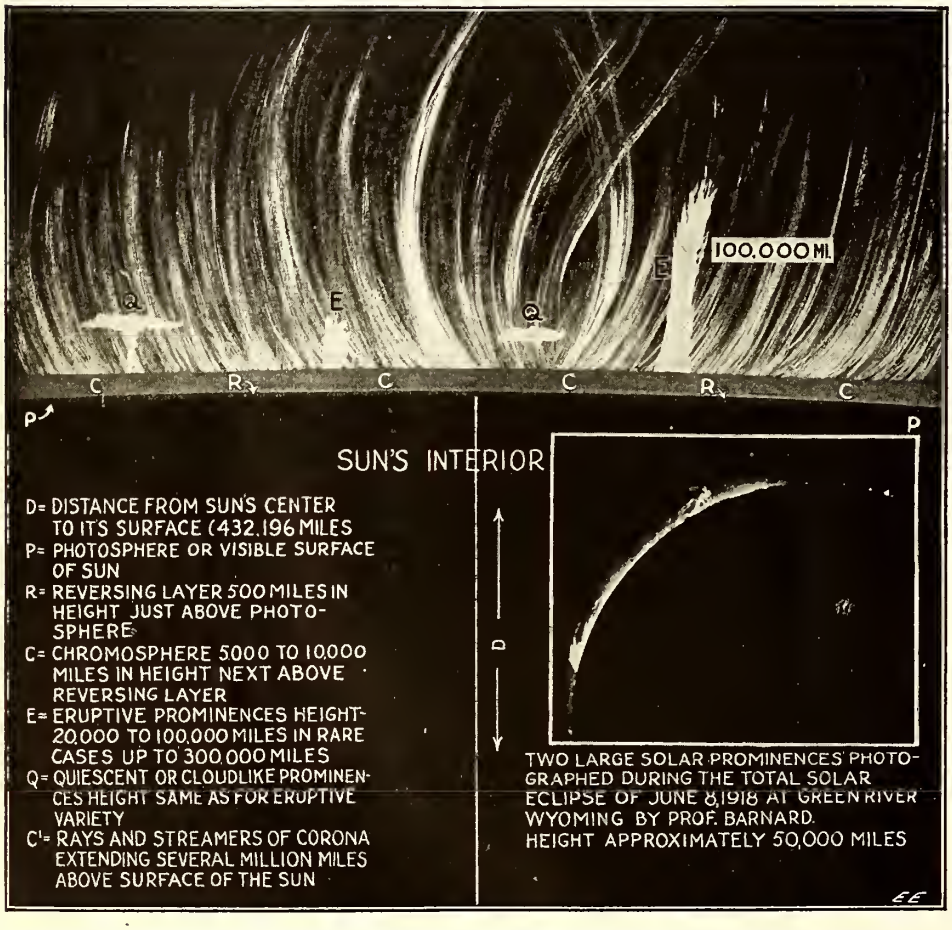
Of the U. S. Naval Observatory



The Surface of the Sun

SUN'S ENERGY UNEXPLAINED MYSTERY.

THE source of the radiant energy of the sun is one of the unexplainable mysteries of the universe. For millions of years the sun has been pouring forth its light- and heat-giving rays at a most prodigal rate without the slightest sign of decreasing strength.

As seen from the sun, the earth is not much more than a point on the celestial sphere, appearing very much as one of the nearer planets, Venus or Mars, does to us.

The amount of the solar energy that is intercepted by the earth must be, therefore, almost infinitesimal compared with the total amount poured forth from the surface of the sun. It has been estimated, in fact, that all the planets together receive less than one one hundred millionth (1/100,000,000) of the total radiant energy of the sun in the form of light and heat, the remainder passing on to the stars beyond at the rate of 186,000 miles per second.

Yet the almost inappreciable amount of energy that our own little planet Earth receives from the sun as compared with the total output is, in reality, *one and a half horsepower per square yard,* or 230,000,000,000,000 horsepower for the whole earth!

It is this seemingly inexhaustible supply of energy that is behind all forms of terrestrial life and activity and if it should fail us the earth would become a barren and lifeless planet in less than one year.

7000° CENTIGRADE.

The surface temperature of the sun is, according to Abbot, at least 6,000°, and may be as high as 7,000°, absolute centigrade, which is 3,000° hotter than the hottest terrestrial source, the electric arc, which is considered to be at a temperature of 4,000° C.

Since all terrestrial elements vaporize in the electric arc, it is concluded that no known element could exist at the surface of the sun except in a gaseous condition. As to the condition of the sun's interior, whether it is entirely gaseous or partly fluid, there is some doubt. The low density of the sun, only one and four-tenths the density of water, precludes a solid interior, and it is now generally considered that the sun is entirely gaseous thruout, tho the tremendous pressure and temperature that must exist far beneath the upper radiating gaseous strata of the sun may produce changes in the elements beyond human comprehension and understanding. *It is even possible that the continual and mysterious replenishing of the solar energy that is poured forth so extravagantly may be brought about by a breaking down of the atoms within the sun's interior and a release of all the sub-atomic energies in a manner analagous to the action of radio-active substances.*

Since we cannot reproduce terrestrially the abnormal conditions of temperature and pressure existing within the sun's interior, we can only speculate as to the nature of the forces at work therein.

When we consider the surface of the sun, however, we are more in a position to understand and interpret correctly the evidence that is furnished us in abundance and in the greatest detail and an understanding of the nature of the forces at work at the surface of the sun and in its enveloping atmosphere may lead later to an explanation of the forces at work far beneath.

THE PHOTOSPHERE.

The visible surface of the sun is spoken of as the *photosphere.* Even the smallest telescopes will show its peculiar "rice-grain" structure, consisting of intensely brilliant flecks or nodules about 500 miles in diameter, which are resolvable by the higher power telescopes into smaller elements averaging 100 miles in diameter, against a darker background. It has been estimated that these bright nodules or rice-grains occupy only one-fifth of the total surface of the sun, yet radiate three-fourths of the total light.

Most astronomers believe that the "rice grains" are the summits of highly heated columns of gas, convection currents arising from the sun's interior, and that the darker portions between are due to cooler descending currents.

It is well known that the photosphere or visible surface of the sun appears to be much brighter in the center of the disk than near its circumference. This is due entirely to its gaseous nature and to the fact that it is surrounded by an atmosphere of dense enveloping cooler gases. Rays from the center of the disk travel a shorter distance thru the sun's atmosphere than the rays from the rim and therefore suffer less absorption by surrounding gases. We look further down into the sun's interior near the center of the disk than in the direction of its circumference.

The photosphere is the region where sun spots appear and they are found in zones extending from 8° to 35° on either side of the solar equator, never appearing exactly at the equator or near the poles.

SUN-SPOTS ARE SOLAR CYCLONES.

The disturbances that produce sun-spots and many allied phenomena occur cyclically in periods of approximately eleven years. The first outburst of the disturbance is manifest in the appearance of sun-spots in high solar latitudes. These break out and disappear and break out again with increased vigor, working gradually downward toward the solar equator. The maximum spottedness for a given period occurring in latitude about 16°. The disturbance finally dies out within 8° or 10° of the equator, but even before one cycle of disturbance has entirely passed away a new cycle has broken forth in high latitudes. So during the period of minimum spottedness there are four distinct belts, two in low latitudes, due to the dying disturbance, and two in high latitudes, due to the new disturbance. At sun-spot maximums there are two well-marked zones of great intensity, approximately 16° north and south of the sun's equator.

Sun-spots are solar cyclones, occurring usually in groups, tho large single spots appear less frequently. Each spot is quite sharply divided into an umbra* and a penumbra.† The umbra is the darker central portion, the funnel of the whirling cyclone, and the penumbra is composed of the outspreading gases. The peculiar "thatch-straw" structure of the penumbra is due, it is believed, to the fact that the

* The dark central part of a sun-spot.
† The boundary of light and shade of a sun-spot.

www.americanradiohistory.com

columns of gases that usually rise vertically from the sun's interior and from the "rice grains" of the photosphere are drawn into a horizontal position in the penumbral regions of a sun-spot and therefore we get a longitudinal rather than a cross sectional view of them.

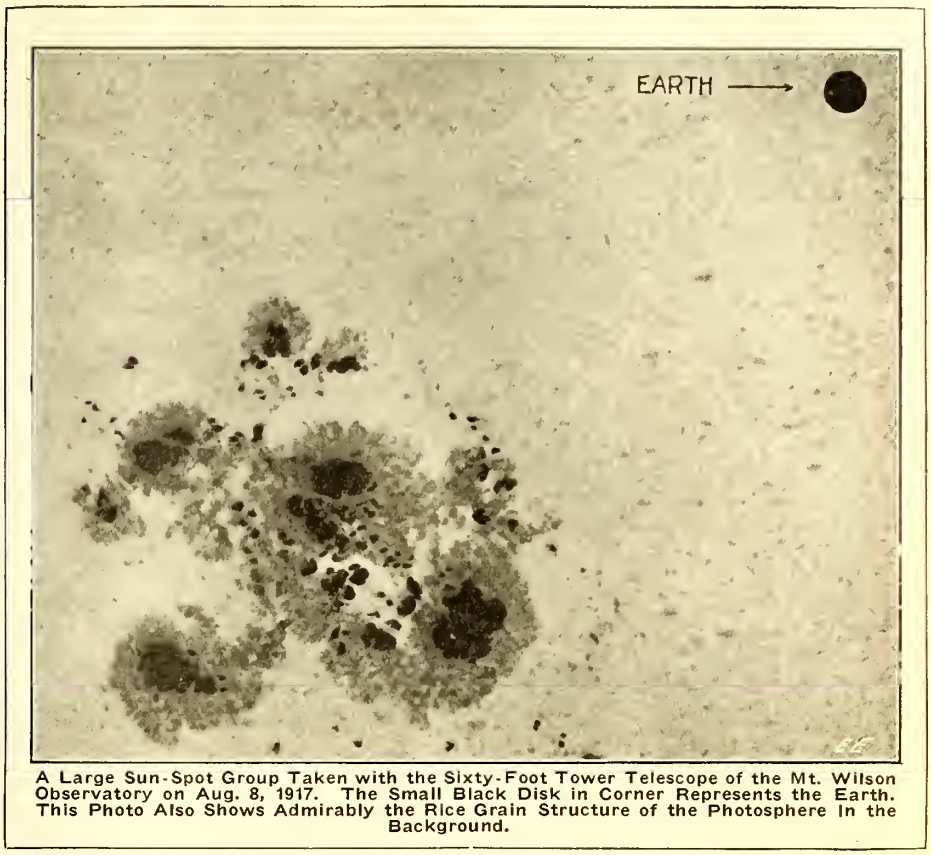
The umbra of a sun-spot is anywhere from a few hundred miles to fifty thousand miles in diameter, frequently exceeding the earth in size, while the penumbra occasionally reaches a diameter of two hundred thousand miles.

The darkness of sun-spots is only relative to their more brilliant background. Owing to the rapid expansion and cooling of gases the temperature existing in sun-spot regions is far below the normal solar temperature and lies between 3,000° and 4,000° C. At this temperature it is possible for the more refractory chemical compounds to form, the oxides and the hydrides, and the spectra of sun-spots reveal the presence of titanium oxide and magnesium and calcium hydride. At the higher solar temperatures prevailing elsewhere over the photosphere and in its overlying gaseous envelopes all chemical elements occur in a free state, intermingling as incandescent vapors without the formation of any chemical compounds.

Strong magnetic fields exist in sun-spot regions and the sun-spot cycle is attended by marked magnetic changes, not only on the sun, but in the earth's atmosphere as well.

THE SUN'S RADIATIONS.

A most interesting discovery has been made in recent years in regard to the nature of the radiations of the sun. It has been found as a result of continuous measurements of the value of the constant of solar radiation by the observers of the astrophysical observatory of the Smithsonian Institute that the sun's radiations are variable with a two-fold period. One of these has a range of about three per cent during the sun-spot cycle, and the second is an irregular variation with a period of several days, weeks or months and a range that is usually about three per cent, but occasionally runs as high as seven or ten per cent.

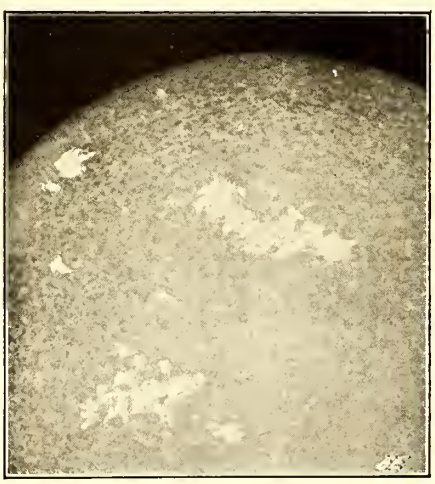


These variations in the solar radiation are considered very important and are now receiving considerable attention since they appear to be attended by appreciable changes in the earth's temperature and weather conditions.

The Smithsonian Institute hopes to establish in the near future a number of stations in widely separated rainless districts of the globe for the purpose of obtaining more accurate determinations of these variations with a view also to making available data for the more accurate predictions of weather changes in various parts of the world.

THE MYSTERIOUS REVERSING LAYER.

Directly above the photosphere of the sun lies the "reversing layer," which is about five hundred miles in depth and is composed of the incandescent vapors of all the chemical elements that are known to exist in the sun, which are also the same familiar elements that exist on the earth. With the exception of coronium, the unknown element in the solar corona, there is no element in the sun that has not been found on our own planet.



The "reversing layer" receives its name from the fact that it reverses the solar spectrum. It produces the dark absorption lines found in the spectrum that serve to identify all the elements existing in the sun, and during the time immediately preceding and following a total eclipse of the sun it produces what is known as the flash spectrum. When the photosphere, which gives the bright continuous background of the solar spectrum, is concealed by the moon the normally dark lines of the reversing layer—dark only by contrast with the bright background—become momentarily intensely bright lines against a dark background. The flash spectrum only lasts a second or so, as the reversing layer itself is soon covered by the moon.

A Large Sun-Spot Group Taken with the Sixty-Foot Tower Telescope of the Mt. Wilson Observatory on Aug. 8, 1917. The Small Black Disk in Corner Represents the Earth. This Photo Also Shows Admirably the Rice Grain Structure of the Photosphere In the Background.

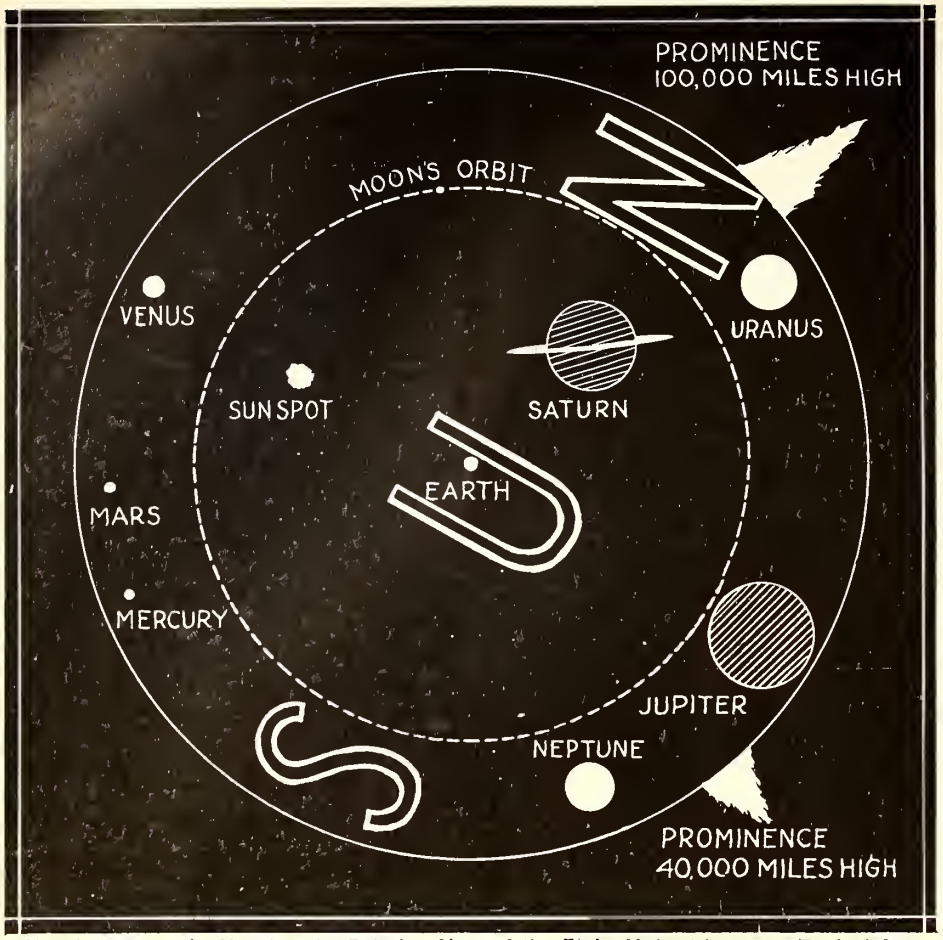
THE CHROMOSPHERE.

Just above the reversing layer lies the *chromosphere*, which is between five thousand and ten thousand miles in depth. Many of the gaseous vapors of the reversing layer are found in the chromosphere, thrown there continually by the vast upheavals of gases that are constantly disturbing the surface of the sun. The greater the solar activity the more is the chromosphere charged with the vapors of the lower strata of the sun's atmosphere. The gases that are most characteristic of the chromosphere, however, are the incandescent gases of hydrogen and calcium, which give it the pink or reddish tinge so noticeable during total solar eclipse. Helium is also found in great abundance in the solar chromosphere.

This Photograph Shows the Distribution of Calcium Over the Surface of the Sun. It was Taken with the Spectro-Heliograph, an Instrument for Photographing the Sun in the Light of a Single Spectral Ray. The Brilliant White Patches Are Intensely Hot Clouds of Incandescent Calcium Vapor, Referred to as "Calcium Flocculi," Surrounding Sun Spots. The Flocculi Show the Same Peculiar Mottlings or Rice Grain Structure that Is Visible in the Photosphere.

Rising from the photosphere with the tremendous velocity of 100 or more miles per second, it can be seen at all times by properly screening off the light from the photosphere the vast solar eruptions known as the *prominences*. These are composed chiefly of hydrogen, tho other elements also appear, especially near the bases of the prominences. They are of two varieties, the quiescent, or cloud-like prominences, that float high above the solar surface for days at a time in some instances, and resemble terrestrial clouds in form, and the eruptive, or metallic prominences, that dart up from the surface of the sun in an infinite variety of forms that may be entirely changed in the short interval of fifteen or twenty minutes.

PROMINENCES 300,000 MILES HIGH.



These eruptive prominences usually attain heights of thirty or forty thousand miles on the average, but *exceptional prominences reach heights of more than one hundred thousand miles and in a few rare cases have reached elevations of nearly three hundred thousand miles, or one-third of the solar diameter.*

They are one of the most spectacular and beautiful of all solar phenomena, only second in interest to the solar corona, which is the outermost of all the solar envelopes and also the most tenuous. The extent of the corona is enormous. Its outer streamers extend usually to distances of several million miles from the center of the sun. Measurements of the coronal light during total eclipses of the sun have shown that its intensity is only about one-half that of full moonlight, and it seems almost impossible to devise methods for detecting it, except during total eclipses, on account of this extreme faintness of its light. Experiments along this line are now being undertaken by means of the photo-electric cell, however, and astronomers have not yet given up all hope of detecting the corona in full daylight.

SUN'S CORONA OF ELECTRICAL NATURE.

The corona is largely electrical in its

www.americanradiohistory.com

Sketch Diagram 2—Showing the Relative Sizes of the Eight Major Planets, a Typical Sun-Spot and the Visible Surface of the Sun with Prominence at Edge. (The Planets Appear Projected Against the Disk of the Sun.) The Earth Marks the Position of the Center of the Sun's Disk.

nature, but it shines also partly by reflected sunlight from widely separated particles of matter and partly by light of incandescence, as well as by electrical excitations. The nature of the unknown element coronium has not yet been determined, but its wave length was accurately measured during the eclipse of June 8, 1918, as well as the positions of several other unknown lines in the coronal spectrum, which will greatly aid in their future identification.

The relations existing between the sun-spot cycle and the change in the form of the corona, which is very pronounced, is not yet clearly understood.

The sun, it is now known, is in the midst of a strong magnetic field. Also strong magnetic fields exist in sun-spot regions and the cycle of sun-spot change is attended by marked changes in many forms of solar activity. The frequency of eruptive prominences, the brightness and form of the corona, magnetic storms and weather changes on the earth are all closely associated with the sun-spot cycle.

The cause of this sun-spot cycle, with all the attendant changes in the general solar activity, and the source of the radiant energy of the sun still remain the two chief unsolved secrets of the sun.

QUESTIONS AND ANSWERS.

Question 1. How much would a man weigh on one of the smaller asteroids?

Answer. Most of the asteroids are simply huge mountains of irregular shape but assuming that the average asteroid is approximately spherical in form and ten miles in diameter its surface gravity equals its mass divided by its radius squared, or $g^1 = \frac{m^1}{r^{1\,2}}$ in which all quantities are expressed in terms of the corresponding quantities for the earth.

To find the asteroid's mass m^1 in terms of the earth's mass its volume, in terms of the earth's volume, is multiplied by its density in terms of the earth's density.

It is generally believed that the density of the asteroids is approximately the same as the density of the moon or six-tenths of the earth's density, therefore

$$m^1 = .6v^1 = .6\left(\frac{5}{4000}\right)^3 \qquad \left(\frac{5}{4000} = r^1 \text{ is}\right.$$

radius of asteroid in terms of earth's radius) and $g^1 = \frac{.6v^1}{r^{1\,2}} = \frac{3}{4000}$

in which g^1 is the asteroid's surface gravity expressed in terms of the earth's surface gravity.

If a man weighs 160 pounds on the earth he would therefore weigh three four-thousandths of 160 pounds on an asteroid ten miles in diameter—*or about two ounces.*

It can also be shown that if he should throw a stone from his hand with a velocity exceeding three feet a second it would never return to the asteroid but would revolve around the sun in an orbit of its own.

Question 2. Will you please explain what the "celestial sphere" is? Why do astronomers refer repeatedly to the "celestial sphere" and yet say that the form of the star system is flattened in the direction of one plane—the Milky Way—and may be a spiral?

Answer 2. The celestial sphere does not actually exist. For convenience in computing the relative positions of all celestial objects such as the sun, moon, planets and stars it is customary to consider that the earth is at the center of a sphere of infinite radius and that the positions of the heavenly bodies are projected upon the surface of this sphere.

The celestial equator, for instance, is simply the intersection of the earth's equator with this imaginary celestial sphere and the Right Ascensions and Declinations of the stars give their positions on this celestial sphere with reference to the celestial equator just as longitude and latitude on the earth give the position of some terrestrial point with reference to the earth's equator.

The ecliptic is the intersection of the plane of the earth's orbit with this imaginary celestial sphere of infinite radius.

The problems of astrophysics dealing with the nature and form of the visible universe are associated with the *actual* relative positions and motions of the heavenly bodies thru space and not with their projected positions upon the celestial sphere of infinite radius.

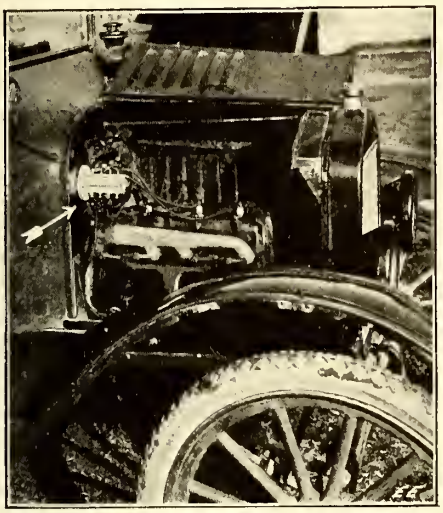
Question 3. Are sun spots holes in the surface of the sun thru which one sees into the sun's interior? I have seen this view expressed in some text book.

Answer. No. This view was held by some astronomers fifty years or so ago but it is now known to be erroneous.

Sun spots are solar storms or cyclones of a periodic nature with periods of maximum and minimum frequency of appearance. Highly heated gaseous material rises from within the sun to its surface in cyclonic whirls and spreads out over the solar surface, cooling rapidly by expansion. Into the vortex of this whirl are drawn down overlying gases, chiefly of hydrogen and calcium. The darkness of sun spots is due to the fact that the rapid expansion and cooling of the gases in these regions lowers the temperature in sun spots far below the temperature of the normal solar surface and they therefore appear dark in contrast to the more highly heated neighboring surface.

WHAT THE SUN DOES.

It is estimated that the earth receives every second from the sun enough heat to raise 600,000,000 tons of ice water to the boiling point, or to melt 480,000,000 tons of ice without change in temperature. If this is the amount that the earth receives, think of the amount that must be passing off into space and other planets. This amount has been computed to be 2,200,000,000 times as great as that which the earth receives.



An Exceptionally Large Solar Prominence, 280,000 Miles High, Mar. 25, 1893, by Yerkes Observatory.

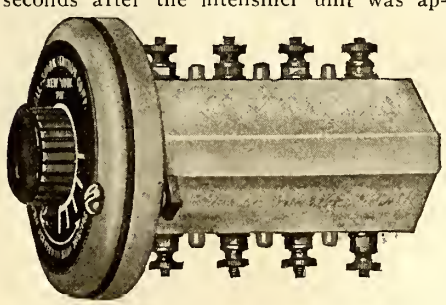
. . . AUTOMOBILE NEWS . . .

A NEW IGNITION ALL-SPARK DEVICE.

There is a new device in the auto world that does some remarkable things, according to its makers.



Ford and Other Four Cylinder Cars and Trucks Can Be Improved for All Around Running by the Addition of This New Spark Intensifier Indicated by the Arrow.

The object of this device is to eliminate all spark-plug troubles on Fords and other four-cylinder cars and trucks, and prevent the constant cleaning and buying of new spark plugs.

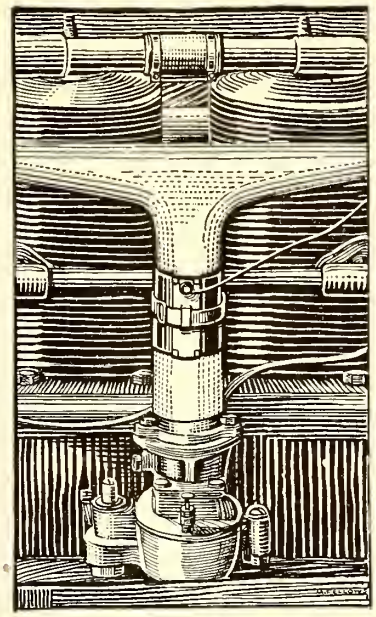
The most important feature is that it will not be necessary to change plugs on trips—when you want to get somewhere in a hurry, or it is raining and cold—in the middle of the night.

The device can be attached quickly, and only needs an extra set of plug wires run to it; it is placed on the dash panel, as the illustration shows. This device, which may be attached to the dashboard or any convenient place on any car, is really a *spark intensifier*. The device is so designed that the secondary current passing thru it is increased in voltage to such an extent that it will leap across practically any ordinary spark gap.

A great number of government tests were made with this unit installed upon government trucks as well as upon Ford automobiles. The illustration shows this device installed upon a Ford car. The plugs had previously been discarded as worthless, yet by the use of the new spark intensifier unit, the engine functioned perfectly. Shortly after this test a second was conducted in which the crankcase was filled with 23 quarts of oil. Without the unit the engine was run until all the plugs were sooted to such an extent that except for one cylinder, they ceased to fire. Within a few seconds after the intensifier unit was applied, however, the engine functioned properly and continued to do so until the oil in the crankcase fell back to its normal amount.

Close-up of the New All-Spark Intensifier for Four Cylinder Cars—Government Tests Have Shown Its Distinct Efficacy.

ELECTRIC INTAKE HEATER ENDS STARTING TROUBLES.



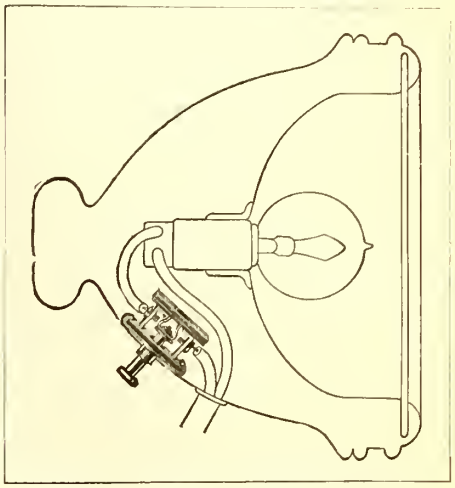
An electric intake heater is the simplest, most logical and surest device offered to automobile owners to assure easy starting of the motor in cold weather. It heats the intake manifold or carburetor by means of an *electric resistance coil*. This heats the air in the pipe and when the throttle is opened the gasoline mixes with the warm air, giving a vapor which ignites immediately.

This electric intake heater will start a motor in *one minute on the coldest day*.

This device can be installed by anyone. It consists of a resistance coil confined in a brass shell which is attached to a brass strap. It is operated from the storage battery by means of an electric wire and is controlled by a button on the dash.

In one minute or less, it heats the intake pipe or carburetor sufficiently to provide a highly combustible mixture which ignites instantly when the motor is turned over. This heater not only makes starting easy, no matter how long the car has stood in the cold, but it overcomes the disadvantage of priming with raw gasoline.

The device also reduces carbon, and most important of all, it saves the battery, as it uses only the same amount of current as the head and tail lights. The intake heater is made for both 6 and 12 volt batteries, single or double wiring system, and can be made to fit any car.

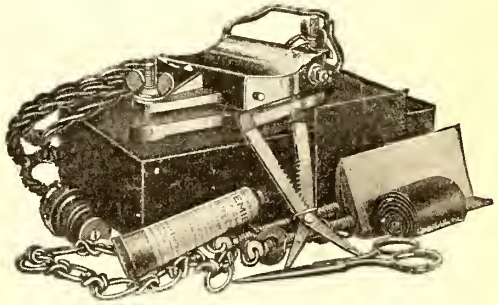


This New Electric Intake Heater Is Claimed to Start the Motor in One Minute on the Coldest Day. It Works on Batteries.

THIS SPOTLIGHT HAS SWITCH.

One of the new developments in auto specialties is a push-and-pull spotlight switch, made for mounting within the shell of a spotlight. Many years' experience in making switches for the automobile trade has proven that such a switch must have large *wiping* contact surfaces to prevent excessive contact resistance, and that the contactor must *float* on the operating shaft, so that vibration and side strain on the button will not cause the lights to flicker.

The insulating parts are made of fiber, the frame of stamped steel, the contacts of brass, and the contactor of phosphor bronze. These parts are riveted together into one solid unit which does not loosen or change alignment when subjected to vibration or strain. The mechanism is not enclosed because this switch is installed inside of the spotlight shell with the button protruding. Either rivets or machine screws can be used to fasten the switch to the shell. No plate is required; drilling one hole the size of the button and two for the rivets or screws permits mounting the switch as shown in the accompanying illustration.



Showing New Electric Spotlight Switch Mounted in Shell of Spotlight, and Wiring Connections.

ELECTRIC VULCANIZER WORKS ON CAR BATTERY.

Never let the little cuts or sand blisters on your tires develop into blowouts. Use an electric vulcanizer like the type here illustrated and repair them. Clean the cut, fill in Para rubber according to directions, apply the vulcanizer and press the red button.

When complete vulcanization takes place, the button automatically "pops" out and the device then cools off. It represents a distinct advance for the motorist in caring for his tire troubles.

This handy little electric vulcanizer, which can be used on casings and tubes, is claimed to be absolutely automatic in operation and connects to battery or lighting circuit. These vulcanizers are furnished to operate either from 110-volt lighting circuit or storage batteries. The standard voltages of the latter type are 6-12-18-30 volts, and when operated direct off the storage battery on your car are positively guaranteed not to damage the battery in the least nor to interfere with its efficiency for starting, lighting or ignition. The 110-volt type will operate from both alternating and direct current. A smaller model of this vulcanizer is made by the same concern which is adapted to repairing tubes only.

Efficient Electric Vulcanizer for Casings and Tubes—It Operates on 110 Volts or Batteries When so Specified.

www.americanradiohistory.com

Legless—He Drives Auto Skilfully

SHOULD you ever be wandering in the streets of New York, or any other large city in the United States, and come across an immense crowd, larger than any ever gathering around an automobile with punctured tires or engine trouble, you will know that the owner of this auto is Mr. Fred Hammel, America's greatest "legless" traveler and autoist. At first one sees absolutely no reason for an immense gathering at a stalled auto. But upon closer inspection it is apparent that even more people might sensibly be gathered there, for Fred Hammel is a cripple. But there is nothing unique in cripples. One sees hundreds of them on the streets of our big cities every day. There is, however, something very unique in Mr. Hammel's skill. His inventive ability coupled with ingenuity have enabled him to build a device by which he can control his automobile, even tho legless from the knees down. To watch him make repairs on the road is a wonderful sight. It seems as tho Dame Nature endowed him with some supernatural ability, inasmuch as he uses his two short legs and his hands, climbing about on all fours with greater ability than we can use our hands and legs. He scrambles over the machine, up at the top of the roof and down again, with the agility of a cat, never missing his foothold or slipping, and at times it seems as tho he is flying in pursuit of his troubles.

A "joy-ride" with him is all that the word implies—and then some. The writer had the opportunity of making a trip thru the crowded streets of New York, across the Brooklyn Bridge to South Brooklyn and back again, being stopt by traffic cops at almost every street crossing, and starting out among the first of those who dart out immediately after the traffic director's whistle blows. Occasionally, some poor fool would step out in front of the machine, and then it seemed as tho one's heart were in his throat, either to swallow it again, or—. But Fred lets his hand glide to the brake lever on his car with absolute calmness, and exerting a slight pressure on this lever causes the car to be brought up to within a few feet of the passer-by. One would think that fifteen or twenty minutes of this kind of excitement would inure one to it. However, this was not the case. Shooting across the Broklyn Bridge at about 45 miles an hour on a down-grade, we suddenly loomed upon an Army truck. Unfortunately, some individuals were working in front of this gigantic truck, when the chauffeur of the truck noticed them almost too late, and jammed on his emergency brakes. About forty feet behind we were sallying forth at 45, and you can just imagine how it must feel for a passenger to be riding on this auto, knowing the chauffeur to be handicapped inasmuch as he cannot apply his feet to the brakes. Again Mr. Hammel's coolness prevailed. With one hand going to the lever, and a pressure ever so gentle, as tho he did not care whether the machine stopt or not, we "fetched" up, so to speak, to within about *five inches* of the truck in front of us. I already saw a smashed radiator and myself being dashed off to the hospital—but not so. The brakes were loosened, and we were on our way again.

Now a word about the machine and its fittings. The photographs clearly depict the appliances used. The three hand levers are of his own design and construction, so adapted that each one controls a distinctive pedal. When it is desired to apply the brakes, it is only necessary to pull its respective hand lever. On the brake lever likewise is a button for the electric horn. On

(*Continued on page* 564)

Without Legs Fred Hammel Drives His Car About the Largest Cities With as Great a Certainty as Any Autoist Possest of All His Limbs. The Hand Levers and Electricity Do the Trick.

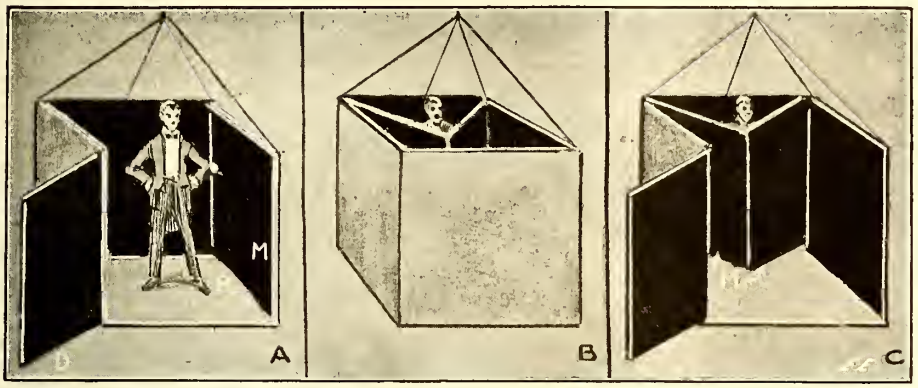
Electricity Steers Blind Man

When a young man of Seattle became blinded early in the summer of 1918 he at once set his inventive genius to work to develop an electric direction indicator which would enable him to get about without the use of a cane. As a result of his labors, he holds a patent on a device which not only enables him to get about without a cane, but one that has great possibilities as an aid to navigation on the seas or in the air or as a self-acting course indicator for timber cruisers, surveyors, explorers, prospectors and men who follow similar callings.

The device, as shown in the picture, is attached to the belt of the wearer. It contains two buzzers, wired to points which come in contact with the needle of a specially constructed compass when the wearer digresses from the set course, and indicates the direction to take.

The mechanism is composed of the compass and two buzzers. A signal is given when the wearer deviates from a set course. The signal is the result of a movement of the compass needle when it touches either of the two pins suspended from the cap of the compass, which closes a circuit and rings the buzzer on the side of the course on which the wearer is digressing.

(*Continued on page* 599)



The Electric Direction Indicator, Worn by Its Blind Inventor, Who Developed It to Enable Him to Get About Without a Cane. The Specially Constructed Compass Is Worn in Front. The Two Metal Projections, One on Each Side of the Compass, Are the Buzzers. Clasps at the Sides of the Belt Hold Two Triple Cell Batteries, Which Supply the Current for the Device.

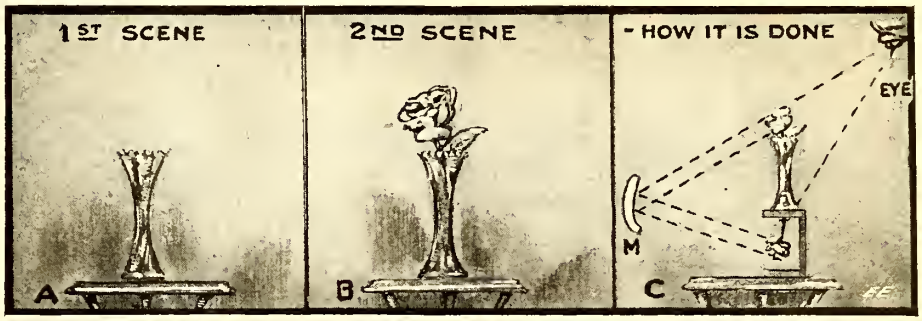
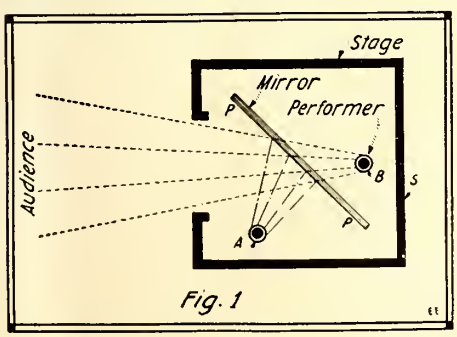
Experiments in Physics

By JOHN J. FURIA, A. M.
DEPARTMENT OF PHYSICS, N. Y. UNIVERSITY

3--Illusions



How the "Magic Cabinet" Trick Is Often Performed. First the Person Steps Into the Cabinet at A; the Door Is Closed and the Box Hoisted Up. The Person in the Cabinet Pulls the Two Hinged Mirrors "M" Together; Next the Door Is Opened and—Presto! the Man Has Disappeared—Apparently! Fig. 5.



THE optical type of illusion, which is the main type and most elaborate, can be divided into two general classes: (1) The virtual image class, and (2) the real image class. By a *virtual image* we mean an unreal image, one which is caught on a screen. The images we see in the ordinary mirror or "looking glass" are of this type. By a *real image* we mean an image which actually can be touched and caught on the screen. The stereopticon, magic lantern and motion picture machine images are real (caught on the screen). The image formed by a camera lens on the plate or film or ground glass is, of course, a real one. *The eye is capable of seeing both the real and the virtual images,* and this forms the basis of all optical illusions. A plane mirror, highly polished plate glass or other plane surface, always gives a *virtual image.* Because of the possibility of being able to see an actual object thru plate glass and semi-silvered glass, they are almost universally used for feature illusions on the stage.

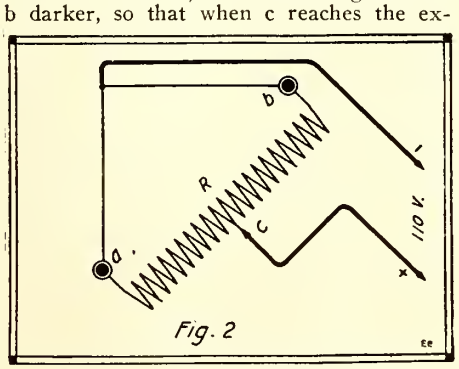


Figure 1 represents the top view of a simple theater stage and illustrates how eminent magicians like Kellar and Thurston made their transformations. The performer stood before the audience while the stage gradually dimmed, and brightened, and lo and behold, the smooth-faced performer changed before the eyes of the audience into a devil. The stage dimmed and brightened again, and the devil was transformed into a skeleton. Then, as an added attraction to the bald-headed first-rowites, the skeleton transformed into a scantily clad chorus girl or a bathing beauty. Finally the audience saw before it, bowing and smiling, in his full-dress suit —the performer. The effect on the audience was immense; the principle and *modus operandi* of the illusion is ridiculously simple. In figure 1, s are the walls of the stage draped in black velvet, p is a piece of highly polished plate glass perpendicular to the floor and arranged at an angle of 45° to the audience. The performer stands at B, in the direct view of the audience. His confederate stands in the wings at A, out of view of the audience. Since the stage is black, neither the performer nor the confederate will be visible *except when illuminated.* A and B are illuminated by a dimming device diagrammed in figure 2. R is a variable high resistance, a and b are lamps connected in parallel illuminating the performer and his confederate at A and B, respectively. As the variable contact is moved to the left, a becomes brighter and b darker, so that when c reaches the extreme left b is practically extinguished. Similarly, as c moves to the right, b becomes brighter and c extinguished. Referring to figure 1 again, when B is illuminated and A dark, the audience sees the performer directly thru the glass. When B becomes dark and A bright, B cannot be seen and A is seen by reflection from the polished surface of the plate glass. Thus as B becomes dark and A light, the performer disappears and changes into a devil (the confederate at A). In the meantime B, being invisible, the performer walks off the stage, makes up as a skeleton and returns to his position. As A is darkened and B brightened, the devil changes into a skeleton. This procedure is followed until finally the performer appears again before his audience to receive his applause. See figure 3.

Figure 4 illustrates the type of illusion making use of the 45° mirror. T represents a revolving table hidden behind the scenery s, P is a good quality mirror placed at an angle of 45° with the vertical. I is the reflected image of the person lying on the revolving table. The person appears suspended in mid-air. If the table is moved along the floor the person appears to move along in mid-air. If the table is revolved the person appears to spin around in mid-air as if pivoted thru his middle. If the person on the table moves his arms or feet the image suspended in mid-air appears to do this also. It is obvious that the person may be made to appear to be flying about, and by interposing a plate-glass tank of clear water in front of the tilted mirror the person appears to be swimming, eating, etc., in the tank of water without having to come up for air. All sorts of variations have been introduced in connection with this simple illusion.

The "Magic Flower Vase." Viewed From a Certain Angle You Apparently See a Flower in the Vase—Can Even Smell it! Advance and Examine the Vase—It's Empty! Figure "C" Explains the "Magic" Paraphernalia. Fig. 6.

How the Magician Changes Into a "Stage Devil" Before Your Very Eyes. His Image as Well as That of His Assistant Can Be Flashed Up Alternately, on the Glass Sheet PP. The Diagram, Fig. 2, Shows the "Dimmer" Used to Switch the Illumination from Image A to Image B, Gradually.

The disappearing cabinet or cage is another of the popular feature stage illusions using tilted mirrors. A man steps into cage or cabinet while the door is open. The cage or cabinet is hoisted up midway between the stage floor and the ceiling. The man shuts the door on himself. The cage or cabinet is let down within a few feet from the floor, the door is opened and the occupant is found missing. The door is closed again, the performer fires a smoky shot. The door is again opened and—presto! the occupant is again seen in the cabinet. One has but to refer to figure 5 to see how simple this illusion is. In figure 5-A P is the performer, M and M are mirrors tight against the sides, D is the door.

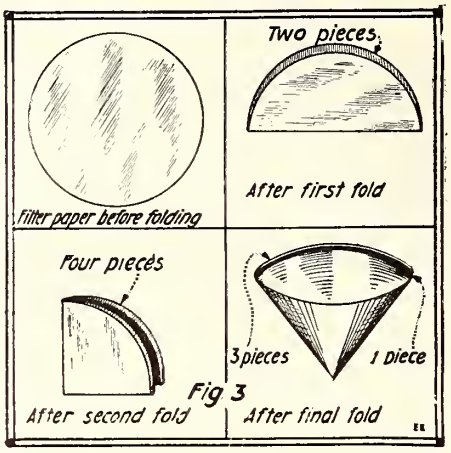
Practical Chemical Experiments

By ALBERT W. WILSDON

Composition of Fruits and Their Food Values.

AT this time of the year, fruits are utilized as a very important part of our daily foods and a little knowledge of their composition and value will not be superfluous. "Fruit" in the restricted sense, includes the pulpy substance enclosing the seeds of various plants, and especially those which are edible in the raw state.

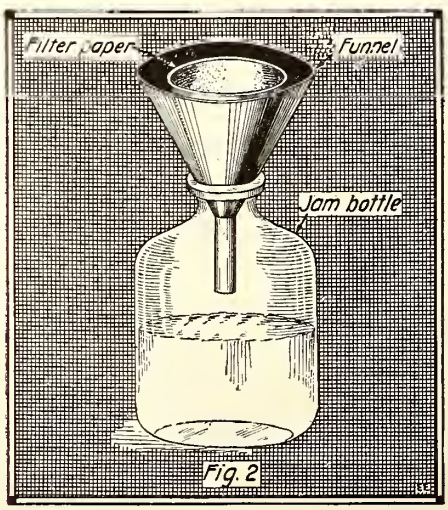
A *green* fruit does not differ very materially from the leaf in composition, but in the process of ripening, under the influence of sunlight, the fruit undergoes a remarkable change in color, texture, composition, and flavor. During this change period it ceases to act on air like a leaf, but to the contrary, *begins to absorb oxygen and liberate carbon dioxid gas.* As the process of ripening goes on, both the *invert sugar and the sucrose increase and the starch and free acid decrease.* Following the disappearance of the starch the sucrose disappears quite rapidly on account of its change to invert sugar. Malic acid appears to decrease, but this phenomenon is largely due to the fact that it is formed



This Form of Filtering Stand May Be Used for All Experiments Requiring Filtering. Fig. 2 Depicts a Convenient Method Which Is Adaptable in Every House.

in the early history of the fruit, and becomes diluted by its growth. It is supposed that while ripening the insoluble pectose changes into pectin and secondary substances of a gelatinous nature. The tannin that made the fruit astringent also disappears. *As the fruit becomes over-ripe, some of the sugar and acid is oxidized, and the fruit in consequence loses its agreeable flavor.* On cold storage this latter condition is deferred, owing to the low temperature, but a very short exposure to air, at ordinary temperature, causes the fruit not only to appear over-ripe, but to decay quite rapidly. Thruout the process of decay, which is assisted by fermentation, carbon dioxid and alcohol are at first formed from the sugar, and later the alcohol is oxidized to acetic acid, and finally in the decayed fruit the seed is set free, ready to start a new plant.

WHAT GIVES TASTES IN FRUITS.



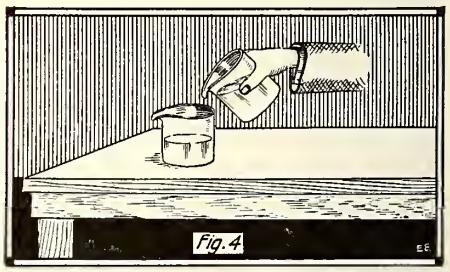
The agreeable tastes possest by fruits are due to the right proportions of the constituents mentioned in the foregoing test, and also to the compound ethers and essential oils which may be present. These flavoring substances are, many of them, present in such small quantities that they are not mentioned in the analysis. Some fruits

Notice that When Finished, the Paper Filter Will Be Conical in Shape and Will Have Three Folds on One Side and One on the Other.

which seem to "melt in the mouth" really do contain considerable soluble matter. It is a well-known fact that sugar disguises acids, and that an agreeable taste in preserved fruits is often due to a judicious mixture of the acid and the sweet. The most important nutritive material in fruits is in the carbohydrate group. Altho starch is present at cetrain stages of growth, sugar is the most abundant of the carbohydrates. This is usually invert sugar, but *apricots, pineapple, and apples contain also cane sugar.* This fact has an important bearing on the dietetic use of fruits, as invert sugar is, in some diseases, as diabetes, more easily assimilated than cane sugar.

The pectus bodies above referred to are not very well understood, but are supposed to be related to the carbohydrates. The insoluble glacto-araban is supposed to give the property of hardness to unripe fruits and vegetables, and is the basis of making jelly. The statement has been made that as the fruit becomes riper the pectose is changed by the action of acids into pectin, a vegetable jelly, which causes the juice, after boiling, to gelatinize when cooled. *This may be noticed in the juice that exudes in the baking of apples.* It is supposed that by boiling too long these

A Clean Ordinary Jam Bottle Will Be Found Efficient as a Filtering Stand When a Funnel Is Used Which Is Sufficiently Large to Rest on the Mouth of the Jam Bottle. If the Stem of the Funnel Is too Long It May Be Cut with a Triangular File.



pectous compounds are concentrated into a more soluble modification, and, if this is true, it may serve to explain the fact that sometimes fruit juices that have been boiled for a long time become thick and viscid, but do not form a true jelly. *A partially ripe fruit is better adapted to making* jelly than is one that is fully ripe.

From the foregoing it is evident that pectin bodies are substances of undetermined function very widely distributed in plant tissues. They occur both in soluble and insoluble forms.

In the studies of these bodies the most important problem appears to be the quantitative determination of the pectin bodies occurring in a given tissue, because such a method could be used to determine the function of the material in plants; whether for example, it is a reserve material, a by-product, is used for structural purposes, or has all three functions or two of them; whether the nature of the pectin body changes with the growth of the tissue, or possesses a practically constant composition; whether the pectin bodies obtained from the different sources are identical, are mixtures of the same substances in varying proportions, or are inherently different.

EXPERIMENTS.

Experiment No. 1. To the filtered apple

The Addition of the Various Reagents Mentioned Will Produce the Results Mentioned in the Text. If Possible, It Is Advisable to Use Either Beakers (Lipt) or, if Not Available, Ordinary Drinking Glasses Will Answer the Purpose. These Permit Easier Handling to Those Performing the Experiments.

juice of a ripe apple add an equal bulk of alcohol, and a gelatinous mass consisting largely of pectin will be precipitated. This may be dried, and it will be found that the powder thus obtained is soluble in cold water.

Experiment No. 2. Stew a handful of cranberries, filter the juice, and allow to stand till cold, when an abundant jelly is obtained.

Experiment No. 3. Test some green fruit, a persimmon or banana, for tannin by extracting the juice, filtering, and adding a small quantity of ferric chlorid. The production of a black, or greenish-black, color indicates tannin.

The acidity of fruits is due to the presence of the free acids, Malic, Citric, Tartaric, or their acid salts. They not only have an agreeable acid taste and serve as appetizers, but when oxidized in the body are converted into the corresponding carbonates, and these help to render the blood more alkalin and the urine less acid.

Experiment No. 4. Add to a solution of Malic acid, calcium chlorid, ammonium chlorid, and ammonium hydroxid in excess. There should be no precipitat, but upon adding to this three volumes of alcohol, calcium malate should separate out as a precipitat.

THE CONSTRUCTOR

Making a Machine for Telegraphing Pictures

PART II

By LEROY J. LEISHMAN
Expert in Telephotography

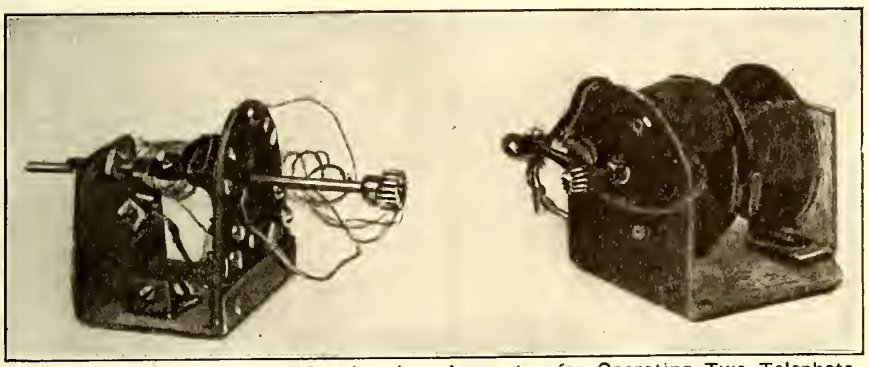

Fig. 3—A Simple Electrical Synchronizer Apparatus for Operating Two Telephotographic Machines. The Commutator of the Motor is Used at the Transmitter and the Motor at the Receiver.

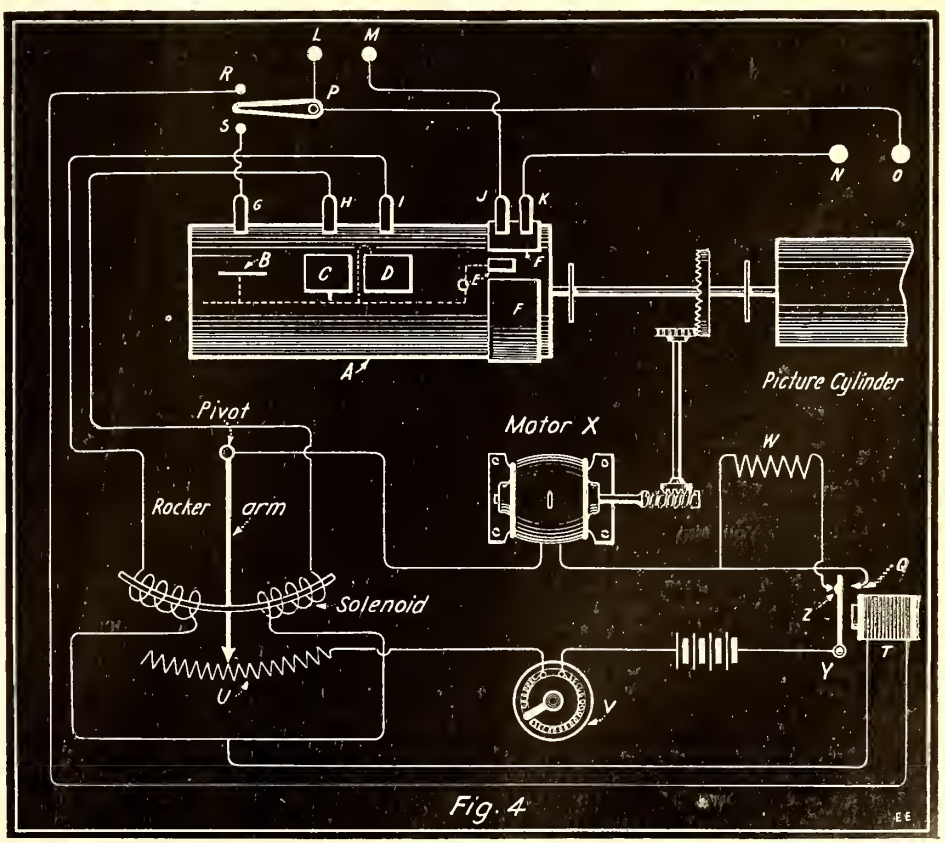
WE can use a rod connection, or one of several different electrical schemes which permit the machines to be operated at long distances away from each other. However, only two electrical synchronizers will be explained. The simplest and least fascinating way to synchronize the machines is by a rod connection H (Fig. 1), with the instruments only a few feet apart. A few rods, such as those used for shafts, can be connected with couplings and one machine placed at each end with the cylinder rods toward you. Make two or more supports for this connecting rod to hold it at the same height as the cylinder shafts, to which it runs at right angles. Place a crown gear I (Fig. 1) or K (Fig. 2) on each cylinder rod, with the teeth turned *toward* you on one machine and *away* from you on the other. Now slip an upright on both ends of the synchronizing rod and place a small gear J (Fig. 1) flush with each end to mesh with the crown gears.

Fix the uprights or supports in place so that the proper connection is maintained and so that both machines run together, regardless of which cylinder is turned. The machines may be operated by a crank attached to the end of one of the cylinder rods, or by a motor properly geared down.

The cylinders themselves must turn at about *one revolution in three seconds.* This may seem quite slow; but it must be remembered that this is a very inexpensive home-made set, and that T. Thorne Baker and Dr. Korn operate their cylinders at only one revolution in two seconds, and that the most delicate sets for one of my systems utilize drums operating as slow as a revolution in one second. Faster work can be done with some of my latest apparatus; but the system is far different from the one for which these machines are used, and the machines are too costly and complex for the average experimenter to build. So let us be content with one revolution in three seconds.

A Simple Electrical Synchronizer.



A simple electrical means for synchronizing the two machines utilizes a motor for one machine and its commutator for the other. (See Fig. 3.) The armature of the motor is separately excited and has but two poles; while the field has three poles connected in series, with the connections tapt between the magnets for the three wires which extend to the three segments of the commutator of the other machine. Two diametrically opposite brushes rotate against this commutator and cause the field to rotate in synchronism. The current can be supplied to the brushes by collector rings. As before mentioned, the armature of the motor is separately excited.

The shaft supporting the brushes must be geared (nothing but gearing will do) to the sending machine, and the motor must be geared *in exactly the same manner* to the receiving machine. The sending machine can be operated by hand or by a motor as desired, and the receiving machine will then operate in exact synchronism.

An Automatic Electrical Synchronizer.

The most interesting and ideal synchronizer of all requires no extra wires whatsoever. The principal part is a wooden or other non-conducting drum A (Fig. 4), the shaft of which is connected to the shaft of the cylinder upon which the pictures are sent and received. B is the edge of a piece of metal electrically connected with the shaft. C and D are pieces of graphite connected on opposite sides to metal strips

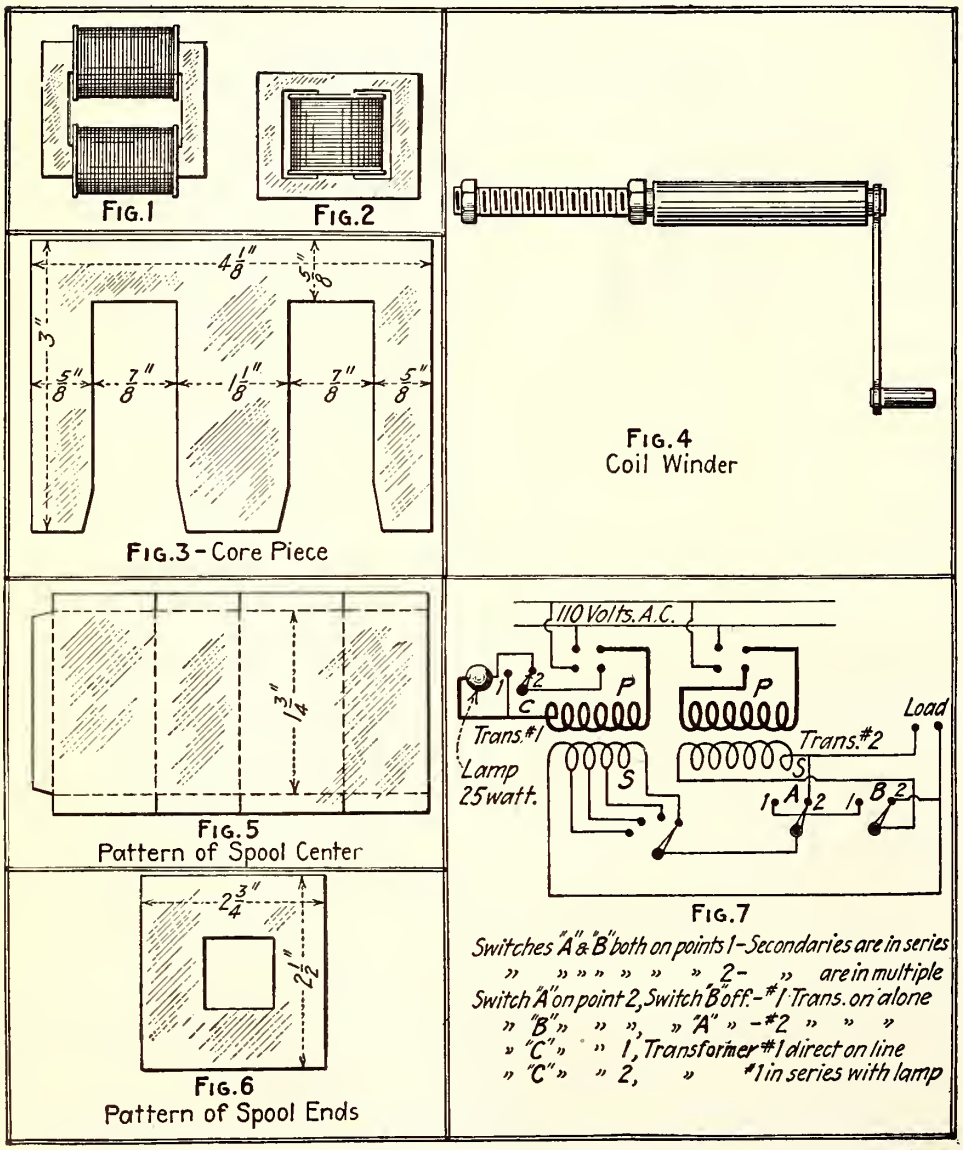
Building and Testing Small Transformers

By J. W. ESHNAUR

BUILDING a small transformer is not a difficult matter if you know the proper sizes and amounts of wire to use and the size and quantity of iron to put in the core. If you do not have this data at hand, you are pretty sure to meet with failure, and in the words of the funny paper ask, "How do they do it?"



The principal trouble in a small transformer is its tendency to heat *when under no load*. This is caused by losses in the core and Primary winding, the technicalities of which it is not necessary to go into here. Properly constructed, a transformer may remain on the line indefinitely under no load and will not heat. Under a load it will warm up slightly, but excepting on a *dead short* of the Secondary, it will not get dangerously hot.

SHELL AND CORE TYPES.

There are two general types of transformers in use, known as the core type and the shell type, shown respectively in Figs. 1 and 2. The shell type is the easiest to construct and probably the most satisfactory in every way for the Amateur, therefore I will deal with it only. The following instructions are for a transformer to deliver voltages ranging from 2 to 20 volts, but further on I will explain how you may vary the size so as to obtain any voltage you may desire.

BUILDING THE CORES.

First prepare the annealed sheet-iron core pieces. These are made from very soft, thin sheet iron (tin-can stock has been used), and are cut in the shape of the letter E, the dimensions being given in Fig. 3. It is best to make a pattern from some slightly heavier stock being careful to get all parts square and close to size. When the pattern is finished, lay it on the iron to be used for the core pieces and with a sharp scriber mark out a piece. Cut this out, using a sharp cold chisel to cut along the back of the piece between the tongues which cannot be reached with the tinsnips. Lay this piece on the pattern, first one way and then the other, and if the lines all coincide you are all right, if not file the pattern in the spots which are out and try again until the pattern and the core pieces line up pretty close. Now cut enough core pieces to make a pile 7/8" high when tightly comprest. Put all the pieces in a pile with the tongues all in one direction line them up as closely as possible and clamp the back of the E in the vise and file the inside edges smooth. Do the same with the end and middle tongues. You need not file the outside edges unless you so desire, as it is only a matter of looks whether they are smooth or not, but the inside must be quite true or you will have trouble in entering them into the spool.

Here's Something You Have Wanted for a Long Time—Data and Instructions for Building and Testing Small Transformers

WINDING THE COILS.

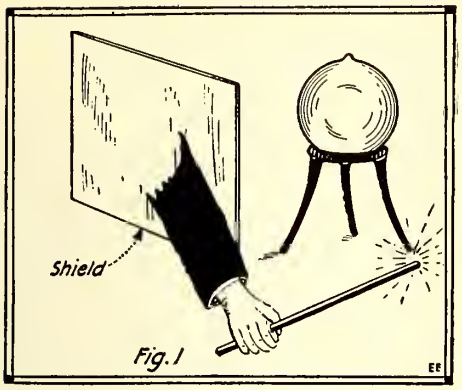
In order to wind the coils evenly, it is necessary to have some form of winding apparatus. If you have no lathe, you can easily make a winding machine as shown in Fig. 4. A 3/8" bolt about 10" long, with threads cut down about 6"; a piece of 1/4" pipe 1/2" longer than the width of your vise jaws, and a couple of 3/8" nuts are about all that is necessary. Saw the head off the bolt and put on a handle. Slip the pipe on the bolt and run one of the nuts down close to the end of the pipe, leaving just enough end play for the bolt to turn easily. Put the pipe in the vise and this part is ready. Now take a piece of wood, slightly larger in dimensions than the middle tongue of the core piece, and bore a 3/8" hole thru the center lengthwise. Then plane it down taking care to keep the sides as near parallel to the hole as possible, until it is 1/16" larger than the core or 15/16" x 1 3/16".

The spool is made from good, stiff cardboard. Lay out a piece as shown in Fig. 5. Cut on the (solid) lines and bend on the (dotted) lines. It is best to form this part of the spool right on the block you have just finished. The end pieces are shown in Fig. 6. Cut the hole in the center just large enough to fit snugly over the center form. Bend up the short ends and glue them in place. Place the completed spool on the block, slip the block on the spindle of the winding apparatus, lock it in place with a nut, and when the glue is dry you are ready to wind the coils.

THE SECONDARY WINDING.

The secondary winding is put on first. It consists of four layers of No. 18 enameled magnet wire with a tap taken off each layer. Punch a hole in one end of the spool, put the end of the wire thru about 4" and proceed to wind the wire on evenly until the first layer is complete. Cut the wire, leaving about 4" beyond the end of the layer. Punch a hole in the end of the spool and push the wire thru. Put the end of the wire remaining thru the same hole and solder the two together, just outside the spool. Cover the layer of wire on the spool with a layer of paper and wind on the second layer, taking a tap off at the end in the same manner as before, and so on to the end. Number each tap as you take them off and cover the completed secondary with several layers of paper, or, better still, with two layers of Empire cloth (oiled linen).

THE PRIMARY.



The primary consists of twelve or fourteen layers of No. 28 enameled or silk-covered magnet wire. Solder a piece of No. 18 wire to the end of the No. 28 wire, make a full turn of the No. 18 around the

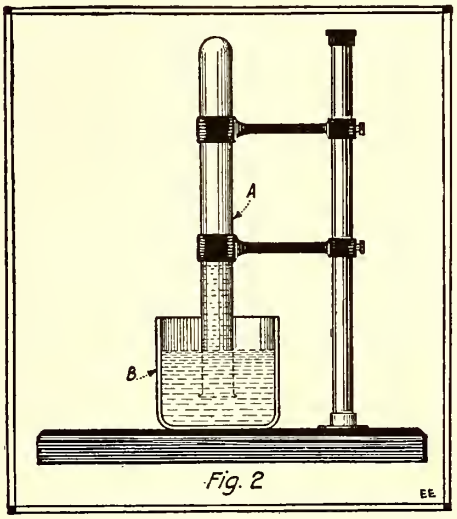
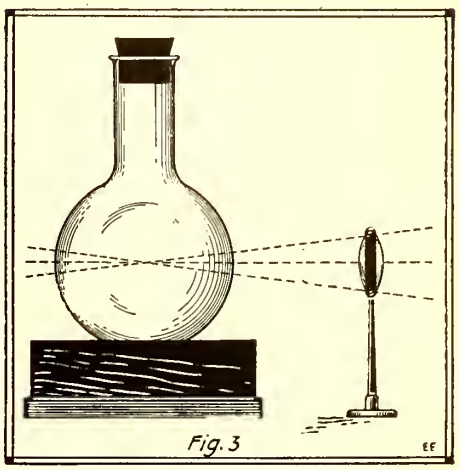
Explosions Caused by Light

By H. J. Gray



A Mixture of Chlorin and Hydrogen Gases, If Sealed up In a Glass Bulb, Will Combine In Diffused Light to Form Hydrochloric Acid Gas. Exposure to Direct Sunlight or Burning Magnesium Wire Ignites Forcibly the Gas so Formed.

THAT photographs are taken by virtue of the chemical properties of light is a fact that is familiar to everyone, and is indicated by the very word *photography*. But there are many other interesting examples of the action of light in promoting chemical action which have no bearing on the photographic art. Under the influence of the *actinic* rays in sunlight, and the light of magnesium, the electric lamp, etc., elements are made to combine and compounds are decomposed into their elements or broken down into simpler and more stable compounds, while certain of the chemical elements are converted into a different form or allotropic modification.



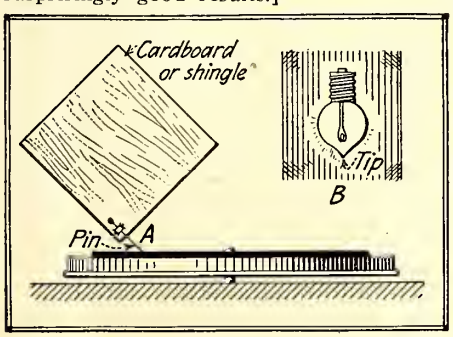
Octahedral sulfur (the form in which native sulfur crystallizes) can be readily dissolved in carbon disulfid. If such a solution is prepared and exposed to a beam of very strong light the clear liquid becomes turbid by formation of insoluble white amorphous sulfur. Yellow phosphorous is also altered by exposure to light.

If a mixture of chlorin and hydrogen gases is sealed up in a glass bulb and exposed to diffused daylight, the gases gradually combine to form hydrochloric acid gas, but the combination does not take place in the dark. Exposure to direct sunlight causes the gases to combine at once with an explosion that shatters the bulb. The same effect is produced by burning a piece of magnesium wire, as in Fig. 1, the experimenter being shielded by a suitable screen.

Another example of chemical synthesis brought about by the action of light is the combination of chlorin and marsh gas (or methan) to form methyl chlorid. Let a tall and wide glass tube, A, Fig. 2, be filled with strong brine and inverted over a vessel, B, containing the same solution, the tube being supported with its mouth beneath the surface of the liquid. One-third of the tube should be filled with chlorin by bubbling the gas thru the brine—in which it is much less soluble than in pure water—and then another third of marsh gas introduced in the same way. The tube must not be exposed to direct sunlight or the gases will combine with explosion but if left in diffused daylight for a few hours the liquid will be found to have risen in the tube which now contains only methyl chlorid. The hydrochloric acid produced at the same time will have been absorbed by the brine, and the resulting vapor will occupy only about one-third the original volume.

The Combination of Chlorin and Marsh Gas Under the Action of Diffused Light, Giving Methyl Chlorid, Which Explodes When Exposed to Direct Sunlight.

The Glass Vessel Contains Sulfur Dioxid Gas. A Strong Electric Light Beam Is Focust on It Thru the Lens Shown, Causing a Mist to Appear and Finally a Fog Which Fills the Bottle. Removing the Light, the Fog Disappears.



Examples of decomposition by light action are more numerous. Mercurous oxid has to be kept in the dark if required in a laboratory, because it is gradually decomposed by exposure to light, forming mercuric oxid and mercury. Many other metallic salts are similarly reduced by light, hence their use in photography. Those of silver and uranium are particularly sensitive. Glue or gelatine containing a little potassium bichromate is rendered insoluble and leathery by exposure to light, a property that is made use of for rendering glued joints watertight.

If a large clear glass flask is filled with sulfur dioxid gas and closed with a rubber stopper, a further experiment can be made if a strong electric light is available. The light should be concentrated by means of a lens, as shown in Fig. 3, and past thru the flask. In a few moments a mistiness will appear, and after a short time the vessel will appear to be filled with fog. This is caused by the decomposition of sulfur dioxid into sulfur trioxid and sulfur. Upon removing the strong light these products will soon reunite to form the original and invisible sulfur dioxid.

Novel Phonograph Reproducers

Procure a stiff piece of cardboard about 1 foot square and insert a needle into it so as to project from the corner of the cardboard in the fashion illustrated herewith. See Fig. A.

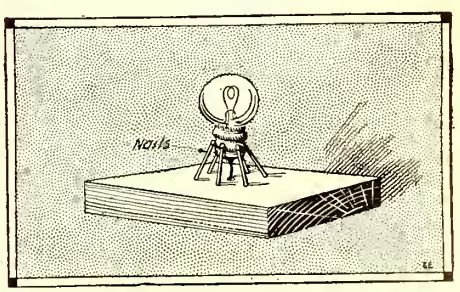
The projecting point is held on the revolving phonograph disc. Best results will be obtained if the cardboard reproducer be held in the fingers where the needle passes thru it. The music is surprisingly clear and can be heard at a distance of 30 feet. [Ed. Note: A wooden shingle gives surprisingly good results.]

Want Some Fun? Try One of These Phonograph Reproducers.

By simply placing the tip of an electric light bulb (see Fig. B) on the disc, the music can be heard about 1 foot away.

Contributed by RUSSELL H. ANDERS.

A SILENT ALARM CLOCK.



About the most gentle way in which to awaken a person is by the rays of the sun falling on the sleeper. This principle is incorporated in the silent alarm proposed herewith. A nitrogen tungsten lamp of high wattage is mounted within a reflector which is in turn mounted on either the headboard or footboard of the bedstead in an adjustable manner so that the light rays may be focust upon the pillow. This light is controlled by a time-switch or suitable alarm clock arrangement to turn the current on at a predetermined time; the circuit should be opened by a switch located at a point distant from the bed. It is also advised that a good lens be used to increase the strength of beam if necessary. After one is awakened, the flood of light will render the chance of dropping off into further slumber improbable, and you will be persuaded to rise and "douse the glim."

A Shoe-Nail Receptacle

First procure seven old shoe-nails an inch or so long and a piece of board. Drive six of the nails into the board in the form of a circle, ¾ inch in diameter. In the center of this circle drive the remaining nail, leaving all 7 nails protruding at least ½ inch. Next bend the six nails toward the central one until they will clamp a miniature base lamp. Drive the center nail down until, with the bulb in the improvised clamp, the base will just touch the center nail.

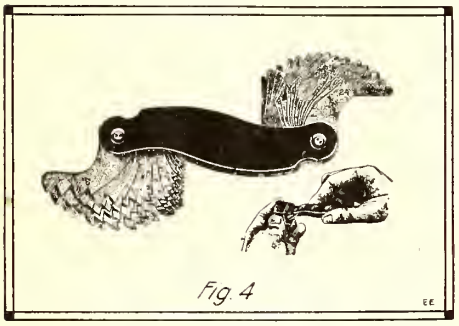
Experimental Mechanics



By SAMUEL D. COHEN

LESSON XV

IN the earlier lessons of this Course, the subject of "thread-cutting" was taken fully under discussion; the same being applied, however, to threads cut by means of the lathe only. The lathe is by no means the only method by which threads can be cut, either internally or externally. The most common method of cutting threads in metal or any other materials is by the application of taps and dies. The latter being used for cutting external threads, while the former are used for cutting internal threads.

There are various types of taps and dies that can be used for this work, and these depending upon the character of the work in which the threads are to be cut. The most common thread as obtained from a tap are those of the 60 degree "V" variety. This type of thread is the most commonly used and for this reason it is recommended for the novice. Taps and dies are most easily procured and you will find that very little effort is imposed upon the user of the tool in obtaining an accurately cut thread.

There are three principal types of *taps*, namely:—the *taper*, *plug* and *bottoming*. These three taps are indicated in Figure 1. The *tapering* tap being used for starting the thread, the *plug* tap being used for smoothing the starting thread obtained

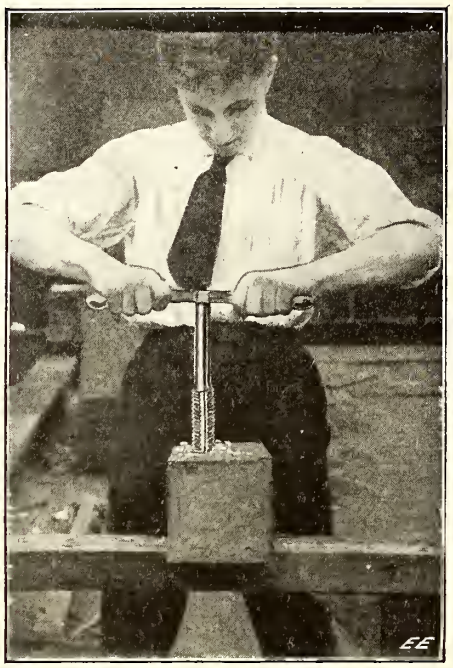
To Ascertain the Pitch of the Thread on a Bolt or Nut, a "Thread Gage" of the Type Shown Here is Usually Employed.

by the taper type, and lastly, in finishing a thread, the *bottoming* tap is employed. The latter tap is also used in places where the depth of the hole is limited and it is desired to produce a sharp V-thread in said hole.

The difficulty encountered in attempting to use the bottoming tap first is that it is difficult for the body of the tap to grip the metal. This can be avoided by slightly chamfering the hole and applying a sudden twist on the tap. (See photo Fig. 3.) Should the hole wherein the thread is to be formed be long enough, it is then recommended at all times to use at least the plug tap as a starter, and not a bottoming tap.

It is strongly urged at all times when using a tap that plenty of oil shall be applied to the working surface. Standard commercial machine oil will serve the purpose. In brass, especially when tapping large holes, soluble oil should be applied.

Taps are usually held in *tap wrenches* as indicated in Figure 2. Do not use monkey wrenches or tools that have an L-shaped handle in operating a tap. This is an important rule to be remembered, as when using the latter type handle it is difficult to start the tap into the metal into which the thread is to be cut at exact right-angles to the tap. Often the tap is broken when utilizing such a tool. It is thus clearly seen



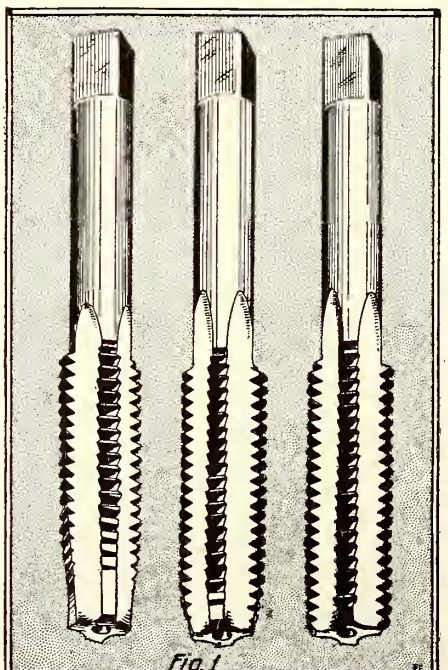


Fig. 3.—Don't Try to Run a Tap in With a Lop-Sided motion, as by Using a Monkey Wrench; Always Use a Balanced, Two-Handle Tap Holder as Here Shown.

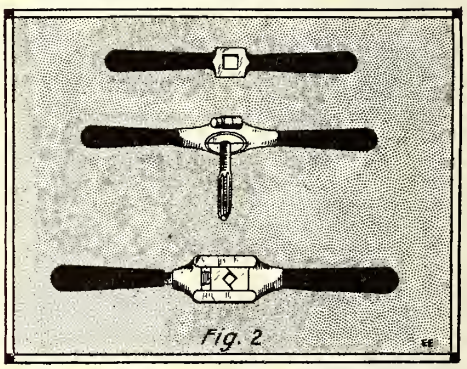
the exact reason for using a tool having a T-shaped handle is that the applied force to the tap is uniformly distributed.

The following may be of assistance to the novice as regards lubrication for different materials which are commonly used. As previously mentioned—in brass work, the tap should be lubricated with soluble oil or standard machine oil. Same being applied in tapping bronze.

In copper and aluminum where tapping is most difficult, it is strongly recommended to use kerosene or turpentine as the lubricant.



Left—Taper Tap. Center—Plug Tap. Right —Bottoming Tap.

In tapping these materials, it is urged that the tap be given a to-and-fro motion; this being necessary in order to eliminate any possibility of causing the metal to adhere to the tap and thereby preventing binding of the tap. At times it is also recommended to remove the tap from the threaded portion and remove all of the dust particles that may be in the metal and flooding the same with the above-named lubricant, before attempting to proceed with the tapping. Tool and machine steel, especially of the high carbon grade, require standard machine oil as a lubricant while tapping.

The following materials do not require any lubricant for tapping: fiber, bone, bakelite, formica, hard rubber and cast iron.

Miscellaneous Notes on Tapping.

All threading of machine parts and castings is not done by means of the standard tap wrench by hand, but in some cases the threading is done in a *drill press* or in a *lathe*. In machine shop practise large holes often have to be tapt measuring two inches or more in diameter. It is manifestly impossible, or at least impractical, to attempt to tap such a hole by hand, altho it is sometimes done in an emergency. For such a job, the first point to be watched should be

Three Common Forms of Tap Wrench Used in Machine Shop Practise.

to get the tap firmly over the opening, the edge of the hole being eased off a little with a file if necessary to start the tap. It is a common trick in tapping holes such as this to place the part or casting on the table of a large drill press and center it so that the spindle of the press comes directly over the hole to be threaded. The tap is then placed in a position over the hole and the spindle either fitted with a chuck to hold the tap, or in some cases the spindle simply carries a tapered *center* which presses against the center hole in the end of the tap. By throwing in the back-gear of the drill press, any pressure desired can be obtained on the tap and under these conditions the tap is threaded into the material by turning it slowly with a large wrench; in the case where the person doing the tapping is sufficiently skilled the tap can be held in the drill press chuck, and by throwing in the compound back-gear so as to cause the spindle and tap to just barely turn, the hole is thus tapt out. By throwing the reverse lever on the drill press, the tap can be *backed out* when the tap has been threaded thru the hole a sufficient distance. The "feed" is worked by hand.

Many small parts and castings, etc., are easily and accurately tapt in the lathe.

HOW-TO-MAKE-IT

This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

FIRST PRIZE, $3.00

MARCHING LIGHT FOR MUSICIANS.

Herewith is a sketch of a Novel Musicians' Light for musicians when marching at night. I have used one for some time and find it very satisfactory. The description follows:

An Electric Light of Many Uses—Here Shown Lighting up the Bandsman's Music.

The box is made of a cigar box or other light wood, of a size to accommodate two flashlight batteries of the type you desire to use, and may be provided with a hinged cover to facilitate replacing the batteries. One end of the box is provided with a small lever switch for opening and closing the circuit. The other end is equipt with two spring clips taken from old batteries.

Secure a piece of brass and bend it in a semi-circle with a projection on one side to be fastened to the wooden clothes pin as shown in the sketch. A lamp socket from an old flashlight is placed thru a hole made in the top of the shade and soldered. Over this is placed a flat bent spring, secured to the clothes pin with small wood screws, and close enough to the socket as to make a firm contact with the lamp when screwed into the socket.

The flexible cords should be of sufficient length to reach from a convenient pocket, in which the batteries will be carried, to the music lyre on the instrument.

The batteries are connected in multiple or parallel to give longer ampere-hour capacity.

SECOND PRIZE, $2.00

OZONE AND ULTRA-VIOLET RAYS FOR PURIFYING THE AIR.

The many uses for ozonized air makes its production in quantity of growing importance, and apparatus suitable for such work is of increasing interest. A convenient design for apparatus of this nature is shown herewith and consists essentially of glass plates, covered with powdered iron, and fixt alternately to the top and bottom of a suitable receptacle. To make the iron adhere properly it may be mixed with shellac and applied in a thin layer. The glass plates come into contact with copper conductors both at the top and bottom of the receptacle, and a brush discharge of electricity will take place between the two sets when the conductors are connected with the secondary of a spark coil or transformer, giving at least 6,000 to 7,000 volts. Air is forced thru the receptacle by means of a blower, and the air currents will take a zigzag course around the ends of the plates, thus coming into intimate contact with the discharging current.

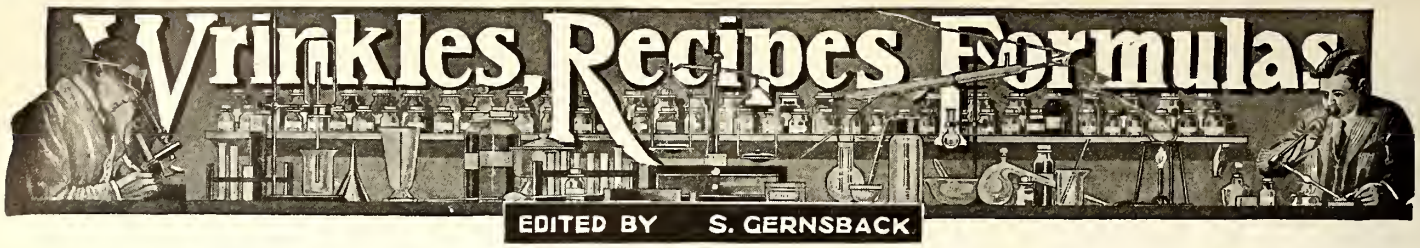
A Home-Made Ozone and Ultra-Violet Ray Generator for Purifying the Air.

THIRD PRIZE, $1.00

AN ODD "SPARK" PHOTO.

The accompanying photograph represents a spark picture which can be easily duplicated with interesting results by any electrical experimenter who possesses a small spark coil, or static machine and Leyden jar. This picture which was contributed by Mr. C. J. Forrest of Blenheim, N. Z., shows a "New Zealand Highlander" in full regalia, and was taken in the following manner:

This Odd "Spark" Photo Was Made by One of Our New Zealand Readers. It Represents a New Zealand "Highlander" and Was Obtained by Passing a Spark From an Electro Thru a Photo Plate, to a Tin-Foil Sheet.



The odd results shown were obtained by placing an old postcard block (printing block) on the film side of a photographic plate, and then placing a piece of metal underneath the plate. The metal block bearing the image was connected to the outside coating of one Leyden jar on a small static machine, while the piece of metal below the photograph plate was connected to the outside coat of the other Leyden jar on the machine. The handle of the static machine was then turned and a spark allowed to jump between the discharging knobs. The photo plate was then developed in the usual manner with the results here shown.

HASTENING ACTION OF NITRIC ACID ON COPPER.

To hasten the action of nitric acid on copper, drop a minute amount of sodium carbonate in the acid. This is especially good when the acid is too weak to readily decompose the copper.

LABORATORY HOT WATER SUPPLY.

By H. J. Gray.

A supply of hot water is a great convenience in the laboratory or workshop, and while a tin kettle and a gas ring will serve very well as a makeshift, it is not a difficult matter to fit up a more serviceable installation. The arrangement illustrated was constructed by the writer for

Distilled Hot Water Any Time You Want It. It's Easy With This Laboratory Hot Water Heater, Which Anyone Can Make With a Little Ingenuity.

use in a small private laboratory. The water is heated in a large oil can, A, which should be the largest obtainable. Near the bottom a brass T gas-pipe fitting, B, is soldered into a hole made to receive it. A small brass tap, C, is screwed into the lower arm of the T, while the other supports a length of glass tube, D, the other end of which is fitted into a brass elbow joint, E, near the top of the can. The glass tube forms a gage to indicate the depth of water within the can. It can be fixt like the water gage in a model boiler. In fact, instead of using gas fittings the necessary parts may be obtained from a dealer in model engineers' sundries if preferred. The gas fittings with a glass tube fixt by means of leather packing, with a piece of thick indiarubber tube to cover the joint outside, make a good substitute for a time. The can is supported on a strong iron stand with a piece of asbestos millboard, F, beneath it to protect the bottom from the flare of a Bunsen burner, G, used as a source of heat.

In order to utilize the escaping steam a condenser was fitted to the side, as shown. This consists of a bent glass tube, H, passing thru a hole made in a sound cork closing the mouth of the oil can, so as to just reach inside. The lower part of this tube is cooled by water circulating thru a wider tube, J, which has a waxed cork at both ends and two side tubes, K K. Cold water enters thru the lower side tube and escapes from the upper one, indiarubber tubes being used to make the necessary connection with a full pail placed above the condenser and an empty one on the floor. The boiler may be filled by siphon action so as not to disturb the condenser fittings by removing the cork. Simply connect an indiarubber tube to the tap, drop the other end in a pail of water standing at a higher level, and suck a little air out from the end of the condenser tube to start the siphon. The water which falls from the end of the condenser tube is preserved as distilled water—always a useful thing to have in a laboratory. Of course the longer the water is allowed to boil the greater the quantity of distilled water formed.

WAX THE CORKS—IT PAYS.

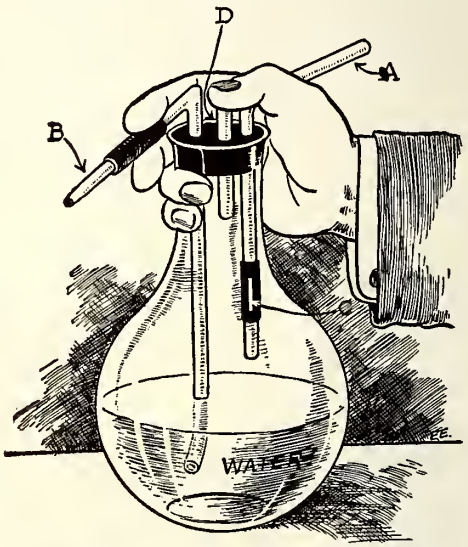
Corks can be made quite air- and water-tight by dipping for a second or two in melted paraffin wax heated in a tin over a spirit lamp. The wax should not be made too hot or it swells the corks unpleasantly and also becomes deteriorated.

When chemicals are put away for a considerable time, and in cases in which they are liable to deteriorate by contact with the air a seal of paraffin wax will form a simple and efficient safeguard. Keep the wax in a shallow tin—the lid of a blacking tin will do very nicely when cleaned—and melt by gently heating over a spirit lamp. Cut the cork flush with the top of the bottle and dip momentarily into the molten wax. The writer has stored even very deliquescent substances for many months in this way without a trace of moisture appearing.

PEROXID FOR ACETYLENE LAMPS

A little peroxid of hydrogen—the stuff ladies use for making the hair golden—works wonders in an acetylene lamp. About a teaspoonful added to the water in the generator causes a marked increase in the brilliance of the light, and is in no way detrimental to the metal parts of the apparatus.

SAWING BOLTS AND SCREWS.



It is sometimes necessary to trim the end of a bolt, or to remove a portion in order to shorten it. In such cases it is a good plan to keep a nut some distance up the bolt, finally running it off to remove any burr left by the saw. Otherwise there is usually some difficulty in starting a new nut, and the threads may sustain permanent injury as a result of the attempt to force a nut over the end.

SHOT FOR CLEANING BOTTLES.

A method of removing obstinate stains from bottles that is often recommended is to pour in some water and small shot and shake until the bottle is clean. This, it is true, removes the dirt, but it generally leaves behind some streaks and particles of lead adhering to the glass which can be distinctly seen in a good light. For chemical and photographic purposes the lead is as bad or worse than the dirt, and must be completely removed before the bottle is used for storing solutions. A little nitric acid should be kept for this purpose, diluted with an equal bulk of water. A good rinse with the acid will dissolve all traces of lead, after which the bottle can be washed in the ordinary way. The acid may be used repeatedly.

A HANDY LABORATORY WASH-BOTTLE

The continuous flow wash-bottle shown in the accompanying sketch will be readily appreciated by those who have used the old type wash-bottle requiring constant blowing. It is simple and effective and should be a valuable asset to every laboratory. It is composed of a flask, stopper and three

We Have Seen Many Types of Laboratory Wash Bottles, But This is an Ideal One—Simple to Use and Easily Made.

tubes, B, D and A; B being the outlet, D for releasing the pressure and A for blowing. Slipt over the lower end of tube, A, is a short section of the rubber tubing with a small stopper inserted at the free end. A slit is then cut into the rubber tubing, as shown at C. This has the effect of a check valve, allowing air to pass thru the slit C, in only one direction, that being into the bottle.

In operating, the flask is held in the right hand with the outlet tube between the index and second fingers and the thumb over the tube D. It is then ready for blowing, which is done in the regular way thru the tube A. The air passes thru the valve, thereby setting up a pressure in the bottle which causes the emission of water from the outlet. The flow from the bottle will then continue until the pressure is relieved by the displacement of the water. As it is possible to create approximately 2 pounds pressure in one blow, considerable water is ejected before the pressure is exhausted and the flow stops. Should it be necessary to stop the flow instantly, or before it would do so by itself remove the thumb from the tube D.

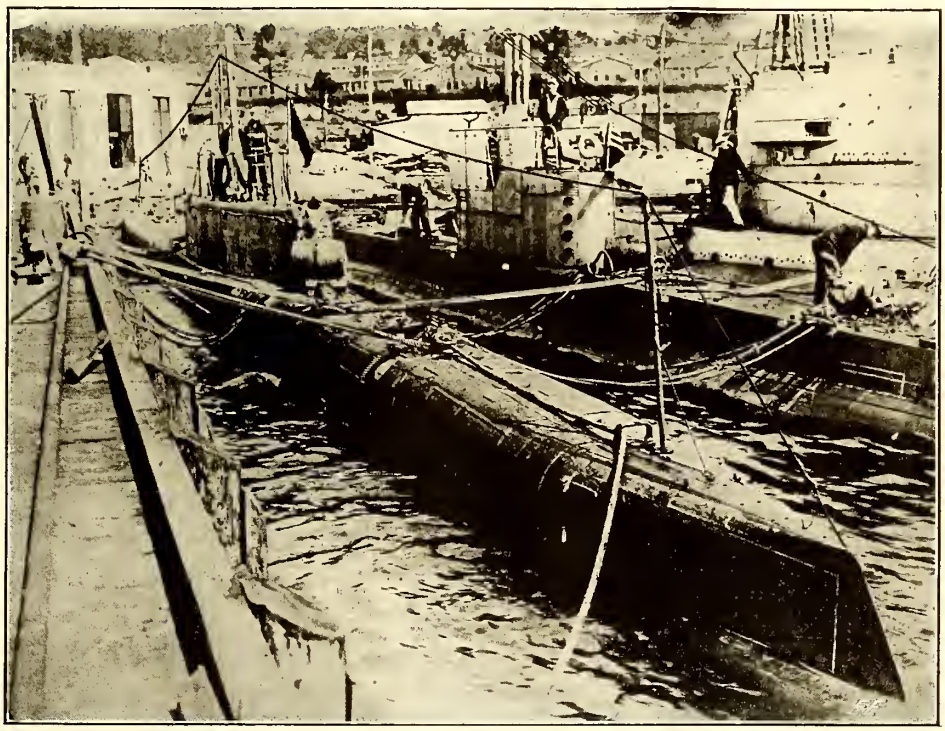
RADIO DEPARTMENT

The Submarine's Under-water Radio

IN a general way it is known that during the war a method was found to communicate with a submerged submarine from shore or sea. How this is done and how it came to be discovered that it could be done not until now has been made public. Like a good many other revelations it came when the researchers were at work on another problem.

The scientists of the radio section of the Bureau of Standards stumbled on the secret and the lucky ones to suspect it were two young assistants not long out of high school. Their experiments and the development of what is known as the "loop aerial" for submarine radio communication by the bureau, resulted in a device so simple and perfect, and producing such wonderful results, that the navy has adopted it and is equipping all its undersea craft with this style of loop.



In the fall of 1917 a series of experiments was undertaken by the bureau to develop an apparatus for the detection of enemy submersibles. Mr. J. A. Willoughby and Mr. P. D. Lowell were engaged in the work. They had a notion that a closed "loop" or rubber encased coil of wire offered the best chances for success. They made one and threw it one night into a tank of fresh water on the grounds of the bureau near Chevy Chase, Md., a suburb of Washington. To their delight they received a signal from the big radio station at Arlington. The next night they submerged the coil in the tidal basin of the Potomac near the new Navy Building. Again the signal came with no difference in strength whether the loop or coil was suspended in air or sunk in the river.

DISCOVERY OF THE "LOOP'S" EFFICIENCY.

The significance of this discovery struck both young men. Here was a way possibly to detect the presence of enemy submarines, but surely to talk with our own, which was equally important, had been thought impossible. This was in November.

In December improvements in the submerged coil brought the reception of signals from Lyons, France; Paris and San Diego, Cal. By March last year excellent signals were received on a single turn coil 150 feet long by sixty feet high having a wave length range of 100 meters to 15,000 meters. Experiments continued.

In April Mr. Willoughby discust with Lieutenant Commander H. P. St. Clair, of the Radio Division of the Navy, the use of "loops" on submarines for both transmission and reception under water. Both he and Mr. Lowell were sent to New London to work under Commander McDowell in charge of the base, to install the apparatus for a try out on submarine D-1. It is a simple contrivance, the metal frame of the submarine itself being a part of it, this being used as a "ground" just as the earth is used in land telegraphy. The circuit is thus made complete. As finally perfected the loop consists of two insulated wires grounded at the extreme ends of the hull carried over suitable supports to the conning tower and thence thru "radio-lead-ins" down into the boat to the receiving and sending apparatus.

Equipping U. S. Submarines with New Under-water Radio Antenna. The Antenna Comprises the Single, Heavily Insulated Wire Passing from Bow to Stern, Over the Conning Tower. Messages Have Been Received 6,000 Miles When the Loop Was Submerged 8 Feet.

SUBMARINE USED AS "GROUND."

A new type of loop was tried on the U. S. S. G-3, in which the lead-in wires were brought in from the upper side of the "loop" instead of the lower and the entire loop was insulated from the hull. Better, but not satisfactory, results were obtained. Up to this time the frame of the boat had not been used as a "ground."

The lower side of the "loop" was removed and the ends of the wire fastened to the bow and stern. The top of the "loop" was submerged eight feet; *signals from Nauen, Germany, were clearly heard.* Very sharp indications of direction were obtained when under water or on top of it. And soon other stations were heard, including *Carnarvon, England, Rome, Italy, and various merchant vessels.* Later experiments showed that communications can be carried on at sea under all conditions more efficiently with the closed "loop" aerial than with the ordinary elevated antenna.

To receive short wave lengths the loop must be near the surface of the water, whereas a wave length of 10,000 meters can be received at a depth of twenty-one feet. Still longer lengths can be heard at greater depths.

TRANSMISSION UNDER WATER.

Signals can be transmitted from the loop to a distance of *ten or twelve miles* when the submarine is completely submerged, the maximum distance being obtained when the top of the "loop" is practically at the surface. The distance decreases to two or three miles when the loop is eight or nine feet below the surface. Submergence of the boat during the reception of or transmission of a message does not alter the wave length. If the maximum depth for the wave length being used is exceeded, communication is then interrupted.

The report of the Bureau of Steam Engineering of the Navy Department in its summary of underwater radio experiments says:—

The Wireless Ukulele

The accompanying pen and ink sketch by our friend, Emerson Easterling, sure does bring back the golden memories of the good old "Amateur Radio" days. Just imagine, friends and fellow citizens, what a wonderful mental exhilaration it is to slip on the "cans" and hear the wireless telephone hum the strains of the Hawaiian ukulele, as played by the natives on the moonlit beach of far-away Wakakai. Oh boy! that sure is the life, and it doesn't require any excessive strain of the mental fibres of your cerebrum and cerebellum to picture the fair Hawaiian maidens dancing the Hula Hula to the tantalizing strains of the Hawaiian Elite orchestra. All this and more does the wireless amateur enjoy at some time in his glorious and educational career, but if Secretary of the Navy Daniels has his way there "ain't agoin' to be no sech animal" as a Radio Amateur from Portland, Maine, to the "Barbary Coast." No siree. In onion—we mean "union," there is strength. So get together, fellow Radio-bugs, and think up all the good arguments and good deeds you can about Amateur Radiodom. Talk about it at your radio club meetings.

The "Radio-Bug" Has it on All of Us—He May Put on the "Cans" and Listen to the Ukuleles Strumming Gaily in Far-off Hawaii, and With a Little Imagination—Well Say, Who Couldn't See the "Hula Hula" Maidens Dancing in All Their Native Charm?

Unique Radiophone Helmet

Photo Underwood & Underwood

The Radio Telephone Apparatus Worn by an Airplane Pilot in the Recent Successful Experiments With This Wonderful Voice-Transmitting Wireless.

Recently Secretary of the Navy Daniels spoke by wireless telephone with a naval seaplane in flight, 150 miles away from Washington, where the apparatus was located which Secretary Daniels used in talking to the plane.

The accompanying photograph shows the interesting radio telephone receiving helmet used by aviators, and which effectively cuts out all extraneous sounds and noises, including that from the airplane engine. These helmets are made of rubber and leather, and the telephone receivers are mounted in the best quality sponge rubber in such a way as to effectually prevent the transmission of sound, even thru the bones of the head.

The wireless telephone conversation held with Ensign Harry Sadenwater, while flying at a distance of 150 miles from Washintgon, when Secretary Daniels asked him *via radio* what kind of a flight he was having, constituted a new record in the field of Airplane Radio-telephony.

The microphone is of a new type and is open back and front, so that the air waves in front are balanced by those in the back. The engine noises are thus nullified and only the voice air waves are effective in vibrating the diafram of the microphone.

A FOOL THERE WAS.

(With apologies to Kipling)

A FOOL there was, who a wireless made,
Even as you and I.
Two coils of wire together he laid,
With the bill at the junk shop still unpaid,
Tho he called his father's purse to his aid,
Even as you and I.

Oh, the years he'd waste and the tears he'd waste,
And the work of his head and hand
Belong to the science he did not know,
And now we know that he never will know,
And never will understand.

A Fool there was and his coin he spent,
Even as you and I.
The money that should have gone for rent
He paid for receivers. for he was bent
To pull from the skies a radio sent
Even as you and I.

Oh! the news he'd get, and the use he'd get
From this instrument he had planned;
But his scheme didn't work, he didn't know why,
And now we know he never knew why,
And never did understand.

He sent a wave as broad as a car
Even as you and I,
Which even Fessenden couldn't bar,
His coil was large and the spark went far,
And mixed with a message for N.A.R.,
Even as you and I.

And it wasn't the kale, and it wasn't the jail
That filled his soul with despair,
But 'twas the losing the set
That he'd famished to get,
For he'd violated the "laws of the air."

By—
Osborne Anderson,
Ernest A. Innes.

HOW RADIO IN THE CLOUDS FOILED THE GERMANS.

Sounds real mystical, doesn't it, radio in the clouds? And it proved just as mystical as it sounds for a long, long time to many hapless German aviators, and other wearers of the ex-Kaiser's iron cross. Airplane radio among the clouds was finally worked out into a regular melodrama by the Yankee wireless experts and fliers in France. It usually required two Allied airplanes at least to play this game, and the villain Hun aviator was invariably brought to justice sooner or later, once the stage had been set.

The setting was arranged in the following manner: An Allied aviator would rise from the ground and fly toward the rear of his own lines, so as to secretly gain a high altitude, and he would then return toward the front, flying so high as to be almost invisible. Presently another Allied flier would join him. Then the trap would be set for the German flier, or fliers. One of the planes would rise above the clouds and hover in a certain locality, out of sight, while the other plane would remain fully exposed, and in some cases even drop to a lower altitude so as to be more visible to the enemy. It would not be long before a German flier would be seen sneaking up in an effort to surprise the Yank. But here is where modern science, in the rôle of wireless telephony, which was so wonderfully developed by the American Signal Corps during the war, is to step in. The aviator watching for the German signals his approach and his position to his fellow aviator hiding above or in the clouds, by a wireless telephone message. At the critical moment the final information is given by radiophone to the hidden flier, and he pounces out of the clouds on the German, who often leads him a merry chase, but our second flier who had been on the watch joined in, so that it was a case of two to one. Sometimes there were several German planes, and then it often happened that two or three Allied fliers had to battle with an equal, or even double and triple number.

Radio Problems in Aviation

By EDWARD RICE DOYLE

Former Radio Officer, Air Service, U.S.A.

THE day is not far distant when all airplanes used in long distance flights will be required to carry standard *wireless equipment*, permitting of communication over distances equal, if not greater, than the ranges of sets required on passenger steamship liners. The reason is obvious. An airplane in distress is far more helpless than a ship and in case of forced landing, relief is almost always an immediate necessity.

Even in cross-country flying a good radio outfit is a necessity in holding a true course and in signaling ahead for special parts or supplies to save time at intermediate landing points *en route*.

The requirements for a reliable radio apparatus on airplanes bring up certain problems which are still unsolved and subject to considerable experiment at this date, when American ingenuity has been able to advertise its achievements in airplane radio. These intensive problems will attract the highest radio engineering skill in their solution.

The problems may be considered as:

1. Directional control of transmitted signals.

2. Wave length adjustment of incoming and outgoing signals.

3. Transmitting ranges and sensitivity of receiving apparatus.

Under the first item, that of directional control, the engineer faces a very difficult task. The design of the aërial has always been the critical factor in directional control, and it is greatly limited by the facilities which an airplane offers for setting up the antenna.

The most effective control has been secured by the single trailing wire antenna. (See Fig. 1.)

A length of about 300 feet of wire is allowed to swing in the air held down partly by a weighted "fish." Thus the metallic parts of the airplane form the counterpoise and as the trailing wire swings backward in a characteristic curve the major electrostatic field is projected downward ahead of the airplane at about 45 degrees.

This gives a directional effect directly ahead of the airplane. Signals behind the plane or to the side of the lateral axis are greatly weakened. Even when the plane banks on a turn, the signals ahead die down rapidly. Hence to transmit in any given direction the plane must be pointed in the direction of the receiving station and to find that direction by compass is not as easy as it seems.

Furthermore, an airplane might have to reverse its direction every time it desired to communicate with a given station, and on long flights this lack of control would be extremely inefficient, in view of the fuel thus lost and the time consumed.

In land radio for long distance transmission the towers supporting the aërial are built for a given directional effect. Where non-directional effect is desired an umbrella type of antenna is used. However, since the airplane must get the maximum efficiency in range from the least amount of aërial weight, an umbrella type antenna, even if practicable, would not be suited to the airplane.

When it is attempted to arrange a fixt antenna (as opposed to the trailing type, which is free to sway) on an airplane the limiting conditions of aërial capacity and structural areas impose very harsh conditions on the designer. Consider the capacity of a wire equal to the wing span of an airplane, seldom more than 30 feet, and with no means of suspending the aërial over a foot above the wing surface, and with comparatively little metal in the wing itself to give the desired field its maximum capacity. Wing spread is the longest overall dimension of the airplane in any case.

Fixt wire antennæ on airplanes have never attained results commensurate to their cost in installation and in reduced flying efficiency; for every wire that is thus exposed to the air means increased *head resistance* and a few wires can multiply head resistance to a very serious extent.

One design of fixt wire antenna which was used in the army combined the fixt type with the trailing type. (See Fig. 2.)

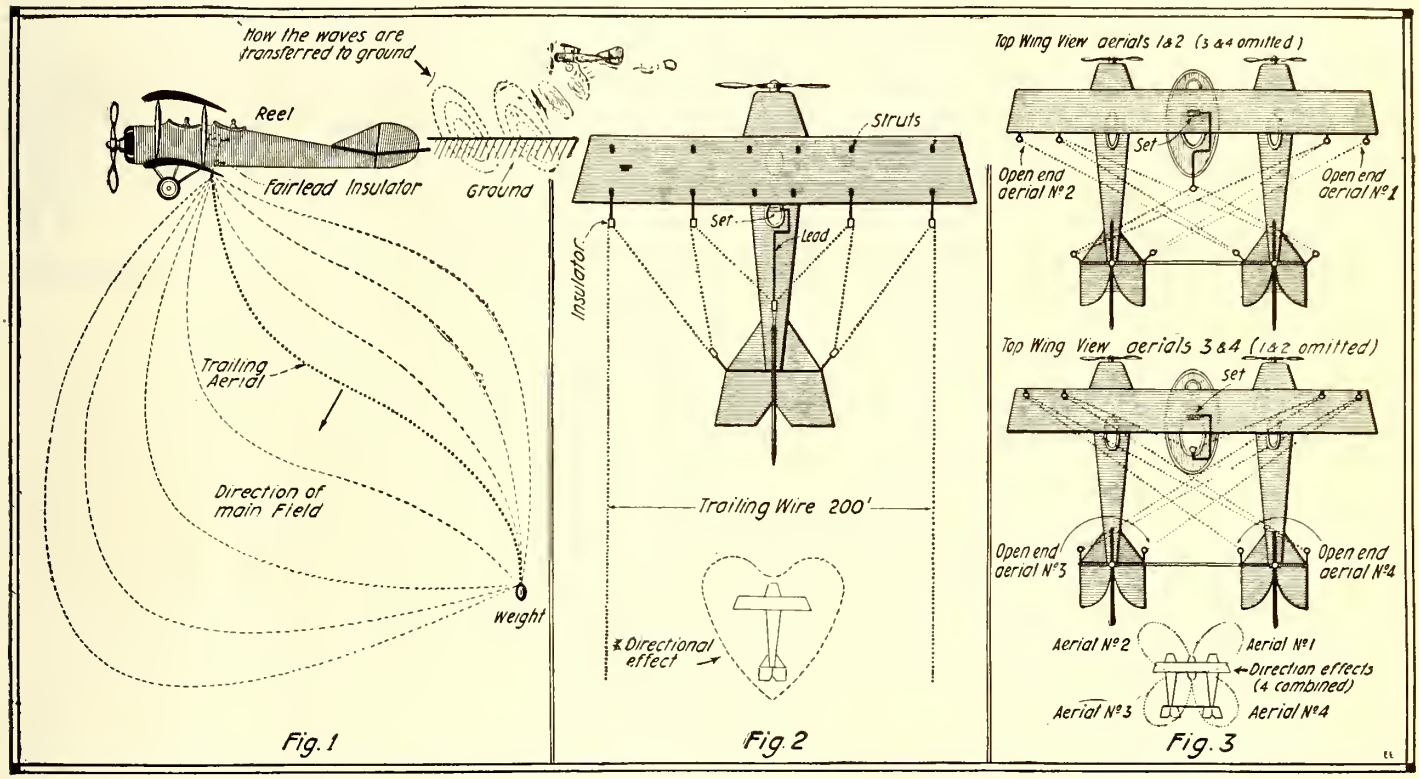

Fig. 1—This Illustrates the Simple Trailing Type of Airplane Radio Antenna, Used to a Great Extent During the War. It Can Be Reeled Up Quickly But Possesses Several Disadvantages. Fig. 2—A "W" Type, Combined Fixt and Trailing Radio Antenna, Successfully Used for Inter-plane Communication. Top View. Fig. 3—Radio Antenna Rig-up Proposed By the Author, for Double Fuselage Biplane. The Quadruple Antenna and Its Directional Effects Are Clearly Illustrated.

Here the ends of the wire were not weighted and as they were constantly liable to become tangled in the controls such fine wire had to be used that their effective capacity, low enough with any practicable airplane antenna, was further reduced. Furthermore, the trailing wires were awkward in landing and in taking off, since they could not be reeled and the fixt wire system was an added menace, due to the fire hazard which they involved.

This "rig-up," however, was effective for *interplane communication* over short distances, not exceeding a mile, using a 200 watt fan-driven generator. Communication to the ground was easily establisht, but receiving from the ground was difficult. The directional effect was low ahead and strong to the rear of the airplane.

The results obtained in army aviation radio were generally satisfactory for their purpose, but in the broad field of commercial aviation, the *directional control* must be far more highly developed before the radio apparatus can be relied upon.

The same structural conditions which impose so many difficulties on directional control also affect selectivity of wave lengths. As is well known, a long wave length is more efficient for long distance transmission. To get long wave lengths a great deal of inductance and capacity are needed. The land radio operator little considers the

www.americanradiohistory.com

An Efficient Radio Crystal Detector

By ROBERT F. GOWEN, Radio Engineer

THE Multi-crystal Detector Mounting here illustrated is the result of an extended study by the author of many different forms of crystal detectors both commercial and home-made. It was built to provide a detector having the following characteristics: (1) Maximum sensitiveness; (2) Maximum robustness or power to hold its adjustment; (3) Maximum flexibility in its use.

Left:—The Detector Arranged to Use Two Crystals. Center:—The Detector Top Bar Swung Back and Cups Removed.

View Above Shows the Detector Being Used with Metal Point on Single Crystal, Held in Lower Cup.

Fig. 1 (at left) shows the mounting used to hold a pair of crystals or a crystal couple such as Zincite-Chalcopyrite or Zincite-Bornite. The electrodes are made eccentric to each other so that any point in the lower cup may be made to intersect with any point in the upper cup. The crystals are mounted in small brass thimbles by means of Wood's metal, Hugonium, or a similar soft solder and are held fast in the cups by means of the set screws.

By removing the upper cup a phosphor-bronze point is exposed which is used in connection with *Silicon*. When using *Carborundum*, the pin cup is unscrewed and the pin reversed to obtain a contact having a comparatively large area. When *Galena* is used, a pin shown in front of the instrument and having a very fine contact wire, takes the place of the pin shown in use. The lower cup is made large enough to hold several crystals at once so that in the case of one burning out, another may be immediately substituted by simply rotating the cup on its pedestal.

Rotating the cups also provides an easy method of determining the most sensitive crystal surfaces. It is only necessary to connect the detector in circuit with a test-buzzer and rotate the cups and thimbles until the head receivers show that the most sensitive crystal faces are in contact.

A good method of comparing the sensitiveness of different crystals is also a feature. This is accomplisht by inserting the several types of crystals in the large cup and bringing one after the other in contact with the pin while an observation for each is made with some type of receiver shunt. In this manner, the crystals may be separated into groups of varying sensitiveness for future use.

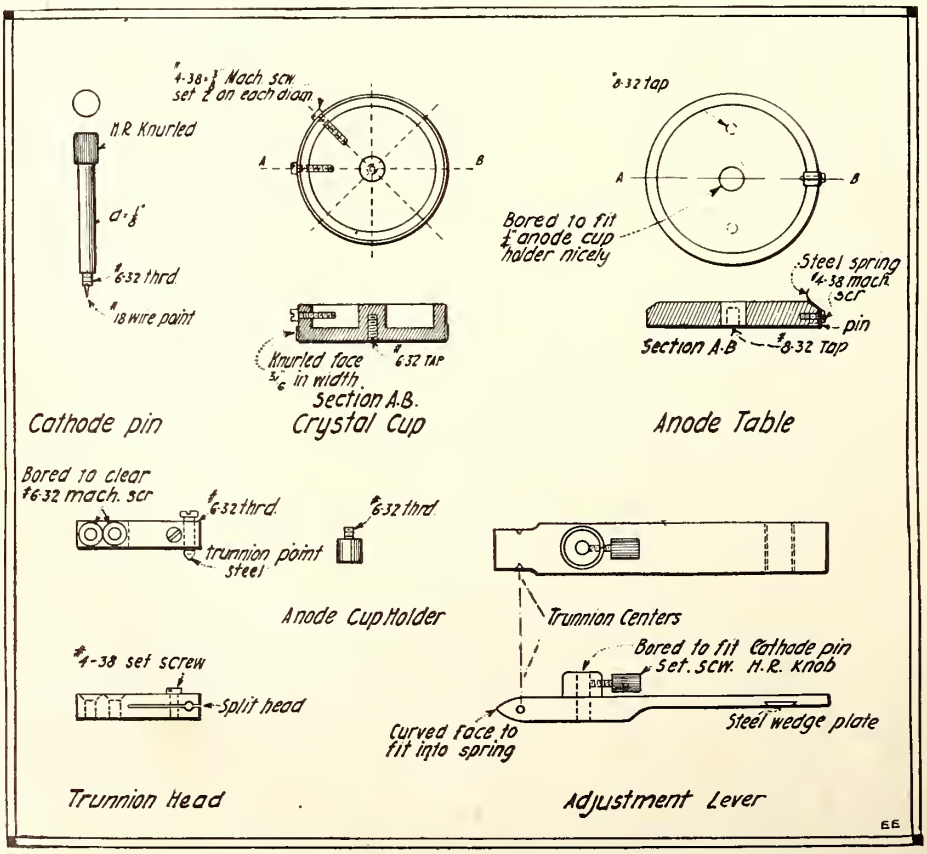
In order to change the cups it is simply necessary to throw the lever back against the spring as shown in Fig. 2 (at center). This cut shows the detector unassembled.

The large hole shown in the pedestal provides a bearing for the small shoulder shown in front of the large cup, into which it is screwed when in use; or if preferred, the large cup may be screwed on to the pin in the lever arm.

The small hole shown directly in front of the larger one is threaded to take an 8-32 machine screw which may be used to hold in place a small acid container for an electrolytic detector. In this case a third pin is used, to the end of which is soldered the fine Wollaston wire.

The adjustment screw on the front of the detector is provided with a very fine thread, thus assuring a very sensitive adjustment. The spiral spring shown in the unassembled view is slipt over the contact pin to allow of an easy adjustment while pushing the pin down in place, after which the pin is clamped in place by means of the set screw with its hard-rubber handle

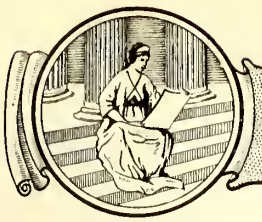
The lever arm holding the pin moves in adjustable conical bearings in the fork mounted on the back piece and is held under tension by means of a flat, steel spring, the end of which may be seen directly over the bearings.



Experience has shown that for the experimenter the detector fulfills a long felt want in that the parts are entirely interchangeable and accessible. It may be used as a detector of any of the well known crystal types or as an electrolytic detector of the "whisker-point" type. By replacing the contact point with a small glass tube containing a fine platinum wire, a "Dip-point" electrolytic detector is provided.

To change from one detector to another it is simply necessary to throw back the lever arm and take out the cups. This action requires a very small time period to perform.

In order to adjust the detector the large cup is turned so that the crystal to be used is underneath the pin or upper crystal holder, whereupon the pin is pushed down against the spiral spring until contact is made, after which it is clamped in place by means of the set screw. The lower cup is then turned slightly until a good point of contact is obtained, whereupon the detector is brought into final adjustment by means of the sensitive adjusting screw at its front.



The author has found this type of detector to retain its adjustment for several weeks at a time and believes this is due to the use of a rigid marble base and the stiff, non-vibrating spring. For the base a special marble is used having a very high insulation value.

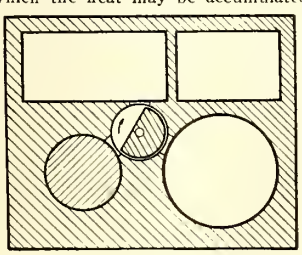
LATEST PATENTS

Electric Fly-Catcher.

(No. 1,311,281, issued to Maik Kurka.)

Of all the thousands of inven-

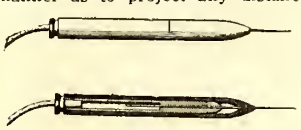


tions made monthly and yearly in this country, perhaps there is nothing at this time of the year which interests us more than a fly-catcher—and especially an electric fly-catcher, for by its very cognomen it must be good. This electric fan device for catching flies provides a specially designed blade which acts when rotating at a high speed to produce a suction thru the horn or tunnel, and the flies are whirled around inside the fan casing into the blind vault, where they conveniently die a most horrible death.

Electric Heat Storer.

(No. 1,311,464 issued to Oskar Sælid.)

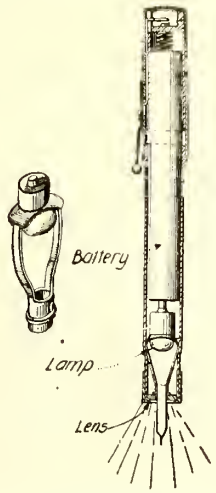
An electric heat storing device, in which the heat may be accumulated



from an electric heating member or grid in a storing body placed in a chamber formed in a secure body of sealed "heat insulating" material. This is designed particularly to apply to electric heat-storing kitchen ranges. The heat generated electrically may be transferred thru special channels and a multiple heat valve to various heat-storing chambers. The heat may be conducted by metal members or by air-filled channels, as provided by the movement of the valve.

Electro-Surgical Needle.

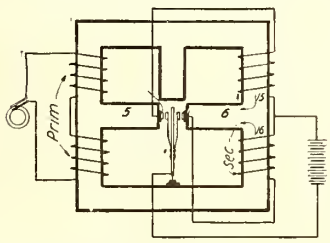
(No. 1,311,494, issued to Ervin M. Camp.)



This electro-surgical needle is intended to provide a device of this kind, in which the electrically operated needle is provided with a grip chuck arranged to hold it positively in any desired position or adjustment. Further, the surgical needle is longitudinally adjustable in the gripping chuck, in such a manner as to project any distance.

Illuminated Pen or Pencil.

(No. 1,310,476, issued to Louis F. Hart.)

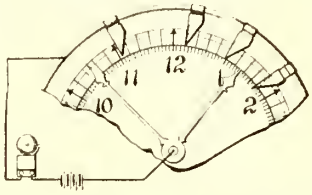


A novel writing instrument is here illustrated which may he in the form of a fountain pen or pencil. It is very cleverly designed, and incorporates a small incandescent electric lamp similar to a flash-light bulb, together with a small reflector lens and a tubular dry battery. There is also a clever cap switch for opening or closing the lamp circuit. The lamp bulb proper is mounted a short distance above the writing point in a special form of tripod as shown in the illustration; the light from the bulb flashing downward thru the lens having a hole thru its center to accommodate the pen or pencil point.

Vibrating Rectifier.

(No. 1,311,490, issued to Quincy A. Brackett.)

In the ordinary A.C. to D.C. vibrating rectifier, several of which have been on the market for an appreciable period of time, it is usual to provide two co-acting magnetic fluxes; one of these is uni-directional and the other alternating, the uni-directional flux being invariably supplied by a permanent magnet or from coils excited by auxiliary direct current. In the present design the inventor very cleverly arranges a special circuit for the rectifier, whereby he obtains both of these magnetic fluxes in a simple and yet effective manner, without the use of any windings except those of the ordinary transformer commonly employed with rectifiers, and

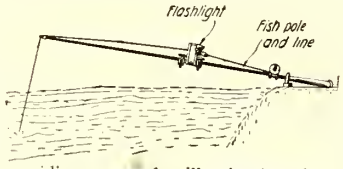


further without the use of a separate direct current exciting source. The alternate pulses of current in the two halves of the secondary winding will set up waves of magnetic flux, as indicated by the arrows 15 and 16, and these waves will consolidate to form a uni-directional magnetic flux thru the pole pieces 5 and 6, as becomes apparent. The vibrating reed will thus oscillate at synchronous speed and co-act with the uni-directional poles 5 and 6.

Electric Clock Alarm

(No. 1,311,424, issued to Benjamin H. M. Spargo.)

This electric clock alarm is devised with a number of adjustable contact

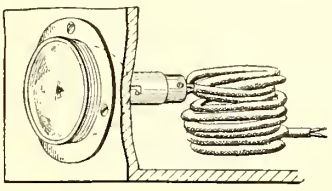


members, which may be arranged around the dial at any hour or fraction of an hour desired. One side of a bell and battery circuit is connected to the hands, while the other side connects to a metal member on which the contacts may be snapt into place. It is at once seen that the alarm may be arranged to ring as many times in the course of a day, as desired. This is often required in schools, offices, factories, etc.

Electric Fishing Signal.

(No. 1,309,365, issued to John E. Monighan.)

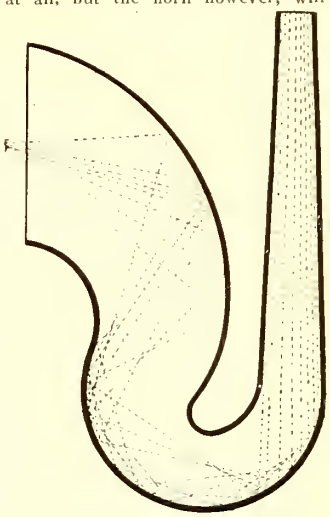
This invention comprises something which is of interest particularly to sportsmen and Nature-lovers during the warm months of the year. It comprises nothing else than the fisherman's rod, which supports a flashlight electric alarm for night fishing, so that the instant the fish bites on the hook and starts to unreel the line, the movement of the line thru a special trigger switch device on the flashlight holder, closes the circuit and the lamp flashes. Full details of the device are given in the patent and the action of the switch is simple and ingenious, permitting a line to be run out or wound up on the reel, without being interfered with in any way by the device, and yet



providing means for illuminating the flashlight whenever a fish bites.

Tonneau and Trouble Lamp.

(No. 1,311,295, issued to Jason C. Stearns.)

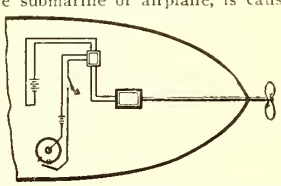


A useful and practical development in auto accessories, comprising an electric tonneau and trouble lamp, so constructed as to be capable of use in an efficient and convenient manner. The design of this lamp is carried out in such a manner that the lamp proper and its holder can be readily removed or replaced in its stationary receptacle on the auto dash or on the wall of a tonneau, etc. In order to do this, the inventor has provided a clever bayonet joint, by which the lamp is held rigidly in position when desired, or also easily and quickly removed, and when used as a portable trouble light, current is supplied to lamp thru a flexible duplex wire, which is normally coiled up in back of the lamp as the drawing shows.

Amplifying Horn.

(No. 1,311,478, issued to Russell A. Willson.)

A specially designed amplifying horn for use on phonographs and other similar instruments. The inventor claims that to give a clear-cut sound reproduction of a record, the horn must be so designed that each tone will be conveyed thru the horn so as to reach a certain focal point, after having travelled over approximately the "same distance" thru the horn, as have been travelled by other accompanying tones. In other words, the inventor states that the length of the sound waves or vibrations in the horn is the same. We do not agree with his theory at all, but the horn however, will



work in the usual manner in spite of it, if so we may express our idea of the matter. The inventor also mentions that the horn is designed rectangular in cross-section with diverging walls, while the outlet end of the amplifying portion is provided with parallel walls. Sound waves when conveyed thru a horn like this have a tendency to swirl or travel in a spiral direction giving inferior tone reproduction; the rectangular construction overcomes this by providing dead air spaces along the corners of the horn.

Submarine Signaling.

(No. 1,311,157, issued to Reginald A. Fessenden.)

This invention by Prof. Fessenden, relates to signaling by sound in a fluid media, such as water or air. It is also applicable to airplane signaling, and should prove particularly efficacious in sending out signals at night. The secret of this invention lies in the fact that either by means of automatic or key-operated electric switches, the electric circuit for driving the propeller on the submarine or airplane, is caused

to fluctuate a slight amount in its rotation. This need not be sufficient to cause the propeller to stop, but simply to cause a slight change in the humming note projected from the spinning propeller. The inventor states that he has tested this idea out under practical working conditions, and that slight variations in the notes are readily detected.

WITH the AMATEURS

Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $5.00 each month for the best photo or photos and $2.00 to each "Honorable Mention." Address the Editor, "With the Amateurs" Dept.

"Amateur Electrical Laboratory" Contest

THIS MONTH'S $5.00 PRIZE WINNER— EDWARD H. COX

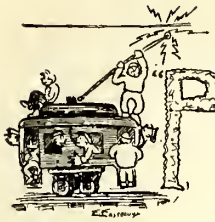
I PRESENT herewith four flashlight photos of my "Experimental Laboratory." In the first photo may be seen my electrical test-board, all controlled from the small switch-board observed in the upper left-hand corner of photo. This switch-board is so wired that I can obtain 1½ volts; 24 volts A. C. or 120 volts A. C. thru a rheostat of my own design. Also 1½; 24 or 120 volts D. C. thru a rheostat, all from the plug shown on bottom of the fiber switch-board panel. There is also shown my submarine chaser model which is undergoing repairs at present. In front of this is a small brass steam engine constructed entirely without any lathe work. On the right-hand side of photo may be seen my electric furnace and high frequency set. In the upper centre is shown a safe operated entirely by electricity.

One photo shows my "Chemical Laboratory," while a third photo shows my wireless set and "Yours Truly." I have a wood-turning lathe and jig-saw which are not shown.—Edward H. Cox, 9 Pierce Avenue, Hamburg, N. Y.

HONORABLE MENTION— ARMAND DE PICHON $2.00 PRIZE PAID EACH "HONORABLE MENTION"

AFTER seeing numerous photos of Amateur "Labs" publisht, I at last decided to send some photos of my own. In my chemical "Lab." I have Florence and Erlemeyer flasks, a retort, pestle and mortar, test tubes, microscope and other apparata. My radio receiving set consists of a loose coupler, two detectors, two sets of receivers, a 43-plate variable condenser, switch, fixt condenser and a test buzzer. I also have quite a number of transmitting instruments, including a helix, transformer, key, spark coil, spark gap, D.P.D.T. switch for sending and receiving, and a fuse block switch. Some of my apparata is home-made, and I intend to put up my sending set sometime in the future, or as soon as the ban on transmitting sets is lifted by Uncle Sam.

I am now fixing up a switch-board in my electrical "Lab.", and I will send you some more photos of it when completed.



I find much useful and interesting information in your magazine, which I read constantly. Armand de Pichon, 1100 Morton Street, Alameda, Calif.

Science in Slang

By EMERSON EASTERLING

"POWER'S off," remarked a passenger as our trolley car came to a dead stop in absolute darkness.

"While we are so conditioned," I remarked, "would you mind spilling us a little anointment in the line of electro-propelled vehicles and the like, and so forth?"

"Yes," he replied. "I was just dying to slip you the oil, anyhow."

"Yes," spoke up a stranger from Missouri, "let us all in on it. I have a brother that knows a street car conductor in Vancouver, Washington. He works for the North Coast Power Company on the car that walks out to the Standifer Steel Ship Yards."

"Well," commenced Jazz, lighting up a cigar—and also the entire car. Over in one corner a man and a woman—but that is another story. "It all started way back in 1835——"

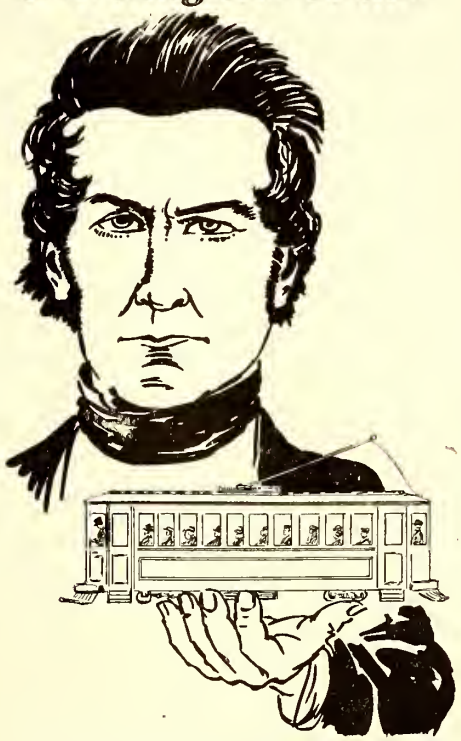
"Say, partner," reproved the rather aged man with the ditto woman in the corner, "you don't need to insinuate."

"As I was saying," continued Stokes, "a bird by the name of Tom Davenport invented——"

"A couch!" broke in a furniture dealer absent-mindedly.

"A Yankee by the name of Davenport invented an apparatus, contraption, or contrivance that was able to live up to the name of primeval surface jolter.

"About the same time a Scotch Highlander (or Lowlander), Bobbie Davidson —no relation to Harley as far as known— tried out a trolley in the 'auld' country.



"In Washington, D. C., Prof. C. I. Page gave the public the sensation of seeing a real (almost) street car. That was way back in 1850.

"Moses G. Farmer stuck onto the public the first electro-bus with reduction gears from the motor—in spite of his name.

"But it was in Berlin that a couple of guys combined efforts and gave the grasping—or should I say yawning or reaching —world the pleasure of witnessing the first practical working model of life size—of the 'juice jerked' juggernaut. These ducks were Siemens and Halske. The same Siemens that is guilty for the early dynamos and motors that bear his John Hancock. No, not the one that met the pieman!

"From 1880 to 1883 Steve Fields and Tom Edison had a spat over patent rights, but finally they came to a settlement by forming a League of Notions; that is, they consolidated in the traffic jamming project. At the 'Chi' Railway Exhibition they showed off their first performance of their product and in a few years the people over the country were cautiously entering the moving houses and gripping to their seats and praying while the motorman did his best to 'keep things going' up in front.

Trucking the Traffic

A Yank by the Name of Tommie Davenport Invented an Apparatus, Contraption, or Contrivance, that was Able to Live Up to the Name of Primeval Surface Jolter.

"Kansas City was the first 'burg' to install an electric railway of any note. That was in '84. I don't know why that 'burg' should be first in the line any more than I know why it is one of the toughest towns in the States.

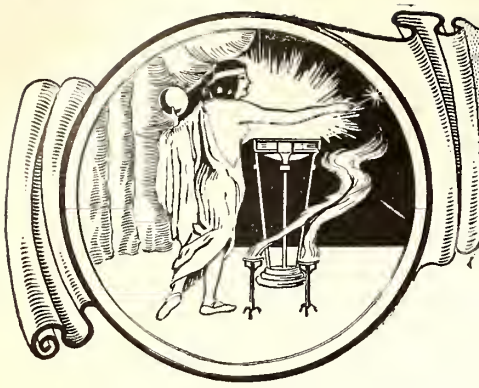
"The first line had the juice entering one rail and leaving the other. Then along come another model having the juice from double overhead trolleys, as in Kansas City. Another bird figgers out the third rail, and another the stunt of using the trolley and track, while still others carried the batteries aboard the municipal boxcar. Edison had a pretty fair example of the battery car.

"The original—and a lot of the subsequent—cars were put out with about the same horsepower as the present-day motorcycles. Think of it! They grew up to twenty horsepower, and then they *doubled* the power by furnishing both trucks with motors. The larger electrical interurban railways have ten times—and in some cases more than that—the power of the street cars."

"How do these strings of cars that snake thru the ways work?" asked a voice next to me. "They have only one engineer on the front car."

"They employ what we call the multiple unit system of control. The cars are connected together by connections at the ends of each car. The motorman at the head car in controlling his own car operates the other ones automatically. The—but if I would explain the workings of a single unit you would probably get me better.

"On the simple or single unit the juice is handled by resistance and varied connections at the control panel that the motorman operates. On starting the resistance and all the separate (the field coils are arranged so as to be connected series or multiple, or both—that is, some series and others multiple) field coils are in series with each other, the resistance and the armature. To increase the speed the resistance is first thrown out, then the field is changed from series to series and multiple and then to multiple; then the armature is connected multiple, making the motor shunt wound instead of series. If you should look out the window at this point you find yourself jazzing right along under ideal conditions.



"To get back home without turning the car around the motorman straddles thru the car to the other end and jams his crank down on the controller and when the conductor gets one trolley arm down and the other up—or the same one yanked around —the connections are now so arranged that the armature is in a different relation with the field; that is, the different judicial flow renders the magnetic jerk on the armature around to another field pole instead of the one that it did before—the result: 'reversed motion.' Also there is a separate control in each end that makes it possible for the street car to be backed up without going thru the above actions. This makes it nice in the 'traffic jams,' as it avoids the necessity of the passengers getting out and pushing said car back to let the auto truck, go-cart, bicycle, ice wagon, widow with pack-

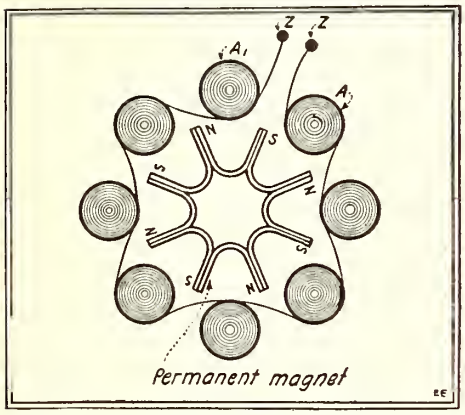
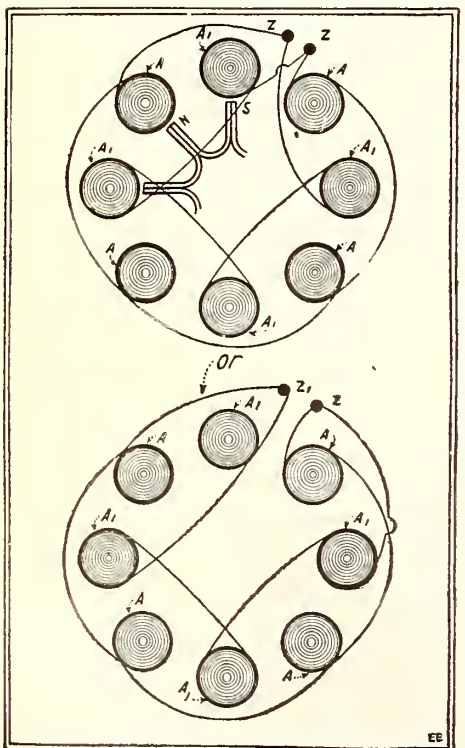
THE ORACLE



The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be publisht. Rules under which questions will be answered:

1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered. Your correct name and address must be signed.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addrest to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of 25 cents is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.



CHANGING THE FORD MAGNETO FROM A. C. TO D. C.

(1023) Rev. V. F. M., North Dakota, asks the "Oracle" several questions relative to converting the Ford auto magneto from A. C. to D. C.

A. 1. We have examined your diagram

Original Connections of Ford Magneto and Arrangement of Rotating Steel Magnets to Produce "Alternating" Current.

Two Proposed Re-connection Schemes for Ford Magnetos, in Order to Derive "Direct" Current. The Reason it Will Not Work as Anticipated Is Explained in the Accompanying Text.

and proposal for converting a Ford A. C. fly-wheel type magneto to a D. C. generator. We have looked over your diagrams carefully, but do not see that you will gain any such result by simply changing the connections and the coils, for the following reason. If you will take, for example, one of your diagrams where you have changed the windings so as to have two series of four poles each, and select a given pole, let us say, A, and note that the revolving steel magnets having alternate north and south poles, of course you will see that this coil will, for example, first be acted upon by a moving *north* pole—and then successively by a moving *south* pole, then by a *north* pole, etc., etc. This will mean, of course, that an *alternating current* will be set up in that particular coil, and in all the other coils so situated and acted upon in that circuit.

Your suggestion prompts the following discussion: Your idea would seem to be the same as trying to get direct current from a revolving field type of alternating current generator, without using a commutator. And here the same reasoning as just set forth comes into force, i. e., you must not forget that in any such case as this the *north* and *south* field magnet poles act alternately on each winding coil, pole or unit, many times per minute. Therefore you will get, as we always do get from a revolving field type of alternator, an *alternating current.* The simplest solution of the whole problem would appear to be to either rig up a commutator on the machine or else to use a D. C. dynamo, and this can be purchased for about $10.00. The Ford magneto, which is an A. C. type of course, owing to its fundamental design, is very rugged, simple and efficient, all things considered, as it only operates the lamps, and in some cases an electric siren, the A. C. current does the work in a thoroly efficient manner. Where a self-starter is fitted to a Ford, which is very exceptional in the Editor's observations, a storage battery is used for operating the starting motor, and this *same* motor is utilized as a charging dynamo by a simple relay arrangement, which changes the circuits for either requirements. The Ford A. C. magneto operates all right as a generator, but it would certainly work very poorly as a motor under any consideration.

TRAIN-DISPATCHING SELECTOR.

(1024) H. H. Gowan, Peterboro, Ont., Canada, writes:—

Q. 1. What book or manual is there available on the subject of train-dispatching selectors?

A. 1. Regarding the details of the "Selector" used on the Western Electric Railroad telephone dispatching system, would say that, so far as the Editor knows, there is no special book on the subject, but the best thing to do, as he has found, is to obtain copies of some of their patents which explain the matter fully. One of these patents which proves very interesting is U. S. Patent No. 1,244,544, which we can supply for 10c.

SPINTHARISCOPE.

(1025) Paul S. Howard, Okmulgee, Okla., asks:—

Q. 1. About construction of a home-made spinthariscope?

A. 1. The microscope by itself cannot be used as a radium spinthariscope. It is necessary to have radium or some radio-active material at one end of your magnifying tube in order to have a spinthariscope. The radio-active substance must be mixed with zinc sulfid or arranged just above a disc covered with the zinc sulfid. The alpha particles shooting off from the radium and colliding with the zinc sulfid is what gives the effect of the "shooting stars." This radio-active material may be secured from radium supply companies.

WANTED!!!

"ODD PHOTOS" AT $1.00 EACH.

Here's what we want! What have you got?

ELECTRICAL PHOTOS—
New photos of Lightning; new and unusual Electrical Apparatus and Machinery; Electric Signs; Electric Autos; Electric Clocks.

SCIENTIFIC PHOTOS—
New Scientific Apparatus; Results; Effects; Motion Pictures; Stunts.

OPTICAL PHOTOS—
Peculiar stunts obtained with various lens arrangements; odd film effects caused by unusual conditions; novel micro-photographic subjects.

ASTRONOMICAL PHOTOS—
New eclipse photos; star and moon effects caught by the camera; comets; shooting stars; progressive moon studies; moon and star photos.

FREAK PHOTOS—
Odd double and triple exposure effects; novel and striking effects due to unusual exposures.

MECHANICAL PHOTOS—
Electrical and Mechanical apparatus of unusual news interest.

RADIO PHOTOS—
New stations, both commercial, government, and private. Owners of private or amateur stations will find a special contest for these photos on another page of this issue.

And don't send us plate or film "negatives"; send unmounted or mounted "prints", preferably a light and dark one. Enclose stamps if photos are to be returned and place a piece of cardboard in the envelope with them to prevent mutilation.

Address photos to—Editor "Odd Photos", Electrical Experimenter, 233 Fulton Street, New York City.

Why Electrical Workers Are Needed.

Consider for a moment what part electricity plays in every-day life, in the comfort, convenience, pleasure and even health of the whole civilized world.

Think of having to ride in horse cars again—

of writing a letter every time you now phone—

of waiting days for what the telegraph does in a few minutes—

of no automobiles or moving picture shows—

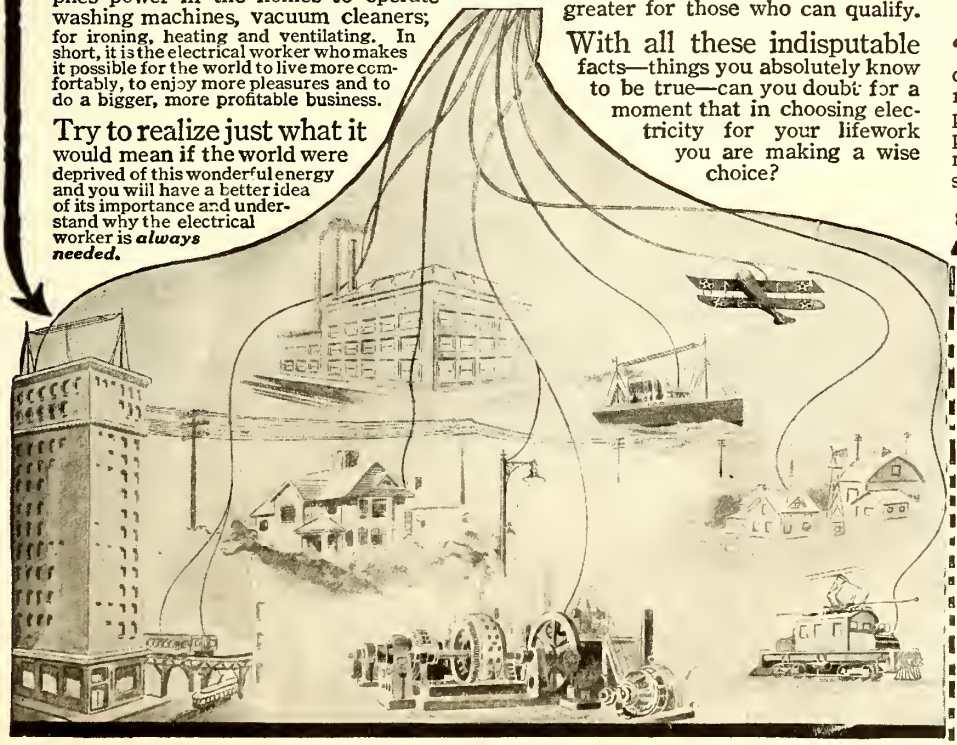
Electricity takes millions to and from work. Without it the automobile and airplane would be impossible—the telephone and telegraph would be useless. All the civilized world relies on it for light, heat, transportation and communication. In a thousand ways electricity is used in factories, offices and in the homes.

Electricity is almost as essential as the air we breathe. Business would be almost at a standstill if deprived of its energy.

To say that electricity is still in its infancy is no exaggeration. Every day brings into practical use some new method of controlling it, some new device or appliance for using it. In industrial work there are still scores of operations where electricity will be utilized sooner or later. The day is coming when the railroads will entirely replace steam with electricity. Doctors, dentists and scientists are only beginning to realize the possibilities af electrical energy.

These facts merely touch the high spots, yet they prove beyond a doubt that electricity plays a vital part in business, in our individual lives, and that there is unlimited scope for those who make electricity their life work.

The electrical worker provides other men light to work by, the telephone and telegraph to convey their orders, the power to run their machines and transport their goods. He supplies power in the homes to operate washing machines, vacuum cleaners; for ironing, heating and ventilating. In short, it is the electrical worker who makes it possible for the world to live more comfortably, to enjoy more pleasures and to do a bigger, more profitable business.



Try to realize just what it would mean if the world were deprived of this wonderful energy and you will have a better idea of its importance and understand why the electrical worker is ***always needed.***

What Electricity Offers You

Once you have mastered the A-B-C of electricity you are confronted with unlimited opportunities for advancement. You can specialize in extending and perfecting the wonders already accomplished in the field. You may take up those branches of electrical and mechanical work which cover the design and manufacture of electrical apparatus or start in to qualify for a well-paid position in the designing, construction, operating or consulting branches of the electrical engineering profession, and to fit yourself eventually for a position as Distribution, Operating, Testing, Erecting or Designing Engineer.

In the automobile, airplane, telephone and telegraph lines there is also great scope for the trained electrician. Many wonders of electricity have yet to be unfolded—its uses multiplied—and opportunities still greater for those who can qualify.

With all these indisputable facts—things you absolutely know to be true—can you doubt for a moment that in choosing electricity for your lifework you are making a wise choice?

How You Can Qualify

You don't have to interfere with your present work while qualifying for a good electrical position. The American School can give you just the training you need in your SPARE TIME. Our electrical courses have been specially prepared for home study—are written so you can understand everything quickly—and from your first lesson until you get your Diploma expert instructors coach you. Our training will enable you to get into the game RIGHT.

Read This Guarantee —Then Act

"We guarantee at any time during the first year of your enrollment to refund the entire amount paid if, immediately upon the completion of ten examinations, you notify the School that you are not satisfied with your course."

One pupil says, "It's the best money I ever invested. The lessons would be cheap at double the price."

Who wants to learn boxing?

Would you like to know how to protect yourself against a bully? To be able to outbox someone bigger than you? To know the eight most effective blows to use, and the best guards against violent attack, not only against blows, but kicks and wrestling holds? Do you know that you can learn these things easily and quickly by the new "shorthand" system of boxing instruction, the Marshall Stillman Method, making your daily exercise interesting as well as beneficial?

Marshall Stillman teaches boxing by science. By this new method he has taught a novice in 15 minutes the difficult scientific left hand lead. It often takes 20 lessons to learn it by the old method. In 40 minutes Marshall Stillman taught 46 new members of the New York State Guard the principles of the hit, guard, and duck. Boxing professors in the Army say that it took them weeks to teach a group those fundamentals by the old method.

This system is so simple that it is taught by mail. You learn the fundamentals right in front of your own mirror. When you face your first opponent, you know how to hit him, what to expect in return, and how to guard against it. Two weeks after receiving it pupils have been able to outbox bigger and stronger opponents. Even boys of 15 have learned to hit and to protect themselves. Men of 50 and 60 have taken it, not only to learn boxing, but for the interesting and beneficial daily exercise.

The new complete Home Study Edition is only $5—less than you would pay for a few lessons by the old method. Besides the 5 "shorthand" lessons on the hit, guard, duck, feinting and clinching and footwork with 25 illustrations, it includes one lesson on daily exercise, 8 illustrations; 3 rounds of shadow boxing, 8 bone-breaking holds and releases (Jiu Jitsu) and 8 holds in standing wrestling, with 69 illustrations; and a complimentary copy, specially bound for home study, of Mike Donovan's famous book "The Science of Boxing," including 70 illustrations.

Send no money

Frankly, you don't believe boxing can be taught by mail, do you? All right, we'll take you on your own ground—we will mail the complete course to you on 5-day approval. Use the coupon below.

Marshall Stillman Association, Suite E-10, No. 461 Fourth Ave., New York.

You may send me on free 5-day approval your new complete Home Study Course in Boxing, including 5 "Shorthand" or Sub-conscious Boxing Lessons, one lesson for daily exercise, 3 rounds of shadow boxing, 8 bone-breaking holds and releases, 8 holds in standing wrestling, and a complimentary copy of Mike Donovan's Book, "The Science of Boxing." I will either return the course or remit $5 in full payment within 5 days after its arrival.

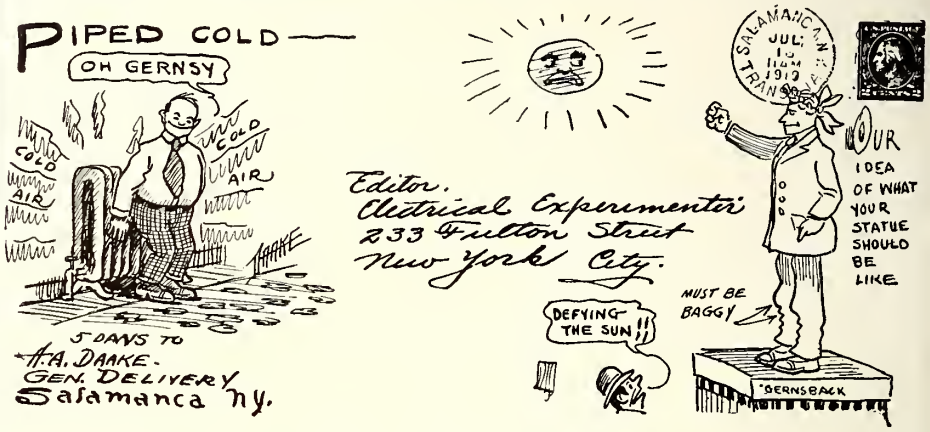
"Piped Cold" — Prof. Bell Has It

(*Continued from page* 517)



our radiators and pipes. But we prefer not only to let our babies and our feeble old folk die unnecessarily every summer, but we actually lose untold millions of dollars thru non-production when the "dog-days" are upon us. No one can work at his best when the mercury climbs to dizzy heights. Production, whether mental or physical, slows down anywhere between forty and eighty per cent. Statistics prove it. Factories as well as offices slow down and just barely creep along. Think of this enormous, incalculable loss alone, not to mention all the physical suffering due to the heat.

Ah, yes, we *do* have our brave fans—which, however, do not cool at all, but only remind us how hot our bodies are the minute we are not in the immediate vicinity of one of these spinning monuments to our stupidity.

For our dear fans only stir up the hot air *and* the dust. Our skin, wet or moist from perspiration, meets this stirred up air and due to a well-known physical phenomenon, *surface evaporation*, we experience a *sense of coolness*, but the air itself is *not* cooled. It is true that surface evaporation produces cold, but in order to have it, it is necessary to let the fans blow upon us, or nearly so, and everyone knows this is far from healthy, frequently producing severe colds. Besides, as soon as we leave the fan our suffering from the heat is all the more acute.

Where is the practical genius who will "study up" on refrigeration and sell us a cheap refrigerating machine which we can connect to our already existing steam or hot water radiators? For the same money which we now spend on fans we ought to be able to buy the machine. And for the money it costs to run the fans we can run the refrigerator, too.

Hundreds of refrigerators have been invented, but the simplest and best no doubt for our purpose is the *cold-air process*. It is based on the principle that the compression of air generates heat and in its subsequent expansion absorbs heat. The air is first comprest, is then past thru a cooler under pressure, after which it is expanded in a cylinder. No chemicals are used with this system and it possesses the very distinct advantage that extremely low temperatures are readily obtainable.

What H. A. Daake, of Salamanca, N. Y., Thought of Mr. Gernsback's Editorial "Piped Cold."

My Inventions

By Nikola Tesla

(*Continued from page* 508)

receiver. The higher the terminal and the greater the space encompast by the wires, the more pronounced is the effect, but it must be understood that it is purely local and has little to do with the real trouble. In 1900, while perfecting my wireless system, one form of apparatus comprised four antennae. These were carefully calibrated to the same frequency and connected in multiple with the object of magnifying the action, in receiving from any direction. When I desired to ascertain the origin of the transmitted impulses, each diagonally situated pair was put in series with a primary coil energizing the detector circuit. In the former case the sound was loud in the telephone; in the latter it ceased, as expected, the two antennae neutralizing each other, but the true statics manifested themselves in both instances and I had to devise special preventives embodying different principles.

The Remedy for Static.

By employing receivers connected to two points of the ground, as suggested by me long ago, this trouble caused by the charged air, which is very serious in the structures as now built, is nullified and besides, the liability of all kinds of interference is reduced to about one-half, because of the directional character of the circuit. This was perfectly self-evident, but came as a revelation to some simple-minded wireless folks whose experience was confined to forms of apparatus that could have been improved with an axe, and they have been disposing of the bear's skin before killing him. If it were true that strays performed such antics, it would be easy to get rid of them by receiving without aerials. But, as a matter of fact, a wire buried in the ground which, conforming to this view, should be absolutely immune, is more susceptible to certain extraneous impulses than one placed vertically in the air. To state it fairly, a slight progress has been made, but not by virtue of any particular

Be a Draftsman

Raise Your Income

Get into this paying profession and have positions opened to you by manufacturers, architects, railroads, contractors—by every kind of a corporation where mechanical design and construction are carried out. Draftsmanship puts you in the class of specialists, raises you above the crowd of job hunters, makes you a man whose services are needed.

You have the same opportunity to get the training that other men had who took the Chicago "Tech" Course in Draftsmanship and are now drawing large salaries and holding important, responsible positions. You also can learn how to earn

$25 to $100 a Week

Not enough really skilled draftsmen are available to fill the places open now. All you need is training to be prepared to answer the call that will mean more money for you. Begin your training without delay. Don't waste time waiting. The Chicago "Tech" experts are ready today to give you the thorough, practical instruction which will enable you to step into the drafting room of some big organization prepared to do the kind of work that earns high salaries and leads to advancement. At least write. Mail the coupon below or a letter stating which branch specially interests you.

Drawing Outfit

(No Extra Charge)

Every student of the Chicago "Tech" Home Study Course in Draftsmanship receives this drawing outfit—set of instruments in case, drawing board, T square, triangles, scale, curve, drawing paper, pencils, etc. or a cash credit in case he already has an outfit. These instruments are of the same make and sizes as used by high salaried experts in drafting rooms of factories, shops, railroads, etc. You use them while learning — then take them right into your practical work.

Come to Chicago "Tech" OR TRAIN AT HOME

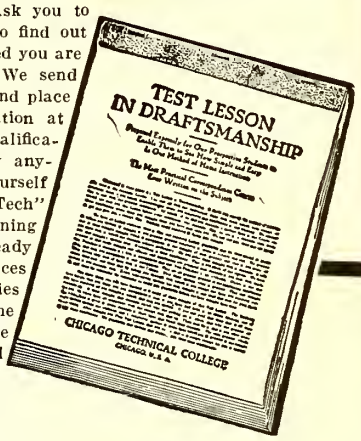
Chicago "Tech" has its students everywhere. If you can't come to Chicago, take the Home Study course. The same professors who direct the resident courses will teach you by mail. You will have their personal direction, you will learn the most modern methods—all this while holding your present job. We train hundreds of ambitious men—and see them quickly rise to success. You therefore need not be denied this technical education. Sign and mail the coupon.

Get Practical Training from Practical Men

NO TIME PUT IN ON NEEDLESS STUDIES

Enrollment with Chicago "Tech" means getting direct personal instruction from men who for years have planned and directed big architectural and engineering work in leading cities. They have weeded out useless theories and needless studies and will give you the kind of instruction which will enable you to work beside the most experienced men.

That is one reason why you can get a complete, thorough technical training here in such a short time. Also the reason why Chicago "Tech" men are in such great demand. They go into work prepared to give the kind of service wanted.



This is the training you are offered either at the college or by mail. And this is the time to enroll when there is such a pressing need for highly trained draftsmen. Use your spare hours to fit yourself for a bigger salary—a more important position. Chicago "Tech" offers you the opportunity. **WRITE.**

EASY PAYMENTS

Low tuition fees and easy terms of payment. Pay as you go along. Get training which will soon repay in extra earnings all the cost of the course. You know the salaries received by skilled technical men today. Get information on the opportunities which are opened wide to you by Chicago "Tech". We will give you all this information about fees, terms, etc., and send testimonials from Chicago "Tech" graduates on how they have profited from our instruction, if you will send the coupon.

FREE TEST LESSON

Other institutions ask you to pay first—and then to find out later how well qualified you are for this profession. We send the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything. And see for yourself just what Chicago "Tech" offers you in training which will bring a ready market for your services and open opportunities which are closed to the untrained man. The coupon will bring all the facts about the course, the small fee, and the easy terms.

Auto and Gas Engine Course

All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Learn all about Principles of the Automobile, all about Gas Engines, Power Plants, Transmissions Lubrication, Cooling, Batteries, Starting and Lighting Systems, etc.

KNOW HOW TO FIX TROUBLES

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men.

Aeronautics

Complete, practical instruction in Aeronautic Engineering. Every principle made clear. Construction of every type of machine fully explained. This course equips you for expert work. Get the catalog and information. Send coupon.

WRITE

Below we list our principal courses in Drafting and several others. Just mark X in the [ ] to show which course interests you and we will send catalog and information about that particular subject. If in doubt about yourself, tell us your ambitions and we will advise you. Sending this coupon may mark a turning point in your career. May lead to a larger measure of success than you have expected. We can train you as we have trained others. Send the coupon today.

Boys! Win an Auto-Wheel

In This Interesting Contest

TO THE BOY who can think of the most interesting uses for the popular AUTO-WHEEL COASTER, for earning money and for play, we shall award one of our large models absolutely FREE. It's a mighty generous prize for a few minutes' work. And the following eleven valuable prizes will be given to those sending in the next best uses: **Camera, Camping Tent, Mess Kit, Scout Knife, Fleetwing Steering Sled, Compass, Ingersoll Watch, Axe, Bank, Electric Flashlight, Poncho.**

INFORMATION ABOUT CONTEST

1. Any boy or girl not over 15 years may compete.
2. Contest will be judged by three men well-known in the Boy Scout organization.
3. Write to Business Idea Dept., Buffalo Sled Co., for pamphlet explaining the Contest, and colored catalog telling all about Auto-Wheel.
4. At end of letter write names of three Coaster Wagon Dealers in your town. If any carry the Auto-Wheel put an "x" after name.

YOU CAN DO IT. Any live boy who knows how to get fun and earn money out of a good, strong coaster wagon, has a fine chance to get the Auto-Wheel as a prize. **Here are a few pointers:** The Auto-Wheel is a wagon for work or play. It's built for strength and speed. Has roller bearings, steel axles and tires, body white ash, maple gear.

If there's an Auto-Wheel dealer near you, he'll gladly let you see the Auto-Wheel Coaster in his store, and he'll give you some good ideas for your letter. CONTEST CLOSES NOVEMBER 30, 1919.

HERE'S YOUR CHANCE. GET BUSY.

Buffalo Sled Co.,
163 Schenck Street,
N. Tonawanda, N. Y.

In Canada:
Preston,
Ontario.

ONLY $5.00
A MONTH PAYS FOR THIS SPLENDID DIAMOND RING

SPECIAL VALUE

SWEET'S Cluster; 7 fine Diamonds set in Platinum. Looks like $225 Solitaire.

Seven perfectly matched, blue-white Diamonds, skilfully mounted in Platinum to resemble one magnificent Solitaire. The Diamonds were selected for their perfect cut, their blue-white color, their superior quality and wonderful brilliancy, by one of our most skilful Diamond experts; together they look like one large, single stone. A most handsome and showy ring for the least amount of money.

SEND NO MONEY—we will send the ring, all charges prepaid—you are sure to be pleased. Pay only $12.50 on delivery—the balance in ten months: $5.00 EACH MONTH, until entire price, $62.50 has been paid.

OUR PROFIT-SHARING PLAN

Our customers have the benefit of a 7½% increased re-purchase value. Write for particulars—know the House of Sweet.

method or device. It was achieved simply by discarding the enormous structures, which are bad enough for transmission but wholly unsuitable for reception, and adopting a more appropriate type of receiver. As I pointed out in a previous article, to dispose of this difficulty for good, a radical change must be made in the system, and the sooner this is done the better.

Radio Government Control Not Wanted.

It would be calamitous, indeed, if at this time when the art is in its infancy and the vast majority, not excepting even experts, have no conception of its ultimate possibilities, a measure would be rushed through the legislature making it a government monopoly. This was proposed a few weeks ago by Secretary Daniels, and no doubt that distinguished official has made his appeal to the Senate and House of Representatives with sincere conviction. But universal evidence unmistakably shows that the best results are always obtained in healthful commercial competition. There are, however, exceptional reasons why wireless should be given the fullest freedom of development. In the first place it offers prospects immeasurably greater and more vital to betterment of human life than any other invention or discovery in the history of man. Then again, it must be understood that this wonderful art has been, in its entirety, evolved here and can be called "American" with more right and propriety than the telephone, the incandescent lamp or the aeroplane. Enterprising press agents and stock jobbers have been so successful in spreading misinformation that even so excellent a periodical as the *Scientific American* accords the chief credit to a foreign country. The Germans, of course, gave us the Hertz-waves and the Russian, English, French and Italian experts were quick in using them for signaling purposes. It was an obvious application of the new agent and accomplished with the old classical and unimproved induction coil—scarcely anything more than another kind of heliography. The radius of transmission was very limited, the results attained of little value, and the Hertz oscillations, as a means for conveying intelligence, could have been advantageously replaced by sound-waves, which I advocated in 1891. Moreover, all of these attempts were made three years after the basic principles of the wireless system, which is universally employed to-day, and its potent instrumentalities had been clearly described and developed in America. No trace of those Hertzian appliances and methods remains today. We have proceeded in the very opposite direction and what has been done is the product of the brains and efforts of citizens of this country. The fundamental patents have expired and the opportunities are open to all. The chief argument of the Secretary is based on interference. According to his statement, reported in the New York *Herald* of July 29th, signals from a powerful station can be intercepted in every village of the world. In view of this fact, which was demonstrated in my experiments of 1900, it would be of little use to impose restrictions in the United States.

America First.

As throwing light on this point, I may mention that only recently an odd looking gentleman called on me with the object of enlisting my services in the construction of world transmitters in some distant land. "We have no money," he said, "but carloads of solid gold and we will give you a liberal amount." I told him that I wanted to see first what will be done with my inventions in America, and this ended the interview. But I am satisfied that some dark forces are at work, and as time goes on the maintenance of continuous communication will be rendered more difficult. The only remedy is a system immune against interruption. It has been perfected, it exists, and all that is necessary is to put it in operation.

The terrible conflict is still uppermost in the minds and perhaps the greatest importance will be attached to the Magnifying Transmitter as a machine for attack and defense, more particularly in connection with *Telautomatics*. This invention is a logical outcome of observations begun in my boyhood and continued thruout my life. When the first results were publisht the *Electrical Review* stated editorially that it would become one of the "most potent factors in the advance and civilization of mankind." The time is not distant when this prediction will be fulfilled. In 1898 and 1900 it was offered to the Government and might have been adopted were I one of those who would go to Alexander's shepherd when they want a favor from Alexander. At that time I really thought that it would abolish war, because of its unlimited destructiveness and exclusion of the personal element of combat. But while I have not lost faith in its potentialities, my views have changed since.

The Road to Permanent Peace.

War can not be avoided until the physical cause for its recurrence is removed and this, in the last analysis, is the vast extent of the planet on which we live. Only thru annihilation of distance in every respect as, the conveyance of intelligence, transport of passengers and supplies and transmission of energy will conditions be brought about some day, insuring permanency of friendly relations. What we now want most is closer contact and better understanding between individuals and communities all over the earth, and the elimination of that fanatic devotion to exalted ideals of national egoism and pride which is always prone to plunge the world into primeval barbarism and strife. No league or parliamentary act of any kind will ever prevent such a calamity. These are only new devices for putting the weak at the mercy of the strong. I have exprest myself in this regard fourteen years ago, when a combination of a few leading governments—a sort of Holy Alliance—was advocated by the late Andrew Carnegie, who may be fairly considered as the father of this idea, having given to it more publicity and impetus than anybody else prior to the efforts of the President. While it can not be denied that such a pact might be of material advantage to some less fortunate peoples, it can not attain the chief object sought. Peace can only come as a natural consequence of universal enlightenment and merging of races, and we are still far from this blissful realization. As I view the world of today, in the light of the gigantic struggle we have witnest, I am filled with conviction that the interests of humanity would be best served if the United States remained true to its traditions and kept out of "entangling alliances." Situated as it is, geographically, remote from the theaters of impending conflicts, without incentive to territorial aggrandizement, with inexhaustible resources and immense population thoroly imbued with the spirit of liberty and right, this country is placed in a unique and privileged position. It is thus able to exert, independently, its colossal strength and moral force to the benefit of all, more judiciously and effectively, than as member of a league.

"The Job is Yours— on One Condition!"

"For a long time I watched the new men who came into this business. Some stood still—stayed right where they started. Others climbed—made each job a stepping stone to something better.

"Now, what was the difference? Well, I investigated and found out. The men who were getting ahead had been devoting part of their spare time to study along the line of their work. Our treasurer used to be a bookkeeper. The factory superintendent was working at a bench in the shop a few years ago. The sales manager started in a branch office up state. The chief designer rose from the bottom in the drafting room.

"All of these men won their advancements through spare time study with the International Correspondence Schools. Today they are earning four or five times—yes, some of them *ten* times as much money as when they came with us.

"So out of this experience we have formed a policy. We are looking for men who care enough about their future not only to do their present work well, but to devote part of their spare time to preparation for advancement.

"And I'll give you this job on one condition—that you take up a course of special training along the line of your work. Let the I. C. S. help you for one hour after supper each night and your future in this business will take care of itself."

Employers are begging for men with ambition, men who really want to get ahead in the world and are willing to prove it by training themselves in spare time to do some one thing well.

Prove that you are that kind of a man! The International Correspondence Schools are ready and anxious to help you prepare for advancement in the work of your choice, whatever it may be. More than two million men and women in the last 28 years have taken the I. C. S. route to more money. Over 100,000 others are getting ready in the same way right now. Surely the least you can do is to find out what there is in this proposition for *you*. Here is all we ask: Without cost, without obligating yourself in any way, simply mark and mail this coupon.

The Mechanistic Theory of Life.

In one of these biographical sketches, published in the ELECTRICAL EXPERIMENTER, I have dwelt on the circumstances of my early life and told of an affliction which compelled me to unremitting exercise of imagination and self-observation. This mental activity, at first involuntary under the pressure of illness and suffering, gradually became second nature and led me finally to recognize that I was but an automaton devoid of free will in thought and action and merely responsive to the forces of the environment. Our bodies are of such complexity of structure, the motions we perform are so numerous and involved, and the external impressions on our sense organs to such a degree delicate and elusive that it is hard for the average person to grasp this fact. And yet nothing is more convincing to the trained investigator than the mechanistic theory of life which had been, in a measure, understood and propounded by Descartes three hundred years ago. But in his time many important functions of our organism were unknown and, especially with respect to the nature of light and the construction and operation of the eye, philosophers were in the dark. In recent years the progress of scientific research in these fields has been such as to leave no room for a doubt in regard to this view on which many works have been published. One of its ablest and most eloquent exponents is, perhaps, Felix Le Dantec, formerly assistant of Pasteur. Prof. Jacques Loeb has performed remarkable experiments in heliotropism, clearly establishing the controlling power of light in lower forms of organisms, and his latest book, "Forced Movements," is revelatory. But while men of science accept this theory simply as any other that is recognized, to me it is a truth which I hourly demonstrate by every act and thought of mine. The consciousness of the external impression prompting me to any kind of exertion, physical or mental, is ever present in my mind. Only on very rare occasions, when I was in a state of exceptional concentration, have I found difficulty in locating the original impulses.

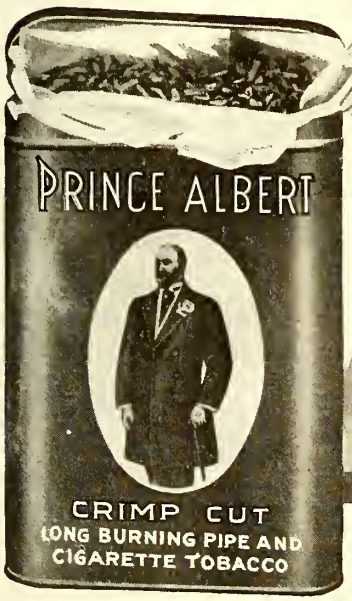
Lack of Observation a Form of Ignorance.

The by far greater number of human beings are never aware of what is passing around and within them, and millions fall victims of disease and die prematurely just on this account. The commonest, every-day occurrences appear to them mysterious and inexplicable. One may feel a sudden wave of sadness and rake his brain for an explanation when he might have noticed that it was caused by a cloud cutting off the rays of the sun. He may see the image of a friend dear to him under conditions which he construes as very peculiar, when only shortly before he has passed him in the street or seen his photograph somewhere. When he loses a collar button he fusses and swears for an hour, being unable to visualize his previous actions and locate the object directly. Deficient observation is merely a form of ignorance and responsible for the many morbid notions and foolish ideas prevailing. There is not more than one out of every ten persons who does not believe in telepathy and other psychic manifestations, spiritualism and communion with the dead, and who would refuse to listen to willing or unwilling deceivers. Just to illustrate how deeply rooted this tendency has become even among the clear-headed American population, I may mention a comical incident.

Psychic Phenomena in the Manufacture of Flivvers.

Shortly before the war, when the exhibition of my turbines in this city elicited widespread comment in the technical papers, I anticipated that there would be a scramble among manufacturers to get hold of the invention, and I had particular designs on that man from Detroit who has an uncanny faculty for accumulating millions. So confident was I that he would turn up some day, that I declared this as certain to my secretary and assistants. Sure enough, one fine morning a body of engineers from the Ford Motor Company presented themselves with the request of discussing with me an important project. "Didn't I tell you?" I remarked triumphantly to my employees, and one of them said, "You are amazing, Mr. Tesla; everything comes out exactly as you predict." As soon as these hard-headed men were seated I, of course, immediately began to extol the wonderful features of my turbine, when the spokesmen interrupted me and said, "We know all about this, but we are on a special errand. We have formed a psychological society for the investigation of psychic phenomena and we want you to join us in this undertaking." I suppose those engineers never knew how near they came to being fired out of my office.

Confuting Spiritism.



Ever since I was told by some of the greatest men of the time, leaders in science whose names are immortal, that I am possesst of an unusual mind, I bent all my thinking faculties on the solution of great problems regardless of sacrifice. For many years I endeavored to solve the enigma of death, and watched eagerly for every kind of spiritual indication. But only once in the course of my existence have I had an experience which momentarily impressed me as supernatural. It was at the time of my mother's death. I had become completely exhausted by pain and long vigilance, and one night was carried to a building about two blocks from our home. As I lay helpless there, I thought that if my mother died while I was away from her bedside she would surely give me a sign. Two or three months before I was in London in company with my late friend, Sir William Crookes, when spiritualism was discussed, and I was under the full sway of these thoughts. I might not have paid attention to other men, but was susceptible to his arguments as it was his epochal work on radiant matter, which I had read as a student, that made me embrace the electrical career. I reflected that the conditions for a look into the beyond were most favorable, for my mother was a woman of genius and particularly excelling in the powers of intuition. During the whole night every fiber in my brain was strained in expectancy, but nothing happened until early in the morning, when I fell in a sleep, or perhaps a swoon, and saw a cloud carrying angelic figures of marvelous beauty, one of whom gazed upon me lovingly and gradually assumed the features of my mother. The appearance slowly floated across the room and vanished, and I was awakened by an indescribably sweet song of many voices. In that instant a certitude, which no words can express, came upon me that my mother had just died. And that was true. I was unable to understand the tremendous weight of the painful knowledge I received in advance, and wrote a letter to Sir William Crookes while still under the domination of these impressions and in poor bodily health. When I recovered I sought for a long time the ex-

DETROIT

the Automobile Center of the World is the Logical Place to

LEARN AUTOMOBILE ELECTRICS

Training for Head and Hand

Auto Electricians are in big demand everywhere. Interesting work—big salaries—exceptional opportunities for advancement. Every garage, factory and service station needs one or more good men. Also splendid opportunities to open electrical service stations and make big money. Cars need constant attention. Nearly all the trouble is electrical. Six million cars now in use—a million and a half new ones will be put in service this year. That means thousands of trained men will be needed. Men trained in Detroit get the preference.

NOT A "ONE MAN SCHOOL"

The M. S. A. S. embodies the best ideas in the Auto Industry. No other school offers such an advantage as this school here in Detroit. School open all the year, enter classes any day.

KING MOTOR CAR COMPANY

BUILDERS OF KING CARS — DETROIT, U.S.A.

Replying to a recent letter addressed to Mr. Artemas Ward making inquiry as to the reputation of the Michigan State Auto School, will say that as far as we know all Detroit Automobile manufacturers endorse the work they are doing.

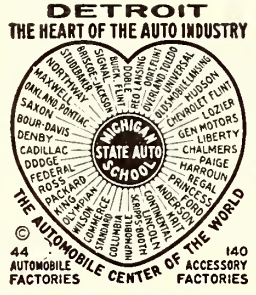
It is managed very efficiently and they have been turning out some pretty good men for the automobile industry, and cannot see any reason why you should hesitate about taking a course with this Institution.

Yours very truly,
KING MOTOR CAR COMPANY

MONEY-BACK GUARANTEE

We guarantee to qualify you for a position as chauffeur, repair man, tester, demonstrator, auto electrician, garage man, automobile dealer, Aeroplane motor mechanic or tractor mechanic and operator, paying from $100 to $400 monthly or refund your money.

Be An Auto Electrician
Earn $200 to $500 Monthly



If you are electrically inclined this is your best opportunity. Our complete Auto Course trains you thoroughly in Auto Electrics. You can hold down **any** job or run a business of your own. You make more money because you can locate trouble quickly, without waste of time. All your time is spent repairing the trouble—not looking for it. Our successful graduates are in every part of the world.

Auto Factories Heartily Endorse Our School

They not only endorse the M. S. A. S. but they also give us hearty co-operation. They employ our students while taking course and after they graduate. We have the latest model chassis for students to work on. In this way our students get best possible training in most practical manner.

"School News" and 176 Page Catalog FREE

Just off the press. Gives complete information. Quotes dozens of letters from students who have actually done what you would like to do. What better proof do you want that YOU can do it? You CAN! — but get busy. "Jump" a train and come to Detroit. Hundreds have done it and made good. Will help you get a job if necessary to pay expenses while taking our course. Get action NOW.

My Inventions

By Nikola Tesla

(*Continued from page* 554)

ternal cause of this strange manifestation and, to my great relief, I succeeded after many months of fruitless effort. I had seen the painting of a celebrated artist, representing allegorically one of the seasons in the form of a cloud with a group of angels which seemed to actually float in the air, and this had struck me forcefully. It was exactly the same that appeared in my dream, with the exception of my mother's likeness. The music came from the choir in the church nearby at the early mass of Easter morning, explaining everything satisfactorily in conformity with scientific facts.

This occurred long ago, and I have never had the faintest reason since to change my views on psychical and spiritual phenomena, for which there is absolutely no foundation. The belief in these is the natural outgrowth of intellectual development. Religious dogmas are no longer accepted in their orthodox meaning, but every individual clings to faith in a supreme power of some kind. We all must have an ideal to govern our conduct and insure contentment, but it is immaterial whether it be one of creed, art, science or anything else, so long as it fulfills the function of a dematerializing force. It is essential to the peaceful existence of humanity as a whole that one common conception should prevail.

Tesla's Astounding Discovery.

While I have failed to obtain any evidence in support of the contentions of psychologists and spiritualists, I have proved to my complete satisfaction the automatism of life, not only through continuous observations of individual actions, but even more conclusively through certain generalizations. These amount to a discovery which I consider of the greatest moment to human society, and on which I shall briefly dwell. I got the first inkling of this astounding truth when I was still a very young man, but for many years I interpreted what I noted simply as coincidences. Namely, whenever either myself or a person to whom I was attached, or a cause to which I was devoted, was hurt by others in a particular way, which might be best popularly characterized as the most unfair imaginable, I experienced a singular and undefinable pain which, for want of a better term, I have qualified as "cosmic," and shortly thereafter, and invariably, those who had inflicted it came to grief. After many such cases I confided this to a number of friends, who had the opportunity to convince themselves of the truth of the theory which I have gradually formulated and which may be stated in the following few words:

Our bodies are of similar construction and exposed to the same external influences. This results in likeness of response and concordance of the general activities on which all our social and other rules and laws are based. We are automata entirely controlled by the forces of the medium, being tossed about like corks on the surface of the water, but mistaking the resultant of the impulses from the outside for free will. The movements and other actions we perform are always life preservative and tho seemingly quite independent from one another, we are connected by invisible links. So long as the organism is in perfect order it responds accurately to the agents that prompt it, but the moment that there is some derangement in any individual, his self-preservative power is impaired. Everybody understands, of course, that if one becomes deaf, has his eyesight weakened, or his limbs injured, the chances for his continued existence are lessened. But

Which Job Do You Want?

NOT one of these jobs is beyond your reach. You can have any one you want. The big pay that goes with it is yours, too. A little ambition and some training that you give yourself at home is all you need. You don't have to serve an apprenticeship. You don't have to go to school. American Technical Society Home Study Books and a little spare time will quickly fit you to hold any kind of job. If you haven't the necessary "know how" to put you in the big pay class, make up your mind to get it right now. Pick out the job you want and send the coupon for the books that will fit you to hold it.

Some of the greatest experts in the world prepared these books just for you—to help you get ahead. They are written in plain, everyday, good old U.S. language, just like you and I talk. No big technical terms—no trouble to understand them. Hundreds of pictures and diagrams in each set help to make difficult things as simple as A. B. C.

Treat Yourself At Home

Here is a partial list of ailments treated successfully, with the Violetta, Violet-Ray Machine.

Asthma
Barbers' Itch
Boils
Blackheads
Bunions
Callous
Catarrh
Chilblains
Colds
Corns
Constipation
Dandruff
Deafness
Earache
Eczema
Eye Diseaso
Falling Hair
Hay Fever
Headache
Goitre
Insomnia
Lumbago
Nervousness
Neuralgia
Neuritis
Obesity
Pains
Paralysis
Piles
Pimples
Pyorrhea
Rheumatism
Skin Diseases
Sore Throat
Sprains
Tonsilitis
Whooping Cough

VIOLET RAYS Remove Pain As If By Magic!

Try This for Health and Beautify—10 Days Free

The magic of Violet Rays now brought to your home. Most famous electrical health and beauty device yours for 1 cent per treatment. Relieves pain almost instantly from neuritis, rheumatism, lumbago. Rid yourself of headaches, catarrh, constipation, insomnia, nervousness. Beautify hair and skin. Double your vigor, energy, and vitality.

VIOLETTA VIOLET RAY MACHINE

Not a vibrator. No shock. No pain. Wonderful even for infants. Soothes and relieves while vitalizing every cell and every tissue. Write today for free book and 10 days' trial offer. Read amazing story of Violet Ray. High Frequency Current. The VIOLETTA is sold direct to you from our own laboratories. Mail coupon or postal right now.

Science in Slang

By Emerson Easterling

(*Continued from page* 547)

ages, baby buggy, and other objects ahead untangle and get on their way. And it always looks more graceful to see the cars running under their own power, too."

"How about the lights and heat in the cars?" spoke up a stranger. Then, after apparent thought, "Oh, of course it comes in like the power."

"Of course," replied Jazz.

Just then the power came on. The lights flashed up again. We were lighted as well

Here We Have Tommy Edison Running His First Model of the Electrical Railway Somewhere Over the Jersey Flats, And Believe Us, It Worked.

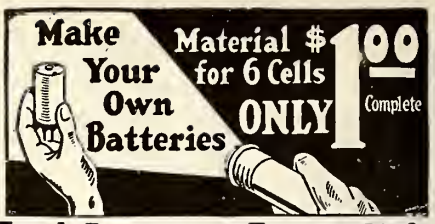
as enlightened. (How do you get that way.)

Somehow I couldn't help looking around at the couple in the corner. They were gone. But some rice was left in the seat. I don't know whether they will have rice or eggs for breakfast, tho.

"Does it make much difference whether they use direct or alternating current for the cars?" I asked of Stokes.

"Not much," he answered back as he spit out of the window of the car, now in motion.

EDISON VS. SPRAGUE ON ELECTRIC RAILWAYS



To the Editor of the New York Sun.

SIR: I have noticed in your paper of August 27, 1919, a communication from Frank J. Sprague in which he takes me to task for claiming in a recently published article the invention of the trolley car.

Mr. Sprague's principal contribution to the trolley car was the mechanical suspension of the electric motor to the truck. The motor itself was the modern reversible, low resistance, high efficiency, dynamo-motor devised and developed by me in working out the incandescent electric light system. This was already invented and at hand for Mr. Sprague to adopt to the conditions of a railway car truck. Neither he nor Siemens nor any one else could have succeeded in making a trolley system commercially practicable without this development.

A trolley car does not constitute a trolley system. A central current generation and distributing station and a complete system of conductors are absolute necessities. I had already spent years in their development for the incandescent electric light system and they were available to Mr. Sprague.

Mr. Sprague states also that he had great financial difficulties in introducing the trolley system into Richmond and carried it out largely by his personal credit. Perhaps he has forgotten that when his com-

Fresh Batteries—Easy to Make

In about 2 minutes you can make a better, fresher flashlight battery than you can buy—and you get full life of chemicals. Stronger light, 25% cheaper—400% more service in Make-UR-Own batteries. Fit 1½ x 6½ in. tubular flashlight case. Enough in outfit to last a year of ordinary use. Don't buy "dead" batteries—make your own. Satisfaction, or money-back guarantee.

Renewal Outfit—Parts and chemicals to make 6 cells complete.... $1.00

Marvel Flashlight Outfit—Flashlight case of fibre heavily nickel trimmed, Mazda lamp, complete with 6-cell Make-UR-Own battery outfit $2.35

In ordering give name and full address plainly written; mention amount enclosed and which outfit is desired.

AGENTS WANTED

PROTECTO EXPLOSION AUTOMOBILE WHISTLE

A pleasing, effective warning signal—clear, loud tone. Gets the right-of-way in dense traffic—prevents accidents. Replaces priming cup, or furnished with attachment for spark plug. Cannot get out of order—no wiring. Attach it yourself in a few minutes. Specify make of car. Order today. $2.50 complete.

pany was without funds and the Richmond project was in a serious situation, due to too much mathematics on the part of Mr. Sprague, I came forward and trusted his company for over $100,000 worth of apparatus and the aid of my men to pull the scheme thru.

What Mr. Sprague can really claim is that by his persistence and electrical knowledge he was the first one to start the trolley car system commercially. This is what I have always thought and publicly stated.

THOMAS A. EDISON.

Orange, N. J., September 3.

Treasure Ships Located Electrically

(*Continued from page* 512)

simple matter to locate the wreck. All the commander of his submarine will have to do is to cruise back and forth near the spot where the sunken vessel is supposed to lie. Sooner or later the faithful induction balance will find the wreck.

In our illustration it will be seen that the balances can be raised or lowered by means of winches on board the submarine. This is necessary because the submarine floats at a certain level. The depth of the ocean naturally varies more or less; if a deeper strata is encountered, the induction balances must be lowered further than in cruising in shallow water. Not only will the induction balance give us the exact spot where the ship is located, but it will also give us the exact location if the ship should be entirely covered with sand or silt.

The cost of an outfit of this kind is negligible, as such an under-water Hughes balance can be constructed for less than $100.

MEASUREMENTS OF WAVE-LENGTHS IN THE SPECTRUM OF NEON.

The lines in the neon spectrum are very sharp, a quality which recommends this gas as a standard source wherever the lines have sufficient strength. The ultra-violet group between 3369A and 3520A may be used for standards, and there are a few good infra-red lines, but the strength and distribution of the lines in the region 5852A to 7438A make the neon spectrum particularly useful as a comparison in this region, says the *Bureau of Standards* Bulletin.

The wave-lengths of fifty-five lines in the neon spectrum have been measured by means of the interferometer. These lines lie in the region of 3369A to 8495A. The strong lines in the visible region of the spectrum have been observed with great accuracy, the probable error being one part in several millions, or less than one-tenth the width of the line. These strong lines were observed by means of three different pairs of interferometer plates, which were each used on several interferometers. The ultra-violet lines and all the strong lines in the visible were compared directly with the fundamental standards 6438A. Some of the deep red and infra-red lines were compared with well-determined lines in the visible neon spectrum.

One hundred and eighty-nine faint lines in the visible and infra-red neon spectrum have been measured by means of a concave grating. The probable error of these grating measurements is one or two hundredths angstrom. The region covered by the grating observations extends from 5343A to 8783A.

The constant differences discovered by Watson are found to hold with remarkable exactness in the case of lines which are strong enough to be measured with the highest accuracy. In fact, the differences are exactly constant within the limits set by the accuracy of the wave-lengths.

Do Germs and Climate Cause CATARRH, Coughs and Colds?

By R. L. ALSAKER, M.D.

R. L. ALSAKER, M.D.

NOTE.—Dr. Alsaker is a successful practicing physician in one of the largest cities of the U. S.

Doctor Alsaker: I have had catarrh since boyhood, and now my two children have it. During the winter months my wife suffers with bad colds.

We have taken treatment from local physicians, using the medicines prescribed; we have used sprays and salves, but have derived no lasting benefit.

We live well, eating and drinking whatever we want, but we do not dissipate in any way. Our family physician tells us that catarrh is caused by germs. Another doctor told us to blame it on the climate. If germs and the climate are the cause of catarrh, I don't see how it can be prevented or even cured. What have you to say on the subject? J. B. W.

THIS family is no exception. The majority have catarrh, either chronic or acute. Catarrh of the head is annoying—and filthy. In the throat it causes irritating coughs. When it is seated in the chest it is called bronchitis. If allowed to continue, the bronchitis becomes chronic and robs the individual of refreshing sleep, comfort and health. It weakens the lungs and paves the way for pneumonia and consumption.

Catarrh of the stomach and intestines points toward indigestion. So does catarrh of the liver, which produces various ills, such as jaundice and gall-stones, often ending in disagreeable and painful liver colic.

Catarrh sometimes causes earache, headache and other forms of pain, and it lays the foundation for many diseases.

This gentleman says that he lives well, but no one lives well who is ill. That is poor living. He can continue to eat what he likes, and grow healthy, if he will only learn how.

He thinks that germs and the climate are to blame, and as germs and climate are everywhere, we are helpless. It is a tragic fate, or would be, if it were true, for we can't escape the omnipresent germs and climate.

But neither germs nor the climate causes catarrh. Catarrh is due to improper eating—so are coughs and colds—and these conditions can be prevented and cured through right eating. And here is how it happens:

When people eat as they should *not*, they get indigestion, which fills the stomach and bowels with acids, gases and poisons; a part of these abnormal products are absorbed into the blood, which becomes very impure and the whole body gets acid. The blood tries to purify itself, and a lot of the waste attempts to escape by way of the mucous membrane. This causes irritation, and the result is colds and catarrhs.

The right kind of food, properly eaten, makes pure blood and produces health, vigor and strength. The right kind of food builds a sound body, puts catarrh, pimples and blotches to flight, and paints roses on the cheeks and makes life worth living.

Catarrh can be conquered quickly, surely and permanently. It has been done in thousands of cases. *If you have catarrh you have eaten your way to it.* You can cure yourself—you can eat your way out of catarrh into health, and while you are losing your catarrh you will rid yourself of other physical ills: The dirty tongue, that tired feeling, the bad taste in the mouth in the morning, the gas in the stomach and bowels, the headache and other aches, pains and disabilities will clear up and vanish. It is marvelous what proper eating will do, when other means fail. Don't take my word for it, but prove it in your own case and on your own person.

Catarrh is a luxury, not a necessity. Those who get it, can keep it indefinitely. They can also get rid of it and stay rid of it. Those who have catarrh should not complain about it, for they can easily get the knowledge that will show them how to get rid of catarrh and back to health.

Realizing the universal need of clearly defined instruction on the cause and cure of catarrh, coughs and colds, I have outlined in a small volume an attractive plan of living that has proved successful in curing and preventing these troublesome conditions. My instructions are easy to understand and pleasant to follow.

The plan shows how to live so as to have health at all times. It tells you in plain English the true cause of catarrh, and it gives you the true cure—a cure that works. There is nothing mysterious about it. You need not go to health resorts. You need not take drugs. It is simple, good, workable common sense that you can apply without expense *right in your own home.* The title of this book is, "CURING CATARRH, COUGHS AND COLDS." Its price is considerably less than the usual charge for prescribing treatment—less than the usual charge for a patent "cure all" *that doesn't cure*—less than it would cost you to lose a day's pay on account of sickness—less than the cost of an evening at the theatre. In fact, its real value to you cannot be measured in dollars and cents.

Send only two dollars and ten cents to my publisher, Frank E. Morrison, Dept. 312, 1133 Broadway, New York, and get your copy of this book of instructions. Follow my complete plan of treatment for the cure of Catarrh and the prevention of colds, for one month; then if you are not entirely satisfied with the improvement in your health, return the book and your money will be refunded to you.

Remember this: If you want to free yourself of Catarrh you can do so. You have your choice of living right or living wrong. This book teaches you the truth and nothing but the truth. Get it.—

(*Continued on page* 560)

PUBLISHER'S ANNOUNCEMENT: R. L. Alsaker, M.D., is an eminent authority on the subject discussed in the above article. He has a large and constantly growing practice; his patients come from all corners of the globe and they learn from him how to get well and stay well. He has put the net results of his many years of professional experience with sick people into his writings and it is a real pleasure for me to recommend them, because I know from personal experience and observation that good results *always* follow an observance of his simple instructions. Don't risk another day's sickness. Send $2.10 for "Curing Catarrh, Coughs and Colds" and learn quickly how you can get back to health and happiness. Money returned if you follow instructions for one month and are not entirely satisfied with your improvement in health. FRANK E. MORRISON (Estab. 1889), PUBLISHER, Dept. 312, 1133 Broadway, New York.

www.americanradiohistory.com

(*Continued from page* 559)

The Alsaker Way

The most remarkable cures known to man have been produced without the use of drugs in any form. Don't continue wasting money for pills, powders and potions. Stop trying to live, or make a living in violation of natural laws. Send $2.10 for any one of the following guides to health and learn how to feel well and vigorous all the time.

Book 1. "Curing Catarrh, Coughs, and Colds."

Dr. Alsaker tells you in simple English the true cause of Catarrh, and he gives you a true cure—a cure that works. He does not prescribe salves, sprays, drugs, nor medicines of any kind. This book costs no more than a single visit to your doctor, and less than you have paid for medicine that has not cured your trouble.

Book 2. "Getting Rid of Rheumatism."

You need not take drugs nor waters, nor have your teeth extracted to cure Rheumatism. Learn from this book the true cause of Rheumatism, and then follow instructions for the correct use of the foods you like, and you will get rid of your rheumatic pains and aches.

Book 3. "Dieting Diabetes and Bright's Disease."

Dr. Alsaker explains in this book the many causes of Diabetes and Bright's Disease, and tells how, when, and what to eat to regain health. He shows how a cure may be effected if a cure is possible, and how to prolong the life of those who cannot regain full health. This book would be cheap at $50.00.

Book 4. "Curing Constipation and Appendicitis."

Medicines will not cure Constipation. Constipation and Appendicitis are due to the wrong use of foods. Indigestion is generally the first stage, then Constipation, then Appendicitis. The cause and cure are fully explained in this book. Learn from it what to eat to overcome Constipation, and to prevent Indigestion and Appendicitis.

Book 5. "Conquering Consumption."

In this book Dr. Alsaker has explained the true cause of the disease, and how to overcome it in its early stages—without drugs, serums, or sanitariums. A complete, satisfactory, and successful treatment is given in this book. Sufferers have paid thousands of dollars for less valuable advice.

Book 6. "Curing Disease of Heart and Arteries."

It is generally believed that arteriosclerosis, high blood-pressure, apoplexy, and chronic heart disease cannot be cured. This is far from the truth. This book explains how those who suffer from these diseases can be made safe, and how many of them can make complete recovery even after they have been given up as incurable.

Book 7. "How to Cure Headaches."

A headache is an indication that something is wrong somewhere. There must be a cause, and that cause must be found and removed before permanent relief can be got. This book explains how to find the true cause, and how to prevent and cure headaches of all kinds.

Book 8. "How to Live on 3 Meals a Day."

This is a book of food facts, showing in a common sense way how to reduce the cost of good foods and increase the pleasure and profit of eating. It contains scores of balanced menus for the whole family.

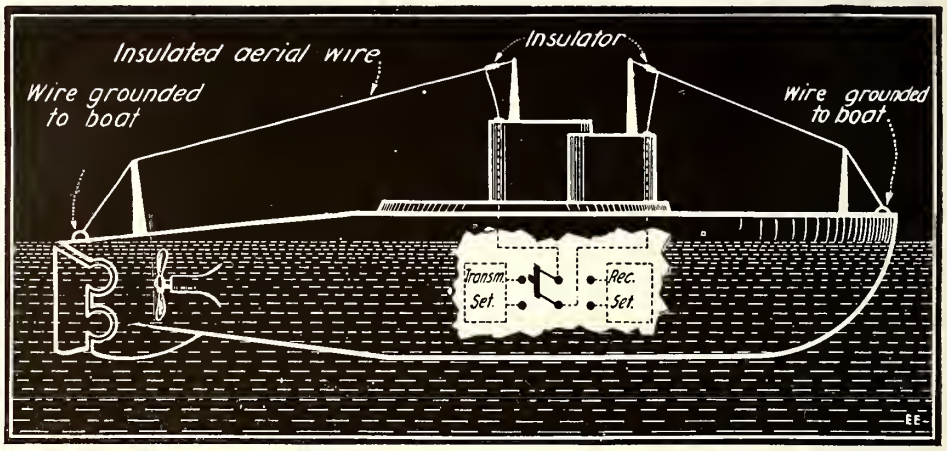
Publisher's Personal Guarantee of Satisfaction or Money Refunded.

An investment in any of these books will pay **daily** dividends in health and happiness as long as you live. It will enable you to save many dollars that might otherwise be wasted on worthless and harmful "cure alls"—and that's the truth!

As soon as you receive your book, read every page thoughtfully. Then put its teachings into daily practice. Give **The Alsaker Way** an honest trial for 30 days. The plan is pleasant and practical to follow and you are sure to be satisfied with **results**. You take no chances in sending your money **today**, because if you are not satisfied after a 30 day trial you may return the book and I will refund your money. So send me $2.10 today for the book **you** need, and I will mail it, postpaid, the day your order is received.

Frank E. Morrison (Estab. 1889), Publisher,
Dept. 313, 1133 Broadway, New York.

The Submarine's Underwater Radio



(*Continued from page* 539)

"Messrs. Willoughby and Lowell, of the Bureau of Standards, working for the Navy Department, have completed a series of experiments in transmitting and receiving radio signals on board submarines. Their results from using a single turn "loop" are very promising and incorporate the most complete data ever obtained in receiving and sending radio signals on board submarines."

Signals Received 6,000 Miles.

We are glad to have the opportunity of presenting herewith official report on the work in "Submarine Radio" conducted by Messrs. Willoughby and Lowell, of the Bureau of Standards, in coöperation with the Navy Department, at the submarine base at New London, Conn. In the tabulated results below we find one of the most remarkable wireless tests ever conducted—a submarine under water receiving signals from Nauen, Germany, *a distance of* 6,000 *miles*. The submarine was submerged eight feet during this particular test. We are indebted for this information to Dr.

(*Continued on page* 584)

Telephone Men Use These a WEEK FREE

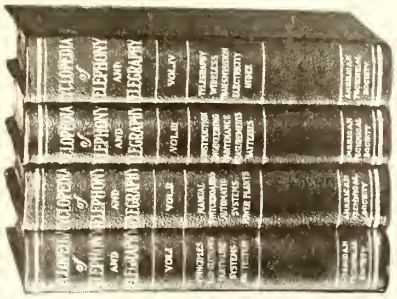
ACCEPT this **free** offer and use these great up-to-date books on the telephone in your own home or shop a whole week free.

We will send you all four volumes bound in genuine red morocco leather, 1728 pages and 2000 pictures, without one cent in advance.

Cyclopedia of TELEPHONY AND TELEGRAPHY

Everything about the telephone is explained in them in simple and plain language—theory—practice—operation—from the first experimental line to the modern equipment and complicated switchboards. Not one detail has been overlooked. Every vital fact that you need to make you an expert is in them.

Free Consulting Service



If you wish to keep the books on our easy terms of $2.00 a month, we will include FREE a year's Consulting Membership in the American Technical Society, and you can have the services of our engineers and experts for one year as often as you wish to write in—ask for their help on any subject within the scope of books.

Send the Coupon Now

Don't send any money. Just mail the coupon properly filled out and the books will come to you at once by express collect. Keep them a whole week and use them as if they were your own. Send them back to us if you want to, but give them a trial anyway, and if you keep them send us only $2.00. You can send the balance of the special $12.80 price the same way—$2.00 each month.

Give yourself a chance to make some real money—right now. Send the coupon before you turn this page.

American Technical Society
Dept. T 257 **Chicago, U. S. A**

American Technical Society, Dept T 257, Chicago

Please send me a set of Telephony and Telegraphy in 4 volumes, express collect. I will send you $2.00 in 7 days and $2.00 each month until I have paid $12.80. If I don't want to keep the books I will return them to you in one week and will owe you nothing.

A New Era Electric Auto

(*Continued from page* 523)

charge. On this basis, for every pound weight saved in mechanical construction an additional pound can be saved in the battery weight; thus it can be truly said that "one pound saved is two pounds earned." The total weight of the rear axle, which includes the entire power plant, is approximately 100 pounds; which is several hundred pounds lighter than any other known to the writer; air springs will save 50 pounds; the wood frame with truss rods accounts for another 75 pounds. These savings are all duplicated in the battery weight, and are only a few of the many savings thruout the car that enables it to be produced at such record light weight, considering its size; but lightness begets lightness, and that is the whole secret.

Sectional View of the New "Dey" Electric Automobile Motor Which Has a Revolving Field as Well as Revolving Armature. This Motor Fits on the Rear Axle, Each Revolving Unit Driving One Wheel. No Differential Gear Is Necessary.

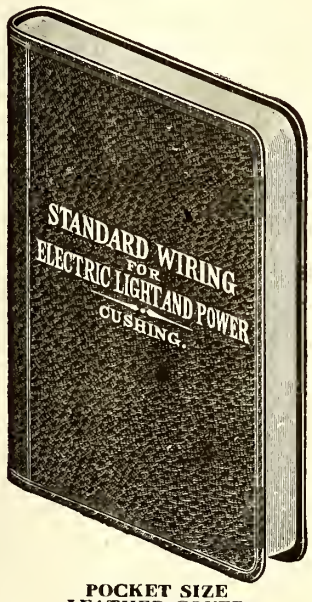
The inventor has largely increased the future field for his car by designing a *portable charging plant*, weighing only about 100 pounds, to be carried under the bonnet of the car. It comprises an exceptionally neat four-cylinder, four-cycle air-cooled engine, minus its flywheel; it is direct connected to the ring armature of a dynamo very similar in design to the motor; its field, however, is stationary. The cylinders of the engine are made of steel tubing, the cooling flanges of which are machined on by rotating the cylinders before a gang of milling cutters that cuts all in one operation. The flanges being formed in this manner permits doubling or tripling the radiating surface, as compared with cast cylinders. There are a number of other special features about the cooling arrangements that should produce an exceptionally well cooled engine, even if we did not consider the small size; for it requires less than two horsepower to meet the power consumption requirements on the road. With this combination the mileage per gallon will be at least *twice that of a gas car;* due to the engine always running at its maximum efficiency load, while a gas car does not average one-tenth of its rating; making its efficiency very low, probably not one-tenth of its best. The experimental car, which weighed 400 pounds more than the commercial vehicle, will *consume less than two electrical horsepower when running at 23 miles per hour* on level dirt roads. Hills will not appreciably change the figures for an average, for there are as many downs as ups in a round trip, and unless a grade is steep enough to make a demand upon the brakes the excess force of gravity will be stored in the form of momentum; and in the Dey Electric the motor converts its braking power into electricity that is stored in the battery; so there is very little loss due to hills, regardless of how steep their grades.

This plant will charge the battery at any time, while the car is running or standing. An automatic device stops the engine and opens the charging connection whenever the battery becomes fully charged. The dynamo acts as a starter when charging is desired. If short runs are the rule, *the plant can be removed from the car and used as a stationary charging plant for both the car and a stationary battery for house lighting.* It is a simple matter to replace at any time for long-distance touring. With the generating outfit aboard one-half of the battery equipment can be dispensed with, thus making a net saving in the weight of the car exceeding 100 pounds. The cost of the plant will also be largely cancelled for the same reason. When ladies drive it will probably be mainly as a plain electric; there is nothing, however, to prevent them using the engine, for the turn of a switch will set it going with a pep not equaled by any self-starter. The operation will be as quiet as any automobile engine.

$1000.00 Reward! For a Single Word

Can you create the one word which will best denote the United States and all parts of Britannia? If so, you will be paid at the rate of $1,000 a word. The World Trade Club of San Francisco has offered $1,000.00 to the person who suggests the word which, in the judgment of the club's Metric Campaign Committee, is best adapted to world-wide use.

The competition is open to all humankind. The money will be paid to the winner at noon on the 15th of May, 1920, by a committee appointed by President W. H. Hammer of the World Trade Club.



"Brit-Am," "Ambria," Ambrittica," "Brit-Am," "Sam-Bull" are some words thus far suggested. New names are constantly coming. The World Trade Club is offering this award because in carrying on its present compaign for the adoption of metric units by all English-speaking people—the United States, the British Isles, Canada, Australia, New Zealand, Tasmania, United South Africa, and so on—it was hampered by the lack of a single short word which would express all these.

The metric units of weight and measure are now used by all the world except "Brit-Am" or "Ambrittica," or "Sam-Bull."

LEARN WIRING

Earn $30.00 to $60.00 a Week

POCKET SIZE
LEATHER COVER

This Latest Edition of "STANDARD WIRING" *Will Make You An Expert Wireman*

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or for A. C. single, two or three-phase.

OUTSIDE WIRING—Pole line construction, line wires, service wires, roof structures, poles and their dimensions and weights, and how to erect and protect them and wires they carry. Insulators, guard arms, guy anchors. Tree wiring, splicing, service and entrance wiring. How to install Lightning arresters. Transformers with diagrams and instructions.

INSIDE WIRING—when and where to use rubber covered, slow burning and weatherproof wire. How to find the proper size of wire to use for lamps, motors or heating devices for any current, voltage and drop, either by formula or by the many tables that are given in this section of the book. How to wire for two-wire or three-wire systems. Direct current, two-phase and three-phase with formulae and tables, with examples worked out for each system and in a simple manner that anyone can understand and use. How to run wires on walls, ceilings, floors, through partitions and walls and in concealed places, damp places and where dangerous surroundings exist. When and where to install Switches, Cut-outs and Circuit Breakers and just how to do it. How to wire for high and low voltage systems and the precautions to be taken. The proper way to install Knife and Snap Switches, Cabinets and Cut-out Boxes, Outlet, Junction and Switch Boxes, Panel Boards, Wooden and Metal Raceways. How to install complete interior conduit jobs either for rigid metal, flexible metal or flexible non-metallic conduit. Concealed knob and tube work or armored cable. How and where to install and wire electric and combination lighting fixtures. How and where to use flexible cord and where not to use it. How to install arc lamps and gas filled lamps and the fixtures and rules required.

LIGHT AND ILLUMINATION—What is meant by proper and efficient illumination, the latest data on Mazda and gas filled lamps of every candle power and wattage. Direct, indirect and semi-indirect illumination and where each should be used. Illumination required for various classes of service from show window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors.

Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.

Don't Belong to the Great Unfit

STRONGFORT
The Perfect Man

You see them on every side—men who don't count—men who are losing every chance of happiness and success in life, some because chronic ailments are wasting away their energy; others through loss of their vitality through early excesses and dissipations.

Has Constipation, Indigestion, Biliousness, or any other chronic ailment got a grip on YOU? Do you feel that you are not as good a man as you used to be; that your former pep and punch and energy is ebbing away? Are YOU slipping gradually into that great army of hopeless, useless, broken-down humanity? If so, **take hold of yourself at once, act quick, and**

Fight Your Way Out

You can do it, if you will only WILL to do it. You can free yourself of your handicapping ailments and build yourself up. You can turn the watery fluid in your veins into rich, red blood, develop your muscles, strengthen all your vital organs, get back the power—THE MANHOOD—you have lost, and have every chance in the world of becoming a big, strong, successful MAN, if you ACT NOW and go about it the right way.

STRONGFORTISM

Strongfortism is the one way out for weak, anaemic, ailing men. It is Nature's way, and Nature is the greatest Builder Up the world has ever known. Put the machine that Nature gave you in shape to do its work; live life as Nature meant it to be lived, and health, strength, happiness—everything worth while in the world—is the inevitable result.

I KNOW. Thousands of my pupils, many of them discouraged, broken-down wrecks when they took up Strongfortism, are walking the streets today, strong, vigorous, healthy, able MEN.

I GUARANTEE to improve you 100 per cent. if you will follow my directions for a few months. It doesn't make any difference what your present condition is or what brought you to it, I can and will do what I claim, and without patent medicines or drugs of any kind.

Send for My FREE BOOK

I have put the results of my life's work, Building Up Men, into **"PROMOTION AND CONSERVATION OF HEALTH, STRENGTH AND MENTAL ENERGY."** It tells you all about Strongfortism. It will show you how YOU can rid yourself of your ailments, build yourself up, make yourself a well, strong, energetic man again, in **Nature's way.** Send for it today. IT'S FREE—but it's worth good money to any man who wants to be strong and virile. Don't wait. Only send three 2c stamps to cover packing and postage, and I'll mail you a copy at once.

Legless -- He Drives Auto Skilfully

(*Continued from page* 530)

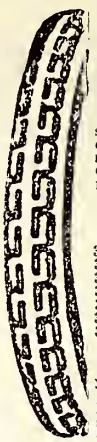
both sides of the car are electric chime bells, which may be rung from conveniently placed push buttons, and the car is thoroly equipt with electric lights, both inside and out. Moreover, not only is this car used for pleasure purposes, but it is also used to economize on the High Cost of Living. The car is equipt with two small stoves on which the cooking is done, the fuel for the same amounting to about 10 cents per week. All cooking utensils are placed in a very tidy position, as neat as any housewife would care to have them. There is a collapsible bed, which can be stretched out and slept in with ease and comfort. This, too, is so arranged that a small tent, which is always carried, may be pitched in some open field on the road from here to "somewhere West," and the bed removed from the car and made use of in the tent. And talk about other comforts, you'll find the machine fitted with an electric fan and dozens of smaller items too numerous to mention, such as a clothes rack, medicine chest—in fact, anything which a small modern home can make use of. According to Mr. Hammel, the only thing that is lacking is a "wife."

Perseverence is the thing that counted. Mr. Hammel has obtained his chauffeur's license after being placed under the most excruciating quizzes which the State License Bureau could possibly give. So cheer up, all you individuals without the use of limbs. This device has been patented and placed on the market, so you will have no difficulty in mastering the science of automobiling, tho legless, and may enjoy your rides without the expense of a chauffeur.

WAR IDEAS SENT U. S. FROM ALL OVER WORLD.

The latest war secret to leak out is how friendly inventors from all over the world gave to the United States their ideas for death-dealing machines for the destruction of Germany.

A companion secret is how all these ideas were kept from the enemy by the "seven serious sphinxes" of the Patent Office. This was a board of seven men, of unquestioned loyalty and sworn to secrecy, empowered to examine and withhold patents on war machines until the war was over and meanwhile turn ideas of promise over to the Government.



Among the spectacular inventions were the depth bomb, submarine signals, and devices for air photography. The committee approved a patent for the special leather for trench shoes, designed to resist the mud and water. It also approved a patent for special alloys for use in steel tools to turn out shells. Patents for wireless and aiming machine guns from airplanes were past upon.

More than 2,000 devices which it was thought might be of value to the United States or the Allies were past upon and 200 were important enough to get before military authorities. Some of them, it is said, helped win the war.

The ideas came from England, France, Switzerland, Hawaii, New Zealand, Australia, Mexico, Spain, Italy, Russia, Poland —*and one from Germany!* Of course, a larger number came from within the United States. Now that the war is over, the patents are being allowed.

Patent Commissioner Newton's committee included five who were West Point or Annapolis graduates, being Sidney Smith, A. E. Glascock, J. H. Colwell, F. W. Holt and F. C. Skinner. They were assisted by A. C. Lewers, chemist, and William J. Rich, metallurgist.

GET MORE MILEAGE at 1/4 the Price

Guaranteed for 4500 Miles
STANDARD GUARANTEE

Good-Wear Double Tread Tires are reconstructed by our skilled mechanics, made of double the amount of fabric than any ordinary tire. Free from punctures or blow outs. Our customers receive from 4,000 to 10,000 miles of service. Reliner Free.

Learn Electricity —the New Way

IT'S no longer necessary to go to school or serve an apprenticeship to learn electricity. With this new library of APPLIED PRACTICAL ELECTRICITY you learn right at home—in your spare time without interfering with your present work.

Any big job that you want in the electrical field is yours if you will train yourself to fill it. It only takes an hour or two a day with these books.

This is the 1920 edition—new from cover to cover—chuck full of the latest methods and most recent discoveries in this fascinating field. Everything is written in plain, good old U. S. language by 27 of the greatest experts in the business. The eight volumes with 3800 pages make up a complete course in electrical engineering. It's a home study course for the beginner and a handy reference guide for the expert combined.

Big Pay for Trained Men Jobs paying $1500.00 to $5000.00 a year are waiting for men who can qualify as Electrical Engineers—Substation Operators—Troublemen—Switchboard Operators—Dynamo Tenders—Electricians. Electricity is the greatest force in the world and it is growing bigger and bigger every day. More and more men are needed all the time. Why don't you get into this big paying field now?

Good Jobs Are Waiting If you are trained in some branch of electricity you will never have to look for a job. The job and the big pay will be looking for you. You can't dodge a good job if you have the "know how" under your hat. Let these 27 great engineers help you to the best kind of job with their books.

Send the coupon below and get them for FREE examination. See our free offer below.

What the Books Teach Elements of Electricity—Electrical Measurements—Electric Wiring—Underwriter's Electrical Requirements—Theory, Calculation, Design and Construction of Direct Current Generators and Motors—Types of Generators and Motors—Management of Electrical Machinery—Electric Lighting—Alternating Current Machinery—Power Transmission—Electric Railways—Self-Propelled Railway Cars—Trackless Trolley—Power Stations—Switchboards and Switching—Storage Batteries—Applied Electro-chemistry—Electric Elevators—Electric Welding and Heating—Wireless Telegraphy and Telephony—Land and Submarine Telegraphy.

Free Service With every set of these great electrical books we give a one year membership in this society. This entitles you to consult our engineers and experts on any electrical problem. Write as often as you like. Ask as many question as you like for one year.

The World's Greatest Electrical Books LOANED to YOU FREE

We will lend you this wonderful library to use in your own home or shop a whole week FREE. It won't cost you one cent. DON'T SEND ANY MONEY. Just fill out and mail the coupon today and the set of eight volumes will come to you by express collect. You be the judge and find out for yourself what the books will do for you. Use them as you please. Show them to your friends and get their opinion. Then if you have any doubt as to their value send them back at our expense and you won't owe us anything.

Only 7 Cents a Day

If you like the books after a week's examination you pay us only $2.00 and the same amount each month until $24.80 is paid. This is only 50 cents a week—7 cents a day. You can't afford to pass up a better job on these easy terms. MAIL THE COUPON NOW.

American Technical Society
Dept. E 257, CHICAGO

Coupon is All You Need— Send it Now

American Technical Society
Dept. E 257
Chicago, U. S. A.

Please send me the 8-volume set of Electrical Engineering for 7 days' examination, shipping charges collect. If I decide to buy I will send $2.00 within 7 days and balance at the rate of $2.00 a month until $24.80 has been paid. Then you will send me a receipt showing that the set of books and the Consulting Membership are mine and fully paid for. If I want to get along without the books, I will return them, after 7 days, at your expense.

Send 5c for this Model Aeroplane Book

Be an Amateur Aviator! This 48-page book tells how you can build and fly "IDEAL" Model Aeroplanes that are true copies—actual, reduced-scale duplicates—of famous Aeroplanes such as the De HAVILLAND Battle Plane, the famous NC-4 Transatlantic Seaplane; and many other well-known and historic machines. They look like the real Aeroplanes and will rise from the ground or water by their own power and fly in the air. You can build one and learn the principles of construction, operation and control. We furnish Complete Construction Outfits containing all parts and full instructions. You put the parts together and build your own Model Aeroplane.

PLANS FOR MODEL AEROPLANES

NC-4, 50c; De Haviland Battle Plane, 35c; Curtiss Military Tractor, Bleriot Monoplane, Nieuport Monoplane, Taube Monoplane, Cecil Peoli Racer—25c each. Send for Plans or Book at once.

IDEAL AIRPLANE & SUPPLY COMPANY

ESTABLISHED 1911
159-161 Wooster Street
New York City
Cor. West Houston St.

SPIDERS TIE UP CABLES.

Spiderwebs are working havoc with cable communication between the United States and Argentina, Brazil, and parts of Chile, as well as paralyzing interior telegraphic routes. The ground spider spins a heavy web which the wind sometimes wraps around the wires. These masses become very damp during a humid spell and short circuits are thus caused.

Large forces of linemen have to follow the wires across the Pampas and the mountains, removing the accumulations.—[When you meet spiders 9 to 10 inches in diameter and weighing a pound or two, you may expect "trouble" somewhere.—ED.]

PHOTO COURTESY CORRECTION.

We wish to make a correction in giving courtesy for the article entitled "NC Planes Had Electric Self Starters," which appeared on page 411 of the September issue, and which was credited to The Westinghouse Electric and Mfg. Co., in error. This credit should have been given to the General Electric Co., and the makers of the Liberty motor electric starter used on the NC planes in the trans-Atlantic flight to Europe, was the Bijur Motor Appliance Co.

Investigating "Psychical Phenomena With Scientific Instruments"

(*Continued from page* 521)

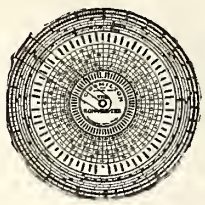
convinced of the reality of these phenomena,—was busy devising an instrument which would register and direct *psychic power* liberated from the body of a physical medium when in trance.

Dr. Imoda, the assistant of Professor Mosso, has also conducted a number of experiments in the discharge of an electroscope, by means of "rays" issuing from the medium's body. It was found that, if the medium held her fingers at a distance of an inch or so from the knob of the electroscope, some form of energy, apparently *radio-active* in character, issued from her fingers, and *gradually discharged the electroscope*. This is the "radiation" or "emanation" issuing from the body, which has been studied extensively by students of the occult. Dr. Imoda concluded—as the results of his experiments—that *"the radiations of radium, the cathode radiations of the Crookes' tube, and mediumistic radiations are fundamentally the same."*

Some other very interesting facts have been observed, by means of the electroscope. For example, Dr. W. J. Crawford (D.Sc.), in his experiments, noted that:—

". . . In séance rooms where tables are moved without physical contact, I found that after a sitting was well started, I was always *unable* to charge an electroscope, even tho I tried to do so in the corner of the chamber farthest from the medium. In order to charge it I had to take it outside the room. I asked the 'operators' (intelligences 'running things,' apparently, in the séance-room) if there was any 'power' in the séance-room so far away from the medium, and they answered in raps that there *was*. By 'power' I understand them to mean particles of matter taken from the medium . . ."

Again, in his "Reality of Psychic Phenomena," he says:—



"I took the electroscope to the table in the corner; then placed it in the circle near the medium. I asked the operators to touch the disc of the instrument very gently. They did this almost at once, the 'touching' consisting of a metallic scraping upon the brass disc, quite audible, similar in type to the imitation of the floor being rubbed with sand paper, a phenomenon I quite often observed. (*Continued on page* 571)

YOU CAN BE A SUPER-MAN!

YOU can take your place as a real leader and advance yourself in business and social life. Why drift along aimlessly with the crowd—merely existing? You do not know what life really means unless you have ROBUST HEALTH, GREAT STRENGTH and a HIGHLY DEVELOPED MIND AND BODY. Pull yourself together—shake off that sloth and indifference that is pulling you down. Brace up—be a real man. Fill yourself with vitality. Be strong and stay strong—assume that commanding appearance that shows success.

EARLE E. LIEDERMAN
the Acme of Physical Perfection

I can help you. I can show you the short cut to health and strength. I have found the way to develop these qualities in the shortest possible time. I have done it for thousands of others and can do it for you. My system will make a new man of you in a quicker time than you imagine. I begin where others leave off. Just remember that—it is the secret of my success.

I Have Trained Some of the World's Strongest Men

Many of the most noted strong men of today owe their wonderful physique to my method. I have taken hold of weaklings—mere physical wrecks—and made powerful athletes of them. This alone shows the superiority of my system. My own development and strength are more convincing proofs. If an instructor can first show results of his teachings on his own person, it speaks well for his ability to train others.

My New Book, "MUSCULAR DEVELOPMENT"

Tells how I can help you. It is handsomely illustrated with 20 full page photographs of myself and some of the finest developed athletes whom I have trained. I will send this valuable book to you by return mail on receipt of only 10c, stamps or coin, to cover cost of wrapping and mailing. This book also contains full particulars of my splendid offer to you.

Don't pass this by. Don't miss a single day on the way to health, success and happiness. Sit right down now and fill in the coupon and mail it to me. Do it now, this minute, before you forget it. The sooner you get the coupon off to me, the sooner you will receive the book.

THAT SOFT, ROSY, VELVETY COMPLEXION

BLEMISHES REMOVED QUICKLY AND PERMANENTLY

Your Complexion Makes or Mars Your Appearance

Miss Pearl La Sage, former actress

You too—can have that Soft, Rosy, Velvety Complexion. This great beauty marvel has instantly produced a sensation. Stubborn cases have been cured that baffled physicians for years. You have never in all your life used anything like it. Makes muddy complexion, red spots, pimples, blackheads, eruptions vanish almost like magic, No cream, lotion, enamel, salve, plaster, bandage, mask, massage, diet or apparatus, nothing to swallow. It doesn't matter whether or not your complexion is a "fright," whether your face is full of mudoy spots, peppery blackheads, embarrassing pimples and eruptions, or whether your skin is rough and "porey," and you've tried almost everything under the sun to get rid of the blemishes. This wonderful treatment in just ten days, positively removes every blemish and beautifies your skin in a marvelous way. You look years younger. It gives the skin the bloom and tint of purity of a freshly-blown rose. In 10 days you can be the subject of wild admiration by all your friends, no matter what your age or condition of health, **All methods now known are cast aside.** Your face, even arms, hands, shoulders are beautified beyond your fondest dreams All this I will absolutely prove to you before your own eyes in your mirror in ten days. This treatment is very pleasant to use. A few minutes every day does it.

Let me tell you about this really astounding treatment free. You take no risk—send no money—just your name and address on coupon below and I will give you full particulars by next mail—Free.

Making a Machine for Telegraphing Pictures

By Leroy J. Leishman

(Continued from page 533)

or wires which are in turn connected with the shaft. E is a narrow piece of metal also connected with the shaft. F is a metal band much wider than E which extends around the cylinder from one side of E to the other, but does not touch E, as E and F must be insulated from each other. G, H, I, J and K are brushes. J touches both E and F as the cylinder revolves, but K touches F only. L and M are binding posts to which the wires are attached that come from the distant machine. N and O are the binding posts of the particular picture *transmitting* machine to which the synchronizer is attached. H and I are connected to two solenoids into which the horns of an iron rocker arm protrude. There is sufficient friction in the pivot of this rocker arm to keep it from turning excepting when the solenoids are energized. U is a rheostat with which a brush on the rocker arm makes contact. V is also a rheostat, and W is resistance in series with the motor. T represents the electro-magnets of a gravity relay, the arm of which rests against the stationary contact Z until T is energized, after which it rests against the contact Q. R, S, P is a two-way battery switch. X is a motor that is geared down to operate the picture transmission machine proper. The electrical connections are all shown in the diagram.

If this type of synchronizer is to be used, one must be made for both machines. The particular advantage of this type over all others which require no additional line wires lies in the fact that the cylinders are permitted to revolve continuously and are not stopt momentarily each time a revolution is made.

Now let us see how this synchronizer operates. With the arm of relay T against Q, we adjust the rheostat V so that the motors X of the sending and receiving machines run as nearly as possible in synchronism when the contact of the rocker arm is in the center of U. The synchronizer is now ready to operate.

Of course, we have not yet explained how a picture is prepared or transmitted, but you know that the needles on the carriage arms must be in contact with the cylinders. Until the machines are running in synchronism, we therefore do not let the needles rest on the pictures, as everything transmitted before synchronism is establisht would be distorted beyond recognition.

On the sending outfit put the arm of the gravity relay against Q, and put the two-way battery switch on S. The motor of the sending machine is now started, and by studying the diagram you will see that a circuit is completed every time B and E come in contact with G and J, respectively, causing an impulse to be sent over the wire once every revolution. Start the motor of the receiving machine with the relay arm against Z, and throw the battery switch to R. This motor is now going slightly slower than that of the other machine, because it is in series with the resistance W. The motor of the sender is not in series with its resistance, as its relay is against Q instead of Z. On account of the slower motion of the receiving cylinder, the brushes are on a different part of the circumference of the drum A each time the once-every-revolution impulse comes from the sending machine. The brushes H and I are therefore finally on C and D when this synchronizing impulse comes. This causes the current to go thru the solenoids and the relay T, the arm of which

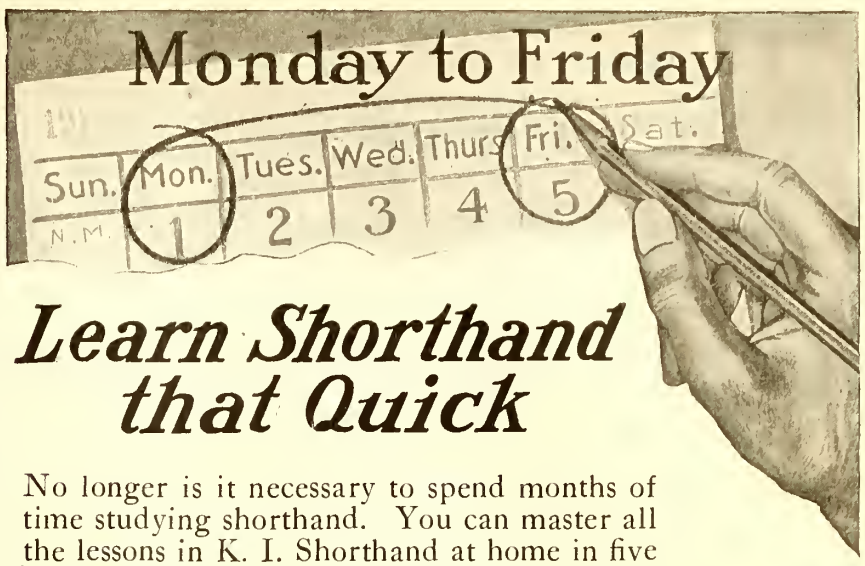
is pulled from Z to Q, thereby cutting out the motor resistance so that the motor will of its own accord run at the approximate speed of the motor on the sending apparatus.

The accurate synchronizing now goes on automatically. You will remember that the current to the resistance pieces C and D comes from metal strips on opposite sides. When the synchronizing impulse comes in, when H and I are in the exact centers of C and D, the currents in H and I are therefore equal. The solenoids also receive equal current and keep the rocker arm in the center of U, supplying the motor with a uniform amperage. If the receiving machine gets slightly behind or ahead of the sending machine, the brushes H and I will be slightly above or below center, and one brush will be nearer the metal strip which supplies the current to the resistance, and the other brush will be further away. One brush, therefore, carries more current than the other, and one solenoid will pull harder than its companion, causing the rocker arm to change its position on the rheostat U, thereby correcting the speed of the motor. The function of E, F and K is to distribute the current alternately to the synchronizer and the picture machine proper.

If this synchronizer seems too difficult or costly to make, the other synchronizer may be used or else the rod connection employed. In the latter case, your picture transmitting set will have been very easily and inexpensively constructed, and the degree of excellence of the received pictures will not be lessened in the least.

The machines are now ready to be adjusted. When sending, the needle in the carriage arm may have a play of as much as a quarter inch. It must at all times touch the cylinder, and should there be any sort of bulge in the rolled transmitting plate, this much play is necessary so that the bulge will not raise the needle beyond its play and throw the half nut on the bottom of the carriage out of mesh with the threads on the shaft. For receiving, the needle must be very delicately adjusted. It must rest on the cylinder when the magnets are not energized, and when raised up, it should be just high enough to clear the cylinder at all points on its circumference. The less upward and downward motion the needle has the faster it will operate and the better the pictures will be.



Extend a wire from one of the binding posts of one instrument to one of the binding posts of the other. The remaining posts must be connected to the batteries—preferably two dry cells. If the last explained synchronizer is used, these wiring directions may be considered to apply to the synchronizer binding posts instead.

TRANSMITTING PICTURES

Before transmitting *half-tones*, you can write or draw with shellac upon a thin metal plate and transmit this. After the shellac is dry, roll the plate into a cylinder and slip it over the cylinder of the machine you are going to use for transmitting. Place the edges at the top of the cylinder with the overlapping part of the cylinder toward the carriage, and if the plate is put on as explained the overlapping edge will not strike the needle and cause trouble. Put heavy rubber bands around the ends of the plate to hold it firmly against the cylinder.

RECEIVING THE PICTURES

To receive the picture, you will need a sheet of ordinary white paper and a piece of pen carbon paper. The carbon sheet goes on the cylinder face down around the white paper. If the rod connection or the first explained electric synchronizer is being used, be sure that the edges of the paper are placed at the top. If you are using the synchronizer which requires the extra cylinder or drum, the edges of the paper when placed on the picture cylinder should be in a straight line with the resistance pieces and the copper strip. This also

Learn Shorthand that Quick

No longer is it necessary to spend months of time studying shorthand. You can master all the lessons in K. I. Shorthand at home in five evenings. Don't doubt this amazing truth! Send for free lessons—also convincing proof that this is the simplest, most practical, lowest-cost course in stenography by *personal correspondence instruction.*

K. I. Shorthand

The Universal Speed-Script

Undoubtedly you have heard of this new and wonderful shorthand system—the *simplest and most practical in the world.* Used in the Army and Navy and in numerous other governmental places. Used by court officials, by doctors, business-men, teachers, clergymen, lawyers, reporters—and those in hundreds of other occupations.

It is the *universal speed-script—the easy-to-learn, never-forgetable, lightning writing.*

K. I. is Shorthand acquired with wonderful speed and ease—but it is so standardized as to make for *perfect legibility* and *absolute accuracy.* Notes years old may be read as easily as when fresh.

How Quickly Can YOU Learn This?

Here's p and, this is a Write the two together, and you have pa Here's th To make path you simply write and with these two easy movements of your pencil, you have made a word that needs 16 pencil movements when written in longhand. Here's t so it is easy to write at, tap and pat.

Already you have learned four K.I. Shorthand signs you won't forget. With the other signs and easy directions you can learn to indicate every word in the dictionary in quarter to twentieth of the time required in ordinary writing, as rapidly as words are spoken!

On 30 Days' Approval

For instance! E. A. Fulton says: "Four months ago I knew absolutely nothing of the first rudiments of shorthand. *To-day, I am holding a position as stenographer in the office of Inspector of Buildings,* where the terms apply almost wholly to building construction."

Henry Dranke writes: "Already I can write 50 or more words per minute and it took only about a *quarter hour each day for ten days.*"

A. Tompkins, journalist, writes: "Your system is excellent, being *simple,* yet *comprehensive.* I find it fascinating in my work as a press correspondent.

The above are but a few of legions of testimonials which we are ready to give you with full addresses.

Free Lessons—Send no Money

K. I. Shorthand is offered on the most liberal terms right now. Do not miss this opportunity. *Send immediately for the first two lessons free.* You may then continue the entire course on a month's approval. We give you a positive guarantee that *you can learn for no cost to you.* King Institute is incorporated in New York State. $100,000 capital.

applies to the copper sending cylinder. Overlap the ends of the paper toward the carriage, the same as you did with the plate. If you should carelessly overlap it the other way, the needle will catch the edge of the paper and tear it off. Be sure that the carbon sheet fits *tightly* against the white paper. Secure these to the cylinder with rubber bands.

Put the carriage at one end of the cylinders with the needle in contact with the same. Now place the switch on your sending instrument at the right and on your receiver at the left. Start your motors, or else turn the cylinders with a crank. As before mentioned, the speed should be about one revolution in three seconds.

By the time your carriages have advanced to the other side of the cylinders the picture is finished. As long as the needle of the transmitting instrument is on bare copper, the current flows, energizing the electric magnets of the receiving carriage and causing the needle to be raised out of contact with the carbon paper. Whenever the shellac comes under the needle the current is broken and the spring holds the receiving needle against the carbon paper, thereby making a mark. In this way the transmitting of the entire picture is accomplisht.

In the inexpensive sets that I mentioned having designed for the market, half-tone pictures are supplied already prepared on copper for transmission; but there is some satisfaction in having them prepared yourself. Any photo-engraver can do it. You should have a photograph without too much detail and with considerable contrast—that is, black and white. Better results are possible if the photograph has a glazed finish. Obtain a sheet of thin polished copper of a size that will roll to fit the cylinders. Tell the engraver that you want him to proceed as if he were going to make a half-tone on this copper plate, but that he must stop after he has cooked his gelatine to a dark chocolate color. *It must not be etched.* Tell him you want the screen to be no finer than 25 or 30. He undoubtedly will have no screen this coarse, so instruct him to make a small zinc half-tone cut of 40 or 65 screen, and to make a print from this. Then have him make an enlargement of this print, *without his screen,* until he has the 25 or 30 mesh which you desire.

This plate is rolled and the picture transmitted just the same as the shellac drawing.

Pictures do not have necessarily to be received with carbon paper. Your apparatus will permit the use of a few other methods. Smoked paper or wax-coated paper will do. If the former is used, however, the received picture will be a negative unless a negative is used for transmitting. Various other plans of receiving may be experimented with and will be found very interesting to the experimenter.

Pictures may be received without any carbon paper by turning the switch of the receiving machine to the right or sending position and utilizing a sheet of paper soaked in a solution of the following proportions:

Nitrate of ammonia, 4 pounds; ferricyanid of potassium, 1 ounce; gum tragacanth, 4 ounces; glycerine, 4 ounces; water, 1 gallon.

The paper should be kept moist while the picture is being received. Like the smoked paper, this produces a negative when a positive is being used for transmission, and a positive when a negative is being sent. These visible ways of recording make a much more interesting demonstration, altho the picture is not as good.

Of course, there are ways to telegraph pictures which are radically different from those explained here, but only the simpler ways are given so that the apparatus can be constructed easily and cheaply.

The experimenter will find telephotography a very interesting, instructive and fascinating field.

Is Your Blood Hungry for Iron?

Iron Is The Red Blood Food That Gives You Strength, Energy and Power—How To Make The Test That Tells

Actual blood tests show that a tremendously large number of people who are weak and ill lack iron in their blood and that they are ill for no other reason than lack of iron. Iron deficiency paralyzes healthy, forceful action, pulls down the whole organism and weakens the entire system. A pale face, a nervous irritable disposition, a lack of strength and endurance and the inability to cope with the strong vigorous folks in the race of life—these are the sort of warning signals that Nature gives when the blood is getting thin, pale, watery and literally starving for want of iron. If you are not sure of your condition, go to your doctor and have him take your blood count and see where you stand or else make the following test yourself: See how long you can work or how far you can walk without becoming tired; next take two five-grain tablets of Nuxated Iron three times per day after meals for two weeks. Then test your strength again and see how much you have gained. By enriching the blood and creating new red blood cells, Nuxated Iron strengthens the nerves, rebuilds the weakened tissues and helps to instill renewed energy and power into the whole system.

Unlike the older inorganic iron products Nuxated Iron is easily assimilated, does not injure the teeth, make them black nor upset the stomach. The manufacturers guarantee successful and entirely satisfactory results to every purchaser or they will refund your money. It is dispensed by all good druggists.

Investigating "Psychical Phenomena"

By Hereward Carrington, Ph. D.

(*Continued from page* 566)

"*Result:*—On examination, the electroscope was found to be completely *discharged!*

"I took the electroscope to the table in the corner of the room and tried to recharge it, but found I was unable to do so even after repeated trials. Accordingly I asked the 'operators' to put back into the body of the medium the matter they had taken out (for the production of the sledge-hammer blows) and to give a few raps when they had done so. In a minute or two some *very light raps* were given, and when I asked if the process was complete I received *no raps in reply at all,* which seemed to indicate to me that all the matter used for rapping had been returned to the medium. At any rate, I found that I could now charge the electroscope; which done, I placed it on the floor as before within the circle, and asked that the disc should be touched lightly. After a little time, there was the metallic scraping as before, and on examination the electroscope was found to be completely *discharged.*"

It will be at once apparent to the reader that two problems confront the investigator, when once he is called upon to solve such problems as the above: (1) the *physical miracle* itself; and (2) the nature of the *intelligence,* lying behind and directing or controlling the manifestations. This latter is called a *psychological* question, which, immensely important as it is intrinsically, does not enter into the *physical* problem. It need only be said that this is *the* baffling question in psychical investigation, and the most puzzling. Whether it be an independent "spirit," as it claims to be; or the subconsciousness of the medium; or whether it is a sort of compound consciousness, made up of the collected minds of those forming the circle at the time; or whether still other interpretation is open to us—this is all a moot question, which is referred to here, merely to draw the reader's attention to the fact of its existence.

It will be at once apparent to the reader, also, that physical and electrical apparatus has played an important part in such investigations, in the past, and is certainly destined to occupy a far more important place in the future. These curious phenomena—like all others in our world—depend upon invisible forces or energies for their production. Those interested in electricity should realize, more than all others, the power of the invisible; and the fact that *the invisible is the real.* Anything that we see consists merely in a bundle of "phenomena"—of *effects.* The real cause is always behind, and is always invisible. Thus, there is an old saying that "No man hath seen God." But it is equally true that "No man hath seen man." We see his clothes; these can be changed. We see his face and features; even these can at times be camouflaged! But the real man, the Self, the Ego, is something within,—invisible, intangible,—the directing and guiding power, which in life we know as the "Person."

There is nothing inherently absurd or impossible, therefore, in these odd manifestations,—however bizarre and unusual they appear to us at first sight. An unusual combination of circumstances might bring them about. Stones do not ordinarily fall out of the air; yet at times they *do* (meteors). Water does not usually rise above its own level, yet it can be made to do so. The curious freaks of lightning are well known. There is nothing inherently impossible, therefore, in supposing that a

Learn Mechanical Drafting

Earn $35 to $100 a Week

"Get into the profession of big pay and Rapid Advancement with the help of the school that has started hundreds on the Road to Success. I am ready to help you." Roy C. Claflin, President, Columbia School of Drafting.

Learn At Home In Spare Time

You don't have to stop work or leave home in order to become a trained Draftsman. Through our practical home study Training we will teach you Right in Your Own Home so that you will soon be able to qualify for a good position at Big Pay. We will continue to instruct and help you until we know you have the knowledge necessary to succeed.

No Previous Training Necessary

Right now—TODAY—there are openings for thousands of Draftsmen in the Government Departments, industrial concerns, and the big engineering offices. One department alone recently called for 1,800 draftsmen. With this tremendous demand has come a big increase in salaries.

Draftsmen Are Getting $35 to $100 a Week

with big chances for even better pay as the demand grows. By enrolling NOW for our practical Home Study Course in Drafting you can quickly qualify for a position as Draftsman and by properly applying the principles we teach.

You Have a Chance to Become a Chief Draftsman

and get to the very top in this fascinating profession. Our course will give you just the knowledge you need to make good as chief draftsman when your chance comes.

Industrial Activity Demands Draftsmen

With the problems of reconstruction facing the nation the demand for draftsmen is Greater Than Ever Before in American History. All big engineering, construction and manufacturing projects must first go through the drafting room before the workmen can commence. You can help in the work of reconstruction and secure a Big Salary with excellent opportunities for advancement. Many Big men in industry got to the top through Drafting.

We Will Help You Secure a Position

as soon as you complete our course. We have already placed hundreds of our graduates in good paying positions and are constantly in touch with vacancies for which Draftsmen are Urgently Needed. Government Departments and Private Concerns are continually calling upon us for our graduates because they know that our instruction produces draftsmen of the caliber they need.

Men Needed Right Now

Drawing Outfit FREE

As soon as you enroll you will be sent our special drawing outfit FREE so that you will be sure to have it to work with while taking the course. This set will be yours to keep. You are not asked to return it after completing the course.

Illustrated Book of Particulars Sent Free

Fill in the coupon below—send it to us and we will send you FREE a copy of our illustrated book telling all about our practical Home Study Course and how you may secure our instruction at once on Easy Terms so as to quickly qualify for one of the Big Positions Now Open.

Mail This Coupon To-day

Columbia School of Drafting

Finish This Picture

Fill in the missing lines. See how close you come to the original drawing. The above picture was drawn by Student Wynn Holcomb. We have a great number of students and graduates whose work appears in magazines and newspapers all over the country.

Can You Draw?

If you like to draw write for our book. Read about our new method Home Study Course in cartooning, illustrating, designing. Learn at home, by mail, in spare time.

Become an Artist

Illustrators, Cartoonists, Commercial Artists make big money. You can earn $25 to $100 a week and more. Learn under personal direction of Wilt H. Chandlee, famous newspaper, magazine, advertising artist of 30 years' successful experience.

Book and Outfit Free

Complete outfit free to new students. Write for handsome book, "How to Become an Artist." Tells what Course includes, shows many drawings made by Director Chandlee and many students.

Write Postal NOW

Don't miss our book. Even if you have no previous knowledge of drawing, our Course will enable you to become a successful cartoonist or illustrator. Many students earn money while they are learning. If you are ambitious to get ahead, to earn more money, write for our free book and special offer now. You can do as well as our other successful students! Write now for free book, "How to Become an Artist." Mail letter or postal.

WASHINGTON SCHOOL OF ART, Inc.

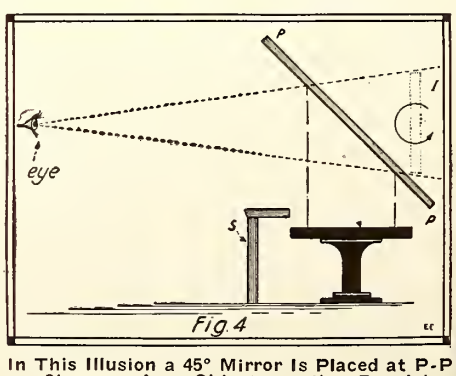
table can be "levitated" into the air, under unusual conditions; it is simply the manifestation of an unknown energy—of which, doubtless, there are many. We can manipulate and control the electric current; but we do not know yet precisely what it *is*. Similarly, we can study the effects of many of these curious biological forces, without understanding their true nature. Above all, it behooves us to keep an open mind, and not to cry "impossible," just because we have never seen such facts, or because they appear to us innately improbable.

Here, as elsewhere, we depend upon hidden and unknown energies. Could we but find *an energy common to the two worlds*—the spiritual world and the material world—we should have here a means of direct communication, possibly by instrumental means. *Delicate physical and electrical apparatus may be the means, after all, by which such communication will ultimately be established!* At all events, when subtle causes and forces are in operation (as they doubtless are during a séance) it is only natural to suppose that instruments, *far more delicate than our senses*, should be the logical method of detecting them, and, as yet, such experiments have rarely been attempted.



When we take into consideration finally the electrical theory of the nature of matter; when we remember the many striking analogies between electricity and the life-force; when we remember that the science of electricity is yet in its infancy, it should hold out to us the hope that, *here*, we may find a solution of many of these obscure problems, and that further investigations in the field of electricity may serve to explain to us many of these unknown and mysterious secrets of our inner nature, and the still more mysterious secrets of the séance-room. No more interesting and profitable researches could be attempted than those which endeavor to establish a connection between known and unknown phenomena; between physical and electrical manifestations, on the one hand, and these curious "psychical" phenomena, on the other. I hope that a number of readers of this article may see their way clear to try experiments in this direction, and to publish their results.

Experiments in Physics

By John J. Furia, A.M.

(*Continued from page* 531)

After the performer has stept into the cage and the door is closed, he pulls in the mirrors as in B. When the door is opened again he is hidden behind the mirrors, while the *mirrors reflect the sides of the cage* out to the audience, giving the illusion that *the back of the cage* is seen. On pushing the mirrors back into place again while the door is shut the performer again comes into the view of the audience when the door is opened.

In This Illusion a 45° Mirror Is Placed at P-P as Shown. Any Object on the Revolving Table "T" Appears to Be Rotating in Mid-air at a Point in Space "I".

Telegraphy Pays BIG MONEY

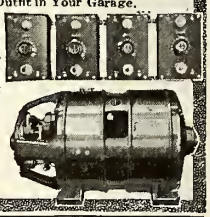
RADIO TOO

We teach you in two to four months In Your Own Home or at our Institute

The demand for telegraphers is enormous and increasing; there are ten positions for every man or woman available; the pay is high; advancement rapid; the hours are short—it's pleasant work and it's worth while. Write for catalog—learn how quickly you can qualify for positions paying

$125.00 to $350.00 Per Month

Our scientific system of teaching telegraphy, perfected by a corps of practical experts, makes you fully competent in 2 to 4 months—railroad 2 months—commercial 3 months and brokerage 4 months. Our new **phonographic system of instruction** is making expert telegraphers of hundreds without leaving their homes or interfering with present business. Easy to learn in spare time. Hundreds of graduates now profitably employed in railroad offices, banks, brokerage offices, etc.



Our course is short, the cost is low—and the result is certain. We put you in touch with the position you want. Write today for catalog. It explains all fully. Endorsed and recognized by U.S. Gov't Depts., R. R. Officials, etc.

www.americanradiohistory.com

So far the illusions described have been of the *virtual image* class. The audience has seen an *unreal* image. The real image class is not used as extensively. The following is an illustration of this type. A fragrant odor meets the nose, a beautiful bouquet is seen in a handsome vase. One gets nearer and nearer to the vase and the bouquet has—disappeared! Figure 6-C

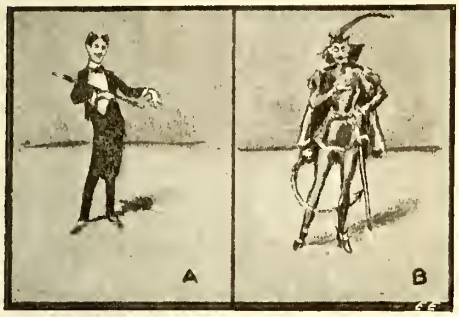

Fig. 3. The Performer Mystically Changes from His Evening Clothes to a Devil's Costume Before Your Very Eyes—Thanks to the Lighting Stunt and Glass Screen Shown in Figures 1 and 2.

tells the story. An empty vase A is placed on a hollow box. Inside the hollow box hangs a bouquet unside down. A concave mirror M, directly in front of the eye, is concealed by its dark surroundings. The mirror forms a *real image* of the bouquet, and by moving the mirror to the proper distance and tilting it to the proper angle this image can be formed just at the right point on the vase as to give the appearance of the bouquet being actually in the vase. As one moves out of the line of the vase and mirror, the image is no longer seen and the flowers have disappeared.

The subject of illusions is a vast one, and in a short article of this kind one can only "hit the high spots." In detecting illusions always look for mirrors and polished surfaces.

(To be continued)

To Europe In Three Hours

By H. Winfield Secor

(*Continued from page* 514)

what a difference the body and its organs have to accustom themselves to in this short time, and it is small wonder that the pilot can hardly stand the rapid atmospheric changes occurring. Ascending to an altitude of 40,809 feet in another official test which the weather bureau has conducted, and utilizing a pilot balloon with scientific instruments attached for recording the atmospheric constants, we find the air pressure here dropt to the low figure of 2.69 pounds per square inch. At 60,000 feet elevation above sea level, the official figures show but 1.17 pounds per square inch. At 88,000 feet, 16.7 miles above sea level, the recorded air pressure is .3146 pounds per square inch, or approximately 5 ounces. Let us now jump to a real high altitude—100,000 feet, or 18.9 miles above good old terra firma at sea level, where we find but a fraction of a pound, or 3.05 ounces (.91 lb.) per square inch, atmospheric pressure. Even a flea could not live up there, we will wager, except that it is in a vacuum bottle, and a strong one at that. The highest figure to which a test balloon carrying recording instruments has flown is 126,800 feet, or 24 miles above sea level. The pressure at this dizzy altitude is but a fraction of an ounce.

The various degrees of cold found in recent tests, most of which were carried on during the summer months, are tabulated

DOUBLE YOUR STRENGTH

For Vital Strength **IMPROVE YOUR HEALTH AND LENGTHEN YOUR LIFE**

Resistance on abdomen increases automatically

THE SUCCESS OF YOUR LIFE — your business, your position, your happiness, all depend upon YOUR HEALTH and STRENGTH.

I guarantee that my system of CONDENSED EXERCISE with my patented

AUTOMATIC EXERCISER

Overhead exercise for straightening and strengthening spine and shoulders

will more than double your constitutional and muscular strength in from two to three months. My many pupils all over the country will testify that the Automatic Exerciser will do this.

Ten Minutes Daily on the Automatic Exerciser will build for you a degree of fundamental, physical strength that will make life and work a pleasure.

Wrist and upper arm

Massages and exercises the small of the back

IT WILL GIVE YOU
A Clear Brain
A Powerful Heart
Massive Chest
Strong Lungs, A Fine Back
Broad Powerful Shoulders
Strong and Well Shaped Legs
A Wrist and Arm of Steel

Detachable Hollow Ball in 2 Pieces

The **AUTOMATIC EXERCISER** will fortify the entire area of the abdominal walls throughout all its layers.

Its influential effect on the digestion eliminates the special diet question. It will strengthen the entire organism and insure immunity from the many ills the "busy" man knows so well.

It will instantly relieve that brain and body fag. It will make nervousness and complications therefrom a thing of the past.

You quickly outgrow any mail course.

Their results are only temporary.

You Cannot Outgrow the "AUTOMATIC EXERCISER." It does not "use up" your vital energy. It generates MORE VITAL ENERGY.

Like the heart, which has a rest between each beat, so in my system there is a resting pause between each contraction of the muscle brought into action with the "Automatic Exerciser." This enables you to develop a superior physique without undergoing the strenuous and exhaustive training which the ordinary gymnasium methods require.

The patented mechanism of the Automatic Exerciser induces complete relaxation in the nerves and muscles and develops great strength and flexibility in the joints. It will cure any case of "muscle bound" condition in a short time.

The attachments for different parts of the body are hooked to the chain at any point desired.

The resistance increases automatically with each pull and the numbers on the bar REGISTER the increase at each pull as the lever bar moves ahead one cog each time.

The resistance and increase is POSITIVE and UNIFORM and can be adjusted less than a pound or several pounds to suit the requirements of the different parts of the body.

WHAT OTHERS SAY

"I am well pleased with the AUTOMATIC EXERCISER. Before taking exercise on your machine my blood and liver were slow and sluggish—but now! what a difference—I am full of energy.

"It is worth a hundred times the price I paid for it."
Wichita, Kansas. EARL PINNEY.

"The Automatic Health Exerciser is a wonder. It has done more for my health and strength in two months than all the exercises and apparatus put together which I have tried in years." MAURICE DALY, JR.
Daly Billiard Academy, N. Y. City

Mr. Anton Hromatka, City Infirmary, St. Louis, Mo., sends records of his results, which he secured with my machine and instructions in four months.

Strength of	First Record	Second Record	Strength Gained
Thighs	754 lbs.	2,000 lbs.	1,246 lbs.
Knees	754 lbs.	1,800 lbs.	1,046 lbs.

Send for 25, when sold send money and receive premium.

SPENCER PUB. CO., Dept. 305 Chicago

in the accompanying illustration, and these exert a very severe effect on the pilot indeed, covering his glasses with frost, so that it is impossible to see the instruments and steer the plane, even at altitudes of 25,000 feet and less; causing the engine to misfire, and in fact to stop in many instances. Electric self-starters which are now being fitted to most of the sea and land planes help the pilot out of many difficulties such as this, which may otherwise end disastrously for him.

To Europe in Half a Day by Airplane.

If we have an airplane which can go over 200 miles an hour, such as the "Christmas" Bullet plane, and ascending to an elevation let us say of between 30,000 and 40,000 feet, where we had an air current traveling Europeward at 200 miles an hour, then our net speed upon reaching this strata would total 400 miles an hour. With a "vacuum bottle" cab fitted to the airplane, together with oxygen tanks and atmospheric compressors for the carburetor system of the engine as well as for the cabin, it would then become possible to fly the 3,000 miles separating New York and London in approximately *one-half day or seven and one-half hours.* Possibly in flights of the future, when aircraft will abound in large numbers, there will be a strict classification of the air strata, such as shown in the accompanying drawing; the lower strata being assigned to the slow-going and shorter trip airships—the middle strata to the speedier open-cabin planes or dirigibles; and finally, the upper highly rarefied, rapidly moving air strata to the specially protected aircraft engaged in negotiating long distances, such as trans-oceanic and trans-continental trips, where speeds of 400 to 600 miles will be not only frequent, but common. The passengers will hardly realize that they are traveling at such prodigious speeds, owing to the fact that one of the principal components of their relative velocity to the earth will be the air current in which they are moving. If the plane had to tear its way thru the air, so that air currents had to rush by the edges and surfaces of the machine at a velocity of 400 to 500 miles an hour, the terrific air friction would probably injure the craft speedily; however, when the plane is actually cutting thru the air at 200 miles an hour, and the air current with which it travels is going at an equal speed, then no abnormal air friction will be encountered.

Around the Earth in 24 Hours by Airplane.

If we can devise an aircraft with large enough wings to support itself, sufficiently large multi-bladed propellers, compensated engines and proper crew housing arrangements to survive the extremely rarefied atmosphere at an altitude of forty to fifty miles (which is in the region of the limit of the earth's atmosphere, as our scientists tell us), then it is possible that the aviator would meet with air currents of such high velocity that he would be able to practically shut off his power and travel 25,000 miles (generally speaking) in 24 hours. Why is this so? Due to the fact that it is known from kite and balloon sounding tests in the upper atmospheric air strata, that many miles above the surface of the earth there are air currents moving eastward, and probably some of them westward with the rotation of the globe, or 1,000 miles per hour. Prof. McAdie, a noted American meteorologist, Harvard University, has estimated that such high velocity air currents may be encountered at even 50,000 feet. Considering that such a high velocity air current is found at 50,000 feet, then he considers that above this there may be a *westward-moving* air stratum, and still higher another *eastward-moving* air stratum. These phenomena were attested very markedly by the high altitude flight of Major R. W. Schroeder, of the American

The Electric Safety razor makes shaving a pleasure. Blade vibrating 7,200 times a minute cuts the beard smoothly and without slightest pull or irritation—feels like a gentle massage. Can be used with or without electric current.

All users of the Lek-Tro-Shav speak well of it

A barber says—"Have shaved for years and have never used any shaving device near its equal."
A home user says—"The most pleasing shave I've ever had in my life. Shaves my face closer than I used to shave, but there is no after irritation or ill effects as I usually get from another razor."
No. 1 Made for use from Light Socket.
No. 2 Made for use from Dry Battery.

THE MIDGET SLIDE RULE will solve any problem in addition, subtraction, multiplication, division and proportion. A Log-Log Scale gives any root or power of any quantity. Gives Logarithms, Sines, Tangents, Cosines, Cotangents and the decimal equivalents of fractions to six figures. It is grease and water proof and will give years of service. This rule is not to be compared with the paper utility rules which sell for $1.00 and are put together with paper fasteners. It is accurate, simple to operate and comparison shows that it is undoubtedly the fastest and most complete rule made. Our refund guarantee protects you from loss or disappointment. An instruction book 16 pages, 12 illustrations, is sent with each rule. Diameter of rule 4 in. Made in two models: Metal (white coated steel), **$1.00**; White Celluloid, **$1.25**. Leather Case **50c** extra. Send for catalogue of Slide Rules. Your money back if you are not satisfied.

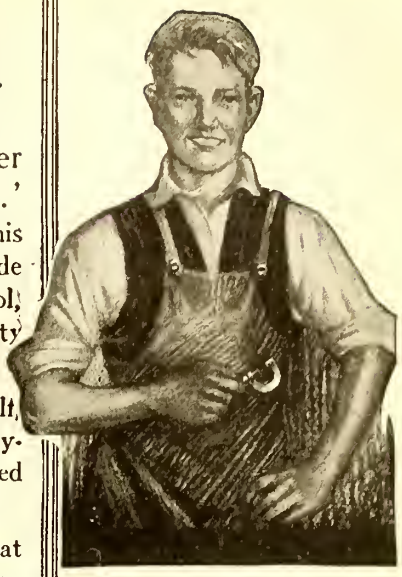
Flying Corps, who found himself carried 200 miles *east* of the location from which he had ascended; and not only this, but with his plane traveling *west* at 100 miles an hour, the great eastward moving air current must have had a velocity of more than 300 miles an hour, or it would not have carried him 200 miles *eastward* from where he ascended. Thus do we learn more and more daily of the uncharted wonders of the great translucent envelope surrounding our earthly habitation, which we call the "atmosphere."

High Altitude Flying Machines.

What type and form of aircraft will the high altitude machine be? This question was answered in part by the above discussion, where it was mentioned that the machine intended to fly at altitudes of 40,000 feet or over would be necessarily equipt with wings of much greater sustaining surface or else a triplane or quadplane could be employed. Also in order to "get hold" on the thin rarefied air of the higher strata, longer propellers would be necessary, and preferably also an increase in the propeller speed. It should be remembered that while the air has become lighter and less dense at these high altitudes that the weight of the plane and aviator has remained practically the same, the slight loss in weight due to the change in gravity pull, occasioned by going away from the earth's surface, being very small and having no practical bearing on the matter. Balloons have ascended with passengers as high as 38,000 feet. The heat of the sun rapidly expands the gas in balloons, and they also expand markedly at such altitudes, due to the reduced air pressure. At a height of 70,000 to 80,000 feet a pilot test balloon (no passengers) *will expand to about four times its normal size.* The air pressure acting on the balloon bag has fallen decidedly; so the hydrogen gas with which it is filled pushes outward on the envelope to a proportionate extent. Many times these weather bureau pilot balloons burst before they have reached the altitude intended for these reasons—heat and rarefication of the atmosphere. The large passenger-carrying dirigibles, containing gas to make them buoyant, such as the R-34, which recently crost the Atlantic ocean and return, have special compensating valves which release some of the gas at intervals as the airship ascends—losing about 1/30 of its volume of gas for every thousand feet of "climb."

What does this demonstrate? Simply this: that what gas is lost by heat and rarefication expansion by ascending cannot be recovered. Therefore the balloon must carry sufficient gas to permit its remaining buoyant when it descends again to a denser or lower atmospheric strata. A certain amount of expansion in a non-rigid or even in a rigid balloon or dirigible is permissible and desirable, as this increases the surface area exposed to the atmosphere; therefore the lifting power is maintained, within certain limits, in the less buoyant and highly rarefied air. It is conceivable, therefore, that as the rarefaction of the air increases very rapidly as we rise to greater altitudes than 40,000 feet above sea level we shall probably find our dirigible altitude airmen confined to air strata below 40,000 feet. This seems logical, for the reason that to ascend much above this air level a very considerable amount of gas would have to be liberated to prevent the balloon expanding to the bursting point, and therefore the gas so lost would apparently soon reach the limiting point where no more gas could be liberated, or else the dirigible would not retain a sufficient volume of gas to give it the necessary buoyancy to hold the weight of the crew, cabins, engines and fuel. A pilot balloon as used by the Weather Bureau for testing purposes is a simple spherical and easily expansible af-

(*Continued on page* 596)



The apprentice says:

"Almost the first tool I ever heard of was a Starrett 'mike.' Somebody pinched Dad's out of his jumper pocket and the fuss he made showed he thought it was *some* tool, even if he had had it close on twenty years.

"When I got into the shop myself, I noticed the toolmakers and everybody who had 'fussy' jobs preferred Starrett Tools.

"There's something about 'em that the fellows like. Yeh! They're accurate and they're convenient, but I guess the fact that the men who make 'em are pretty good mechanics themselves, has something to do with it.

"What? Sure I'm getting me a set of Starrett Tools—I need 'em every day. Yes, I got me one of those seventy-five cent Starrett Apprentice Books, too. It saves me asking the foreman a question every five minutes. Now, when I want to know how to do something, I can look in the book and study it out myself."

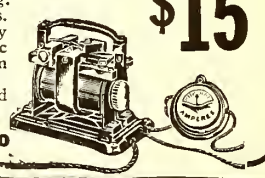
HOME BATTERY CHARGING

means Vitality, and Long Life to your battery and anyone can do it with the



NEW F-F BANTAM BATTERY BOOSTER

which will charge any 6 volt storage battery eF-Ficiently from 100 to 130 volt 60 cycle alternating current lamp socket at a cost about equal to burning an electric lamp for a few hours.

This is a new size of F-F Rectifier and similar to our standard F-F Magnetic Rectifiers which have been on the market for over 3 years. Thousands in use giving satisfactory service. Simple, safe, sure acting. Copper and carbon electrodes rectify the current. Capacity 8 amperes. Shipping weight 10 pounds. Price complete with Ammeter and Battery Clips $15. Also F-F Rectifiers of larger capacities for private or public garages as well as Battery Charging Rheostats that operate from Farm Lighting Plants and Direct Current Service.

Send check for prompt shipment via express or if via parcel post add sufficient for postage and insurance. Bulletin 12 on request.

AMAZING OPPORTUNITIES in the Airplane Industry

Right now is your opportunity to get into the greatest industry the World has ever known. Thousands of new positions opening up everywhere in this attractive new field. Never before have ambitious men had such a glorious chance. Send Coupon at once—find out how our wonderful Course in Practical Aeronautics will give you the knowledge to enter this new field. Learn at home by mail during your spare time.

Prepare NOW for these positions
Aeronautical Engineer
Aeronautical Instructor
Aeronautical Contractor
Aeroplane Repairman
Aeroplane Mechanic
Aeroplane Inspector
Aeroplane Salesman
Aeroplane Assembler
Aeroplane Builder

Enormous Demand for Men—Big Pay
If you know Practical Aeronautics, some big Airplane Corporation will want you. Unheard of Salaries are being paid trained men. Act at once. The pioneers are going to reap the big rewards. Automobile history, railroad history, movie history will repeat itself in Aviation

Special Offer NOW—Send Coupon
Send the Coupon at once for full particulars of our remarkable offer open to you now. We will also send you our big new book "Opportunities in the Airplane Industry." No obligation. Be sure to tear off and mail coupon today.

"The Joy of Father and Boy."

Chemical Laboratory

We present herewith to our friends our new **E. I. Co. Chemical Laboratory** which contains **real** chemicals and apparata to perform **real** chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a **Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.**

It contains the following 44 chemicals:

Alum $Al_2(SO_4)_3$, $(NH_4)_2SO_4$
Antimony (powdered) (Sb)
Ammonium Aqua (NH_3+H_2O)
Ammonium Carbonate $(NH_4)_2\ CO_3$
Ammonium Chloride (NH_4Cl)
Ammonium Sulphate $(NH_4)_2\ SO_4$
Barium Chloride $(BaCl_2)$
Boric Acid (H_3BO_3)
Brimstone (Sulphur) (S)
Calcium Chloride $(CaCl_2)$
Calcium Oxide (CaO)
Calcium Sulphate $(CaSO_4 2H_2O)$
Charcoal (Carbon) (C)
Chloride of Zinc $(ZnCl_2)$
Copper Sulphate $(CuSO_4)$
Ferrous Sulphate $(FeSO_4)$
Ferrous Sulphide (FeS)
Glycerol (Glycerine) $C_3H_5(OH)_3$
Hydrochloric Acid (HCl)
Iodine (I)
Iron Chloride $(FeCl_2)$
Iron Oxide (Fe_2O_3)
Lead Acetate Pb $(C_2H_3O_2)_2$
Litmus Paper
Magnesium Carbonate $(MgCO_3)$
Manganese Dioxide (MnO_2)
Mercury (Quicksilver) (Hg)
Nickel Chloride $(NiCl_2)$
Oxalic Acid $(H_2C_2O_4)$
Sodium Bicarbonate $(NaHCO_3)$
Sodium Borate $(NaBO_2)$
Sodium Carbonate (Na_2CO_3)
Sodium Chloride (NaCl)
Sodium Nitrate $(NaNO_3)$
Sodium Phosphate (Na_2HPO_4)
Sodium Sulphate (Na_2SO_4)
Sodium Sulphite (Na_2SO_3)
Stannous Chloride $(SnCl_2)$
Sulphate of Nickel $(NiSO_4)$
Sulphate of Zinc $(ZnSO_4)$
Sulphuric Acid (H_2SO_4)
Tin (Granulated) (Sn)
Zinc (Metal) (Zn)
Zinc Carbonate $(ZnCO_3)$

The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube
Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure
Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

DESCRIPTION OF THE OUTFIT:

The outfit consists of forty-four (44) Chemicals all C. P. (chemical pure) put up in appropriate wooden boxes, glass bottles, and hermetically closed jars. The acids are put up in glass bottles, with ground-in glass stoppers and there is a sufficient quantity of chemicals supplied (mostly one to two ounces) enough to make dozens of experiments with each. See list of Chemicals herewith.

The apparata furnished are all of the best obtainable make and of standard laboratory size and shape. A list of the 17 pieces of apparata furnished with this outfit is printed also herewith.

The Instruction book is a real **Chemistry Course for the Beginner.** Some of the Contents are: **Division of Matter:** This is a Treatise on Elementary Chemistry and deals with the theory of the Elements, Molecules and Atoms, etc. **Chemical Nomenclature:** This explains in simple language the derivation of the chemical names of the Elements and their compounds. There is a chapter on **Laboratory Operations; Glass Working; First Aid; Fire Extinguishers; Experimenters' Aphorisms,** etc.

A good part of the book is devoted to Weights and Measures. The Metric System, the English system and the U. S. System are fully explained.

The following tables are furnished: Symbols and Atomic weights of the Elements; Measures of Weights, Volume, Capacity and Length; Per Cent solutions; Conversion of Measure expressed in parts; Poisons and their antidotes; Technical and common name of chemical substances; Formulas for Cleaning various substances, etc., etc.

Among the **100 Experiments** are:

How to make chemical tricks; How to make invisible and magic inks; How to test flour; How to test soil; How to Make Chlorine Gas and smoke (German War Gas); How to bleach cloth and flowers. How to produce Oxygen and Hydrogen; How to make chemical colors; How to test Acids and Alkalies and hundreds of interesting hints and formulas.

The price is still $5.00. Shipping Weight 10 lbs. (Can be shipped by Express only.)

www.americanradiohistory.com

In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries addrest to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

Combination Salt and Pepper Shaker.

(340) Messrs. Frank B. Martin and G. L. Pastor, Braddock, Pa., submit what they call a combination salt and pepper shaker. The idea is to use the two vessels side by side, and then by having a sliding member with holes, either salt or pepper may be shaken out from either vessel as desired. Our advice is asked on the invention.

A. This is a capital idea and should prove a success. We are certain that a patent can be obtained upon it, and that the article when made properly will prove a good seller.

Multiple Phonograph Record.

(341) Jackson Lloyd, Long Beach, Calif., would like to know whether a patent can be obtained on a phonograph record which has four pieces on it, two on each side. The idea is to use a double track, similar to a double thread on a bolt. This would require the record to be twelve inches in diameter to hold the same amount, or the same length, of music as on a ten-inch record. The starting operation would be accomplisht by placing the needle in a groove, which would have to extend out into the smooth rim while the machine was not in operation. It is then started going.

A. There is nothing new about this device, and no advantage is gained because each piece would take up a certain amount of the record, and you might just as well have the second piece after the first was played. This is the present mode of doing it, and is perhaps more satisfactory than the suggested manner, which has been tried out in the past and found unsatisfactory.

Electric Shutter Trip.

(342) Lewis H. McCarrow, San Diego, Calif., would like to have our advice on an electric shutter trip for cameras to be used as a cable release operated shutter. Drawings accompany the request.

A. Nothing fundamentally new is shown in this device, and while no doubt it will work, there is nothing new contained in it that would warrant our correspondent to obtain a patent.

Pliers.

(343) B. F. Freese, Williamsburg, Pa., submits description and illustration of a combination electrician's pliers. Several new improvements are shown, where the jaws of the pliers have several different sizes of openings, which are used to remove insulation from different gage wires. Our opinion is asked as to patentability, etc.

A. We can offer no encouragement to our correspondent on this idea. Nothing fundamentally new is shown, and we doubt very much whether a patent could be obtained.

Shuttle Alarm.

(344) G. L. Busse, Cedar, Minn., has conceived an idea to use an electric contact arrangement which gives an alarm when the thread on the sewing-machine bobbin becomes depleted. It is well known that many pieces of material are spoiled or have to be run over because the thread has run out from the shuttle bobbin when the person operating the machine was not aware that the thread supply had run low. Our advice is asked as to patentability and usefulness of this improvement.

A. This is a very good idea, and we think a patent can be obtained on the device. How practical it will be and how the women folks will take to it, is impossible to say. One advantage of the device is that it can be manufactured for a few cents and is readily attached to any machine. All that is required is a battery and a buzzer, and the whole outfit can be put on the market for $2.00. What success there would be in marketing the device, however, is problematical.

Cold from Electricity.

(345) Mr. Ernest F. Prucha, Howells, Nebr., submits an idea showing a net-work of bismuth and antimony bars, which are crost and soldered together in the form of a Peltier's cross. This is to be used to cool a room, etc.

A. There is nothing fundamentally new shown, and the principle is well known and quite old. No patent could be obtained, in our opinion.

Spark Plug.

(346) Frederick L. Umbach, Troy, N. Y., writes: "I have a small invention and would like to know if it is on the market. It is a low-tension make-and-break spark plug. No coil or magneto is used. All that is needed is a dry-cell battery to make the plug throw a large spark. I have tried this plug on gasoline engines, motorcycle and automobile engines, and it has worked with success. I have made a few and sold them to different men who have cars, and they have had good results with this plug, so that the carbon from the engine could not stop the sparking. I would like to know whether this could be patented, and wish to hear from you as soon as possible."

A. Not having more details on the invention, it is quite impossible for us to give any information on the subject.

Hat Covering.

(347) Alex. Yenyo, Johnstown, Pa., writes: "I would like to submit a plan for a rubber covering for a hat, which is to be made of thin soft rubber overlapping a quarter of an inch at the brim. It is shaped exactly like the hat so that it fits snugly over it, to protect it from the rain. When not in use, it can be slipt into the pocket or a case made to hold it. I would like to know if this idea can be patented, or if there is any such idea out."

A. It is quite an old idea and any United States army or navy officer will be glad to show you one of the coverings which he uses to cover his cap. Such rubber coverings are for sale in stores selling headwear to officers.

Talking Film.

(348) Donald Hucke, Sheldon, Iowa, writes as follows: "I have read so much of the impossibility up to the present time to obtain perfect synchronism between the motion picture machine and the phonograph. In the February, 1918, issue of the ELECTRICAL EXPERIMENTER, on the first page, the vibrations of the voice was recorded on a celluloid film. Couldn't this be applied to the edge of a regular picture film. If heat was needed for the talking record, it could easily be localized so as not to affect the film. Altho this would have to be recorded on each individual film sent out, this also could be easily done from the original. The difficulties of talking would be few. A phonograph recording attachment and a few sensitive microphones would be all. I have thought this over from every point and I can't see any objection to it that could not easily be remedied. Will you please put this on your "Patent Advice" columns of the E. E. and tell me whether it works or not.

U.S. PATENTS

Don't Lose Your Rights

Before disclosing your invention to anyone send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception" sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

A. This magazine has publisht quite a good deal about talking films in the past, and while the fundamental idea seems to be right so far, we have never seen the device work out in practise, presumably for the reason that the investigators have struck a snag. As to our correspondent's idea to put the phonograph record alongside of the perforation of the film, this would not constitute a patentable idea, nor would there be enough room for the voice, as far as we are able to ascertain.

Automatic Talker.

(349) A. B. W., Chicago, Ill., says as follows: Could you please advise me through the ELECTRICAL EXPERIMENTER whether or not I would be able to secure a patent on the following apparatus. The apparatus is an instrument which will automatically answer a telephone; that is, when the party being called is not at home; tell the party calling that there is no one at home and asking if there is any message which they would desire to leave, which, if there is, it will take it and reserve for the party being called. Upon the return of the party being called the same machine which talked to the incoming calling party will play off the message which has been received. The instrument is only set at times desired.

Here is an example of the machine having been connected. Machine answering phone: "Hello—Drexel 4368." "There is no one at home just at present. Is there any message which you wish to leave?" The party calling: "Yes. Please tell Mr. Jones that I would like very much for him to call Mr. Smith at Eng. 5346." When the calling party hangs up the machine automatically comes to a stop. Upon the return of the party being called they play off the record which has been made by the call.

The machine is connected in the home and is started by the incoming call.

A. There is nothing new to this device, it having been described a number of times in the ELECTRICAL EXPERIMENTER, as well as other magazines. The device is not impossible, altho we believe it is impractical, as, first of all, few people would go to the trouble of installing it, and the device would be unduly complicated in case two or three more people would call up in succession.

Electrical apparatus for tapping trees, which can be left without attention for months, has been invented.

For mines using electric haulage, a door opening motor and safety signal, operated by the drivers of mine locomotives, has been invented.

Practical Chemical Experiments

By Albert W. Wilsdon

(*Continued from page* 532)

Experiment No. 5. Since the acid potassium malate exists in the stalks of the common rhubarb, the juice that is exprest from this may be filtered and tested for malic acid by the method in Experiment No. 4.

Citric acid occurs in the juice of lemons, currants, unripe tomatoes, gooseberries, etc. It is made on a large scale from lime or lemon juice, by saturating the juice with chalk; the precipitat of calcium citrat is decomposed by an equivalent quantity of sulfuric acid and filtered from the calcium sulfate. Evaporate the filtrat and crystallize out most of the calcium sulfate, and from the mother liquor allow the citric acid to crystallize.

Experiment No. 6. Make citric acid from the juice of at least two lemons, as above described.

Experiment No. 7. Add a moderate quantity of calcium chlorid to a concentrated solution of citric acid, and then add sodium hydroxid till the solution is nearly neutral. Calcium citrat will be formed.

Experiment No. 8. Try the above test with a concentrated and filtered sample of lemon juice, and note the formation of the precipitat of calcium citrat.

Tartaric acid is found in many fruits, particularly ripe grapes, as acid potassium tartrate. When the "must" ferments the "cream of tartar" precipitates as the alcohol increases, and this precipitat is known as crude tartar. It is frequently much contaminated with calcium sulfate, which is used in "plastering" the wine. To make

tartaric acid from this, the solution of the argols (crude tartar) is treated with milk of lime to form the calcium tartrat, and the latter salt is suspended in water and treated with an equivalent of sulfuric acid, and the calcium sulfate so formed is filtered off, and the tartaric acid is obtained in crystals by concentration of the filtrate.

Experiment No. 9. Add to a concentrated solution of tartaric acid a concentrated solution of potassium chlorid, when a precipitat of potassium tartrat will be formed on shaking and allowing to stand at ordinary temperature. The test is more delicate if the solution is nearly neutralized with sodium carbonat before the potassium chlorid is added.

Experiment No. 10. Make a similar experiment with filtered grape juice, which may conveniently be obtained from canned grapes. A more delicate test is made by adding to 100 cc. of the fruit juice a few drops of concentrated acctic acid, a few drops of concentrated potassium acetate solution, and 15 g. of pure, finely ground potassium chlorid; dissolve the latter salt by shaking and add 20 per cent of 95 per cent alcohol. Stir and shake vigorously to assist in the crystallization of the acid potassium tartrat.

Cultivation has changed the character of many fruits, and has much improved their flavor, so that many luscious fruits have been developed from disagreeable, or, to say the least, very medium stock. Cooking improves many fruits by softening the cellulose and converting the gums and allied bodies into a gelatinous form. Sucrose is inverted and pectin bodies converted into soluble forms. If there is starch remaining, this is made more digestible by cooking. There are many fruits that in the raw state are not suitable to use as food for persons with dyspeptic tendencies. They are, however, very satisfactory and useful when suitably cooked. Apples, pears, quinces, and cranberries belong to this class. It should also be noted that a jelly made from the fruit juice is usually more acceptable to an invalid and less irritating in its action than the raw fruit or the jam. This is especially true of raspberries, blackberries, and currants, on account of the numerous fine seeds that are present in the jam.

(*To be continued*)

Experimental Mechanics

By Samuel D. Cohen

(*Continued from page* 536)

Practically all brass fixture parts are threaded in the lathe.

One of the commonest methods of tapping the part, where it is not too large, is to grip it in the large chuck on the *live* spindle of the lathe. The tap may then be held by its square head in a monkey wrench or tap wrench, in such a way that the center hole in the top of the tap rests on the tail center of the lathe. The wrench holding the tap from turning rests against the lathe bed. The belt on the lathe or the gearing is shifted so as to give a slow rotative speed to the lathe chuck supporting the part to be threaded. When the material is thus rotating slowly, the tailstock center is slowly advanced, thus causing the tap to start cutting. A taper or plug tap is invariably used in this case, and where the hole does not pass entirely thru the material a bottoming tap may be employed to cut the threads of full pitch and diameter clear to the bottom of the drill hole. Where much tapping is done in the lathe, it becomes a very simple matter to lubricate the tap by placing a can contain-

DRAWING
Big Pay—Easy Pleasant Work

Draftsman earn $150.00 to $300.00 a month. The work is pleasant and the hours are short.
You can get this big pay too. All you need is the new 1919 edition of the Cyclopedia of Drawing and a little of your spare time. The cost is only 7 cents a day, and we give a year's consulting service free. See the FREE examination offer below.

Cyclopedia of DRAWING
4 big volumes each 6½x8¼ in., bound in genuine American Morocco and trimmed in gold 1578 pages and more than 1000 illustrations plates, diagrams and blue prints.

The only books that thoroughly cover Mechanical, Structural and Architectural Drafting in a non-technical way. You don't have to know anything about the subject to understand them. They begin at the beginning and tell you everything about Blue print Reading—Mechanical Drawing—Machine Design—Machine Drawing—Structural Drafting—Architectural Drawing and Lettering—Shades and Shadows—Perspective Drawing—Freehand Drawing—Pen and Ink Rendering—Typographical Drafting—Drawing Instruments and Their Uses and hundreds of other things connected with the work.

Use One WEEK FREE!

You can have these books for a whole week free without sending one cent. Just send the coupon below and all 4 volumes will come to you at once by express collect. Use them as if they were your own—go through them thoroughly and send them back at our expense if you don't want to keep them. If you do keep the books send us only $2.00. You can send the balance of our special introductory price—only $13.80 the same way—$2.00 each month.
Remember you don't take any chances. The risk is all ours and the benefits will all be yours—Send the coupon today

MURDOCK No. 55 RADIO RECEIVERS

The Truth

is what we all want to know about something we are going to buy. Advertising nowadays is comparatively reliable—yet we are apt to be anxious about articles bought from printed description. We must see them and try them before we can be sure that they are up to the mark.

MURDOCK advertising has always held fast to the truth, and has been devoted to an attempt to get those who may have need of our product, to buy and try.

So, with regard to our No. 55 'phones we simply say: — we believe that we are offering the best value in the world. If you will try them, we think that you will find this statement the truth.

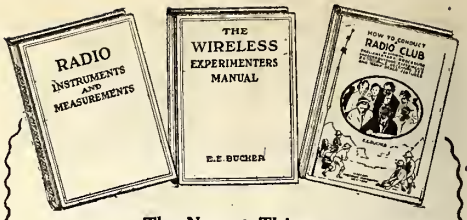
Building and Testing Small Transformers

(*Continued from page* 534)

spools and bring the end out, marking it P. Commencing about ⅛" from the end of the spool, wind the small wire on evenly, stopping about ⅛" from the opposite end. Cover the layer with paper and proceed in like manner until you have twelve layers on. Now fasten the wire so that it cannot unwind, remove the spool from the block and insert the core pieces from alternate sides. Do not cut the wire, but scrape a small bit of the insulation off and connect the primary coil to the 110 volt A.C. circuit with a 25-watt Tungsten lamp in series. Leave the secondary coil open. If the lamp lights up brightly, you have not enough wire on the primary. Cover the bare spot on the wire with a small piece of paper or silk and wind on two more layers and test again. Now if the lamp does not glow at all, you have enough wire on, but if it still glows a dull red, wind on another layer. When you have sufficient wire on the coil the lamp should show no color at all. Now short-circuit the outside ends of the secondary coil and if the transformer is working properly the lamp will light up quite brightly. Make the terminal at this end of the coil in the same manner as at the beginning and cover the coil with paper or Empire cloth.



MOUNTING THE TRANSFORMER.

There are several ways of mounting the transformer, but probably the best way is to drill a hole thru each end of the core piece. Do this after the transformer is all assembled. If you place a block of wood under the ends and another over them, clamping the blocks together with screws, you can drill thru the laminations without any trouble. It can now be mounted on a board.

Now as to varying the size and output of a transformer. By keeping the same proportions thruout in making the core pieces, having a difference of eight or ten sizes between the primary and secondary wires and testing as above, you can get almost any voltage you desire. For example, if you wished to make a simple bell-ringing transformer, make the center tongue of the core about ¾" x ⅝" and the other sizes in proportion. Use four layers of No. 26 wire for the secondary and ten or twelve layers of No. 34 wire for the primary. If you wish to make one larger than the one given, make the center tongue 1⅝" x 1⅛", use five layers of No. 16 wire on the secondary and fourteen or sixteen layers of No. 26 wire for the primary.

TWO TRANSFORMERS GIVE GREAT FLEXIBILITY.

A very nice arrangement for the experimenter who desires to have a large range of voltages is to make two transformers like the one given in detail. Make one with no taps off the secondary and the other as described. Mount them on one board and wire up according to the diagram shown in Fig. 7. This will give a range of from 1 to 35 or 40 volts and the system is very flexible. The two primaries are in multiple, and may be used together or separately. The secondaries may be used separately, in series or multiple. The four steps in transformer No. 1 give you four different voltages; in series with No. 2 you get four more; in multiple, four more. Now if you cut in the 25-watt lamp on No. 1 circuit, you will get four still different voltages, and if you replace the tungsten lamp with a 16-candle-power carbon lamp, you will get four lower voltages still, so that you have at your command almost any voltage you wish within the limits of the maximum power of the two transformers.

GET THE BEST OUT OF WIRELESS!
BUY THESE FOUR Newman-Stern PRODUCTS
Ready now for immediate delivery. Order today to avoid disappointment

THAT VITAL SPOT IN YOUR RECEIVING SET—you can make it fool-proof by using
N. S. ARLINGTON TESTED MINERALS

Why buy minerals on a gamble? Be *SURE* of results—*GOOD* results! *KNOW* when you put a crystal in your detector that it is absolutely and *EXTREMELY SENSITIVE!*

You *can* be sure if you use our Arlington tested Minerals. They cost more, of course. We discard a very large percentage of our tested minerals. You buy only *one* crystal at a reasonable price—but you *KNOW* the quality of that crystal. It has been selected and re-selected, and finally tested by experts for distant stations. It *MUST* come up to our high standard. Every Arlington Tested crystal must receive messages from far distant stations before you get it. It must "come in" loud and perfect. It must show performance—extraordinary performance.

If, when you buy our Arlington Minerals, they are not exactly as we state, we will replace any crystal returned to us within one week. Remember, that after all, even Arlington Tested Minerals are not expensive—so why buy quantity when quality is the only thing that counts?

Genuine Arlington Tested Minerals have been on the market for five years. They are individually packed in neat lithographed tin containers. Each genuine package bears the signature of J. S. Newman, the originator of tested minerals. Look for his signature when you buy NAA minerals. Reputable dealers carry them in stock.

NAA GALENA, per guaranteed crystal, prepaid..... $0.25
NAA SILICON, per guaranteed crystal, prepaid..... .25
NAA ZINCITE COUPLE, per guaranteed set, prepaid..... .25

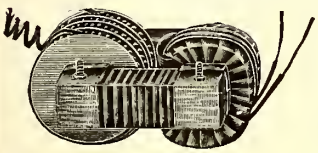
The World Famous Newman-Stern
"Red-Head" Receivers
The New Standard in High Resistance Phones

"Red Head" Receivers are so well known by this time that little need be said here in again introducing these splendid phones to the radio world. That Red Head Receivers have made good is indicated by the unprecedented number of orders that have come in to us since the lifting of the wireless ban. The public has handsomely appreciated our effort to market the finest possible high resistance receivers at a moderate price.

"Red Head" Receivers are now standard in their field. We boldly claim that no instruments selling at less than double the price of "Red Heads" can compare in sensitiveness or appearance.

Description and Specifications

The receivers are built after the most approved design. The backs are made of aluminum. Each receiver is wound to 1000 ohms (2000 ohms per pair) with electrolytic copper wire of the highest grade. The best magnet steel obtainable is used in the construction of Red Head 'Phones—and plenty of it. The interior parts of each receiver are highly nickled and polished. The diaphragms are extra thin.



Special attention is given to the shape of the genuine Bakalite ear caps. They are comfortable. They properly concentrate sound. They fit closely.

Every part that goes into the manufacture of Electro-set "Red Head" Receivers is machined to a nicety. The pole pieces and shells are ground to the thousandth part of an inch. The windings and magnets are examined and tested by experts. The sizes and weights of parts are calculated mathematically for efficiency. The finish even of the interior parts, is as high grade as that in a good watch.

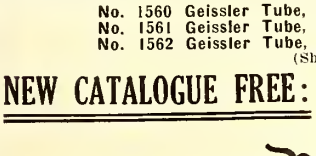
Split phosphor-bronze head band, fully adjustable; 5 foot double cord.

No. 2020 "RED HEAD" RECEIVERS, per pair, complete with head band and cord, 2000 ohms.....$6.50
(Shipping weight 2 pounds)

EXPERIMENTERS! RADIO MEN! SCHOOLS!
Here's Your Ideal Source of High Tension Current OUR NEW 1918 MODEL
1-6 KILOWATT High Tension TRANSFORMER

Five years ago, in order to meet the demand for a smaller size, high frequency transformer of real quality, we introduced our now famous 1/6 K.W. model.

Our 1/6 K.W. Transformer enables you to enjoy all the advantages of transformer operation at a lower cost than ever before.



This famous instrument represents the best buy possible for the experimenter at anywhere near the price. It compares with the best ¼ K.W. instrument on the market, and will transmit further than many of them.

Thirty-five mile transmission is common with our transformer. 400 miles has been successfully transmitted but, of course, only under "freak conditions."

Specifications: Core built up of high grade silicon transformer sheets. Windings taped and shellaced. Insulation tested at every stage of manufacture. Core laminations are bolted between heavy fibre frame strips to prevent buckling or dissembling. By a new process, the windings are vacuum impregnated and baked to stone hardness. Overall size 8x9x4 inches.

No. A-1000 1/6 K.W. Transformer, as described, shipping weight 10 pounds.....$10.50

N. S. GEISSLER TUBES Made in U. S. A.

Geissler Tubes are now very scarce and difficult to procure. The large bulk of tubes used in America were of German manufacture and, of course, are now practically extinct in this market. We are one of the very few American concerns who have attempted their manufacture.

The Geissler, or Vacuum Tube, is simply an exhausted glass container, provided with suitable electrodes for passing a high tension current thru the residual gases. The discharge is accompanied by a beautiful colored glow, ranging from greenish blue to orange, pink and red, depending on the degree of vacuum and the structure of the residual gas contents. Many beautiful and interesting experiments may be performed with Geissler Tubes.

In radio work they are widely used as indicators in place of the more expensive hot wire meters. A tube is connected in series with the antenna. The circuits are then adjusted until maximum glow is observed at which point the circuits are properly tuned.

No. 1560 Geissler Tube, 4 inches long..... $0.45
No. 1561 Geissler Tube, 6 inches long..... 0.55
No. 1562 Geissler Tube, 7 inches long..... 0.75
(Shipping weight, any size, 8 ounces)

NEW CATALOGUE FREE: Our New Catalogue will be ready for distribution by the time this magazine is in circulation. Every experimenter will want this book of instruments, parts and raw materials. Just write for Catalogue D-4. It's yours for the asking.

TWO STEP AMPLIFIER

TYPE TRIODE B

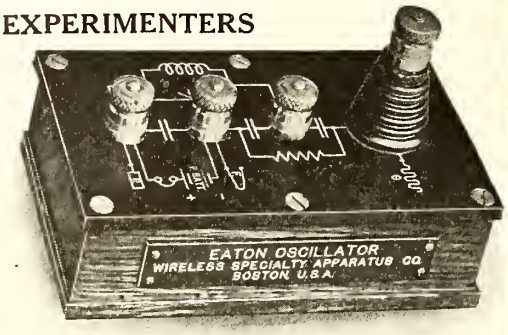
This amplifier is a compact unit of the regenerative low frequency type, and provides a maximum of amplification.

Its compactness, simplicity and efficiency render it an attractive investment to the progressive radio experimenter.

IMMEDIATE DELIVERY

Particulars and price on application.

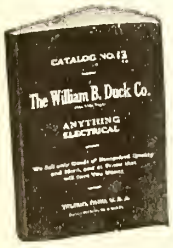
THE EATON OSCILLATOR



FOR EXPERIMENTERS

Designed to transform receiving circuits to receive arc and other undamped signals.

It will oscillate over a wave length range of 250—25,000 meters.



Requires no adjustments of any kind. Only one variable, the tuning condenser, is required.

The simplest and cheapest way of receiving undamped signals.

PRICE $14.90 Immediate Delivery

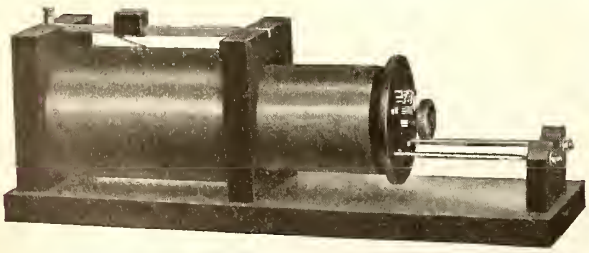
DUCK'S New Big 264-Page Wireless and Electrical Catalog Just Out—Now Ready

It is mailed for 12c in stamps or coin which may be deducted on first order of $1.00. Catalog not sent otherwise.



We regard this catalog as our greatest effort. It embraces everything in wireless worth while. 172 pages with no waste space devoted exclusively to wireless instruments. Your amateur friend will tell you that there never has been any wireless catalog to take the place of catalog of this company and above all that you can absolutely depend on our goods. There is no need for any other catalog when you have this big catalog.

NEW MODEL 5BB. NAVY TYPE RECEIVING TRANSFORMER

A big improvement over our former model. Primary divided into two sections, with three dead end switches, greatly improving selectivity.

Secondary divided into three sections, with two dead end switches, eliminating harmonics. By changing the construction of the end piece, there is also greater loose coupling. It is a wonderful improvement over our old model both in performance and appearance. Only $23.50.

OUR IMPROVED ARLINGTON RECEIVING TRANSFORMER

The secondary on our new type Arlington is divided into three sections with two dead end switches, eliminating dead end effect and harmonic and giving greater selectivity. The end support similar to that on our Navy type permitting of greater loose coupling. It is a beautifully finished instrument and will be sold by us at the same price as the old model. $9.00.

THE WILLIAM B. DUCK CO., 230-232 Superior St., Toledo, Ohio

Latest Amateur Radio Receiving Apparatus

(*Continued from page* 542)

with some of the standard type vacuum tubes and having such constants as will give best and most efficient results. A series resistance is inserted in the filament circuits, in such position as to give a negative charge on the grid, thereby eliminating the use of external means of producing this effect necessary in proper amplification work. These resistances are mounted on the vacuum tube holders.

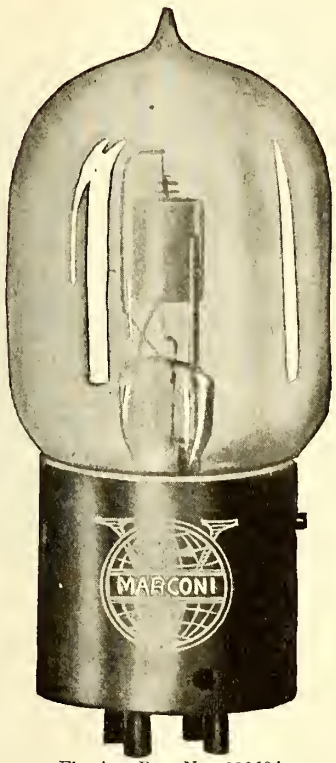
Three jacks are mounted on the lower part of the panel and so connected that with the aid of the jack plug connected to the telephone receiver as shown, it is possible to quickly interchange from the vacuum type receiver circuit to the first or second stage amplifiers as desired simply by inserting this plug in the respective jacks. The jack to the left is used to connect the telephone directly across the vacuum tube detector. The middle jack connects to the first stage amplifier, and the jack to the right connects the second stage amplifier to the telephone. The jacks are so constructed that when the first stage is connected in series the second stage is kept open, thereby eliminating the unnecessary flow of current to the second stage, and when the plug is thrown in the second stage jack the first stage jack is automatically closed, thereby permitting the first and second stage amplifiers to be used simultaneously.

The binding posts to the left are the *input* side to the amplifier and are connected to the telephone side of the vacuum tube receiver. The two lower binding posts to the right are connected to the filament battery, the two center binding posts are connected to the plate battery, while the two upper binding posts to the right are connected directly across the second stage of the amplifier and are used in connection with a loud-talking telephone.

Each vacuum tube has its individual filament rheostat and this is mounted on the outside of the box (as shown in Fig. 3). Two holes, closed by Bakelite covers on top of the box, permit the operator to insert or remove the vacuum tubes from their respective sockets whenever desired.

All of the instruments are of standard height, and each set of binding posts on each respective instrument is so arranged that by means of metallic straps it is possible to connect the receiver, the vacuum tube detector and the amplifier as a complete receiving equipment.

NEW YORK ELECTRICAL SHOW TO BE RESUMED.



The electrical exposition and motor show is to be resumed this year, opening at the Grand Central Palace on September 24th. This will be the first show since 1917, last year's display having been omitted because of the war.

In announcing the resumption, Arthur Williams, President of The Electric Show Company, said that while there had been some uncertainty as to the time and place of the exposition, there had never been any doubt that the first year of peace would see the exposition back in its accustomed place. In fact the show plans began to take form soon after the armistice was signed.

The Grand Central Palace was used during the war as a debarkation hospital. An indication of the importance with which the electrical industry regards this show is seen in the fact that 40 per cent of the space had been assigned to exhibitors before the date of the exposition had been finally settled upon.

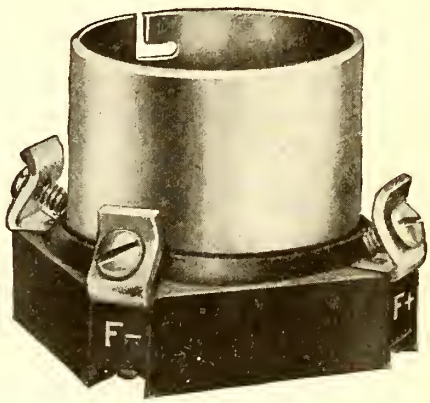
THE HEART OF THE WIRELESS

Fleming Pat. No. 803684
De Forest Pat. Nos. 841387-879532

An Amateur Station Without a Vacuum Tube is Years Behind the Times

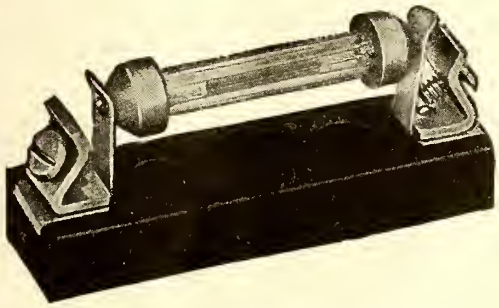
MARCONI V.T.

$7.00 each



Under agreements recently effected the Marconi V. T. is the only vacuum tube, or audion, which may be sold to amateurs, laboratories, schools of instruction and experimenters.

The approximate operating life of the MARCONI V. T. is 1,500 hours.



Class I.—Designed for use as a detector; operates with plate potential of 20 to 60 volts.

Class II.—Designed for use as an amplifier; plate potentials from 60 to 110 volts may be applied.

Tubes in either class may be used for detection or amplification, but those of Class I are best as detectors, and Class II tubes are superior as amplifiers.

Standardized Socket $1.50 additional

Standard Resistance, Complete $1.00

The Marconi Resistance, connected in the circuit between the grid and the filament of the Marconi V. T., is made in the following standard sizes:

½ megohm, 1 megohm, 2 megohms, 4 megohms, 6 megohms.

Resistances of any special fractional values up to 6 megohms can be supplied.

An Efficient Radio Crystal Detector

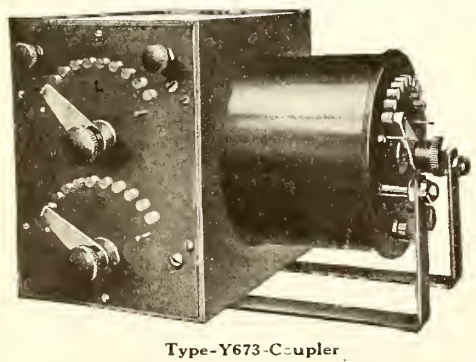
By Robert F. Gowen

(*Continued from page* 544)

In conclusion a few remarks regarding the operation of crystal detectors in general may be in order. It is best, of course, to cover over any crystal detector with a glass bell or cup so as to keep it free from dust and the dampness of the atmosphere, which tend to corrode the surface of the metal parts and the crystals, thus impairing the efficiency of the instrument. Another very good thing to watch out for in operating crystal detectors is vibration.

Sectional and Top Views of Crystal Detector.

CORE WIRE



At Pre-war Prices, 20cts. lb.

We have been fortunate in securing thru auction several tons of guaranteed pure, double annealed **Norway Iron Core Wire** and are selling this wire to "Experimenter" readers at 20c lb. This wire is just the thing for spark coils, transformers, etc., and it is, of course, a very much more superior product than the usual iron wire. We have only one size left:

24 INCHES LONG. Thickness about No. 21 B and S

If this size should be too long we advise cutting the wire down yourself by means of shears. As long as the supply lasts we offer this wire as described above to our customers at the very low price of 20c a pound. Add postage or we will ship express collect. Order at once.

The Submarine's Under-water Radio

(*Continued from page* 560)

E. B. Rosa, Acting Director, U. S. Bureau of Standards.

SUBMARINE RADIO.

During the past summer (1918) a series of experiments have been carried out by J. A. Willoughby and P. D. Lowell, of the Bureau of Standards, at the submarine base, New London, Conn., with the view of improving, if possible, the present methods of radio communication with submarines. The experiments have shown that communication at sea can be carried on under all conditions, more efficiently with an insulated closed loop than with an ordinary antenna now in general use. The loop is of simple construction, requires no mast and therefore does not interfere with submergence. Under storm conditions or during a submergence where the ordinary antenna is useless, communication by means of the closed loop is perfectly practicable. The following are among the most important results obtained:

A. When the submarine is submerged, any North American or European station can be received as distinctly as when it is on the surface; the maximum depth of submergence, however, is determined by the wave length of the transmitting station. To receive short wave lengths it is necessary that the top of the loop be near the surface of the water, whereas a wave length of 10,000 meters can be received when the top of the loop is submerged twenty-one feet. Still longer wave lengths can presumably be received at still greater depths.

B. Recognition signals can be exchanged (using the standard 952 meter wave length) at a distance of ten or twelve miles when the submarine is completely submerged, the maximum distance being obtained when the top of the loop is practically at the surface, decreasing to two or three miles when the top of the loop is eight or nine feet below the surface.

C. Submergence of the submarine during reception or transmission of message does not alter the wave length, though if the maximum depth for the wave length in question is exceeded, communication of course is interrupted.

D. When the submarine is running awash or on the surface, signals can be transmitted (with a 1-KW. spark set) a distance of at least a hundred miles even under very stormy conditions; grounds or short circuits caused by heavy seas, which render the ordinary antenna useless in stormy weather, do not affect the closed loop.

E. The closed loop can also be used as a direction finder, either on the surface or submerged, the maximum strength of signal being obtained when the long axis of the loop (of submarine) is pointing toward the transmitting station and the minimum signal when it is at right angles to the stations.

What the Entire Amateur Radio-World Has Been Awaiting

A WIRELESS TELEPHONE

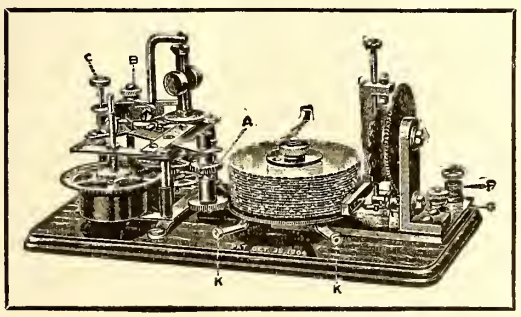
that plugs into a lamp socket, at a price you can afford. A genuine DE FOREST UNDAMPED WAVE RADIOPHONE (and telegraph) OPERATING DIRECT FROM YOUR 60 CYCLE 110 VOLT HOUSE CURRENT. NO MOTOR GENERATOR REQUIRED. *JUST PLUG IN AND TALK—SIMPLICITY ITSELF.*

A greater invention than wireless telegraphy. Absolutely silent in operation. Trouble-proof, foolproof and *only one adjustment required* after which the instrument "stays right." Couldn't possibly be simpler to operate. Practically simultaneous transmission and reception by means of electrically operated relay transfer switch. Marvellous, snappy clear speech. Voice quality superior to that over a wire. Absolutely stable in operation. Utmost selectivity. No decrement. The panel is divided into three divisions—rectifier, filter and oscillator. The rectifier employs two bulbs thus taking advantage of both halves of the cycle. The filter of inductances and capacities smooths out the ripple, freeing the speech from distortion. The oscillator of four tubes comprises a new circuit of high efficiency both in power output and modulation.

Tested Ranges { **Telephone 10 to 20 miles** / **Telegraph 50 to 75 miles** } **Depending upon aerial height and terrain.**

Our actual experience with this set indicates that these ranges can be greatly exceeded.

PRICE COMPLETE INCLUDING BULBS, $200.00
SPECIAL RATES FOR RADIO CLUBS



You will eventually use this type of transmitter, now recognized as the most efficient of all low-power systems—so why not now? Order immediately to insure early delivery.

DE FOREST RADIO TELEPHONE & TELEGRAPH COMPANY
1415 SEDGWICK AVENUE, NEW YORK CITY

LEARN THE CODE WITH THE OMNIGRAPH

The Omnigraph Automatic Transmitter

will teach you both the Wireless and the Morse Codes, *at home, in half the usual time,* and at the least possible expense. The *Omnigraph* connected with your Buzzer, or with Buzzer and Head Phones, or with Sounder, will send you unlimited Wireless or Morse Code messages by the hour, and at any speed you desire.

We offer the *Omnigraph* as a positive success and with the strongest of endorsements. It is used by the U. S. Gov't. in testing all applicants applying for a Radio license. It is also in general use by a large number of the leading Universities, Colleges and Telegraph Schools throughout the Country.

If you are a beginner, it will make you an operator in the shortest possible time.

If you are already an operator, the Omnigraph will make you a better one.

Send for free catalog describing 3 different models—$9.00 to $23.00—or order direct through your electrical dealer. We sell the *Omnigraph* with the guarantee that you must be satisfied or your money back for the asking.

THE OMNIGRAPH MFG. CO., 39L Cortlandt St., New York

How did you learn to talk? By listening. **JUST LISTEN,—THE OMNIGRAPH WILL DO THE TEACHING**

THE BEST

Yes, the best and only the best is cheapest in the end. Then why not apply this rule when taking a course in wireless? Our correspondence course is simple, easy to master, up to date and consists of 15 lesson books prepared by our expert theory instructors. All practice and transmitting apparatus for mastering the code is furnished free.

We Operate the One Big

radio school of the world, and this correspondence course is an extension of our activities, a Post Graduate Course in our Washington School being given you free, if you desire. You see we are not *A RADIO SCHOOL*, but actually and absolutely *THE RADIO SCHOOL*—the top one, the biggest one—the one that *HAS BEEN* and *IS* turning out the *WINNERS* every week. You can't compare us with any other school, because we are head and shoulders above all—the very top. You get the idea? You can't get a better or higher course, we are the final—the finish. Act now. Get a grip on yourself—take the big important step. Settle your career today. Our new catalogue, just out of press, will tell you how. Send for it.

Government Radio Control—Once More

(*Continued from page* 541)

cient to maintain contact under all circumstances with American military and naval forces abroad. This was done successfully and as one result this department has had a wide experience in transocean radio communication.

No one thing indicates more clearly the closeness of contact that is surely coming in the world than the fact that it is now quite within the practical to erect a radio station so effectively that its signals can be intercepted in every village in the world. Such an instrumentality can be of incalculable value in bringing the world together and furthering common understandings. The same instrumentality, however, gripped by evil-minded government or private enterprise, is just as available for selfish and dissentious purposes. Yet the risk must not be overlooked and such control must be provided as will lead to its use for social and not antisocial purposes. From the very character of radio its development and control must be considered from a world viewpoint. Messages in the air recognize no boundaries. The full utilization of radio requires world organization and coordination.

From an American commercial point of view, it is evident that the permanent extension of American foreign trade is largely conditioned upon cable and radio communication. Orders are placed and ship movements are directed largely by cable and radio. If other countries have better communication services with lower rates, their nationals have a distinct trade advantage. Further, it has become clear that if the American reader is to have full news reports from all parts of the world, and if American news—the publication of which has very definite commercial and political advantages—is to be printed throughout the world, America must have a highly efficient communication contact with all parts of the world.

As high-power radio is going to play an important part in future commercial development, it is incumbent upon the United States to give immediate consideration to this fact. It would be very detrimental to the interests of the United States were the ultimate control of high-power radio to become lodged in a foreign corporation or in any foreign country or if the United States lagged behind in the utilization of radio.

The Navy Department is required, for purposes of communicating with its ships at long distances and with its outlying bases, to maintain and operate high-power radio stations. These stations are a naval necessity for purposes of national defense. In normal times it is inconceivable that all the available time of these stations will be utilized for Government messages. It seems a comon-sense view that the spare time of these stations should be utilized for the benefit of the American people by handling personal, commercial, and press messages.

Whether the Government should own and operate all transocean radio stations is a subject on which the department, on the basis of its experience, has decided views. Especial considerations enter into radio communication between the United States proper and American possessions. Naval operations and assurance of uninterrupted communication with outlying possessions make essential the further development of these facilities and the maintenance of stations and personnel at highest efficiency. Radio communication at low rates will go far toward linking our outlying possessions to this country. Certainly under no circumstances should such radio communication be allowed to pass into the control—direct or indirect—of foreign corporations or countries.

The immediate problems in connection with transocean radio are: (1) To make available to American commerce and press the present Government-owned stations; and (2) to further the development of transocean radio for the benefit of this country.

Since the Government must have a high-power radio system for its control of the fleet and for other Government business, which includes communication with Army transports, Coast Guard vessels, aircraft, lighthouse tenders, lightships, weather reports, storm warnings, time signal service, hydrographic information and safety of life at sea, it is a needless duplication of capital and effort to permit private stations to operate where they might interefere with each other and with the military and other Government work of stations, and where the Government stations can easily handle commercial work in times of peace; one control only can efficiently manage the variety of communications required.

Radio communication should be considered not alone from the point of view of Government ownership of utilities, but chiefly from the point of view of the best interests of the United States in its international relations. The governments of many of the great powers control wireless either directly or indirectly. The Marconi Wireless Telegraph Co., a British organization, has endeavored to establish a British-controlled wireless circuit of the globe. The high-power Marconi stations in the United States and Hawaii form a part of this system. The high-power stations at Sayville and Tuckerton, as well as those in certain parts of South America, were constructed by German corporations.

The Navy Department is the principal user and

www.americanradiohistory.com

the most extensive buyer of radio apparatus in the United States. It has had the strongest influence in developing apparatus since the early days of the use of radiotelegraphy in this country. It has gained large experience concerning the operative features of radio apparatus, and it is convinced that Government operation and control of all transocean and ship-to-shore stations used for commercial purposes, is necessary on account of present interference between stations, and for other reasons given below:

(*a*) To permit the greatest amount of business, Government and commercial, being done through consistent changes in apparatus, through systematic apportionment of any prompt and frequent changes of wave lengths, and through standardized methods of operating, one management is necessary.

(*b*) Radiotelegraphy has been looked upon as a natural Government monopoly. Since only by the closest regulation can the best use of this art be obtained, not only for commercial and safety at sea, but for military purposes, radiotelegraphy is a strict Government monopoly with the larger number of foreign nations; and, in those countries where commercial stations are permitted, the Government control is generally so strong as to amount to monopoly.

It seems therefore admitted that:

(*a*) Efficient radio communication for military (naval) and other Government purposes is a necessity.

(*b*) Efficient radio communication requires effective control; effective control requires a monopoly and the Government should exercise that control.

(*c*) Military (naval) necessity demands not only efficient and rapid communication, including effective control, but protection of the radio stations from destruction.

(*d*) During periods of strained relations, as well as during war, direct Government control and operation would be the only safe and effective control and operation, as the personnel would be subject at all times to Government supervision and discipline.

(*e*) The commercial interests of the Nation will be served best by having its radio communication facilities under a control that is non-partisan, and one which precludes the possibility of foreign domination or of private domestic monopoly, with consequent liability to preferential treatment by such agencies, of the interests controlling them.

(*f*) The dissemination of news to all countries can be accomplished best and mutual international understandings can be arrived at with more facility through national control of radio.

Radio traffic is very much congested at present; but on account of the centralized control by the Navy at the large ports, there is more traffic being handled than ever before. To turn to the old method of separate control by competing private companies would be disastrous to the merchant marine and the general public.

One central control facilities the coordination of the various systems, i. e., coastal, aircraft, medium power and high power. It enables the proper concentration of radio as an aid to navigation and other radio developments designed to render the life of the mariner more safe.

High-power radio is international in character because it causes interference thruout the world. It is much easier for the Government to regulate international interference than it is for private companies to do so. Most of the countries of the world already own all radio stations within their boundaries, and it is more or less a simple matter for the United States Government to come to an agreement with foreign administrations regarding technical details.

Also, as the art advances and new apparatus is constructed, that will lessen the amount of interference, the international conventions will be modified accordingly. A private radio communication company might not be able, on account of financial reasons, to adopt the more modern apparatus. This might result in complications with foreign countries, and further handicapping of the radio service for the general public might ensue.

In certain localities there are several high-power stations within a small area. When they operate independently the business of all is seriously handicapped. But, on the other hand, when they are operating from a central control, business is expedited, and the general public is able to file more messages. In this connection, it might be said that a station running at full load and handling a maximum amount of traffic is able to give cheaper rates to the general public than those stations which are not running at full capacity on account of interference. The only way to handle transocean radio traffic efficiently is to control all the stations from a central point. A few radio stations controlled in this way will handle more traffic than several cables.

In the above I have endeavored to advance proper arguments which would seem to show the desirability of Government ownership of all radiotelegraph stations which are engaged in ship-to-shore work or long-distance transocean work, and particularly that these should be under the jurisdiction of the Navy Department, which Government department alone has the means and facilities to carry on this work efficiently.

This question of national and international communication by means of radiotelegraphy is particularly prominent at this time, when on ratification of the peace treaty, all restrictions on the use of this art will be removed and many interests will be attracted to this form of investment. It is conceived and shown that ship to shore and transocean radiotelegraphy can only be efficiently carried on under a monopolistic control, and this department contends this should be a Government monopoly, and requests congressional authority to assume this ownership and control. At this time this depart-

"ASK ANYONE WHO HAS USED IT"

Submarined Three Times and Still In Use

Said an Englishman: "I've been submarined three times—and put my Brandes headset in my pocket each time. You bet I saved it. I wouldn't have any other make." (Name on Request.) Think of the help to wireless operators, that the perfect sensitiveness and dependability of Brandes Headsets provided during the war. Life or death depended upon *hearing correctly*. They are made today just the same, and give the same quality of service.

BRANDES WIRELESS HEADESTS

CLEAR TONE
LIGHT WEIGHT
DEPENDABLE SERVICE

"Superior" Set, 2000 ohms, $6

Score 100% efficiency in actual use. Sharp, Unblurred, Readable Signals assured by

"BRANDES MATCHED TONE"—

Exactly matching the tone of both receivers in each set and thus eliminating all confusion due to unmatched harmonics.

TRIAL OFFER

Brandes Wireless Headset sent to you on trial for 10 days. If, for any reason, you are dissatisfied, your money back without a question. Test it,—compare with others,—for sensitiveness, clearness, distance. Prove for yourself the fine quality, the "matched tone." The two diaphrams, toned exactly alike, strengthen the signals and prevent blurring. Used by many U. S. Gov't experts, and experts abroad; by colleges and technical schools; and by professionals and amateurs everywhere.

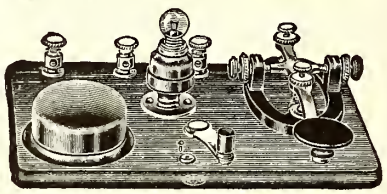
Wireless Receiving Ban Raised

MESCO WIRELESS PRACTICE SET

The Practice Set comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one cell Red Seal Dry Battery, and four feet of green silk covered flexible cord.

The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

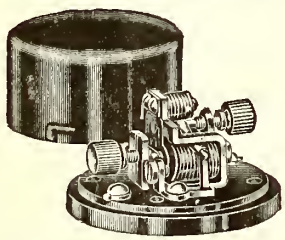


List No. Price

342 Telegraph Practice Set, with Battery and Cord $3.24

Weighs 4 lbs. packed.
Price does not include postage.

MESCO Combination Practice Set for Learning the Morse and Continental Visual and Audible Codes



This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord $4.05

Weighs 4 lbs. packed. Price does not include postage.

MESCO RADIO BUZZER

This buzzer maintains a constant note and is recommended as an exciter for checking wavemeters where pure note and ample energy are required.

It consists of practically a closed circuit field of low reluctance, having a steel armature to which is riveted a strap supporting a movable contact. The armature tension is adjustable by means of a screw with a milled head large enough to be easily and permanently adjusted with the fingers. The stationary contact is adjusted by means of a similar screw. The magnet coils are connected in series with a total D. C. resistance of 3.9 ohms. Shunted across these coils is a resistance having a D. C. value of 3 ohms. This shunt eliminates all sparking such as occurs at the break on ordinary radio buzzers and the energy saved thereby is transferred into any oscillating circuit connected to it, the result being that this buzzer as constructed radiates five times more energy than any other existing type. All connecting wires liable to be broken are eliminated. Contacts are of genuine platinum, which is essential in order to maintain a constant note. The parts are mounted on a Condensate base to insure constancy in operation.

Diameter 2 in., height 1¼ in. The cap is attached to the base by a bayonet joint.

List No. Price

55 Mesco Radio Buzzer $2.05

We carry a Large and Complete Line of Standard Wireless Material Recognized by Experts as such with Competent Experienced Wireless Attendants in Charge

SPECIAL SALE!

Reduced Photograph of Transmitter showing nickel plated case and Hard Rubber Mouthpiece

$1.00 ONLY

Postage extra.

Ship. Weight, 2 lbs.

Diameter, 3¼ ins.

We have on hand 2,000 Carbon Grain Transmitters as per photograph. They are first-class instruments and may be used for all kind of experiments, especially for wireless telephone sets, where a heavy current is to be passed through. Slightly used, but in perfect working order. Money refunded if not satisfied. A real bargain. Order one or more today.

THE ELECTRO IMPORTING CO., 231 Fulton St., NEW YORK

ment is confronted with conditions which make it imperative to ask for this monopoly.

Obviously the United States can not own radio stations in other countries. These countries fall into certain groups: (1) Those in which the Government itself maintains a radio monopoly; (2) those in which the Government permits its own nationals, but not foreigners, to own and operate stations; (3) those in which any authorized individual or corporation can erect s ations.

Obviously every encouragement should be given American companies to manufacture and sell radio equipment abroad and to own and operate stations abroad. The American Government-owned stations should exchange traffic with such stations and assist them in any legitimate way. Especially should any patents or improvement controlled by the Government be made available to such American companies under proper safeguards and guaranties.

In conclusion this department recommends that Congress immediately enact legislation regarding radio communication along the following lines:

(1) Either by a committee of Congress or by special designated commission, authorize a comprehensive study of the problems in connection with radio within the United States. This, however, is not of immediate concern to this department. Of course, the department stands ready to give the benefits of its experience and technical knowledge.

(2) Authorization to the President to set aside by proclamation certain bands of wave lengths for ship-to-shore work, for shore to aircraft, and for transocean services in accordance with international conventions and demonstrated needs from time to time.

(3) Constituting ship-to-shore radio service a Government monopoly under the Navy.

(4) Constituting transocean and international radio service a Government monopoly under the Navy.

(5) Authorization for Navy Department to utilize immediately all Navy radio stations for commercial and press business.

(6) Authorize the Navy and other departments to assist American enterprise in the sale of radio apparatus and the development of American-owned radio stations abroad, and especially to authorize the Secretary of the Navy to authorize the use by American companies under proper conditions of Government-owned patents and improvements, to be paid for either in exchange of patent rights or in other suitable ways.

Sincerely, yours,

JOSEPHUS DANIELS.

THE SPEAKER OF THE HOUSE OF REPRESENTATIVES.

Radio Problems in Aviation

By Edward Rice Doyle

(*Continued from page* 543)

factors of capacity on an airplane, since he is used to the high building and tower aërials and the solid capacity of Mother Earth. But the airplane must give its capacity effects with little more than the engine and tank metals for counterpoise. And to build up any additional capacity with lengthened aërial means increased weight and lowered flying efficiency. These considerations have therefor held the aviation radio sets to wave lengths of 300 meters or less. And if any radio engineer was asked to design a transmitting set with a minimum range of 500 miles with 300 meters to work with he would think you had asked the impossible.

It is not so difficult to use loading coils to permit of reception by the radio set in an airplane of longer wave lengths than 300 meters, but the added resistance is always undesirable and for transmission it is impracticable.

And in addition to the head resistance and structural limitations on the radio sets for airplanes we have a number of other complications peculiar to aviation radio, to wit:

The engine noises are always present during flight and make accurate message reading difficult even with "noise-proof" receivers. The army practically never attempted to require aviators to receive messages in the air. All signals to the airplane were visual.

The engine magneto sets up a field which has a marked effect in reducing the transmitting range of the airplane set ahead.

Effective power generation for transmitting means a sacrifice of speed. If coupled

www.americanradiohistory.com

to the engine it means a loss of power and if fan-driven generator is used it must greatly increase head resistance. Storage batteries of sufficient capacity are too heavy.

On account of the narrow range of wave lengths available for airplane radio sets, the possibility of interference is greatly increased.

Since a minimum weight in coils and condensers used in the set itself is necessary, broad tuning is generally used, and this means further difficulty from interference.

Changes of altitude which affect condenser capacity are liable to make prearranged wave length communication difficult where close tuning is required.

Cloud effects are apt to reduce the efficiency of transmission and reception, while static can effect airplane radio communication as disastrously as a land station.

The higher the voltage used on the airplane set the higher the fire hazard. Many precautions against sparks which could be observed in a roomy land station are impossible in the small limits of an airplane cockpit.

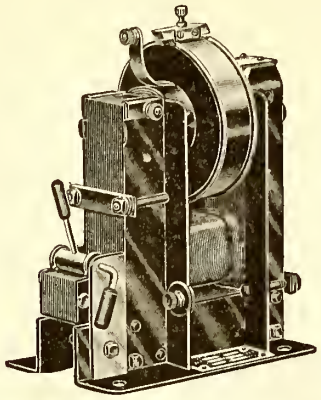
Difficulties in controlling the frequency of the generator, especially if fan-driven, involve wave length difficulties not encountered on land.

If in spite of these difficulties some radio engineer can evolve a system that will even partly afford effective radio communication with the airplane, he will find ample rewards awaiting him.

Aside from the structural difficulties presented by the airplane toward experimental work, there is always the actual difficulty of "flying" itself. You can plot an audibility chart for a land station with accuracy, but the airplane is constantly moving while in the air and at every moment it is operating under different conditions. To efficiently experiment, the airplane must proceed thru a given maneuver at a given point several times and the possibilities for error are magnified with speed and distance.

The solution of those problems seems to lie in larger planes. With greater wing spans and greater counterpoise capacity the airplane can attain certain advantages. A plane with a double fuselage, for example, ought to give the best structural advantages both in efficient flying (not to be considered here) and in maximum radio control. (See Fig. 3.)

Note that to obtain directional effect in any point of the compass a maximum change of direction of flight required would be but 45 degrees at most. This is certainly not a serious handicap. Also note the absence of trailing wires.



For ideal results, the set would be operated by a storage battery of large capacity, charged by a generator actuated by either of the engines. Thus if the airplane were at rest on the water or land, the set could still be used and any variation of speed or wind would not affect wave length or power input.

Four or five stage amplifications could be used to obtain increased sensitivity of the set to calls, and close tuning would be possible with finely graduated fixt air pressure or oil condensers.

Permanent aërial supports would be built into the airplane by the manufacturer.

DR. GOLDSMITH DIRECTOR OF RESEARCH FOR AMERICAN MARCONI COMPANY.

Dr. Alfred N. Goldsmith, professor in charge of electrical engineering at the College of the City of New York, has been appointed Director of Research of the Marconi Wireless Telegraph Company of America. Dr. Goldsmith is Editor of Publications for the Institute of Radio Engineers, and has recently written an important book on the subject of Radio-telephony.

New Method Makes Music Amazingly Easy to Learn

Learn to Play or Sing—Every Step Made Simple as A B C.

TRY IT ON APPROVAL

Entire Cost Only Few Cents a Lesson—and Nothing Unless Satisfied.

How often have you wished that you knew how to play the violin or piano—or whatever your favorite instrument may be—or that you could take part in singing?

How many an evening's pleasure has been utterly spoiled and ruined by the admission "I can't sing," or "No, I am sorry, but I can't play."

And now — at last—this pleasure and satisfaction that you have so often wished for can easily be added to your daily life.

No need to join a class. No need to pay a dollar or more per lesson to a private teacher. Neither the question of time nor expense is any longer a bar—every one of the obstacles that have been confining your enjoyment to mere listening have now been removed.

My method of teaching music by mail—in your spare time at home, with no strangers around to embarrass you—make it amazingly easy to learn to sing by note or to play any instrument.

You don't need to know the first thing about music to begin—don't need to know one note from another. My method takes out all the hard part—overcomes all the difficulties—makes your progress easy, rapid and sure.

Whether for an advanced pupil or a beginner, my method is a revolutionary improvement over the old methods used by private teachers. The lessons I send you explain every point and show every step in simple Print-and-Picture form that you can't go wrong on—every step is made as clear as A B C. My method makes each step so easy to understand and practice that even children only 7 to 10 years old have quickly become accomplished players or singers under my direction by mail. Also thousands of men and women 50 to 70 years old—including many who had never before tried to.

My method is as thorough as it is easy. I teach you the only right way—teach you to play or sing by note. No "trick" music, no "numbers," no makeshifts of any kind.

I call my method "new"—simply because it is so radically different from the old and hard-to-understand ways of teaching music. But my method is thoroughly time tried and proven. Over 225,000 successful pupils from boys and girls of 7 to 8 to men and women of 70—are the proof. Largely through the recommendations of satisfied pupils, I have built up the largest school of music in the world.

For Beginners or Advanced Pupils

Piano	Harmony and Composition
Organ	Sight Singing
Violin	Guitar
Viola	Ukulele
Banjo	Harp
Mandolin	Cornet
Clarinet	Piccolo
Flute	Trombone
Saxophone	
Cello	

To prove what I say, you can take any course on trial—singing or any instrument you prefer—and judge entirely by your own progress. If for any reason you are not satisfied with the course or with what you learn from it, then it won't cost you a single penny. I guarantee satisfaction. On the other hand, if you are pleased with the course, the total cost amounts to only a few cents a lesson, with your music and everything also included.

When learning to play or sing is so easy, why continue to confine your enjoyment of music to mere listening? Why not at least let me send you my free book that tells you all about my methods? I know you will find this book absorbingly interesting, simply because it shows you how easy it is to turn your wish to play or sing into an actual fact. Just now I am making a special short-time offer that cuts the cost per lesson in two—send your name now, before this special offer is withdrawn. No obligation—simply use the coupon or send your name and address in a letter or on a postcard.

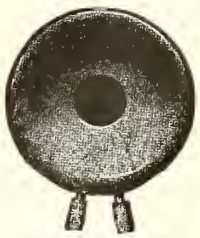
AMPLIFY YOUR RADIO SIGNALS

With the new DETECTAGRAPH-TRANSMITTER, the amateur can amplify radio signals to such an intensity that he can hear the signals about his station without the need of the telephone head set.

By the addition of a loud talking telephone he is able to hear the messages many feet away from the instrument.

The super-sensitive DETECTAGRAPH-TRANSMITTER herewith shown is two and three-eighths inches in diameter, five-eighths of an inch thick and weighs less than three ounces. It is the most sensitive sound detecting device ever brought before the public.



The manner in which the amplifying process is attained is by attaching with tape the DETECTAGRAPH-TRANSMITTER to the regular wireless receiver.

Not only is this instrument applicable for amplifying radio signals, but it can be used with equal satisfaction for magnifying other sounds. Phonograph music can be transmitted from one place to another by means of this instrument, and those who are afflicted with deafness will find enormous benefit by using this transmitter. It is the greatest device for building your own loud talking telephone, detectagraph and other devices. Can be used for any purpose where a sensitive detecting instrument is required.

SUPER-SENSITIVE Detectagraph MICROPHONE DEVICES

Our Super-Sensitive Detectagraph Transmitter. Price, $7.00 Complete

Our Special No. 25 Loud Talking Receiver. Price, $4.00 Complete

Detectagraph Rheostat, especially made for amplifying circuits. Price, $2.00 Complete

Super-Sensitive No. 40 Receivers to be used in connection with Detectagraph-Transmitters, $10.00

The Detectagraph Junior Deaf-Phone $15

Equal to any $35 instrument made. Outfit consists of Super-Sensitive Transmitter with cord connector; Super-Sensitive Ear Piece with small black cord; Black Single Headband; Black Case and Two Batteries.

Model "B" Horn, with Loud Talking Receiver, Cord Plugs and Desk Stand Base. Price, $10.00 Complete

Model "C" Horn, with loud talking Receiver, Cord Plugs and Wall Base. Price, $10.00 Complete

Detectagraph $15

This detecting instrument of marvelous sensitivity can be used for detecting secret conversations. Outfit consists of Sensitive Transmitter, 25-ft. Black Cord, Receiver, Headband, Case and Battery.

Order direct from ad.

School established 45 years. Endorsed by wireless, railway and telegraph officials. Low rates. Students can earn living expenses while attending school. **Catalog Free. Write Today.**

Dodge's Telegraph and Wireless Institute 22nd St. Valparaiso, Indiana

The Submarine's Under-Water Radio

(Continued from page 584)

The design and specification of the closed loop are given below:

DETAILS OF SUBMARINE LOOP ANTENNAE.

The loop antenna consists of two insulated wires *grounded* at the extreme ends of hull carried over suitable supports to the bridges, and thence thru radio lead-ins to the apparatus.

(1) *Wire.*—Seven strands of No. 14 B. & S. phosphor bronze wire, covered with 40 per cent Para rubber, to a total outside diameter of ½".

(2) *Supports.*—Two substantial masts, triangular or oval in cross-section, 3 feet high with insulators at the top, erected at either end of the boat and braced to withstand considerable strain.

(3) *Stanchions.*—Two stanchions insulated at the top placed high enough to support the wire at least 1 foot above the bridge.

(4) *Radio Insulators.*—An extra radio insulator similar to the one already installed, placed in the space now occupied by the antenna mast (or in any convenient place at least 3 feet away from the other insulator), and extended vertically thru the hull.

(5) *Water-tight Sleeves.*—(To prevent the sea water from working up under insulation on wire.) Brass stock 3" long bored to outside dimensions of insulated wire for 2¾" and drilled dimensions of bare wire for ¼". The wire is stript of insulation for a few inches and is slipt thru the sleeve, the insulated portion being smeared with white lead and the stript portion being soldered to the brass.

(6) *Grounded Connections.*—Lugs on end of wire grounded to hull by bolts.

(7) *Lead-in Joints.*—Junction of insulated wire and radio conductor is made water-tight by marine glue poured in a cylindrical mold.

(8) *Wire-tightening Device.*—(*a*) Turnbuckles may be placed at the end of each wire next to ground connections; or (*b*) in order to take up slack on both wires equally it is preferable if construction of boat permits to place one insulated turnbuckle between stanchions on bridge.

(9) *Receiving Apparatus.*—Tuner capable of receiving wave lengths of 300 to 16,000 meters, and oscillation audion detector and three-stage resistance type amplifier of French design. (The Navy standard audion control box type SE 1,000 two-step amplifier cannot be used unless placed in a noise-proof and inductive-proof compartment.)

(10) *Transmission Apparatus.*—Regular quenched spark set, preferably the 1 KW. size. Terminals of loop antenna are connected to the antenna and ground connections, respectively, with a .0005 microfarad condenser in series with the loop. The ground connection on the set being removed.

SENATOR MARCONI A PEACE DELEGATE.

The new Italian Ministry has selected Senator Marconi as one of the Italian peace delegates. The illustrious scientist was appointed a Senator by the King of Italy in 1915 and seems to be entering more and more into the public life of his country. It is surely most fitting that he, whose genius has so greatly contributed to the preservation of human life and the promotion of international communication, should now receive the signal honor of being made a peacemaker. He is shortly to visit America on the subject of the peace treaty and other matters.

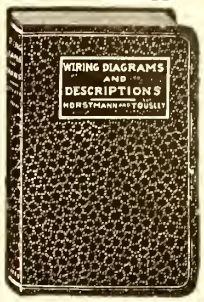
Can Radio Ignite Balloons?

(*Continued from page* 516)

WHAT NIKOLA TESLA SAYS

Probably no other living electrician could be found today who can more authoritatively state just what effect can be produced at a distance by radio currents, than Dr. Nikola Tesla. He has produced and measured the greatest electrical discharges ever developed by man—sparks 70 to 100 feet in length, which manifested their influence 12 miles and more distant. In a special interview with the ELECTRICAL EXPERIMENTER representative, Dr. Tesla said in regard to the present blimp disaster:

"Referring to electrical or radio wave action at a distance, I know from experience that if proper precautions are not taken, fires of all kinds and explosions can be produced by wireless transmitters. In my experiments in Colorado, when the plant was powerfully excited, the lightning arresters for *twelve miles around* were bridged with continuous arcs, much stronger and more persistent than those which ordinarily took place during an electric storm. I have excited loops (coil aerials) and lighted incandescent lamps at a considerable distance from the laboratory without even using more than five or ten per cent of the capacity of the transmitter. When the oscillator was excited to about 4,000,000 volts and an incandescent lamp was held in the hand about *fifty or sixty feet from the laboratory,* the filament was often broken by the vibration set up, giving some idea of the magnitude of the electromotive forces generated in the space. The accompanying illustration shows one of my experiments in which I lighted several lamps at a distance of 100 feet from the laboratory, purely by wireless energy. Such induced currents might easily fire a gas balloon under the proper conditions. When the large transmitter coil, 51 feet in diameter, which I had in the center of the laboratory, was powerfully energized, butterflies were carried around in a circle as in a hurricane and could not get out, no matter how they tried. I was unable to satisfactorily explain the gyrations in the circle, altho I can well understand that the charged coil might, by repulsion, keep them in the center. Perhaps the most remarkable of all the observations was the production of sparks in the sand when one walked at some distance from the building. At night a continuous stream of tiny sparks could be seen between the heels and the earth and between the grains of sand. Another most curious effect was the action on horses, which shows how very sensitive they are to electric shock. When I operated with undamped waves, the oscillator being perfectly silent (no streamers whatever), a horse at a distance of perhaps *one-half a mile,* would become scared and gallop away the instant the switch was thrown on. I suppose the capacity of the body was sufficiently great to derive a rather strong current thru the legs which would frighten the animal. When using damped waves the roar was so strong that it could be plainly heard ten miles away and despite all precautions, such as using cotton in the ears, one would get a singular sensation in the head as if something was bursting, similar to that I observed with Röntgen Rays in 1896 or '97, when I was operating with a powerful apparatus designed for their production.



"In my experiments in New York in the laboratories at 35 South Fifth Avenue and at Houston Street, I have exhibited to thousands of people effects of loops or coil antennae. In one experiment, for instance, I would tune a coil about 30 inches in diameter with which I would collect at

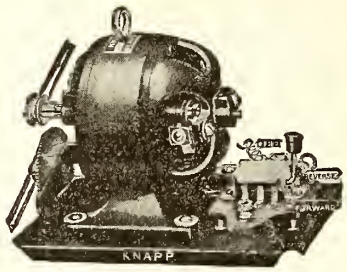
DEPENDABLE KNAPP ELECTRIC SPECIALTIES

Motors and Electrical Specialties Are Best

Knapp Goods have stood the test for 29 years. No detail in construction has been spared to make them the best that money can buy. The complete Knapp line includes Toy and Power Motors, Generators and Dynamos. Specialties and Novelties that amuse and instruct. Fans, Rheostats, Compasses, etc. And Knapp prices are always lowest. Always insist on Knapp Goods.



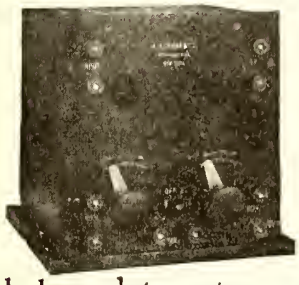
KNAPP DYNAMO MOTOR

Will electroplate, charge storage batteries, run lamps, motors, train of cars, induction coils,—in fact, the number of experiments it can be used for is unlimited. Runs on 4 to 6 Volts or can be connected to run on 110 Volts through a transformer.

Price, Complete, $8.00

KNAPP "LEADER"

An efficient and reliable motor that greatly resembles the big motors of real power plants. Drives from either pulley. Two speeds and reverse. A motor that you will be proud to own and one that will give you unlimited service.



Price, Complete, $4.00

Order to-day. Or your dealer can secure them for you. DESCRIPTIVE CIRCULAR and CATALOG of celebrated **KNAPP MOTORS** *and Electrical Specialties from 10c up mailed FREE on request.*

KNAPP ELECTRIC & NOVELTY CO., 523 West 51st Street, New York City

ARE YOU GETTING THE MOST OUT OF YOUR RECEIVER?

The ether is full of signals these days, some easy to hear and some inaudible. Inaudible because the proper apparatus is not being used.

It is to make those inaudible signals audible that the Grebe RORB two-stage audio-frequency amplifier has been designed. Here is a properly balanced two-stage amplifier, which gets the most out of available vacuum tubes without distortion. A telephone cam switch with auxiliary contactors accomplishes the change from the "off" position to either one or two stages without necessitating any other manipulations. The filaments, as well as the stage circuits, are controlled by this cam switch. This is a feature not found in other amplifiers available at present. Send for bulletin R-108.

TYPE RORB, TWO STAGE AMPLIFIER, PRICE, $45.00

RICHMOND HILL **NEW YORK**

Boys! You Can Make Your Own Electrical Apparatus with the aid of these wonderful books

Home-made Electrical Apparatus

By A. M. Powell

Three wonderful big books, chuck full of just the sort of information you have been looking for and at a price within reach of your pocket book. Each volume is printed on heavy paper, contains **75 pages and over 60 illustrations, complete working drawings for making every sort of electrical apparatus.** Written so you can understand them. **The price is only 30 cents per copy**—practically the cost of publication. See partial table of contents below and order now. The supply is limited.

Vol. I Contains *working drawings* and directions for making all sorts of Static Machines, Static Apparatus, Home-made Batteries, Storage Cells, Transformers, Rectifiers, etc.

Vol. II contains *working drawings* and directions for all sorts of Voltmeters, Ammeters, Galvanometers, Switches, Rheostats, Telegraph Keys, Sounders, Telephones, Shocking Coils, Spark Coils, Experiments, etc., etc.

Vol. III contains *working drawings* and directions for making all sorts of Dynamos, Motors, Electric Engines, Miniature Lighting Plants, Wireless Telegraph Apparatus, Tesla Coils, Wireless Telephone, Electroplating, Experiments, etc., etc.

Any one of these wonderful books will be sent to you *postpaid* for **30 cents.**

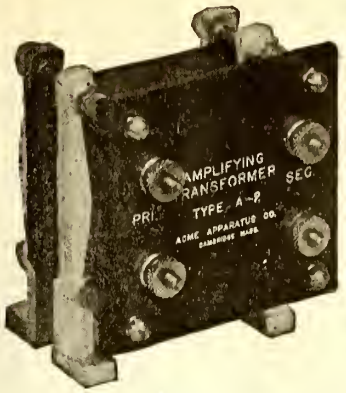
THE WILCOX LABORATORIES, Lansing, Mich.

any place in a large hall, *nearly three-quarters of a horsepower,* lighting incandescent lamps, producing long discharges, streamers, etc. One of my exhibits, which was particularly appreciated, was a coil carried on the head which, when resonantly excited, would develop streamers several feet long.

"As regards that deplorable accident to the blimp in Chicago, of course a powerful wireless plant is capable of setting up, at a few hundred feet distance, electro-motive forces of such magnitude that if there is even moderate rise thru resonance, long sparks may result. *In Colorado I drew 1-inch sparks between my body and an iron pipe buried in the ground about 100 feet from the laboratory.* I think it perfectly practicable to produce an explosion by wireless designedly at a considerable distance from a wireless transmitter, and I look upon the accident as very likely having been due to some such cause. By taking proper precautions, however, it is possible to entirely eliminate this danger and I have devoted much thought to the subject, having early recognized the peril to such bags filled with hydrogen. According to my ideas, the accident is not so much chargeable to the plant as to the neglect of proper precautions on the aërial vessel itself. Such a vessel has a considerable span and the guy wires, gondola and other metallic parts constitute a considerable capacity, so that an appreciable amount of energy can be deprived from a wireless plant at a great distance, as it is well shown in the ease with which messages are transmitted to, and received from, aërial vessels.



"Why do the naval and other authorities allow such forms of aircraft to use an explosive gas like *hydrogen?* A short time ago the press was filled with the wondrous stories of how the U. S. Government experts had perfected the manufacture of the new and non-inflammable balloon gas—*helium,* to such an extent that it was very cheap and readily obtainable in quantities. Funny, how these "new" inventions require so long a time to reach the public and those who need them. Helium, extracted from illuminating gas, is not new or wonderful at all. My friend, Sir James Dewar, showed me experiments with it over 20 years ago."

How radio waves, even at distances of several miles, can cause sparks to occur among bales of cotton, baled with wire hoops, etc., is shown in one of the accompanying illustrations. The cotton bale wires have currents induced in them every time a radio message is sent from the ship or in its vicinity. This induced current is practically never strong enough to heat up the wire, but should one of these wires break and form a spark gap, then very often the induced current will cause a spark to jump the gap. That is enough to start a fire. Where wired bales are packed close together in the hold of a steamer, in trains, or warehouses, here also radio waves are liable to cause fairly strong electrical oscillations to be set up by resonance in adjacent loops on the bales, as the diagram shows. Result, a spark occurs, and another fire of "unknown origin" has started.

M. George A. Leroy, a French chemist, in his municipal laboratory at Rouen, France, very ably demonstrated that wireless waves could without doubt cause fires at a distance. His apparatus is shown schematically herewith.

Mr. Leroy's apparatus has been christened by him the "Igniting Resonator." The apparatus he used consists of a glass bulb having four apertures; one at either side and one at the top and bottom, respectively. The substance to be tested with this igniter resonator can be placed in the airtight glass compartment and the two electrodes very accurately adjusted by micrometer screws fitted to them. The transmitter comprises a spark coil giving a 15-to-20-

inch spark, which was connected with a spark gap, glass plate and tin-foil condenser and a loop antenna or spiral comprising a few turns of heavy wire, about 2 feet in diameter. Several yards distant, Mr. Leroy placed his receiving coil or igniting resonator, which included a loop or heavy copper conductor about three feet in diameter. The action on the device was similar to that of the Hertzian resonator, i. e., whenever the spark coil or transmitting helix were excited, allowing a spark to jump the gap, electromagnetic waves were set up in the intervening ether, causing corresponding currents to be induced or set up in the receiving loop. As in the historic experiments of Hertz, this loop will gather sufficient energy from the etheric waves to cause a small spark to jump a gap connected across the terminals of the loop, as the accompanying diagram clearly shows.

Mr. Leroy carried out many different experiments with his apparatus, placing the glass spark chamber of the igniting resonator in a bath of oil or vaseline, which can be heated when desired by incandescent lamps, etc.

One of the most interesting experiments carried out by Mr. Leroy was that with miniature bales of cotton, which were enclosed in jute wrappers and provided with iron wire bands, in the way cotton is usually packed for shipment. "Spontaneous combustions in cotton warehouses and in shipholds loaded with cotton or similar material, are not always what they seem," says Mr. Leroy, in describing his experiments and results with the radio igniter. One of the hoops encircling the bale of raw cotton may break or become loose under the action of shock or from some other cause, and the gap created by the breaking of the wire, forms a miniature Hertzian resonator. When a wireless station situated in the immediate vicinity, or perhaps at some quite distant point, starts in to transmit (and the more powerful the station the more pronounced the effect and danger from fire of course), currents will be induced in the iron wire around the bales or other packages, and sparks may pass between the various metal members. Especially will they be inclined to jump small gaps in the wire which occur in the immediate loop. We may say right here, that to a layman all of this phenomena may seem somewhat far-fetched, and not within the realm of everyday possibilities, but anyone who has experimented with high frequency currents, as generated from even a small size oscillator, will at once be convinced that these effects can and do take place under most unbelievable conditions. Of course, one objection that the average electrical and radio reader will probably think of, is that if the cotton bales, et cetera, are placed in a steel vessel, that this metallic hull will act as a screen, and that the bales will not have any current induced in their wire loops, but while this may be partially so, in some cases it is not always so by any means; especially when the home transmitting station, such as on ship-board, starts in operating. In this case, the steel hull of the boat is charged whenever the transmitting key is depressed.

The secret, if so we may call it, of the production of inflammatory sparks or discharges in metallic bodies such as here described, lies in the phenomena known as "resonance." This means that the nearer the metallic members come in tune with the radio waves, the more pronounced the induction effects produced in any instance. It is of course readily conceivable that a cargo of cotton bales presents many peculiar conditions of resonance, due to the varying capacities and inductances of the various loops. In fact, so obvious and possible is this condition, that a wooden vessel carrying bales of cotton or other material having wire or metal members to hold them, and providing she is fitted with a

MATHEMATICIANS

Engineers, Astronomers, Surveyors, Scientists—

EASTERN RADIO INSTITUTE

RADIO

899 Boylston St. Boston - Mass.

RADIO—Splendid opportunities now in the Merchant Marine for Wireless Operators. Big salaries! New Schedule: Junior operators, $100 per month; Chief operators, $125; food and quarters besides. Equivalent ashore from $40 to $50 a week. Graduates in all parts of the world as Inspectors, Instructors, Engineers, Operators, etc.

The oldest, largest and best equipped radio school in New England. Recommended by Marconi and Government officials. DAY AND EVENING CLASSES. START ANY MONDAY.

"The Eastern" is a Large Achromatic Telescope

MADE UPON NEW SCIENTIFIC PRINCIPLES.

Positively such a good Telescope was never sold for this price before. **Eastern Telescopes** are made by one of the largest manufacturers of telescopes in America; we control entire production; measure closed 9 inchss and open over 3 feet in 4 sections. They are nicely brass bound, with scientifically ground lenses. **Guaranteed by the maker.** Every sojourner in the country or at the seaside resorts should certainly secure one of these instruments, and no farmer should be without one. The scenery just now is beautiful, a Telescope will aid you in taking views. Objects are brought to view with astonishing clearness. Sent by mail or express, safely packed, prepaid, for only **99 cents.** Our new Catalogue of Watches, etc., sent with each order. This is a grand offer and you should not miss it. **We warrant** each telescope just as represented or money refunded. Send **99 cents** by Registered Letter, Post Office Money Order, Express Money Order, or Bank Draft payable to our order, or your newsdealer or store-keeper will order one for you. Whether consumer or dealer, send cash with order. **To dealers 6 for Four Dollars.**

EASTERN NOVELTY CO., 67, 177 E. 93d STREET, NEW YORK

SMOKE IT BEFORE YOU PAY FOR IT

Order on your Business Stationery

To introduce this new and better way to make a pipe we make this extraordinary offer, we will let you smoke this pipe before you pay for it. More than 10,000 BANKERS HAVE BOUGHT BY MAIL. Genuine French Briar, solid Vulcanite mouth piece. Its simple construction makes cleaning easy. Try it. If it is not satisfactory you may return it. Price $1.50. Straight or Bent Models. You breathe, not pull through this excellent pipe and we guarantee satisfaction.

THE CALUMET CO.

wireless station of even a few kilowatts, that the Editors would prefer to stay on land than go to sea on such a ship.

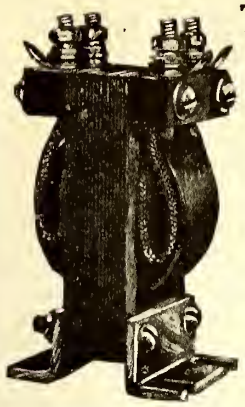
One of the accompanying photographs shows how a great multitude of close oscillatory circuits are provided unwittingly in all-framed or rigid gas airships, and even in the non-rigid gas airships there is usually a sufficient amount of metal present in the gondola, wires and other fittings to form one or more resonant circuits, which may cause a spark at an imperfect joint or other gap. It should be remembered, as laboratory tests have demonstrated beyond cavil, that it is not necessary to have a metal wire coil *in spiral form* in order to have powerful currents induced of sufficient strength to cause a spark to jump from it; a straight metallic wire, bar or even tools, lying within a few yards of a small high frequency coil, will pick up sufficient energy to cause sparks to jump from them, and they will sometimes glow with a vivid brush discharge when viewed in a darkened room.

NATIONAL INSTITUTE OF INVENTORS.

The installation of the officers of the National Institute of Inventors, 118 Fulton Street, New York City, N. Y., was held at the Broadway Central Hotel recently, in the presence of 1,000 guests and members. After a very fine entertainment in which the well-known coloratura-soprano, Miss Edna Blanche Showalter, had rendered selections, and Miss Cecelia Bornstein executed in remarkable fashion her salome dance, the newly elected officers were installed.

Addresses were given by Prof. Chandler, a chemist of international reputation and patent expert; Joseph H. Choate, Jr., who spoke of the founding of the Chemical Foundation, Inc., to which foundation all the German chemical patents had been turned over by former Alien Custodian, Attorney-General Palmer, and an address was made by Thomas Howard, executive chairman of the institute, on the severance and dissociation of the patent office from the Department of the Interior, and the establishing of a Court of Appeals to pass upon patent litigation. He was presented with a medal for faithful services. Refreshments were served and the guests danced until the wee hours of the morning.

The newly elected officers, to serve until 1920, were L. J. Wing, President, pioneer inventor of exhaust fans; Carl Schonert, manufacturer of automobile accessories, of Newark, First Vice-President; Robert C. Lafferty, architect, New York City, Second Vice-President; George Julian Houtain, attorney at law, of 44 Court Street, Brooklyn, Third Vice-President; Milton F. Williams, manufacturer of pulverizers, St. Louis, Mo., Fifth Vice-President; W. H. Kennedy, Recording Secretary; Nathan Langer, Treasurer; Paul Revere Fay, one of the fighting Sixty-ninth, Executive Secretary, and R. Nerenstone, Assistant Executive Secretary.



On the Board of Governors to serve for five years were elected: David Moss, New York City; L. Kenner, New Orleans; Julius Glantz, New York City; Michael Quinane, Paterson, N. J.; J. M. Harding, New York City.

AND WOMAN IS LUCKY TO MAKE ONE MATCH.

One of our newspaper friends—the Oklahoma City *Times*—quotes us as follows: "The ELECTRICAL EXPERIMENTER tells us that a man contains phosphorous enough to make 800,000 matches, and it might be added that a woman does well to make even one."—(Yes, very well, we'll say she does! With shoes at $25.00 a throw, dresses at $100.00 a piece, and food—Ach! Hoover—the needle!! The thought of H. C. L. to-day gives us a fever of 114° in the shade.—ED.)

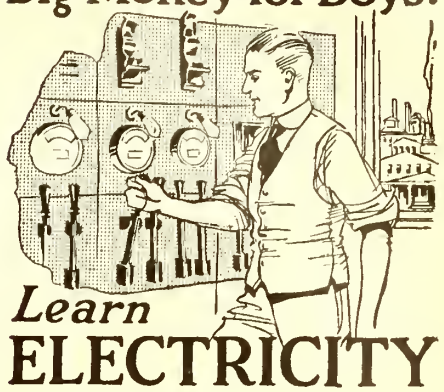
Experimental Mechanics

By Samuel D. Cohen



(*Continued from page 579*)

ing oil just above the work. A small brass pipe is soldered into the bottom of the can and leads down to a point just above the tap. By fitting a small valve or stopcock to the bottom of the brass pipe the amount of oil fed onto the tap may be regulated to any degree desired. In threading holes in this manner in the lathe, the tap is very easily backed out by reversing the shift lever on the lathe or counter-shaft, so as to reverse the direction of the chuck, when the threaded object will unwind itself from the tap. In performing this reverse operation to remove the tap, the tail-stock should of course be backed away from the tap so that no pressure whatever is on the tap or otherwise the thread may be ruined, due to the tap being jammed into the threads.

Holes often have to be tapt in very inaccessible locations and for such work a machinist usually provides himself with a long tap wrench. In fact a very good stunt for this work is to arrange a standard tap wrench, so as to fit several different lengths of threaded extension rods, and in this way such out-of-the-way holes can readily be threaded. (*To be continued.*)

Big Money for Boys!

Learn ELECTRICITY

There is a wonderful opportunity right now for boys who like electricity. Boys who are ambitious and will train themselves in spare time can step into positions just as soon as they are ready. Good salaries are offered to start with splendid chances for rapid promotion.

For 28 years the International Correspondence Schools have been training boys for success in electricity and over 200 other subjects. They will help you prepare right at home for a position in the line of electrical work you like best—or in any other work that appeals to you. Thousands of boys, through I. C. S. training, have stepped into fine jobs, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least, and it will bring you information that will start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon *now*.

TEAR OUT HERE

To Europe in Three Hours

(*Continued from page* 575)

fair, not to be compared with our passenger carrying types of lighter-than-air aircraft, which incorporate the important factor of having a "dead load" (crew, engines, fuel, etc.); this takes a very large proportion of the total lifting effort exerted by the balloon envelope. In the testing balloon the ratio of "dead lift" to the weight of the balloon itself is very much less, and if some of the gas originally put into the bag has to be dissipated by an automatic valve, to keep the balloon from bursting, there will still be sufficient gas left in descending to lower levels to sustain the recording instruments carried, owing to two reasons, viz.: the greater free expansibility of the small, simple balloon of this type, whose diameter may have increased at the higher altitudes to four or five times its normal inflated diameter at sea level; and again due to the low ratio of the "dead weight" to the balloon weight proper.

High Altitude Airplanes

When it comes to operating airplanes at high altitudes several factors confront us. Some of these factors we have already mentioned in the foregoing text—such as increasing the wing-spread and the total exposed area of the wings; improving the thrust of the propellers by lengthening them and possibly increasing their specd; utilizing air-compressors for the pilot's cab and carburetor systems of the engines; using "vacuum bottle" cabs for the crew, etc. Variable pitch propellers are being strongly advocated by altitude fliers nowadays, including Major Schroeder. These would seem to improve the climbing and propelling efficiency.

As Mr. Harry E. Dey has pointed out, the reduction in the weight of the air falls off as we go up in the atmosphere; at say 3½ miles altitude the weight of the air is about one-half that at sea level, and the resistance has reduced to approximately one-half also. The airplane at this level should therefore, as Mr. Dey also believes and states, be accelerated to *double* its sea level velocity, which let us consider as having been 200 miles per hour. Here then the plane should travel at 400 miles an hour. Some one objects, however, that altho this may be quite true, the supporting power of the air has fallen to about one-half. True; it has decreased one-half for the *former* 200-mile-per-hour speed, but this loss has been neutralized by the *increased velocity*, 400 M.P.H., with the result that the net buoyancy is the same as formerly.

Reasoning on this basis of reduced weight and less air resistance at the higher altitudes, it becomes possible to attain some real hair-raising speeds in an airplane. For example, if we consider the weight of the air at eight miles altitude to be but (approximately, to simplify matters) one-fifth of that at sea level, then the speed which an airplane attaining 200 M.P.H. at sea level, would attain at this altitude (about 42,000 feet) figures to the astounding velocity of 1,000 *miles per hour*. According to this method of reasoning, as followed by Mr. Dey, Europe is only a stone's throw away from us, and we can call up Cousin John or Aunt Kate in London and tell them to hustle over for Sunday dinner. They'll be with you in your New York city apartment and raving over your wife's salad, *just three hours later!* 1,000 M.P.H. divided into 3,000 miles=3; simple, ain't it? Gad, tho, this is awful; our wife's folks will *all* be with us every week-end! Get that!!! You know there's such a thing as "too much speed." What?!

Q. S. T.

"All men having commercial licenses should report for jobs at once."

Big shortage of operators!

Every student completing the course has qualified himself to fill a position paying $85-$130 per month and keep.

Short, thoro course — excellent laboratory.

Dormitory — swimming pool.

www.americanradiohistory.com

And think of inviting your Aunt Kate or Cousin Myra, from London to make the aërial trip over the pond in three hours! Did you think of the catastrophe that might await you?! No? Well, listen Lester: your aunt, and the rest of the family tree hailing from "dear ol' Lunnun" would be eating your "dinner" at *their* "supper time," and the Sunday visitor from London! Can you imagine him arriving on the morning (at New York) aërial boat at 7 o'clock A. M. He left London at 9 o'clock, traveled over in three hours, which makes it 12 o'clock noon by his turnip; wherefore, and hence—Mr. England would have to sit down with you and eat his *breakfast* all over again, and at "dinner time," at that. It's not as bad as it sounds—the sea air would make it possible.

The Story of Rohlfs—New American "Altitude Flier."

Among other things, Roland Rohlfs, the new American altitude record holder, recently stated:

"I shall take every precaution on my next trial. In order to obviate the trouble I had in keeping my motor warm shutters will be provided, and the gasoline pump, which became airbound, making it necessary for me to pump by hand nearly two hours, has been adjusted. I shall also make more careful selection of the gasoline I use. In my last attempt I used a high test gas and I failed to get within 200 revolutions per minute what I got the first time.

"I shall also wear more clothing. My hands got very cold, in spite of the fact that I had on several pairs of gloves and mittens. I shall also try more oxygen, for on both my flights my supply has given out. I always try to be as sparing as possible, not using it until I reach approximately 23,000 feet.

"What is the purpose of altitude flights? I suppose most people think they are made merely to satisfy the vanity of the pilot or the airplane designer—something like the automobile speed race. Not at all. It has a distinct scientific value. It gives invaluable data to the meteorologist and will be of infinite value when the time comes for the establishment of air lanes of travel for airplanes.

"At the present time our knowledge of conditions is based largely on observations made from kites and from balloons, but these are stationary and, for the most part, the information gained is applicable only to localities in which the tests are made. With the airplane one can cruise about in the thin upper strata of the air and actually chart the conditions that can be expected to prevail there. It will enable us to make certain lanes of travel for airplanes of various types, say the upper levels for the speedier planes and the lower levels for the slower going machines.

"We also get valuable information concerning the kind of planes and motors that will have to be built for use at various air levels. It gives us data concerning the way motors act under certain conditions and at certain levels, how the machine maneuvers, what sort of wing construction is necessary.

"It also gives us valuable medical data concerning the effects of different altitudes on different people.

"It is almost impossible for us to conceive that six miles above one of our bathing beaches, six miles above cities where people are sweltering in the heat, the temperature is twenty-five degrees below zero and that a wind of from 100 to 200 miles an hour is blowing. That information in itself will be important when commercial aviation gets to be a regular thing. With all this information at hand, think how easy it will be for us to go up in a specially-

(*Continued on page* 599)

Let This Faculty of Specialized Experts Train You for Electrical Success

All are specialists in their professions—have had years of practical experience in addition to their scholastic attainments. Through the direct aid and personal attention of this well selected faculty you will forge rapidly ahead in the great electrical field.

All Branches of Electricity

are taught quickly, thoroughly, efficiently here. The maximum of education at the minimum of time and expense.

School of Practical Electricity—1 Year Course

Trains you to become a master electrician. Fully equipped laboratories, latest modern electrical installation. Fifteen years of continuous specialization in one branch—ELECTRICITY. This standard up to the minute course especially designed for us has proved its value through the trained men produced.

Institution of Electrotechnics—Junior and Senior Course

Trains young men of either eighth grade or part high school education for entering a brand new profession. A rapidly increasing demand for men to fill high salaried positions. Course also prepares for entering College of Electrical Engineering, Junior Division (1½ yrs.) open to 8th grade graduates. Senior division (1½ yrs.) for students with seven high school credits.

School of Mechanical & Electrical Drafting

One year course. No special educational requirements for entrance. Train to become an expert in a great and growing profession. "Earn While You Learn" if you like. Athletics. Glee Club. R. O. T. C. (optional). Students Fraternity House with board and room at cost.

4-cyl. Lycoming Motor—37 H. P.

For nearly five years the Bush Car has been doing heavy duty all over this country. It's sold by mail only—we do not have distributors. Our Proposition is liberal beyond your expectations. It contains a good selling profit for you. Get ALL the information quick. Write at once to J. H. Bush, Pres., Dept. M-15

BUSH MOTOR CO.
BUSH TEMPLE, CHICAGO

BUSH PASSENGER CARS

The Bush Car for 1919, in the Light Four is unequaled in value anywhere this year. Think of a car with all the modern refinements which includes in its equipment the Boyce Motor Meter, for instance, at prices modest in the extreme. The Bush method of marketing the Bush Motor Car not only gives the owner a better car than he usually gets, but the Bush method of sales gives the user the benefit of high quality at low price. We list below some of the big things—the high grade features—that go into the Bush Car for 1919.

Full Floating Rear Axle — **Willard Batteries**
Two Universal Joint Drive — **Timken Roller Bearings**
116-Inch Wheel Base — **Plate Glass Rear Windows in Top**
Copper Radiator — **Light Weight—2450 lbs.**
Electric Lighting and Starting (2 unit)

The best material obtainable—the very highest quality construction coupled with what every one knows to be good equipment, such as Willard Batteries and Timken Bearings, insures long life to the Bush Car even under unusually hard service. There is a Money-Back Guarantee Goes with Every Bush Automobile to show you we mean just what we say about the quality of this car and to prove to you that your confidence in us will not be abused. Our Guarantee is in writing.

What 15c Will Bring You from the Nation's Capital

Washington, the home of the Pathfinder, has become the World's Capital and reading the Pathfinder will be like sitting in the inner council with those who will mold the world's destiny for the next generation

The little matter of **15c** in stamps or coin will bring you the Pathfinder **13** weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its **27th** year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send **15c** to show that you might like such a paper and we will send the Pathfinder **13** weeks. The 15c does not repay us; we are glad to invest in new friends. **Pathfinder, Box 76, Washington, D. C.**

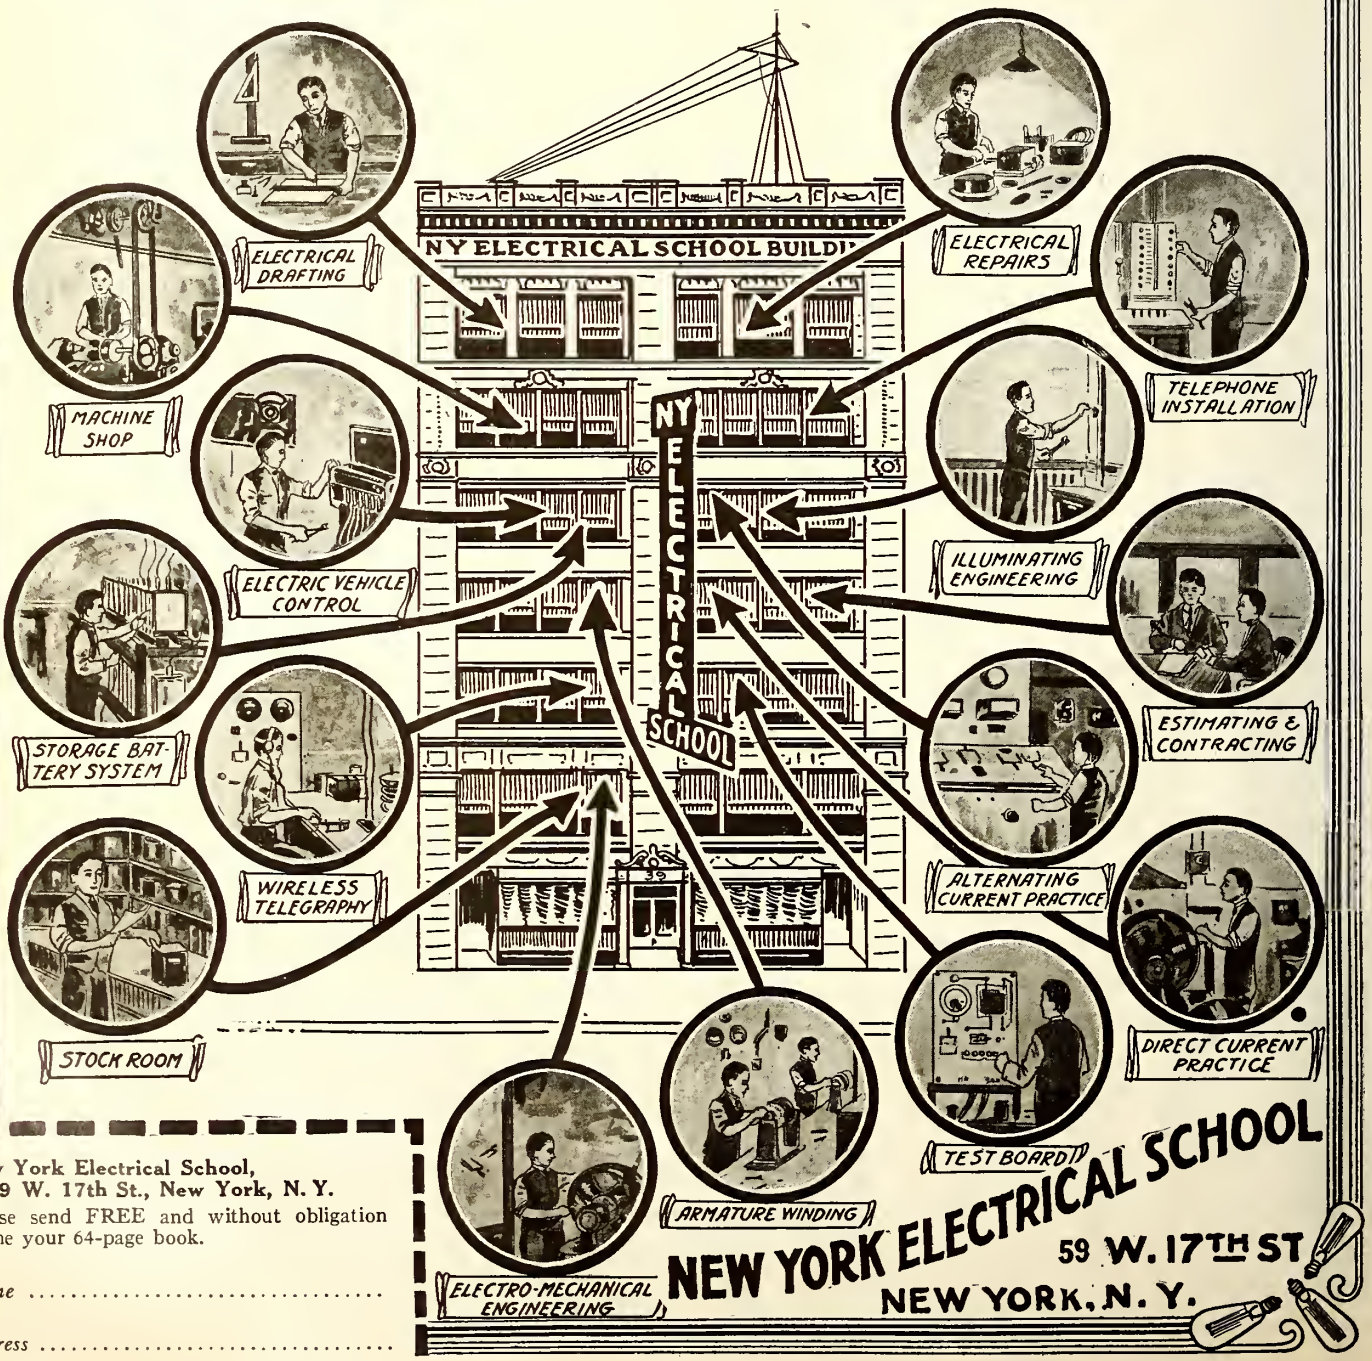
Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.



Over 5,500 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Special Automobile Ignition Course

We have just installed a special automobile ignition course for auto mechanics, garage men and owners. The course covers completely ignition, starting, lighting and other electrical equipment in connection with automobiles, motor boats, etc.

Let us explain our complete courses to you in person. If you can't call, send now for 64-page book—it's FREE to you.

New York Electrical School,

To Europe in Three Hours

(*Continued from page* 597)

constructed machine, the body built perhaps on the principle of the *vacuum-bottle,* take advantage of the 200-mile-an-hour wind which prevails from the east, *and land in Europe in half a day.* Because, with a wind of that velocity, you can conserve gasoline and simply let the wind blow you where you want to go. You can get the wind-direction at various levels by means of observation kites.

"Speeds greater than we have ever thought of will be attained and commercial aviation will take advantage of them sooner or later."

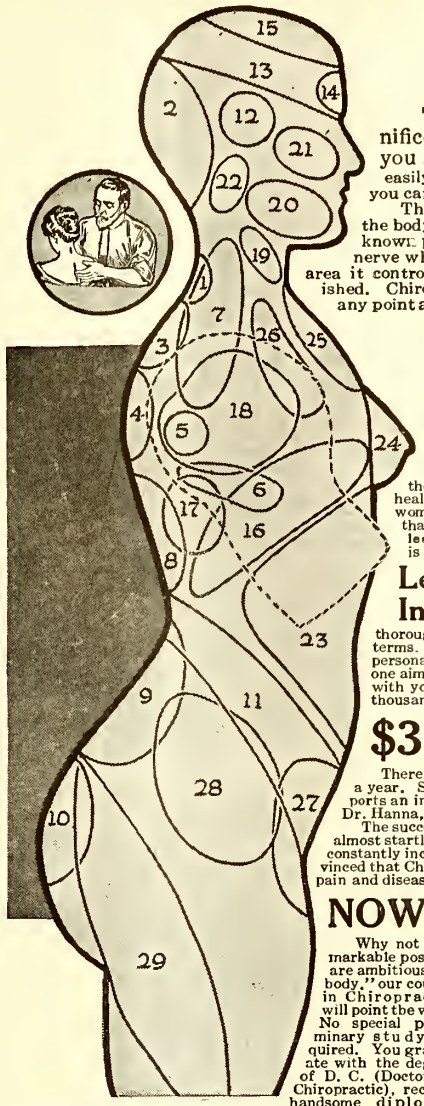
Rohlfs flew a Curtiss Wasp biplane equipt with a twelve-cylinder 400 horsepower Kirkham motor. The biplane weighed 1,900 pounds and had a wing span of 32 feet and half an inch and measured 23 feet over all in length. He tried out the climbing powers of the machine in an unofficial flight, in which he reported reaching a height of 31,000 feet. Numerous witnesses were called after his official altitude climb, to make the flight official, and the barograph was signed by Major J. T. Roessel, Major H. F. Miller, Lieut. Col. W. L. Moose, Jr., Captain A. F. Simonin, Colonel Archie Miller, Augustus Post, on behalf of the Aero Club of America; John T. Tarbox, Secretary of the Aero Club of America, and the pilot himself.

New Altitude Record with Passenger.

A new world's altitude record of 30,000 feet is said to have been establisht for an airplane with passenger by Lieutenant Weiss, the pilot, and Mechanician Begue, according to a message from Paris dated August 13. The flight, which took fifty-two minutes, was made at Villacoublay, near Paris. The aviators' instruments showed that they experienced a temperature of more than 25 degrees Fahrenheit below zero. The official figures on the ascent will be made public later.

ELECTRICITY STEERS BLIND MAN.

(*Continued from page* 530)



Not only is it possible to set the compass by touch or by sight so as to travel due north, south, east or west, by the four notches in the adjustable lid, but it is also possible to set the compass so as to maintain a course in any given direction. This is accomplisht by setting the compass so that the point on the compass which would point north with the needle when the instrument is in a natural position is pointed in the direction desired. The two contact pins are then dropt over the compass needle by means of the lid or cap.

It is difficult for men traveling in the woods or on the desert to maintain a set direction. But with the direction indicator attached to his belt, the wearer could set the compass before starting out—changing it when he desires—and it would warn him every time he deviated from the determined course.

The instrument can be used on boats to automatically maintain a desired course, and this development is being worked out by its inventor. It would also be practicable for aircraft. Instead of sounding an alarm, the device would result in throwing over a rudder, and the boat or aircraft would at once resume its predetermined direction. Especially valuable would the device be for torpedo or bombing craft that are automatically controlled, says its inventor.

Contributed by L. W. PADRONE.

Learn to Treat Disease This Way

This is a small reproduction of one of 22 magnificent charts **all of which** we want to send you **ABSOLUTELY FREE,** just to show you how easily you can master Chiropractic and how successfully you can treat disease by this modern drugless healing method. These charts show the different pain and nerve areas of the body. The science of Chiropractic is based upon the well known principle that when there is bone pressure on a trunk nerve where it leaves the spinal column there will be pain in the area it controls: and that by relieving the pressure the pain is banished. Chiropractic teaches you how to locate nerve pressure at any point along the spinal column and how to relieve it.

BE A DOCTOR OF CHIROPRACTIC

Advanced Science of Spinal Adjustment

The great profession that within the past few years has taken the longest forward strides ever known in the history of drugless healing. It has called to its ranks thousands of ambitious men and women from every walk of life. Today it is calling more insistently than ever because the **tide has turned strongly in favor of drugless healing. Right now** the demand for Doctors of Chiropractic is far greater than the supply.

Learn at Home In Spare Time

The American University method of teaching enables you to study by mail or in class and obtain a complete mastery of Chiropractic in the shortest time consistent with thoroughness, while you hold your position. You can pay on easy terms. From the day you enroll your instruction will be under the personal direction of a splendid faculty of Chiropractic experts. Our one aim will be to make you successful. We will work whole-heartedly with you to advance your interests so that in a short time you, like thousands of Chiropractors, can earn a good income.

$3000 to $5000 a Year

There are many instances of Chiropractors earning from $3000 to $5000 a year. Some upwards of $10,000. Dr. M. D. Moore, of Kentucky, reports an income of $9,000 a year. Dr. L. H. Roche, New Jersey, $5,000; Dr. Hanna, of Kentucky, over $5,000 yearly.

The success of Chiropractors in many cases has come so quickly as to be almost startling. And yet, it is not to be wondered at when you consider the constantly increasing number of intelligent, thinking people who are now convinced that Chiropractic is the common-sense and really scientific way to relieve pain and disease and who, therefore, **demand the services of Chiropractors.**

NOW—Your Great Opportunity

Why not qualify **now** for this splendid profession that offers such remarkable possibilities for making you prosperous and independent? If you are ambitious to make money, increase your social standing and be "somebody," our course in Chiropractic will point the way. No special preliminary study required. You graduate with the degree of D. C. (Doctor of Chiropractic), receive handsome diploma, **FREE,** and are ready at once to open your office.

Get Free Charts offer at once. Regular value of the 22 magnificent charts is $31.50. Many of these charts are handsomely lithographed in life-like colors. Mail coupon and get all the facts. We will send you our beautiful new illustrated book, full particulars regarding course, easy terms, together with free charts offer immediately. Don't put it off—mail coupon or send your name on a postal card—**today.**

$1.00 INEXPENSIVE ELECTRIC POWER $1.00

The wonder of the twentieth century inexpensive electric power, this is possible with our new electric power system, a new idea in electricity. With the aid of our instruction and chemicals you can make and install a power battery as shown in the illustration, absolutely safe and simple. **Stop wasting money** on buying batteries, install the new electric power battery. It is not an acid or dry battery, it is a new combination of wet and dry elements which produce electricity. These batteries are **powerful and cheap** to operate, they produce a direct current of more than 20 volts, cheaper than any other form of battery. They are wonderful for operating all kinds of experimental work, for lighting purposes and for many other uses where electric current is needed. Any user of batteries knows the value of an inexpensive high voltage electric current. These batteries should be in every home, office, shop and factory, no matter how small a current is needed; to reduce or raise the current of the battery, simply move the volt regulator on the switch board. The beauty of these power batteries is, that they do not evaporate or lose current when not in use, therefore, with every day use recharging the battery is necessary about every month or so, it can be recharged at home in a few minutes, **no electricity or machinery is required** for this operation, recharging material can usually be obtained around your home or can be bought for a few cents. These batteries when charged weigh about 84 pounds and if properly installed will last **for years.** Each battery making outfit consists of a completely wired switch board, battery connectors, wire, instructions and plan for making, installing and recharging the battery and complete chemicals. **Special introductory price, $1.00, prepaid.** Outside the U. S., $1.25.

NEW MODEL TELEPHONES $2.00

The most useful and inexpensive wall telephones yet developed. Good use can be found for a set of these telephones in many homes, and in office, store or shop, indoors and outdoors; they save many steps and much time. You can easily install these new model telephones and have your own private line with no operators to bother or listen to your conversation. They are thoroughly practical and serviceable all around telephones. Their construction is simple and neat, nothing to break or to get out of order, a child can operate them with ease, they will give satisfactory service at any distance up to 5 miles, and even at that distance the voice will be perfectly plain and understandable as with the **regular commercial telephone.** These new model telephones are electrically operated, two batteries will operate a set of phones for a long time, the cabinets are made of polished oak and finished with a durable varnish and fitted with excellent receivers and transmitters, fine workmanship and construction throughout, **guaranteed to operate** under all conditions. We are offering the New Model Telephones at an **exceptionally low price.** Each telephone set consists of two New Model Telephones, calling system, wire, instructions and diagram for installing. **Special price to introduce $2.00, prepaid.** Outside the U. S. $2.25. **FREE**—We want every reader to own a New Model Telephone set, so we are going to give away a 2-cell battery **FREE** to every purchaser of a New Model Telephone Set.

ELECTRIC LIGHT IN YOUR HOME $1.00

The latest electric light, no batteries to buy or electric bills to pay. Anyone can install and maintain this midget electric light. Safe, simple and inexpensive. No more smoke and smell, no wicks or oil, no chimneys to clean or break, just as safe in the barn, garage and clothes closet as in any open room, always ready for use, day or night. A touch on the switch and you instantly have a **bright electric light.** No matter where you live this light can be installed. It is not affected by heat or cold. Many homes have installed this electric light in their halls, closets, pantries, barns, sheds, cellars, garages, etc., with good results. It is an extremely useful light which no household should be without. The reason for this bright electric light is that the lighting bulb is fitted with a drawn Tungsten filament wire which is much more efficient and durable, besides giving a **300% increase in light** as compared with the ordinary carbon lamp. The power system furnished with this lighting outfit is somewhat similar to the electric power battery described above. Each electric light outfit includes the following: Complete directions and plans, copper wire, insulated wire holders, knife switch, drop light fixture with socket, friction tape, battery protector, maroon shade, national mazda globe. Our dry battery compound, which assists in renewing and supplying the current and our current renewing system with which you can **renew the current at home without expense.** With every day use one recharge usually lasts two to three weeks. This electric lighting outfit is undoubtedly the most practical and durable electric light of low cost and long service ever devised. **Special price to introduce these electric lighting outfits $1.00, prepaid.** Outside the U. S. $1.25.

Our Guarantee—It is our intention that every article described above will reach you exactly as described, that it will satisfy you perfectly, that it represents full value for the money you paid or we will refund your money.

Just to introduce our new line of goods we are offering them at these greatly reduced prices. We only have a limited number of the above described goods at these prices. **Order now,** direct from this ad. We guarantee safe delivery anywhere for additional 10 cents on each item.

YOU HAVE A BEAUTIFUL FACE

BUT YOUR NOSE?

BEFORE **AFTER**

IN THIS DAY AND AGE attention to your appearance is an absolute necessity if you expect to make the most out of life. Not only should you wish to appear as attractive as possible, for your own self-satisfaction, which is alone well worth your efforts, but you will find the world in general judging you greatly, if not wholly, by your *"looks,"* therefore it pays to "look your best" at all times.

Permit no one to see you looking otherwise; it will injure your welfare! Upon the impression you constantly make rests the failure or success of your life. Which is to be your ultimate destiny? My new *Nose-Shaper,* "TRADOS" (Model 24) corrects now ill-shaped noses without operation, quickly, safely and permanently. Is pleasant and does not interfere with one's daily occupation, being worn at night.

Write today for free booklet, which tells you how to correct ill-shaped noses without cost if not satisfactory

M. TRILETY, Face Specialist **K-1283 Ackerman Bldg., Binghamton, N. Y.**

My Inventions

By Nikola Tesla

(*Continued from page* 556)

this is also true, and perhaps more so, of certain defects in the brain which deprive the automaton, more or less, of that vital quality and cause it to rush into destruction. A very sensitive and observant being, with his highly developed mechanism all intact, and acting with precision in obedience to the changing conditions of the environment, is endowed with a transcending mechanical sense, enabling him to evade perils too subtle to be directly perceived. When he comes in contact with others whose controlling organs are radically faulty, that sense asserts itself and he feels the "cosmic" pain. The truth of this has been borne out in hundreds of instances and I am inviting other students of nature to devote attention to this subject, believing that thru combined and systematic effort results of incalculable value to the world will be attained.

Dr. Tesla's First Automaton.

The idea of constructing an automaton, to bear out my theory, presented itself to me early but I did not begin active work until 1893, when I started my wireless investigations. During the succeeding two or three years a number of automatic mechanisms, to be actuated from a distance, were constructed by me and exhibited to visitors in my laboratory. In 1896, however, I designed a complete machine capable of a multitude of operations, but the consummation of my labors was delayed until late in 1897. This machine was illustrated and described in my article in the Century Magazine of June, 1900, and other periodicals of that time and, when first shown in the beginning of 1898, it created a sensation such as no other invention of mine has ever produced. In November, 1898, a basic patent on the novel art was granted to me, but only after the Examiner-in-Chief had come to New York and witnesst the performance, for what I claimed seemed unbelievable. I remember that when later I called on an official in Washington, with a view of offering the invention to the Government, he burst out in laughter upon my telling him what I had accomplished. Nobody thought then that there was the faintest prospect of perfecting such a device. It is unfortunate that in this patent, following the advice of my attorneys, I indicated the control as being effected thru the medium of a single circuit and a well-known form of detector, for the reason that I had not yet secured protection on my methods and apparatus for individualization. As a matter of fact, my boats were controlled thru the joint action of several circuits and interference of every kind was excluded. Most generally I employed receiving circuits in the form of loops, including condensers, because the discharges of my high-tension transmitter ionized the air in the hall so that even a very small aerial would draw electricity from the surrounding atmosphere for hours. Just to give an idea, I found, for instance, that a bulb 12" in diameter, highly exhausted, and with one single terminal to which a short wire was attached, would deliver well on to one thousand successive flashes before all charge of the air in the laboratory was neutralized. The loop form of receiver was not sensitive to such a disturbance and it is curious to note that it is becoming popular at this late date. In reality it collects much less energy than the aerials or a long grounded wire, but it so happens that it does away with a number of defects inherent to the present wireless devices. In demonstrating my invention before audiences, the visitors were requested to ask any questions, however involved, and the automaton

would answer them by signs. This was considered magic at that time but was extremely simple, for it was myself who gave the replies by means of the device.

At the same period another larger tetautomatic boat was constructed, a photograph of which is shown in this number of the ELECTRICAL EXPERIMENTER. It was controlled by loops, having several turns placed in the hull, which was made entirely water-tight and capable of submergence. The apparatus was similar to that used in the first with the exception of certain special features I introduced as, for example, incandescent lamps which afforded a visible evidence of the proper functioning of the machine.

Telautomatics of the Future.

These automata, controlled within the range of vision of the operator, were, however, the first and rather crude steps in the evolution of the Art of Telautomatics as I had conceived it. The next logical improvement was its application to automatic mechanisms beyond the limits of vision and at great distance from the center of control, and I have ever since advocated their employment as instruments of warfare in preference to guns. The importance of this now seems to be recognized, if I am to judge from casual announcements thru the press of achievements which are said to be extraordinary but contain no merit of novelty, whatever. In an imperfect manner it is practicable, with the existing wireless plants, to launch an aeroplane, have it follow a certain approximate course, and perform some operation at a distance of many hundreds of miles. A machine of this kind can also be mechanically controlled in several ways and I have no doubt that it may prove of some usefulness in war. But there are, to my best knowledge, no instrumentalities in existence today with which such an object could be accomplished in a precise manner. I have devoted years of study to this matter and have evolved means, making such and greater wonders easily realizable. As stated on a previous occasion, when I was a student at college I conceived a flying machine quite unlike the present ones. The underlying principle was sound but could not be carried into practice for want of a prime-mover of sufficiently great activity. In recent years I have successfully solved this problem and am now planning aerial machines devoid of sustaining planes, ailerons, propellers and other external attachments, which will be capable of immense speeds and are very likely to furnish powerful arguments for peace in the near future. Such a machine, sustained and propelled entirely by reaction, is shown on one of the pages and is supposed to be controlled either mechanically or by wireless energy. By installing proper plants it will be practicable to project a missile of this kind into the air and drop it almost on the very spot designated, which may be thousands of miles away. But we are not going to stop at this. Telautomata will be ultimately produced, capable of acting as if possessed of their own intelligence, and their advent will create a revolution. As early as 1898 I proposed to representatives of a large manufacturing concern the construction and public exhibition of an automobile carriage which, left to itself, would perform a great variety of operations involving something akin to judgment. But my proposal was deemed chimerical at that time and nothing came from it.

At present many of the ablest minds are trying to devise expedients for preventing a repetition of the awful conflict which is only theoretically ended and the duration and main issues of which I have correctly predicted in an article printed in the *Sun* of December 20, 1914. The proposed League is not a remedy but, on the con-

BOYS
Learn Drafting

Employers everywhere are looking for skilled draftsmen. They are offering good salaries to start with splendid chances for advancement.

Drafting offers exceptional opportunities to a young man because drafting itself not only commands good pay, but it is the first step toward success in Mechanical or Structural Engineering or Architecture. And drafting is just the kind of work a boy likes to do. There is an easy delightful way in which you can learn right at home in spare time. For 28 years the International Correspondence Schools have been giving boys just the training they need for success in Drafting and more than 200 other subjects. Thousands of boys have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon, then mark and mail it. This doesn't obligate you in the least and will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon now.

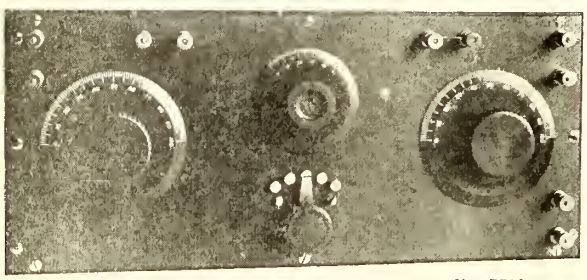
E. I. Co.'s High Grade Radio-Instruments
FOR SCHOOLS AND LABORATORIES AT REASONABLE PRICES

No. 7710

Arc for Generating Undamped Waves for Radio Telephonic & Telegraphic Transmission

These instruments are the acme of perfection in Radio Transmission. The latest and best developments in Radio during the *Great War* are embodied in this apparatus. Educational Institutions and Laboratories can now procure the most modern Radio equipment at a reasonable cost. The undamped *Wave Generator* illustrated is exceptionally well constructed of heavy aluminum. The Arc chamber is flanged in order to offer the greatest cooling surface. The Arc takes place across two solid special Tungsten electrodes which have been found particularly efficient for this work. The electrodes are fully adjustable, permitting very precise adjustment of the emitted oscillatory currents.



No. 7710—½ K.W. Sustained Wave Generator, as illustrated, operates on 110 V D.C. Size 6½ x 6½ x 8½. Shipping weight, 35 lbs.; price.....$50.00

This complete ***Radiophone Transmitter*** is unquestionably one of the finest pieces of Radio apparatus ever placed on the market. A Radiophone might have been sold heretofore; but it was felt that in justice to the purchaser, no instrument of this nature should be sold unless it were possible to obtain efficient results therefrom. This transmitter is the result of great effort expended in the design of a Radiophone set which should meet all requirements as to practicability and compactness combined with highest efficiency. It includes all apparatus necessary for transmission. The Arc is similar to the one illustrated elsewhere on this page.

No. 7711—Complete Sustained Wave Radiophone and Telegraph Transmitter, inclosed in a beautifully finished cabinet; size 14½ x 9 x 12½"; weight 50 pounds; as illustrated; price.....$150.00

No. 7711

No. 7712

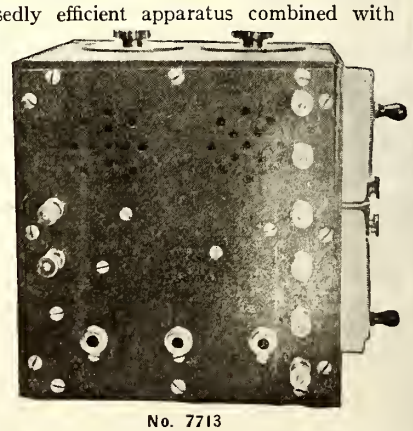
The Short Wave Regenerative receiving cabinet shown is built in accordance with the most modern methods of reception. In work with oscillating audions it is necessary that all losses be diminuated as it was found that tuning should preferably be done with inductance alone, without using variable condensers.

This Receiving set will be found fully up to the mark in comparison with the highest priced set on the market to-day, yet its cost is well within the reach of all.

No. 7712—Regenerative Receiving Cabinet set, as illustrated; size 16¾ x 7⅝ x 8"; weight 25 pounds; price.....$50.00

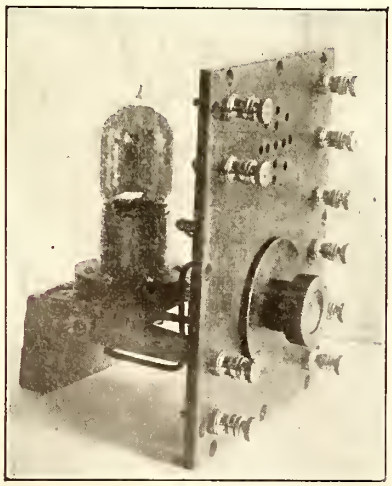
The Vacuum Tube Socket illustrated was designed to be used by those who are desirous of assembling their own vacuum controls and who need a good socket to hold the bulbs. It is well designed, durable and reasonably priced.

No. 7715



No. 7715—Vacuum Tube Socket; 2¼ x 2¼ x 1½"; weight 1 pound; price.....$1.50

This Tube socket is adaptable for both receiving and transmitting tubes.



The Two Step Amplifier illustrated is undoubtedly one of the finest instruments offered to the experimenter. It is an example of unsurpassedly efficient apparatus combined with exceptional mechanical skill in its design and construction. Two Vacuum Tube sockets are mounted within the cabinet which also contains the two amplifying audio-frequency transformers which were especially designed for this instrument. It is of great consistance in amplifying live and radio telephone currents.

The telephones are plugged in any of three jacks mounted on the panel, permitting the use of either one or two steps of the amplifier or simply cutting the amplifier out entirely.

No. 7713—Two Step Amplifier, as illustrated; size 7⅝ x 7¼ x 8"; weight 7 pounds; price.....$55.00

No. 7713

No. 7714

The Vacuum Tube Control Cabinet is one of the essential instruments of the modern radio station. The Vacuum Tube holder, filament, rheostat, grid condenser and grid leak are mounted within the cabinet, the only part on the exterior being the rheostat control knob and dial. The construction throughout is on the same high level of excellence with the other instruments illustrated on this page.

No. 7714—Vacuum Tube Control Cabinet, as illustrated; size 6 x 7⅝ x 6¾; weight 5 pounds; price.....$25.00

P. S. No Tubes furnished by us with these instruments.

My Inventions

By Nikola Tesla

(*Continued from page* 601)

trary, in the opinion of a number of competent men, may bring about results just the opposite. It is particularly regrettable that a punitive policy was adopted in framing the terms of peace, because a few years hence it will be possible for nations to fight without armies, ships or guns, by weapons far more terrible, to the destructive action and range of which there is virtually no limit. Any city, at a distance, whatsoever, from the enemy, can be destroyed by him and no power on earth can stop him from doing so. If we want to avert an impending calamity and a state of things which may transform this globe into an inferno, we should push the development of flying machines and wireless transmission of energy without an instant's delay and with all the power and resources of the nation.

What the X-Rays Show

(*Continued from page* 510)

hardly ever be suspected as being caused by the small and apparently infinitesimal "toothache." The modern dentist not only needs an X-ray, but he practically *must* have one of these scientific apparatus in order to be sure that every tooth is sound.

In figure 10 is shown one of the latest advances in X-rays—the "Movie X-ray." This branch of X-ray science has only been developed to a very slight extent, and gives promise of really wonderful possibilities in the near future. A year or so ago there was exhibited before a body of surgeons and physicians in New York City an *X-ray motion picture* in which the action of various organs, functioning in a live person, were shown, a bismuth meal having first been ingested; the intestines were shown functioning as well as the heart. It is not commonly known that with the modern X-ray, provided with an up-to-date tube of the Coolidge tube, and excited by a 5 to 10 kilowatt, 100,000-volt transformer, and the other necessary appurtenances, practically every part of the body and its organs may be seen on the fluoroscope, or otherwise on the photographic negative or skiagraph. This includes the heart, lungs, stomach, ulcers of the stomach, the intestines, the appendix, gall stones, the gall bladder, and many other ailments and organs within the body which sometimes have to be diagnosed and operated on in a very short length of time, or otherwise the death of the person would often result. *X-ray-therapy* is a new field being investigated today, and gives much promise in the treatment of cancer and various skin diseases.

X-raying tobacco in order to kill organisms, especially the *tobacco weevil,* has been carried on for several years in a number of large tobacco establishments. In this case, the tobacco in large bales is wheeled into an X-ray examination chamber on small trucks, see figure 12. In this manner the tobacco can be very rapidly X-rayed. The powerful rays from the bulb have the effect of killing the weevil even in its primary germinating state.

There are many other industrial uses of the X-ray which space does not allow us to mention here, but among which we may mention the X-raying of steel and copper ingots to analyze the structure and to detect flaws, such as cracks and air-pockets, and of coal for the purpose of extending our knowledge of geology.

Go to School at Home!

HIGH SCHOOL COURSE IN TWO YEARS

YOU ARE BADLY HANDICAPPED if you lack High School training. You cannot attain business or social prominence. You are barred from a successful business career, from the leading professions, from well-paid civil service jobs, from teaching and college entrance. In fact, employers of practically all worth-while positions demand High School training. You can't hope to succeed in the face of this handicap. But you can remove it. Let the American School help you.

FIT YOURSELF FOR A BIG FUTURE This Course, which has been prepared by some of America's leading professors, will broaden your mind, and make you keen, alert and capable. It is complete, simplified and up-to-date. It covers all subjects given in a resident school and *meets all requirements* of a High School training. From the first lesson to the last you are carefully examined and coached.

USE SPARE TIME ONLY
Most people *idle* away *fifty* hours a week. Probably you do. Use only one-fifth of your wasted hours for study and you can remove your present handicap within *two years*. You will enjoy the lessons and the knowledge you will gain will well repay the time spent in study.

TAKE 10 LESSONS FREE So that you may see for yourself how thorough and complete our training is. We invite you to take *ten lessons* in the High School Course—or any Course of specialized training in the Coupon below—before deciding whether you wish to continue. If you are not then satisfied you are not out one cent. *We absolutely guarantee satisfaction.* On that basis you owe it to yourself to make this test.
Check and mail the coupon NOW for full particulars and Free Bulletin.

Electrical Supplies & Appliances.

Boys—Here is the simplest and cheapest electric telegraph ever devised. With the "K" Applicator you need no batteries. Get electricity free, instantly, anywhere, at any time. Send 30c (postal money order) for full instructions how to make the "K" applicator and how to operate an electric telegraph without batteries. Is easier to make and requires less material than you would use in making a kite. Gives constant, smooth, even current day and night, never runs down, even upon closed circuit. Works on any metallic line, even barbed wire fence, as no insulators necessary. The "K" Applicator, Missouri Valley, Iowa.

Radio Paint Glows at night. Bottle, 20c. Box 3613 Kens. Station, Philadelphia.

"Investors' Adviser" sent free on request. William C. Linton, 918 F St., N. W., Washington, D. C., 363 University Street, Montreal, Canada.

Inventions Patented; Trade Marks Registered; Labels, Prints, Publications copyrighted; prompt service; reasonable fees; plain advice; request detailed information before placing your business. Jaynes & Jaynes, 802 Kellogg, Washington, D. C.

Patent Your Own Inventions. Save attorney's fees; we prepare applications; furnish full instructions and give satisfaction. Free information. Carl Larsen Co., Park Row Bldg., New York City.

Patents promptly procured by personal expert service. Information on request. James D. Lyles, Washington, D. C.

"How to Establish Your Rights" to patent protection is a bulletin every inventor should read before disclosing his idea to others. This bulletin form "Evidence of Conception" and other interesting and valuable patent information free. Lancaster & Allwine, 242 Ouray Bldg., Washington, D. C., originators of the form, "Evidence of Conception."

Patents—My fee payable in monthly installments. Send sketch for advice. Booklet free. Frank Fuller, Washington, D. C.

For Inventors.

Inventions Wanted. Cash or royalty for ideas. Adam Fisher Mfg. Co., 205 St. Louis, Mo.

Inventors, send sketch of model of your invention for opinion concerning patentable nature, and exact cost of applying for patent. Book, "How to Obtain a Patent," sent free. Gives information on patent procedure and tells what every inventor should know. Established twenty-five years. Chandlee & Chandlee, 408 Seventh St., N. W., Washington, D. C.

900 Mechanical Movements, also illustrations explaining 50 Perpetual Motions. My book, "Inventor's Universal Educator," Fifth Edition, tells how to procure and sell patents. Government and other costs. Covers the matter from A to Z. 160 pages, elegantly bound. Contains noted decisions of U. S. Supreme and State Courts on patent cases. Mechanical Movements greatly assist inventors—suggest new ideas that may prove of great aid in perfecting inventions. Tells how to select an attorney. Has valuable information regarding Patent Sharks, Selling Agents and Brokers. Price, $2. Postage free everywhere. Fred G. Dietrich, 603 Ouray Bldg., Washington, D. C.

Inventors write me about patents. My fees payable monthly. Booklet free. Frank Fuller, Washington, D. C.

Inventors Protect yourselves. Record idea before exposing to anyone, including attorneys. Paul E. Klein, Cons. Eng., Reg. Pat. Att'y., 21 Park Row, New York.

"Inventor's Guide" Free on request; gives valuable advice and information for all inventors. Write. Frank Lederman, Registered Patent Attorney, 17 Park Row, New York.

Inventors join National Institute of Inventors, 118 Fulton St., New York City; membership society 1,900 strong; will help protect, develop, finance and market your invention. Absolutely no charge. Write for booklet.

"Sell or Finance Inventions." Read Money Talks Magazine. Send for free sample copy. 70-B Park Place, Newark, New Jersey.

Patents for Sale.

For Sale—Outright or Royalty, Patent No. 1,301,741 on Improved Automobile Signal. Send for particulars, enclosing 10c postage for Drawings and Specifications. A. Raul, 3534 N. Claremont Ave., Chicago.

Patent for sale covering simplified rotary spark gap machine. Extra high merit. Information, pictures. Address: Mr. Teele, 139 Genesee St., Buffalo, N. Y.

Chemicals.

Radium Radium! Advanced experimenters may at last obtain a variety of Rare and Radioactive metal salts at a reasonable cost. Order our Radium Rare Metal Collection immediately!! It contains over three grams each of Radium ore, Beryllium Nitrate, Zirconium Chloride, Thorium Nitrate, Selenium, Uranium Nitrate, Tungstic Acid, Titanium Oxalate, Lithium Chloride, and Cerium Nitrate. Can you beat this for only $1.75? One-half ounce each of above, $5.00. Radio Chemical Supply Co., 915 Westcott St., Syracuse, N. Y.

Two step! "Multi-Audi-Fone," $45. Chemicals, $20. Write! Sherman Whiting, 2010 Park Ave., Bridgeport, Conn.

Thousands pure Chemicals. Dime packages. Gleasman, Morris St., Utica, N. Y.

Amateurs and Experimenters—We can supply you with any chemicals and apparatus at the lowest prices. Write for our price list. Jos. Simpson, 3880 Windsor Pl., St. Louis, Mo.

One Hundred Chemical Experiments printed in book form, 25c. Oliver R. Stalter, Oshawa, Ontario, Canada.

Experimenters "Chemset" No. 2 Startling Chemical Outfit, containing Chemicals and direction booklet, 20c. No. 1 "Chemset," 15c. Both, 30c. Cactus plant 8c, X-ray Novelty 8c, Magic Trick 5c. All three, 15c. Mystic Shop, 714 Vinton, Waterloo, Iowa.

Cameras, Supplies—Photo Developing.

For 15c we will develop and furnish prints from one, six or eight exposure film or enlargement 8x10, your favorite negative, 20c to show quality and service. Associated Photo Company, Sta. A 12, Cincinnati, Ohio.

Clean, Neat, Perfect Kodak Finishing at the lowest prices. Work returned the same day received. Send film for sample print and copy of catalogue on developing, printing, enlarging and hand coloring, also copy of Photo Craft Magazine, which will help you make better pictures. Photo Craft Co., Box 69, Ann Arbor, Mich

Special Offer—Your next Kodak Film Developed, 10c, and prints 2c each. Best workmanship. Enlargements a specialty; 24 hours' service. Enclose money with order. Write for price list "6" and sample print. Johnston & Tunick, 53 Nassau St., New York.

Mail us 15c with any size film for development and six velvet prints. Or send six negatives any size and 15c for six prints. Or send 35c for one 8 x 10 mounted enlargement. Prompt, perfect service. Roanoke Photo Finishing Co., 255 Bell Ave., Roanoke, Va.

For the Photographer.

Do you take pictures? Write for free sample of our big magazine showing how to make better pictures and earn money. American Photography, 465 Pope Building, Boston, Mass.

Correct Distance at a glance. MacMillan's Distograph, when adjusted for user's height, will accurately measure the distance at a glance. Sharp picture assured. A war-time invention. Fits in vest pocket. Nickel silver with etched scales. At your dealer's or postpaid, $1.25. A. W. MacMillan, Ellis Ave. and 43rd St., Chicago, Ill.

Postcards.

Rare Real Photos: Bathing beauties, models, the kind you want. Sample, dime. Write. Artiste, Auburn, Ind.

Join a post card club! Have friends everywhere. Membership, 10c. John Miller, 1430 H Street, Sacramento, California.

Five Prettiest Women Cards, hand colored, 25c. Chas. Durso, Dept. 41, 25 Mulberry St., New York City.

Pictures.

French Art Models, Bathing girls. Real Photos. Generous samples and list for dime. E. Davis, Box 71, West Somerville, Mass.

Novelties.

Here, Boys Make a toy aeroplane; see our Nifty ad., page 600.

Stammering.

St-Stu-t-t-tering and Stammering cured at home. Instructive booklet free. Walter McDonnell, 105 Potomac Bank Bldg., Washington, D. C.

Health.

Tobacco or Snuff Habit Cured or no pay; $1 if cured. Remedy sent on trial. Superba Co., SA, Baltimore, Md.

Cigarette, pipe or chewing habit conquered. Nature's method. Guaranteed. Write for free brochure. Edw. J. Woods, TA-300, Station F, New York.

Goiter. Rid yourself of this Terrible Disease at home. Cure Guaranteed or money refunded. Formula and full directions for using this wonderful New Discovery sent to all those afflicted. Price $2.00. P. O. or Ex. Money Order. Address: Wellington Laboratories, No. 40 15th Street, Detroit, Michigan.

Pyorrhea (Rigg's Disease—Bleeding or Swollen Gums). H. E. Kelty, D.D.S., M.D., pyorrhea specialist for 15 years, has developed a successful home treatment for pyorrhea Purifying, healing, preventative. Full month's treatment $1, postpaid. Or, write for free booklet. Pyorem Mfg. Co., 430 Seventh Street, Brooklyn, N. Y.

Instruction.

Stuck? What is it? A question, problem or experiment in physics, chemistry, biology, electricity, mathematics, radio, X-Ray, etc. Prompt and accurate information furnished by us. Enclose 25c to cover expenses. Address: Association Amateur Scientists, Bureau of Technical Information, 225 Lynch St., Brooklyn, N. Y.

Questions answered. All subjects. Answerall Information Bureau, 51 Cliff St., N. Y.

Cartooning Comics and Lettering in 14 easy lessons. Only $3, postpaid. Over 300 illustrations. Sample Lesson 25c. Ernie's School, Elyria, Ohio.

Play Piano in thirty minutes with this new vamping card. Placed behind keys. Colored chart, 20 cents, postpaid. C. Maxwell, Box 903, Portland, Maine.

Cornetists—Trombonists. Send for "Free Pointers" Weak Lips—High Tones. Virtuoso Cornet School. Buffalo, New York.

Progressive Shorthand—home study course complete in five lessons for $5. System based on longhand; easy to learn, easy to read—simple yet perfectly adapted to English or any Latin language. Progressive Shorthand School (E), 1010 East Fir, Seattle, Wash.

For the Hair.

I Was Bald. Obtained hair growth by an Indian's ointment containing genuine bear oil and rare plant juices. Many others have good hair-growing results. Will send box, postpaid, with recipe, 10c. John Hart Brittain, 150 E. 32nd St., BA-300, New York.

Portable Garages.

Portable Garages, wood or steel, reasonable prices. Write Bona Fide Building Mfrs., 24 Borden Ave., Long Island City.

Phonographs and Supplies.

Build Your Own Phonograph and manufacture them for profit. Drawing instructions, parts, price list, blueprints, etc., complete, sent free upon request. Write today. Associated Phonograph Co., Dept. E-1, Cincinnati, Ohio.

Make Your Own Phonograph. Particulars free. DeSelO-PhonE, P. O. Box 720, Attica, Indiana.

Build Your Phonograph. "Perfection" high-quality spring and electric motors, tone arms, reproducers. Wonderful results. Big saving. New catalog and building instructions mailed for ten cents. Indiana Phonograph Supply Co., Indianapolis, Ind.

Old Money Wanted.

We Buy and Sell Old Coins. $2 to $500 each paid. Keep All Old Money; you may have valuable coins. Send 10c. for New Illustrated Coin Value Book, 4 x 6. Guaranteed prices. Get posted. Clarke Coin Co., Box 110, Le Roy, N. Y.

Never Sell Old Coins until you see our copyrighted 6 x 9 Illustrated Coin Value Book (New Edition)—showing high prices we pay. $100 paid for 1894 dime, S Mint. $5.00 for 1856 Eagle Cent. Send 10c for your copy today. Hundreds of old coins wanted. International Coin Co., Box 151-P, Philadelphia, Pa.

Motion Picture Plays.

Earn $1,200 a Year in Spare Time writing photoplays. Experience unnecessary. Send for free book valuable information, special prize offer. Photo Playwright College, Box 278 E-6, Chicago.

Photoplays Wanted. Big prices paid. You can write them. We show you how. Free particulars. Rex Publishers, Box 175, E.-6, Chicago.

Musical Instruments.

Violins. Deep, Mellow, Soulful—on credit. Easy terms for wonderful instrument. Get details today. Gustav Henning, 231 11th St., Miami, Florida.

Regain Your Health Thru Renulife VIOLET RAY Treatments at Home

Unequaled for neuritis and rheumatism

More Than 25,000 Volts
No pain, shock or muscular contraction. Entirely harmless — powerfully effective.

This type Violet Ray Instrument is designed with light handle, easily manipulated; the most of the apparatus is contained in a case giving ample space for electric units of efficient size.

There is no "quackery" or uncertainty about *Renulife Violet Ray.* It is not claimed to be a "Cure All," but it has proved in thousands of cases a practical health-producing, revitalizing agent—powerful in restoring normal physical conditions—yet gentle, soothing and perfectly safe. *You* can treat yourself. Get full information regarding uses shown on coupon below.

Users Get Wonderful Results

(Voluntary Testimonials)

"The Renulife Violet Ray High Frequency Generator is superior in efficiency because of its perfect character and control of current, compactness and perfect insulation. The smallness and lightness of Electrode holder is also a great advantage." "The doctor told me that the trouble was hardening of the arteries. I wish I had got it a year ago. I would not be without it for all the money in the world." "I cannot recommend it too highly." "I have been using mine now for a week for Sciatica and I am highly pleased with results." "I think it is one of the best little machines that was ever invented." "I have used it with excellent results for the restoration of hair and stiff and sore rheumatic finger joints." "Am well pleased with the Generator, and the kind treatment received from your Company." "My Generator has stopped my neuritis." "Every house should have a Renulife Violet Ray High Frequency Generator, for the treatment of Neuralgia, Neuritis, Sore Throat, Kernels in Neck, Cramps, Headache, Stiff Neck, Muscular Soreness, Rheumatism, Paralysis—in short, pains of all kinds."—M. D. "I have been much relieved by the use of your Violet Ray Generator." "It is fine for Insomnia." "I find it such a help in nervousness." "I would not part with it for five times the price. It is sure a little wonder." "I am more than pleased with the Generator; the whole family are using it." "A neighbor lady was suffering from lumbago and could not move, and my wife brought over the Generator and in less than ten minutes the lady was greatly relieved." "Your Generator is just the thing for me. That tired feeling has left me, and I feel like myself again." "It has relieved me of the nervousness and also it has helped me a great deal in using it for the treatment of rheumatism."

How Renulife Benefits

Science has demonstrated a strange relation between electricity and life cells. This instrument harnesses a tremendous current of electricity and applies in the form of Violet Rays so that the body welcomes and responds to it in a marvelous manner—no pain—shock or the slightest harmful effects. A few seconds of Renulife Violet Ray gives more benefit than hours of the old time battery methods—because a thousand times as much voltage is made use of.

The irresistible, revitalizing powers of *Renulife Violet Ray* reach every nerve cell, fibre and part of body. Blood is enriched and purified by a flood of oxygen, giving added vitality and strength. Assimilation and digestion improved—functions retored to normal—extra supply of fresh blood quickly brought to area treated, removing congestion and supplying nourishment. While relieving pains and aches, the manifest results of disorders, it removes the deep seated cause, combines the benefits of electricity, vibration, exercise, stimulation and oxidation.

Get Book "Health via Violet Ray"

Learn the whole marvelous story of the Violet Ray—this method that works with nature to restore and build up. Learn how you, at home, can now use these great curative forces of Violet Ray—heretofore only available at big expense from physicians or beauty doctors. Send coupon or postal card now and receive free book describing uses, quoting low prices (within the reach of all) and explaining liberal *Trial Plan.*

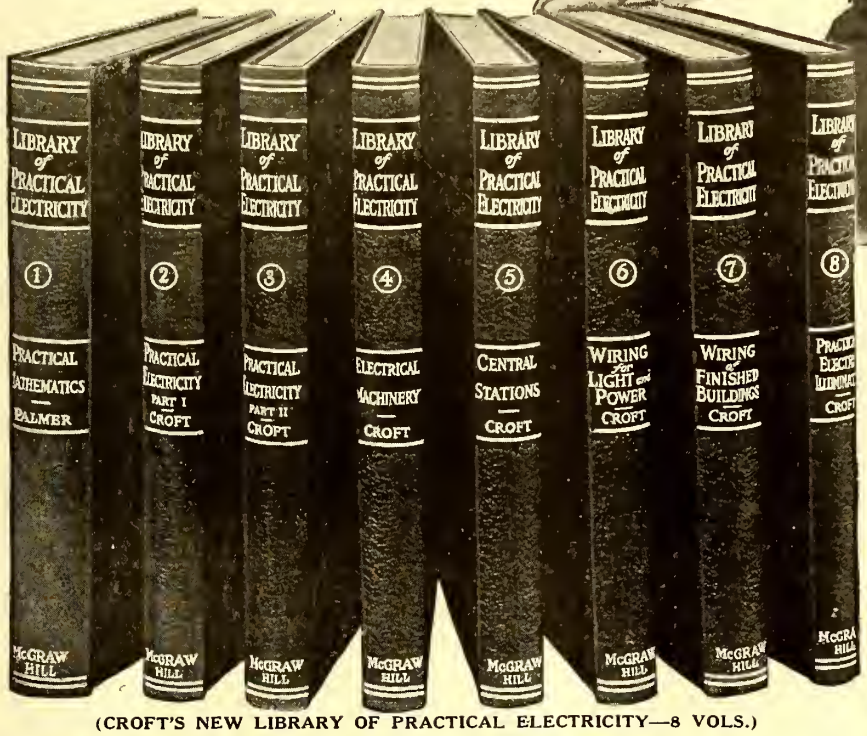
ELECTRICITY

AS EXPERTS KNOW IT

Learn electricity as you would in actual PRACTICE—in accordance with the methods employed by the highest paid electrical experts in America. The New McGraw-Hill Library of Practical Electricity contains the actual working facts which you need in order to succeed in the electrical field. Terrell Croft, formerly with the Westinghouse Company, makes the conquest easy for you.

A New Standard in Electrical Literature



The New Library of Practical Electricity by Terrel Croft marks a new era in electrical literature.

The great field of electrical engineering, with its limitless possibilities of earning power, is brought to you in a form that makes success easy. The Library is a creation—an achievement that is without parallel in technical literature, because it sticks to actual practice throughout its 3000 pages.

"See them First—Pay afterwards"

$3 per month starts you to bigger pay

(CROFT'S NEW LIBRARY OF PRACTICAL ELECTRICITY—8 VOLS.)

A letter that means something to YOU—

McGraw-Hill Book Company, Inc.,
239 West 39th Street,
New York, N. Y.

Gentlemen: In an attempt to express myself about CROFT'S NEW LIBRARY OF PRACTICAL ELECTRICITY, I have never seen, and do not believe there was ever printed in the English language, a more comprehensive set of books. It is a library that is just as valuable to the novice as to the expert, because it is all practice.

Respectfully,

GUY H. PEIFER,
Chief, Doplan Silk Corporation,
Hazeltown, Pa.

NOW is the time to Master Electricity---NOW is the time to prepare for a High Salary---

Old books won't do. Amateurish books won't do. Books compiled by "desk authors" or men with no practical experience will not serve your purpose.

Practical books are easiest mastered. Practical books, written by practical men, teach you accurately and rapidly. There is nothing in the Croft Library which you can not understand. Terrell Croft tells you the secrets of success in electricity in plain words, figures and illustrations. Nothing is left to the imagination. There is no guesswork. There is no theory or higher mathematics.

Send now for these eight volumes. No matter how many books on electricity you possess, you are unfair to yourself unless you take advantage of this free examination privilege. No matter whether you are beginner or expert, these books will show you the clear road to success. Inspection will prove this.

Not one cent in advance—Just the coupon

Examine this new Library for ten full days without expense. Find out for yourself why it is now taking the lead in electrical book sales in America. Use the books as you see fit for ten days. Look at the hundreds of illustrations that clear up all the mysteries in electrical practice. Stick a couple of the volumes in your pockets, and refer to them during the day. Figure out in an instant the problems that have heretofore taken hours.

Then send us $2 in ten days and $3 per month for six months, or return the set entirely at our expense. You risk nothing by returning the attached coupon.

McGraw-Hill Book Company, Inc.
239 West 39th Street, New York, N. Y.

ACT NOW FREE EXAMINATION COUPON

McGraw-Hill Book Co., Inc.
239 W. 39th St.
NEW YORK

Gentlemen:
Please send me the Library of Practical Electricity (shipping charges prepaid) for 10 days' free examination. If satisfactory, I will send $2 in ten days and $3 per month until $20 has been paid. If not wanted, I will write you for return shipping instructions.

TO OUR READERS: Due to the printers' strike in New York, which has paralyzed the entire printing trade with the exception of newspapers, no magazines have been issued from New York during the past eight weeks. Accordingly, this issue is printed out of town, 750 miles from New York. Subsequent issues may be delayed as well until we are caught up with our schedule again. We sincerely trust our readers will understand our difficulties and be patient until conditions become normal.

EDITORIAL

Gravitation and Light

AT the joint meeting of the Royal Society and the Royal Astronomical Society of London, Sir Joseph Thomson recently announced the correctness of the famous Einstein theory. Photographic plates made by British astronomers in northern Brazil on May 29th of this year, at the occasion of the total solar eclipse, showed that the light of the stars passing close by the sun *had been deflected considerably*. In other words the photographs of the stars near the sun revealed the fact that they were not in their accustomed stations, but at a considerable distance away.

If Einstein's theory is correct, it will be seen at once that for one thing our astronomical atlases must be revised and corrected to a certain degree. Every star, as is well known is a huge sun. This means that stars closely together—or rather if they are in a line as viewed from earth—may not be where we think they are. They would be further apart in certain cases.

Many new puzzles will have to be worked out by astronomers. For instance our present figures as to the distance of stars are all wrong if Einstein's theory holds. All our former calculations are based upon the assumption that a ray of light is a mathematically straight line. If it is not, how are we now to determinate the parallax of a certain star? If gravitation affects light, the same as wind affects a long jet of water, how can we possibly know what we are doing? Suppose we wish to determine the distance of a star. That star is billions upon billions of miles distant, and if its light rays pass near one or more dead (dark) suns, *which consequently cannot be seen* by us, how then will we calculate our distance? For the dark stars will deflect the light rays several times *unbeknown to us!* The case thus seems hopeless.

While Einstein's theory is sound, real proofs are still wanting despite what the photographic plate shows. To elucidate: When a light ray passes from one medium to another, it is refracted or bent in its course. Thus, it is well known that due to the earth's atmosphere, we never *actually* see the sun either rise or set. Now the sun too has a gaseous envelope just like the earth, only much more so. In fact, it has several: the corona, the chromosphere and the photosphere. The corona reaches several million miles away from the sun's surface. Any light ray passing thru these intensely heated gases must be bent considerably. Hot gases refract light rays more than cold ones, as anyone knows who has looked over a hot stove plate or thru a bonfire. It is reasoned therefore that the photographic proof is really no proof at all, as the bending of the distant star's light might be caused by the sun's chromosphere.

This immediately brings many questions to mind. If Einstein's theory is correct, and if light rays are affected by gravitation, why then for instance could we not measure the deflection, of a light ray coming from one of Jupiter's moons as it shoots past the huge mother planet?

It should be—theoretically—far easier to prove Einstein's theory within the realms of our planetary system. Here we know the distances accurately because we know the exact orbital time periods down to the smallest fraction of a second, of all planets and their sattelites.

If the objection is made that the case of Jupiter cited above might prove fallacious due to the fact that this planet has a gaseous envelope, or an atmosphere, which would refract and bend the light rays, we still have the reverse case of a light ray coming from a planet as it passes one of its moons, which we know possesses no atmosphere. However, due to the small gravitational influence of such a moon, we would require very sensitive measuring instruments to detect the exceedingly small deflection of the light rays.

Another thought: Faraday over 100 years ago deflected a light ray by means of a small magnet. Gravitation—which has been proved to be of an electrical nature, should not act differently.

H. GERNSBACK.

The ELECTRICAL EXPERIMENTER is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions. Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. **A green wrapper indicates expiration. No copies sent after expiration.**

All communications and contributions to this journal should be address to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

ELECTRICAL EXPERIMENTER. Monthly. Entered as second-class matter at the New York Post Office under Act of Congress of March 3, 1879. Title registered U. S. Patent Office.

Copyright, 1919, by E. P. Co., Inc., New York. **The Contents of this magazine are copyrighted and must not be reproduced without giving full credit to the publication.**

ELECTRICAL EXPERIMENTER is for sale at all newsstands in the United States and [illegible] Brentano's, 37 Avenue de l'Opera, Paris. Sole British agents—Geoffrey [illegible] 62 and 64 The Strd., Ealing, London.

[illegible] of the Audit Bureau of Circulations.

"The Master Key is too modest a title for such a stupendous revelation"

SOME men seem to attract success, power, wealth, health and attainment with very little conscious effort, others conquer with great difficulty, still others fail altogether to realize their ambitions, desires and ideals. Why is this so?

The Master Key will tell you why! It will tell you that these things are controlled by Natural Laws, precisely the same as the falling of an apple.

The Master Key is a key with which many are converting loss into gain, fear into courage, despair into joy, hope into fruition. No one will emerge from its magic pages but with a firmer grasp of the future, a surer understanding of what he can do.

This may seem to be too good to be true, but remember that within a few years, by the touch of a button or the turn of a lever, science has placed almost infinite resources at the disposal of man, is it not possible that there are other laws containing still greater possibilities.

An understanding of this law will enable you to control every other power which exists. It is without doubt the greatest discovery of the Twentieth Century. In it may be found the remedy for every ill, the solution to every difficulty, the gratification for every desire; in fact, it would appear to be the Creator's magnificent provision for human emancipation.

A copy of this magnificent, richly bound hundred-page book will be sent to any address, without cost or obligation of any kind.

Charles F. Haanel, 203 Howard Bldg., St. Louis, Mo.

You should send for a Master Key!

You benefit by mentioning the "Electrical Experimenter" when writing to advertisers.

Learn Wireless By Mail—In Ten Weeks

Calls Coming in Steadily, for National Radio Institute Graduates, from all Parts of the Country. Two Concerns Will Take All Operators We Can Furnish.

Commercial Radio has arrived and many attractive positions are now open in the Merchant Marine, Commercial Land Radio Service, Railroads, Radio Supply Factories, Lake and Ocean Steamship Lines, Telegraph Companies and Aerial Mail Service. We are now receiving requests for more National Radio Institute Graduates than we can furnish.

Salaries Up to $250 a Month

With exceptional opportunity for promotion to Radio Mechanic, Electrician, or Engineer. No previous experience or training is necessary. You can Learn Wireless the National Radio Institute way, in Ten Weeks, by mail, right in your own home. With our help you can quickly qualify for a good position at big pay. Many of our students secure positions before completing the course, because it is based on actual practice and teaches what is needed to make a big success of Wireless work.

Get Your Instructions from the Nation's Capital

(Our Course is Endorsed by the U. S. Government Officials)

The National Radio Institute, headed by authorities who have been closely allied with government training of students, was established in 1914 and is the first school in America to successfully teach Wireless by Mail. The work is under the direction of J. E. Smith, E.E., director of the Radio Department, Howard University, and E. R. Haas, formerly of the Radio Division of Yale University.

We now have students throughout the world. Our location in the Nation's Capital, together with the standing of our officers and their wide acquaintance among government officials connected with Wireless activities, places us in position to give our students the best instructions obtainable and to be of the utmost help in assisting them to secure good paying positions.

Travel If You Want To

If you want to travel and see the world, go to foreign countries and increase your knowledge of world affairs, Wireless offers you the chance of a lifetime. However, you are not obliged to travel, but may secure a permanent position at one of the big Land Stations, Railroad, Telegraph or Steamship Companies if preferred.

Pay as You Learn

Our plans of payment bring a wireless education within the reach of anyone who desires to learn. A small payment down on our convenient payment plan, and small following payments, enables you to earn the cost of your tuition while actually learning to be a wireless operator.

Free Instruments to Every Student

In addition to five text books—35 special Lessons and 18 Personal Examinations—we send you, while taking our course, a Standard Automatic Wireless Transmitting and Receiving Set for sending and receiving messages. These fine instruments are Free only to National Radio Institute Students.

Oldest Correspondence Wireless School in America

In addition to being the oldest and largest Wireless School in America, our location in the Nation's Capital enables our Students' Employment Department to keep in close touch with the best openings for our graduates. A Post Graduate Course is Given Free to every graduate.

FREE

Our booklet, "Wireless the Opportunity of Today," gives you complete information in regard to our course, the quick and easy methods by which you can master wireless, and other important facts you should know. It is free. Just mail the coupon. No obligation whatever on your part.

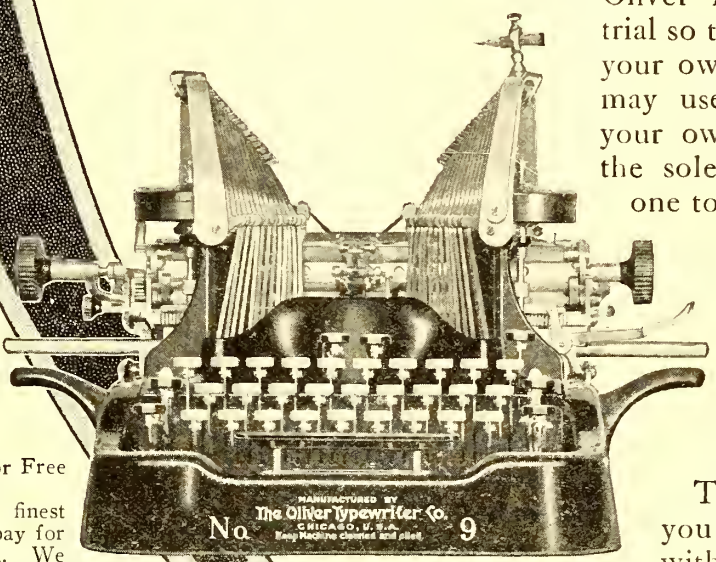
FREE TRIAL
No Money Down

10c a day soon buys an Oliver Typewriter—latest model



Before you realize it you have this splendid Oliver paid for. And you get to use it right away—while you pay.

To begin with, you save $43 on the price, for we now sell the $100 Oliver for $57. It is our latest and best model, the No. 9. The finest product of our factories.

We are able to make this great saving for you through the economies we learned during the war. We found that it was unnecessary to have great numbers of traveling salesmen and numerous expensive branch houses through the country. We were also able to discontinue many other superfluous sales methods

You may buy direct from us via coupon. We even send the Oliver for five days' free trial so that you may act as your own salesman. You may use it as if it were your own. You can be the sole judge, with no one to influence you.

Used by U. S. Steel Corporation, Pennsylvania R. R., National City Bank of New York, Encyclopedia Britannica, New York Edison Co., Otis Elevator Co., Boston Elevated Railways, and other big concerns.

Was $100

Now $57

Let us send you the Oliver for Free Trial. The coupon brings it.

If you agree that it is the finest typewriter, regardless of price, pay for it at the rate of $3 per month. We ask no partial payment in advance. You have over a year to pay. And you'll have the Oliver all that time. There is no need to wait until you have the full amount.

If, after trying it, you wish to return it, we even refund the outgoing transportation charges. So the trial does not cost you a cent. Nor does it place you under obligations to buy.

Our new plan has been a tremendous success. We are selling more Olivers this way that ever before. Over 700,000 Olivers have been sold! Oliver popularity is increasing daily.

This, the Oliver 9, has all the latest improvements. It is noted for its sturdiness, speed and fine workmanship. It is handsomely finished in olive enamel and polished nickel. If any typewriter is worth $100, it is this Oliver, for which we now ask only $57, after its being priced for years at $100.

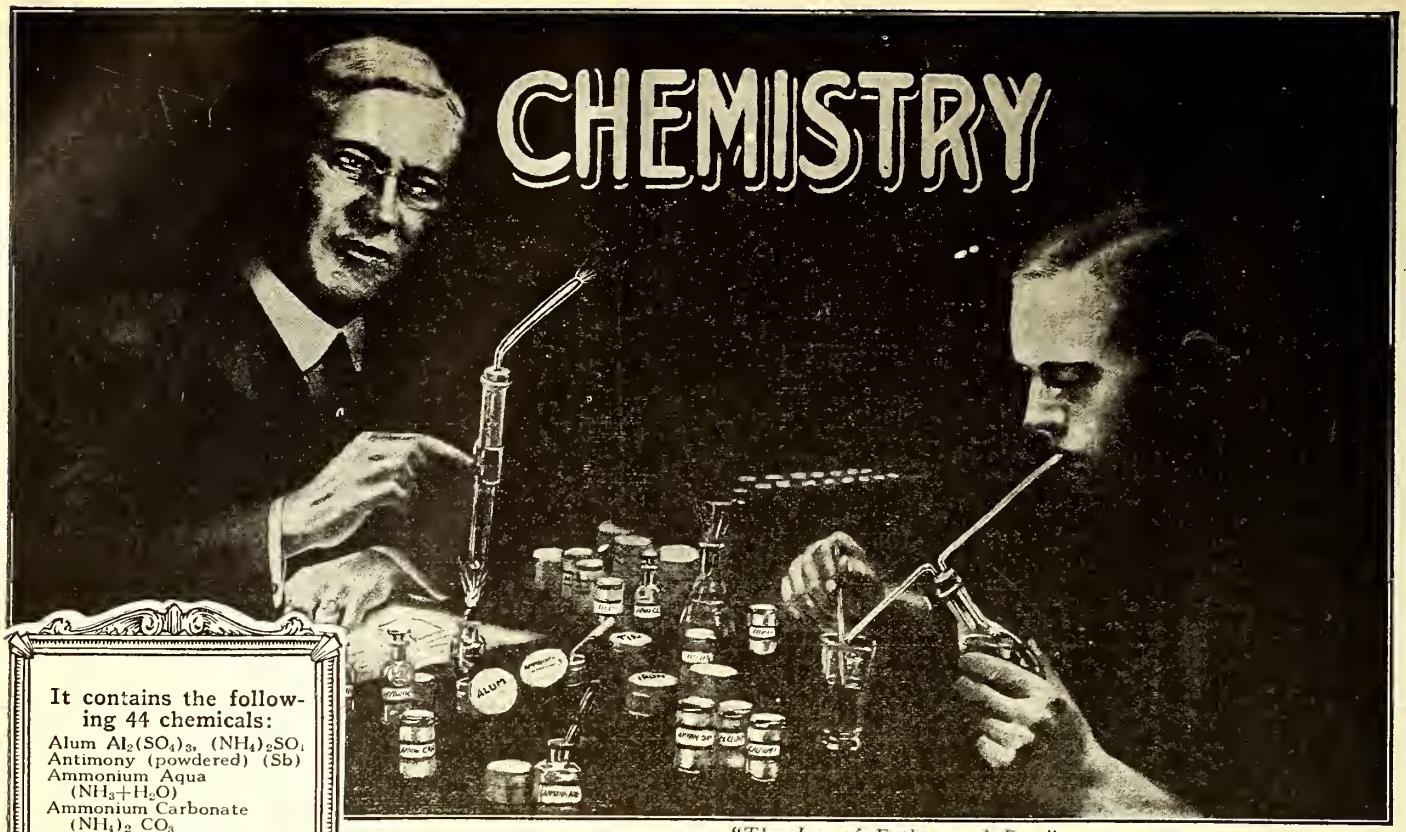
Mail the coupon for EITHER a free trial Oliver or further information. Be your own salesman and save $43. This is your great opportunity.

Canadian Price $72

THE OLIVER TYPEWRITER COMPANY
678 Oliver Typewriter Building, Chicago, Ill. (29.02)

This coupon brings you a Free Trial Oliver without your paying in advance. Decide yourself. Save $43.

Or this coupon brings further information. Check which you wish.



THE OLIVER TYPEWRITER COMPANY,
678 Oliver Typewriter Bldg., Chicago, Ill.

☐ Ship me a new Oliver Nine for five days free inspection. If I keep it, I will pay $57 at the rate of $3 per month. The title to remain in you until fully paid for.
My shipping point is.....
This does not place me under any obligation to buy. If I choose to return the Oliver, I will ship it back at your expense at the end of five days.

☐ Do not send a machine until I order it. Mail me your book—"The High Cost of Typewriters—The Reason and the Remedy," your de luxe catalog and further information.

"The Joy of Father and Boy."

Chemical Laboratory

We present herewith to our friends our new **E. I. Co. Chemical Laboratory** which contains real chemicals and apparata to perform real chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a **Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.**

It contains the following 44 chemicals:

Alum $Al_2(SO_4)_3$, $(NH_4)_2SO_4$
Antimony (powdered) (Sb)
Ammonium Aqua (NH_3+H_2O)
Ammonium Carbonate $(NH_4)_2\ CO_3$
Ammonium Chloride (NH_4Cl)
Ammonium Sulphate $(NH_4)_2\ SO_4$
Barium Chloride $(BaCl_2)$
Boric Acid (H_3BO_3)
Brimstone (Sulphur) (S)
Calcium Chloride $(CaCl_2)$
Calcium Oxide (CaO)
Calcium Sulphate $(CaSO_4 2H_2O)$
Charcoal (Carbon) (C)
Chloride of Zinc $(ZnCl_2)$
Copper Sulphate $(CuSO_4)$
Ferrous Sulphate $(FeSO_4)$
Ferrous Sulphide (FeS)
Glycerol (Glycerine) $C_3H_5(OH)_3$
Hydrochloric Acid (HCl)
Iodine (I)
Iron Chloride $(FeCl_2)$
Iron Oxide (Fe_2O_3)
Lead Acetate Pb $(C_2H_3O_2)_2$
Litmus Paper
Magnesium Carbonate $(MgCO_3)$
Manganese Dioxide (MnO_2)
Mercury (Quicksilver) (Hg)
Nickel Chloride $(NiCl_2)$
Oxalic Acid $(H_2C_2O_4)$
Sodium Bicarbonate $(NaHCO_3)$
Sodium Borate $(NaBO_2)$
Sodium Carbonate (Na_2CO_3)
Sodium Chloride (NaCl)
Sodium Nitrate $(NaNO_3)$
Sodium Phosphate (Na_2HPO_4)
Sodium Sulphate (Na_2SO_4)
Sodium Sulphite (Na_2SO_3)
Stannous Chloride $(SnCl_2)$
Sulphate of Nickel $(NiSO_4)$
Sulphate of Zinc $(ZnSO_4)$
Sulphuric Acid (H_2SO_4)
Tin (Granulated) (Sn)
Zinc (Metal) (Zn)
Zinc Carbonate $(ZnCO_3)$

The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube
Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure
Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

DESCRIPTION OF THE OUTFIT:

The outfit consists of forty-four (44) Chemicals all C. P. (chemical pure) put up in appropriate wooden boxes, glass bottles, and hermetically closed jars. The acids are put up in glass bottles, with ground-in glass stoppers and there is a sufficient quantity of chemicals supplied (mostly one to two ounces) enough to make dozens of experiments with each. See list of Chemicals herewith.

The apparata furnished are all of the best obtainable make and of standard laboratory size and shape. A list of the 17 pieces of apparata furnished with this outfit is printed also herewith.

The Instruction book is a real **Chemistry Course for the Beginner.** Some of the Contents are: **Division of Matter:** This is a Treatise on Elementary Chemistry and deals with the theory of the Elements, Molecules and Atoms, etc. **Chemical Nomenclature:** This explains in simple language the derivation of the chemical names of the Elements and their compounds. There is a chapter on **Laboratory Operations; Glass Working; First Aid; Fire Extinguishers; Experimenters' Aphorisms,** etc.

A good part of the book is devoted to Weights and Measures. The Metric System, the English system and the U. S. System are fully explained.

The following tables are furnished: Symbols and Atomic weights of the Elements; Measures of Weights, Volume, Capacity and Length; Per Cent solutions; Conversion of Measure expressed in parts; Poisons and their antidotes; Technical and common name of chemical substances; Formulas for Cleaning various substances, etc., etc.

Among the **100 Experiments** are:

How to make chemical tricks; How to make invisible and magic inks; How to test flour; How to test soil; How to Make Chlorine Gas and smoke (German War Gas); How to bleach cloth and flowers. How to produce Oxygen and Hydrogen; How to make chemical colors; How to test Acids and Alkalies and hundreds of interesting hints and formulas.

The price is still $5.00. Shipping Weight 10 lbs. (Can be shipped by Express only.)

TRADE MARK **THE ELECTRO IMPORTING CO., Mfrs.** TRADE MARK

How I Improved My Memory In One Evening

The Amazing Experience of Victor Jones

"Of *course* I place you! Mr. Addison Sims of Seattle.

"If I remember correctly—and I *do* remember correctly—Mr. Burroughs, the lumberman, introduced me to you at the luncheon of the Seattle Rotary Club three years ago in May. This is a pleasure indeed! I haven't laid eyes on you since that day. How is the grain business? And how did that amalgamation work out?"

The assurance of this speaker—in the crowded corridor of the Hotel McAlpin—compelled me to turn and look at him, though I must say it is not my usual habit to "listen in" even in a hotel lobby.

"He is David M. Roth, the most famous memory expert in the United States," said my friend Kennedy, answering my question before I could get it out. "He will show you a lot more wonderful things than that, before the evening is over."

And he did.

As we went into the banquet room the toastmaster was introducing a long line of the guests to Mr. Roth. I got in line and when it came my turn, Mr. Roth asked, "What are your initials, Mr. Jones, and your business connection and telephone number?" Why he asked this, I learned later, when he picked out from the crowd the 60 men he had met two hours before and called each by name without a mistake. What is more, he named each man's business and telephone number, for good measure.

I wont tell you all the other amazing things this man did except to tell how he called back, without a minute's hesitation, long lists of numbers, bank clearings, prices, lot numbers, parcel post rates and anything else the guests gave him in rapid order.

* * * *

When I met Mr. Roth—which you may be sure I did the first chance I got—he rather bowled me over by saying in his quiet, modest way:

"There is nothing miraculous about my remembering anything I want to remember, whether it be names, faces, figures, facts or something I have read in a magazine.

"You can do this just as easily as I do. Anyone with an average mind can learn quickly to do exactly the same things which seem so miraculous when I do them.

"My own memory," continued Mr. Roth, "was originally very faulty. Yes it was—a really *poor* memory. On meeting a man I would lose his name in thirty seconds, while now there are probably 10,000 men and women in the United States, many of whom I have met but once, whose names I can call instantly on meeting them."

"That is all right for you, Mr. Roth," I interrupted, "you have given years to it. But how about me?"

"Mr. Jones," he replied, "I can teach you the secret of a good memory in one evening. This is not a guess, because I have done it with thousands of pupils. In the first of seven simple lessons which I have prepared for home study, I show you the basic principle of my whole system and you will find it—not hard work as you might fear—but just like playing a fascinating game. I will prove it to you."

He didn't have to prove it. His Course did; I got it the very next day from his publishers, the Independent Corporation.

When I tackled the first lesson, I suppose I was the most surprised man in forty-eight states to find that I had learned in about one hour—how to remember a list of one hundred words so that I could call them off forward and back without a single mistake.

That first lesson *stuck*. And so did the other six.

Read this letter from Terence J. McManus, of the firm of Olcott, Bonynge, McManus & Ernst, Attorneys and Counsellors at Law, 170 Broadway, and one of the most famous trial lawyers in New York:

> "May I take occasion to state that I regard your service in giving this system to the world as a public benefaction. The wonderful simplicity of the method, and the ease with which its principles may be acquired, especially appeal to me. I may add that I already had occasion to test the effectiveness of the first two lessons in the preparation for trial of an important action in which I am about to engage."

Mr. McManus didn't put it a bit too strong.

The Roth Course is priceless! I can absolutely *count* on my memory now. I can call the name of most any man I have met before—and I am getting better all the time. I can remember any figures I wish to remember. Telephone numbers come to mind instantly, once I have filed them by Mr. Roth's easy method. Street addresses are just as easy.

The old fear of forgetting (you know what that is) has vanished. I used to be "scared stiff" on my feet—because I wasn't *sure*. I couldn't remember what I wanted to say.

Now I am sure of myself, and confident, and "easy as an old shoe" when I get on my feet at the club, or at a banquet, or in a business meeting, or in any social gathering.

Perhaps the most enjoyable part of it all is that I have become a good conversationalist—and I used to be as silent as a sphinx when I got into a crowd of people who knew things.

Now I can call up like a flash of lightning most any fact I want right at the instant I need it most. I used to think a "hair trigger" memory belonged only to the prodigy and genius. Now I see that every man of us has that kind of a memory if he only knows how to make it work right.

I tell you it is a wonderful thing, after groping around in the dark for so many years to be able to switch the big searchlight on your mind and see instantly everything you want to remember.

This Roth Course will do wonders in your office.

Since we took it up you never hear anyone in *our* office say "I guess" or "I think it was about so much" or "I forget that right now" or "I can't remember" or "I must look up his name." Now they are right there with the answer—like a shot.

Have you ever heard of "Multigraph Smith?" Real name H. Q. Smith, Division Manager of the Multigraph Sales Company, Ltd., in Montreal. Here is just a bit from a letter of his that I saw last week:

> "Here is the whole thing in a nutshell: Mr. Roth has a most remarkable Memory Course. It is simple, and easy as falling off a log. Yet with one hour a day of practice anyone—I don't care who he is—can improve his Memory 100% in a week and 1,000% in six months."

My advice to you is don't wait another minute. Send to Independent Corporation for Mr. Roth's amazing course and see what a wonderful memory you have got. Your dividends in *increased power* will be enormous.

VICTOR JONES.

While Mr. Jones has chosen the story form for this account of his experience and that of others with the Roth Memory Course, he has used only facts that are known personally to the President of the Independent Corporation, who hereby verifies the accurrary of Mr. Jones' story in all its particulars.

Send No Money

So confident is the Independent Corporation, the publishers of the Roth Memory Course, that once you have an opportunity to see in your own home how easy it is to double, yes, triple your memory power in a few short hours, that they are willing to send the course on free examination.

Don't send any money. Merely mail the coupon or write a letter and the complete course will be sent, all charges prepaid, at once. If you are not entirely satisfied send it back any time within five days after you receive it and you will owe nothing.

On the other hand, if you are as pleased as are the thousands of other men and women who have used the course, send only $5 in full payment. You take no risk and you have everything to gain, so mail the coupon now before this remarkable offer is withdrawn.

FREE EXAMINATION COUPON

MAGAZINE Prices Slashed

Millions of magazine subscriptions expire this month! With the tremendous advance of paper prices and labor it is certain that nearly all magazines will advance their subscription prices at least from 25% to 50%.

BY ORDERING NOW YOU WILL SAVE BIG MONEY.

In announcing these wonderful prices it is with the absolute knowledge that our readers are offered the lowest prices for standard Magazines that it is possible to obtain anywhere. Only by special arrangement with the publishers are these prices possible, but to take advantage of them, you must act quickly. **Don't delay, do it now.** This offer is so good that of necessity it must be limited in time. Just think of buying standard Magazines at reduced prices in time for Xmas Presents, and they certainly make ideal gifts being a constant reminder for a whole year of a considerate friend. Just glance over our wonderful prices, and see how we enable one dollar to bring you two dollars' worth, and then make up your list. When sending your order, don't forget to state where magazines are to be sent. But be sure you do it now. To-morrow means you may forget and lose this wonderful opportunity. All prices quoted are for subscribers in U S. A. only, Canadian and Foreign subscriptions require additional postage.

The Publishers Will Mail the Magazine Direct From Their Own Office to You.

Are You a Blond?

The Secret of Making People Like You

Gloria Swanson
In "Male and Female"
Paramount-Artcraft Picture

THE greatest asset any man can possibly have is the faculty for making people like him. It is even more important than ability.

The secret of making people like you lies in your ability to understand the emotional and mental characteristics of the people you meet.

Did you know that a blond has an entirely different temperament than a brunet?—that to get along with a blond type you must act entirely different than you would to get along with a brunet?

When you really know the difference between blonds and brunets, the difference in their characters, temperaments, abilities and peculiar traits you will save yourself many a mistake—and you will incidentally learn much you never knew before about yourself.

* * * * * * * * *

PAUL GRAHAM was a blond, and not until he learned that there was all the difference in the world between the characteristics of a blond and those of a brunet did he discover the secret of making people like him.

Paul had been keeping books for years for a large corporation which had branches all over the country. It was generally thought by his associates that he would never rise above that job. He had a tremendous ability with figures—could wind them around his little finger—but he did *not* have the ability to mix with big men; he did *not* know how to make people like him.

Then one day the impossible happened. Paul Graham became popular.

Business men of importance who had formerly given him only a passing nod of acquaintance suddenly showed a desire for his friendship. People—even strangers—actually went out of their way to do things for him. Even *he* was astounded at his new power over men and women. Not only could he get them to do what he wanted them to do, but they actually anticipated his wishes and seemed eager to please him.

From the day the change took place he began to go up in business. Now he is the Head Auditor for his corporation at an immense increase in salary. And all this came to him simply because he learned the secret of making people like him.

You, too, can have the power of making people like you. For by the same method used by Paul Graham, you can, at a glance tell the characteristics of any man, woman or child—tell instantly their likes and dislikes, and YOU CAN MAKE PEOPLE LIKE YOU! Here is how it is done:

Everyone you know can be placed in one of two general types—blond or brunet. There is as big a difference between the mental and emotional characteristics of a blond and those of a brunet as there is between night and day. You persuade a blond in one way—a brunet in another. Blonds enjoy one phase of life—brunets another. Blonds make good in one kind of a job—brunets in one entirely different.

To know these differences scientifically is the first step in judging men and women, in getting on well with them; in mastering their minds; in making them like you; in winning their respect, admiration, love and friendship.

And when you have learned these differences—when you can tell at a glance just what to do and say to make any man or woman like you, your success in life is assured.

For example, there's the case of a large manufacturing concern. Trouble sprang up at one of the factories. The men talked strike. Things looked ugly. Harry Winslow was sent to straighten it out. On the eve of a general walkout he pacified the men and headed off the strike. And not only this, but ever since then, that factory has led all the others for production. He was able to do this, because he knew how to make these men like him and do what he wanted them to do.

Another case, entirely different, is that of Henry Peters. Because of his ability to make people like him—his faculty for "getting under the skin" and making people think his way, he was given the position of Assistant to the President of a large firm. Two other men, both well-liked by their fellow employees, had each expected to get the job. So when the outside man, Peters, came in, he was looked upon by everyone as an interloper and was openly disliked by every other person in the office.

Peters was handicapped in every way. But in spite of that, in three weeks he had made fast friends of everyone in the house and had even won over the two men who had been most bitter against him. The whole secret is that he could tell in an instant how to appeal to any man and make him well-liked.

A certain woman who had this ability moved with her family to another town. As is often the case, it is a very difficult thing for any woman to break into the chill circle of society in this town, if she was not known. But her ability to make people like her soon won for her the close friendship of many of the "best families" in the town. Some people wonder how she did it. It was simply the secret at work—the secret of judging people's character and making them like you.

* * * * * * * * *

YOU realize, of course, that just knowing the difference between a blond and a brunet could not accomplish all these wonderful things. There are other things to be taken into account. But here is the whole secret.

You know that every one does not think alike. What one likes another dislikes. What pleases one offends another. And what offends one pleases another. Well, there is your cue. You can make an instant "hit" with anyone if you say the things they want you to say, and act the way they want you to act. Do this and they will surely like you and believe in you and will go miles out of their way to PLEASE YOU.

Wallace Reid
Star in "The Valley of the Giants"
A Paramount-Artcraft Picture

You can do this easily by knowing certain simple signs. In addition to the difference in complexion, every man, woman and child has written on them signs as distinct as though they were in letters a foot high, which show you from one quick glance exactly what to say and to do to please them—to get them to believe what you want them to believe—to think as you think—to do exactly what you want them to do.

Knowing these simple signs is the whole secret of getting what you want out of life—of making friends, of business and social advantage. Every great leader uses this method. That is why he IS a leader. Use it yourself and you will quickly become a leader—nothing can stop you.

You have heard of Dr. Blackford, the Master Character Analyst. Many concerns will not employ a man without first getting Dr. Blackford to pass on him. Concerns such as Westinghouse Electric and Manufacturing Company, Baker, Vawter Company, Scott Paper Company and many others pay Dr. Blackford large annual fees for advice on dealing with human nature.

So great was the demand for these services that Dr. Blackford could not even begin to fill all the engagements. So Dr. Blackford has explained the method in a simple, seven-lesson course, entitled, "Reading Character at Sight." Even a half hour's reading of this wonderful course will give you an insight into human nature and a power over people which will surprise you.

Such confidence have the publishers in Dr. Blackford's course, "Reading Character at Sight," that they will gladly send it to you on approval, all charges prepaid. Look it over thoroughly. See if it lives up to all the claims made for it. If you do not want to keep it, then return it and the transaction is closed. And if you decide to keep it—as you surely will—then merely remit five dollars in full payment.

Remember, you take no risk, you assume no obligation. The entire course goes to you on approval. You have everything to gain—nothing to lose. So mail the coupon NOW and learn how to make people like you, while this remarkable offer is still open.

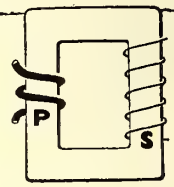
Electricity
taught by a practical man!

Home Study Courses of Definite Value
For Experienced Men and Beginners



PERSONALLY CONDUCTED

by a man who has long experience as a consulting engineer and who has developed the ability to impart his knowledge to others.

RIGHT in your own home, if you are ambitious, you can fit yourself for an electrical position and graduate forever from the ranks of those who are held back because of lack of technical knowledge. I don't make any false statements about the wonderful salaries you will command. But I do promise, if you are in earnest, to give you unusually valuable service that has enabled many others to increase their earnings greatly.

Each Lesson Meant for You

My method is different from others. It is based upon my years of practical experience. It leads the student quickly over fundamentals right up to practical information, such as is experienced in everyday work. You get my personal attention. It's really a class where you who want to learn and I who know the angles of the electrical industry from experience, get together. This method has been so successful that my students are sending others to me and a number of concerns require their employees to take my course.

Advancement

is made possible to any ambitious man—whether a beginner or experienced in electrical work—who will conscientiously devote his spare time to my course of study.

Tough Problems Made Simple

There isn't a problem that can't be solved if you have the proper foundation of knowledge. There is no limit to what you can achieve with the aid of the practical electrical information supplied in my course. It's up to you. I can't tell you much in this little space. Let me send you my catalog.

What Our Students Think of Our Course

"It has been several years since I graduated and since that time I have been connected with The General Electric Company, The Westinghouse Electric Company, and several other electrical manufacturing concerns.

During this time it has been impossible for me to keep in close touch with you to whom I owe, to a large extent, the measure of success I have had in the electrical field.

I wish to take this opportunity to thank you for the instruction given me, and to say that I believe you have exceptional ability along educational lines. Yours, very truly,

E. DICKEY, *Asst. Chief Engineer,*
The Domestic Engineering Company.
Dayton, Ohio.

"I took some of my lessons down to the plant and studied them. The Superintendent saw them and asked me what they were so I told him. The next day he informed me that I would draw $150.00 instead of $110.00. This came in very handy for me of course. Hoping to hear from my exams real soon, I remain,"

Your pupil,
G. D. WATERS, Fairview, W. Va.

RESULTS OF MY SERVICE

Practical Electricians Recommend My Course to Others.
My Students Are Invariably Promoted and Get Better Salaries.
Over 65 Per Cent. of My Students Are Engaged in the Electrical Business.
Over 11 Per Cent. of My Present Enrollment Came Through Satisfied Students.
Beginners Get Employment in Electrical Work After Taking My Course a Short While.

The Right Way to Pay

You pay me a small amount each month. You may stop any time and your payments will then stop. I don't want your money if I'm not teaching you satisfactorily.

Apparatus Supplied

Electrical materials, charts, electrical apparatus, drafting material, etc., are furnished with the course without charge. Write me frankly about yourself—what you are doing now and what you hope to do. Let's get together on your problems.

SEND FOR MY BOOK which clearly tells you how the work is handled, what I have done for others and the benefit you can expect to receive.

YORKE BURGESS, Superintendent

BURGESS ELECTRICAL SCHOOL, 745 E. 42nd Street, Chicago, Illinois

The Opinions of Men Who Have Bought the Blue Book

"I am sure it will solve many problems that may arise in my line of work. I have showed this book to some of my fellow workers and they think it really is a wonderful book and they told me to get copies for them."

JOHN H. GOTCHEL,
Santa Barbara, Cal.

"It is surprising how much information, drawings, etc., can be concentrated into such a small pocket size book."

JOSEPH C. HANHAUSER,
Philadelphia, Pa.

"It is such a good publication that you will find enolosed my check for 12 copies for just a few friends I happened to see last night."

E. T. BROWN,
New Orleans, La.

"Your Burgess Blue Book which I have received recently, has caused quite a stir among my fellow electricians for many of them asked me to get one for them as soon as they read mine. They think it is a great help to them in their work."

FRANK STALZER,
Toledo, Ohio.

BURGESS BLUE BOOK
ELECTRICAL MEN AND STUDENTS

A pocket hand-book for ELECTRICAL MEN and STUDENTS. Contains over 200 CALCULATION FORMULAS and worked-out problems showing their use. Also DRAWINGS of ELECTRICAL APPARATUS and DEVICES of which the *inside connections* are clearly shown. ALTERNATING CURRENT CALCULATIONS and dozens of everyday problems are covered. Recommended by electrical men all over the country. Used in technical schools. Purchased by electrical concerns for employees and customers. There is no other book like it.

A $1.00 bill brings the book. We refund your money if you are not fully satisfied.

PRICE $1.00

BURGESS ENGINEERING CO.

Yorke Burgess, President
Consulting Electrical Engineering
750 East Forty-Second Street, Chicago, Illinois.

We give information on electrical subjects, design and perfect electrical devices and apparatus. Power plants, electric railway and operation and railway signals a specialty. Write us your needs and let us furnish data and advise you. Our service is prompt, reliable and satisfactory.

How "Silent Simms" Became a Master of Speech

BY MARTIN M. BYRON

"YOU are exasperating beyond words," shot out Mr. Worden. "Why didn't you keep Mr. Truesdale here? You knew I would be back in ten minutes."

Harry Simms gulped hard, and replied weakly, "I did try to keep him here, Mr. Worden, but he wouldn't stay."

"What? Wouldn't stay even ten minutes? Why you could have kept him that long without his realizing it. Why didn't you *talk* to him about the weather, about peace, about the price of potatoes, about *anything?*"

This wasn't the first calling down I had heard Simms get. He had been with the firm for eight years and had reached the point where he was as much a fixture around the office as the desk or the chairs. He was a slow-going, steady plugger, earning $40 a week. He managed to keep busy in the Sales Department, keeping records of salesmen's reports. No one around the office seemed to notice him. He was so quiet that the only things that would start him talking were such momentous events as the beginning of the war or the end of the war. Even when his baby was born, Harry said only three words—"It's a boy."

It wasn't long before we nicknamed him "Silent Simms."

Yet the "Silent Simms" of two years ago is now our Sales Manager, regarded as one of the most brilliant men in our organization, getting an annual salary that runs close to five figures, and is slated for the vice-presidency!

How all this happened in so short a time makes one of the most remarkable stories of success I have ever heard. But let Harry tell the story as he told it to me when I asked him point-blank what sort of magic he used in transforming himself.

"Well," said Harry, "you remember when Mr. Truesdale came in that day and I could not hold him for ten minutes until the Chief got back? And when the Chief came back and found Truesdale gone, how he bawled me out? *That incident marked the turning point of my life.* I made up my mind that I was going to live down the nickname of 'Silent Simms,' that had fastened itself upon me to a point where I hardly spoke to my wife. I was just afraid. I had almost forgotten how to use my tongue. Perhaps I got that way because every time I opened my mouth I 'put my foot in it.' I was always getting in wrong. I would give instructions and then have to spend twenty minutes trying to explain them. I would dictate a letter and then have to write five more to explain the first one. I would try to explain an idea to the Chief and would get so flustered that I couldn't make myself understood at all. In my social life I became almost a hermit. We never went out because I was like a sphinx among people. I was the best listener you ever saw and the *worst talker.*

"Well, when the Chief called me down that day it was the 'straw that broke the camel's back.' It was the most humiliating experience I ever went through. I had been with the firm 8 years—was getting $40 a week—and was the office 'football.' I went home that night determined to learn how to talk convincingly, interestingly, and forcibly, so that I could hold people spellbound, not only for ten minutes, but by the hour. No more of the silent stuff for me. I had no more idea of how to do it than I have of how to jump across the ocean, but I knew that I wanted to do it, and I knew that I would never get anywhere until I did do it. It took a shock to make me realize what it was that was holding me down to the grind of detail work, but when I finally realized why I was called 'Silent Simms' I began to investigate all that had been written on the subject of talking. I did not want to become a public speaker—what I wanted was the ability to talk as a business asset. I bought numberless books on public speaking, but they all taught oratory, and were so complicated that I gave up almost in discouragement. I continued my search, however, and was rewarded a few weeks later by hearing about the work of Dr. Frederick Houk Law, who was conducting a course in business talking and public speaking.

"You may be sure that I lost no time in attending the lectures. I went after them as eagerly as a hungry wolf goes after food. To my great surprise and pleasure I grasped the secret of being a convincing talker—the secret I had needed all my life—almost in the first lesson.

—the chief wired me to come back and gave me Morgan's job as the sales manager.

"Almost at once I learned why I was afraid to stand up and talk to others. I learned how to talk to a number of people at the same time. I learned how to make people listen to every word I said. I learned how to say things interestingly, forcibly and convincingly. I learned how to listen while others talked. I learned how to say exactly what I meant. I learned when to be humorous with telling effect, and how to avoid being humorous at the wrong time.

"More important than these vital fundamentals were the actual examples of what things to say and when to say them to meet every condition. I found that there was a knack in making reports to my superiors. I found that there was a right and wrong way to make complaints, to answer complaints, to give estimates, to issue orders, to give opinions, to bring people around to my way of thinking without antagonizing them, and about how to ask banks for a loan. Then, of course, there were also lessons on speaking before large audiences, advice on how to find material for talking and speaking, actual rules on how to talk to friends, to servants, and even to children.

"And the whole thing was so simple that in a single evening I learned the secrets that turned me into a very dynamo of ambition. I knew that I had at last found the road to Mastery of Speech. I began to apply the principles at once, and found that my words were electrifying people. I began to get things done. I began to put a new kind of ginger into my letters, into my memoranda, into my talks with customers, and with people in the office. In a little three minute talk with the Chief I nearly floored him with some ideas that had been in my mind for years, but which I had always been afraid to mention. It wasn't long before I was taken off my old desk and put at the city salesman's desk. You know how I made good. Seems almost like a dream now. Then, a short time later, I was given Roger's job on the road, in the hardest territory we have. And when I began to break records there the Chief wired me to come back and gave me Morgan's job as the sales manager when Morgan was put in charge of the Seattle office.

"This great change came over me simply as a result of my having learned how to talk. I imagine there are thousands of others who are in the same boat in which I found myself and who could become big money-makers if they only learned the secret of being a convincing talker."

When Harry Simms finished, I asked him if I could not have the benefit of Dr. Law's Course and he told me that only recently Dr. Law had prepared a complete course in printed form which contained exactly the same instructions as he had given in his lectures. I sent for it and found it to be exactly as he stated. After studying the eight simple lessons I began to realize that Simm's success was the natural outcome of real ability to talk. For my own success with the Course has been as great as his. I can never thank Simms enough for telling me about Dr. Law's Course in Business Talking and Public Speaking.

SEND NO MONEY

So confident is The Independent Corporation, publishers of "Mastery of Speech," Dr. Law's Course in Business Talking and Public Speaking, that once you have an opportunity to see in your own home how you can, in one hour, learn the secret of speaking and how you can apply the principles of effective speech under all conditions, that they are willing to send you the Course on free examination.

Don't send any money. Merely mail the coupon or write a letter and the complete course will be sent, all charges prepaid, at once. If you are not entirely satisfied, send it back any time within five days after you receive it and you will owe nothing.

On the other hand if you are as pleased as are the thousands of other men and women who have used the Course, send only $5 in full payment. You take no risk and you have everything to gain, so mail the coupon now before this remarkable offer is withdrawn.

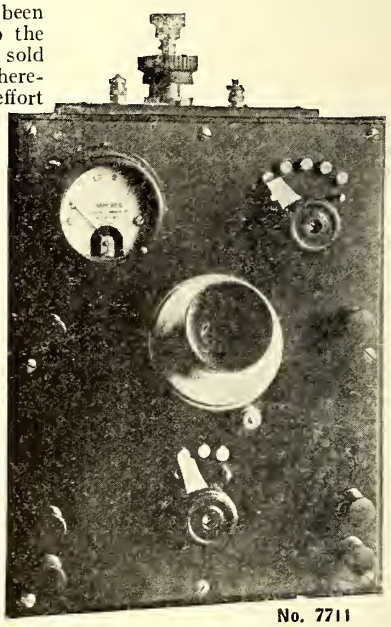
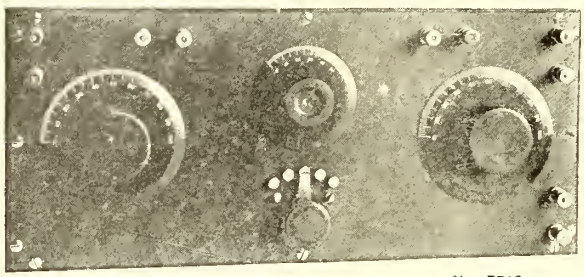
E. I. Co.'s High Grade Radio-Instruments
FOR SCHOOLS AND LABORATORIES AT REASONABLE PRICES

No. 7710



Arc for Generating Undamped Waves for Radio Telephonic & Telegraphic Transmission

These instruments are the acme of perfection in Radio Transmission. The latest and best developments in Radio during the *Great War* are embodied in this apparatus. Educational Institutions and Laboratories can now procure the most modern Radio equipment at a reasonable cost. The undamped *Wave Generator* illustrated is exceptionally well constructed of heavy aluminum. The Arc chamber is flanged in order to offer the greatest cooling surface. The Arc takes place across two solid special Tungsten electrodes which have been found particularly efficient for this work. The electrodes are fully adjustable, permitting very precise adjustment of the emitted oscillatory currents.



No. 7710—½ K.W. Sustained Wave Generator, as illustrated, operates on 110 V D.C. Size 6½ x 6½ x 8½. Shipping weight, 35 lbs.; price.....**$50.00**

This complete ***Radiophone Transmitter*** is unquestionably one of the finest pieces of Radio apparatus ever placed on the market. A Radiophone might have been sold heretofore; but it was felt that in justice to the purchaser, no instrument of this nature should be sold unless it were possible to obtain efficient results therefrom. This transmitter is the result of great effort expended in the design of a Radiophone set which should meet all requirements as to practicability and compactness combined with highest efficiency. It includes all apparatus necessary for transmission. The Arc is similar to the one illustrated elsewhere on this page.

No. 7711—Complete Sustained Wave Radiophone and Telegraph Transmitter, inclosed in a beautifully finished cabinet; size 14½ x 9 x 12½"; weight 50 pounds; as illustrated; price.....**$150.00**

No. 7711

No. 7712

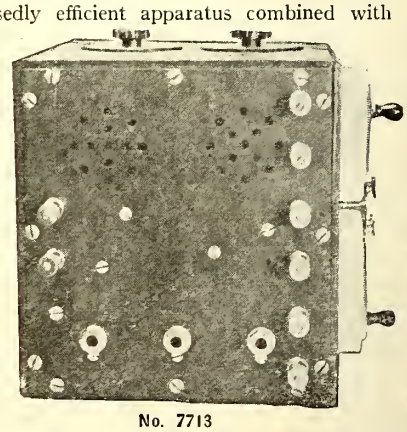
The Short Wave Regenerative receiving cabinet shown is built in accordance with the most modern methods of reception. In work with oscillating audions it is necessary that all losses be diminuated as it was found that tuning should preferably be done with inductance alone, without using variable condensers.

This Receiving set will be found fully up to the mark in comparison with the highest priced set on the market to-day, yet its cost is well within the reach of all.

No. 7712—Regenerative Receiving Cabinet set, as illustrated; size 16¾ x 7⅝ x 8"; weight 25 pounds; price.....**$50.00**

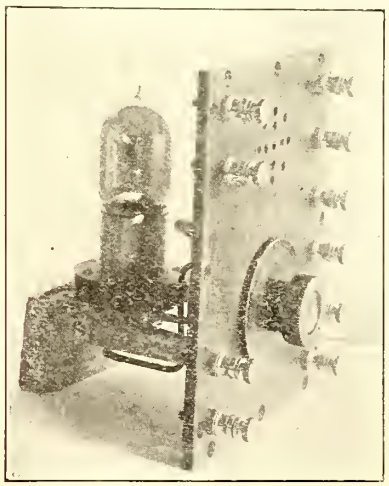
The Vacuum Tube Socket illustrated was designed to be used by those who are desirous of assembling their own vacuum controls and who need a good socket to hold the bulbs. It is well designed, durable and reasonably priced.

No. 7715



No. 7715—Vacuum Tube Socket; 2¼ x 2¼ x 1½"; weight 1 pound; price.....**$1.50**

This Tube socket is adaptable for both receiving and transmitting tubes.



The Two Step Amplifier illustrated is undoubtedly one of the finest instruments offered to the experimenter. It is an example of unsurpassedly efficient apparatus combined with exceptional mechanical skill in its design and construction. Two Vacuum Tube sockets are mounted within the cabinet which also contains the two amplifying audio-frequency transformers which were especially designed for this instrument. It is of great consistance in amplifying live and radio telephone currents.

The telephones are plugged in any of three jacks mounted on the panel, permitting the use of either one or two steps of the amplifier or simply cutting the amplifier out entirely.

No. 7713—Two Step Amplifier, as illustrated; size 7⅝ x 7¼ x 8"; weight 7 pounds; price.....**$55.00**

No. 7713

No. 7714

The Vacuum Tube Control Cabinet is one of the essential instruments of the modern radio station. The Vacuum Tube holder, filament, rheostat, grid condenser and grid leak are mounted within the cabinet, the only part on the exterior being the rheostat control knob and dial. The construction throughout is on the same high level of excellence with the other instruments illustrated on this page.

No. 7714—Vacuum Tube Control Cabinet, as illustrated; size 6 x 7⅝ x 6¾; weight 5 pounds; price.....**$25.00**

P. S. No Tubes furnished by us with these instruments.

How We Stopped the Leaks That Kept Us Poor

How Howard Lindsay and His Wife Discovered an Easy Way to Save One-Third of Their Income. A Secret That Applies to Any Income

By HARRISON OTIS

WHO should walk into the room but Howard Lindsay! Of all men perhaps he was the last I had expected to find as the president of this great new company. They had told me that Mr. Lindsay, of the Consolidated, was looking for a fine country home and was interested in buying the Dollard Place in Englewood; so as executor of the Dollard estate I had come to discuss the terms with him.

But Lindsay! Surely some miracle had happened. For it was the very man who had come to me "dead broke" about four years back and had asked me to help him get a new job.

"You are surprised, Mr. Otis, I can see that without your telling me. Let that real estate matter rest for a moment while I tell you how the change happened. It won't take five minutes. It all seems simple as A B C, as I look back on it now.

How It All Began

"Our new life began when we discovered *how to save money.* That happened soon after I started in the new job you helped me secure. And it all came about right in my own home. Our sole source of supply was my salary of $3,000. That first year we didn't save one cent. Besides that, we woke up on New Year's day to find a big hunch of unpaid bills to be taken care of somehow or other out of future salary checks.

"When I asked myself the reason for all this I found that I did not *know* the reason, and no more did my wife, because we hadn't the faintest idea what our money had been spent for.

"Then we looked around among our friends and learned a great lesson.

"The Weeds, I knew, were getting more than $5,000 a year. They lived in a modest apartment, did not wear fine clothes, seldom went to the theatre, did little entertaining, yet we knew they barely had enough money to pay current bills.

"In the case of the Wells, I found a very different story and one that set me thinking hard. Their income was $2,000 a year, yet, to my amazement, they confided to us that they had saved $600 a year ever since they were married. They didn't have any grand opera in their program—except on their little Victrola—but they did go to the theatre regularly, they wore good clothes, entertained their friends at their home and were about the happiest and most contented couple of all our married friends.

"The difference between these two families was that in one case the expenditures were made without any plan—while in the other the income was regulated on a weekly budget system.

"We sat down that evening and made up a budget of *all* our expenses for the next fifty-two weeks. We discovered leaks galore. We found a hundred ways where little amounts could be saved.

"In one short month we had a 'strangle hold' on our expenses and knew just where we were going. In one year my wife proudly produced a bank book showing a tidy savings account of $800.

My New Grip on Business

"In the meantime an extraordinary change had come over me in business.

"I didn't fully realize this until the president called me in one day and said, 'Lindsay, you have been doing exceptionally well. I have been studying your work for the last year and you have saved the company a lot of money. We have decided to give you an interest in the business.'

"So there you are. It is wonderful, isn't it? I often wish I might tell my story to the thousands of young married couples who are having the hardest time of their lives just when they ought to be having the best time."

So now I have the opportunity and you are lucky, if only you will act on the wonderful message this story contains. HARRISON OTIS.

The Magic Budget Plan

The Ferrin Money Making Account System is built on the experience of Howard Lindsay. This system, which is simplicity itself, comprises:

The Ferrin Money Making Account Book.

The Ferrin Kitchen Calendar (for the household).

The Ferrin Pocket Account Book.

The Ferrin Investment and Insurance Register.

The Ferrin Household Inventory and Fire Insurance Record.

Compact information is given on Making a Budget, Keeping Expense Accounts, Making Safe Investments, Making an Inventory of Household Goods.

There is no red tape or complicated bookkeeping in this system—it is so simple that anyone can keep it—so convenient that you will not notice the few moments of your time required to make entries. The Pocket Account Book (price when sold separately 50 cents) contains *printed* slips so that you have only to jot down the amounts of your daily expenditures. The Kitchen Calendar (price 50 cents) keeps track of household expenses. At the end of each week or month these amounts are transferred to the Money Making Account Book, which contains 112 pages, size 8¼x10¾ inches, and is bound in half blue Silk Cloth Back—Cadet Blue Cover, Paper Sides—Turned Edges, semi-flexible, stamped in gold on Front Cover. This book has been prepared by an expert to fit any salary from the smallest to the largest. Incorporated in it is a recapitulation for every month of the year, which shows at a glance the Budget and the amounts paid out during the month for the various classified items of expense. It is the only book to our knowledge which has a Budget column for every month. Special columns are provided for items on which an income tax does not have to be paid, so that these amounts may be deducted at the end of the year.

One Money Saving Feature

A war tax is now levied on almost every kind of article you buy. Few people know that the amounts so paid on daily purchases may properly be deducted from their income tax report. By keeping track of these war taxes on the pages for daily expenditures, and transferring the weekly or monthly totals to the Money Making Account Book, you will effect a saving on your income tax that will surprise you and that will pay the small price of the System many times over.

The Ferrin Investment Insurance Register is designed to keep an accurate record of your investments, insurance policies, etc. Contains 32 pages, size 5x8 inches, price separately, 50c. The Ferrin Inventory and Fire Insurance Record will enable you to make and keep a complete inventory of every room in the house; also provides for record of your fire insurance policy. It is an absolute necessity in case of a fire. It may save you many thousand times the cost, which is 50c when sold separately.

Two Minutes a Day

The Ferrin Money Making Account System takes only two minutes a day. Any bright grammar school boy or girl can keep the accounts. This method is not a hard task.

Now you need not worry about the money you spend for clothes, food, rent or the theatre. You will spend it freely because you will know how much you can afford to spend.

The Ferrin Money Making System is a most practical gift to any newly married couple. Many people use them for Christmas gifts.

Send No Money

See how magically the Ferrin Money Making Account System works, no matter how much or how little your income. We know what you will think of it when you see it. So we are willing to send you the complete system without your sending us any money in advance. Just mail the coupon, and back will come the system by return mail. If you feel that you can afford *not* to have it, simply send it back and you will owe nothing.

But when you have seen what big returns the Ferrin System will pay you, you will surely want to keep this wonderful aid to money-making, especially as we are now making a special, short-time offer of only $3 for the complete system.

You will appreciate what a remarkable offer this is when you consider that other expense account hooks are sold for $3 and cover a period of only two years. The Ferrin Money Making Account Book covers four years, and therefore has twice the value, $6. And in addition you get the Ferrin Kitchen Calendar, the Ferrin Pocket Account Book, the Ferrin Investment and Insurance Register, the Ferrin Household Inventory and Fire Insurance Record, each worth 50c, or $2.00. You have the opportunity, therefore, of securing $8 value for only $3.

But we can make this special combination offer only for a limited time. We expect to place this System in one hundred thousand homes this year. We want your home to be one of them. You are therefore urged to mail the coupon now—to do so costs nothing and does not obligate you in any way, and it may be a revelation to you of how much more you can get out of your income.

READ!

Letter from Head of Financial Department of Largest Corporation of Its Kind in the United States.

Independent Corporation

Gentlemen:

I consider your account book a remarkable contribution to the people of this country at this time.

In our company we have 5000 employes and it was a revelation to me in giving them advice in regard to the making out of their income tax returns to find how few had any intelligent idea of their income and their living expenses.

The simplicity of your plan which by comparison with previous methods of account keeping would seem to be well-nigh automatic appeals to me strongly.

They say you can't teach an old dog new tricks, but I will say to you that I am going to use the Ferrin Book for my own family expenses, and consider it will make money for me right from the start.

(Signed) D. S. BURTON

What "Radio Amateur News" Is:

With its fifth issue RADIO AMATEUR NEWS holds the field undisputedly as the greatest radio magazine in print today. In point of circulation, number of articles, illustrations, RADIO AMATEUR NEWS now leads all other wireless magazines. Take for instance the November issue with its fifty-six pages; there were fifty-one separate purely radio articles and 112 illustrations. *Over twenty-seven thousand copies were printed and circulated.*

Each issue of the RADIO AMATEUR NEWS now contains 56 pages (or more) and an artistic cover in two colors. The illustrations average 125 every month and there are from 40 to 50 up-to-date articles, some by our biggest radio scientists, in every issue.

RADIO AMATEUR NEWS is the greatest and biggest radio magazine in print today.

RADIO AMATEUR NEWS is the only INDEPENDENT monthly wireless magazine in existence. It caters to no commercial interests—it has no boss save its readers. It is "different"—it has the latest radio news. It is a scientific magazine but it caters largely to the RADIO AMATEUR—it is by and for the Amateur. It is published by the publishers of the ELECTRICAL EXPERIMENTER, but there will be no duplication of articles in the two magazines. Both are entirely different—but both together will give you ALL the radio news of all the world. Whether you are a professor or an Amateur, get a sample copy or order it from your Newsdealer today.

Junior Radio Course

A distinctly new feature began with the September issue in our new **Junior Radio Course.** In the November issue Lesson No. 3 appears complete. This course is intended for the beginner and everything presented will be in plain English—even the merest tyro in radio will find no trouble in understanding and assimilating the knowledge. The series is a very important one and nothing like it has ever appeared in print before. Everyone owes it to himself in this new age to know something about wireless and this course will enlighten all laymen. Profusely illustrated with pictures that anyone can understand.

Learn Electricity —the New Way

IT'S no longer necessary to go to school or serve an apprenticeship to learn electricity. With this new library of APPLIED PRACTICAL ELECTRICITY you learn right at home—in your spare time without interfering with your present work.

Any big job that you want in the electrical field is yours if you will train yourself to fill it. It only takes an hour or two a day with these books.

This is the 1920 edition—new from cover to cover—chuck full of the latest methods and most recent discoveries in this fascinating field. Everything is written in plain, good old U. S. language by 27 of the greatest experts in the business. The eight volumes with 3800 pages make up a complete course in electrical engineering. It's a home study course for the beginner and a handy reference guide for the expert combined.

Big Pay for Trained Men Jobs paying $1500.00 to $5000.00 a year are waiting for men who can qualify as Electrical Engineers—Substation Operators—Troublemen—Switchboard Operators—Dynamo Tenders—Electricians. Electricity is the greatest force in the world and it is growing bigger and bigger every day. More and more men are needed all the time. Why don't you get into this big paying field now?

Good Jobs Are Waiting If you are trained in some branch of electricity you will never have to look for a job. The job and the big pay will be looking for you. You can't dodge a good job if you have the "know how" under your hat. Let these 27 great engineers help you to the best kind of job with their books.

Send the coupon below and get them for FREE examination. See our free offer below.

What the Books Teach Elements of Electricity—Electrical Measurements—Electric Wiring—Underwriter's Electrical Requirements—Theory, Calculation, Design and Construction of Direct Current Generators and Motors—Types of Generators and Motors—Management of Electrical Machinery—Electric Lighting—Alternating Current Machinery—Power Transmission—Electric Railways—Self-Propelled Railway Cars—Trackless Trolley—Power Stations—Switchboards and Switching—Storage Batteries—Applied Electro-chemistry—Electric Elevators—Electric Welding and Heating—Wireless Telegraphy and Telephony—Land and Submarine Telegraphy.

The World's Greatest Electrical Books LOANED to You FREE

We will lend you this wonderful library to use in your own home or shop a whole week FREE. It won't cost you one cent. DON'T SEND ANY MONEY. Just fill out and mail the coupon today and the set of eight volumes will come to you by express collect. You be the judge and find out for yourself what the books will do for you. Use them as you please. Show them to your friends and get their opinion. Then if you have any doubt as to their value send them back at our expense and you won't owe us anything.

Free Service With every set of these great electrical books we give a one year membership in this society. This entitles you to consult our engineers and experts on any electrical problem. Write as often as you like. Ask as many question as you like for one year.

Only 7 Cents a Day

If you like the books after a week's examination you pay us only $2.00 and the same amount each month until $24.80 is paid. This is only 50 cents a week—7 cents a day. You can't afford to pass up a better job on these easy terms. MAIL THE COUPON NOW.

American Technical Society
Dept. E 258, CHICAGO

Coupon is All You Need— Send it Now

American Technical Society
Dept. E 258
Chicago, U. S. A.

Please send me the 8-volume set of Electrical Engineering for 7 days' examination, shipping charges collect. If I decide to buy I will send $2.00 within 7 days and balance at the rate of $2.00 a month until $24.80 has been paid. Then you will send me a receipt showing that the set of books and the Consulting Membership are mine and fully paid for. If I want to get along without the books, I will return them, after 7 days, at your expense.

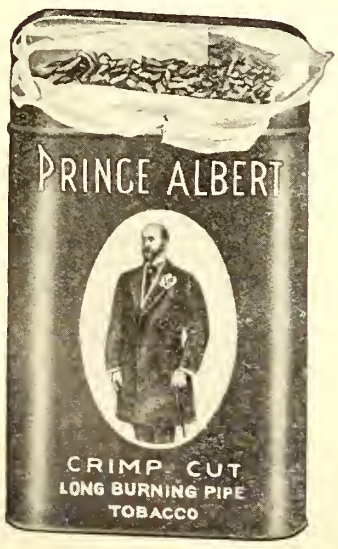
PRINCE ALBERT



the national joy smoke

Copyright 1919 by
R. J. Reynolds Tobacco Co.

Awaiting your say-so, you'll find toppy red bags, tidy red tins, handsome pound and half-pound tin humidors — and — that classy, practical pound crystal glass humidor with sponge moistener top that keeps Prince Albert in such perfect condition!

R. J. Reynolds Tobacco Company
Winston-Salem, N. C.

P. A. has such a joy'us way of making men glad about jimmy pipes!

To shoot it quick:—Prince Albert turns over a new leaf in your smoke-career! Shovels smokesorrows right out the attic airshaft and throws wide open the smoke-section-shutters! Talk about letting in a flood of smoke-sunshine! Bet your pet luckystone that the best you ever heard tell about can't hold a candle *with what Prince Albert will hand you* seven days out of every week! And, then, some-on-the-side!

Smoking Prince Albert is just about twins with having the top time of your life on each fire-up! *It gives you a brand new idea of how delightful a pipe smoke really can be!* Such flavor and fragrance and coolness; such freedom from bite and parch! Prove personally that Prince Albert's exclusive patented process *really does cut out bite and parch!*

Talk about ringing the bell every time you take *just one more little smoke!* You'll agree with your old fellow citizen, General Approval, that Prince Albert puts a man on the firing line with a jimmy pipe, *and keeps him there;* that it sends all previous smoke setto records to the rear-ranks; that it just slams in one good time on top of another so fast, so happy-like, you realize that heretofore you've been hunting regular-man-sport with the wrong ammunition!

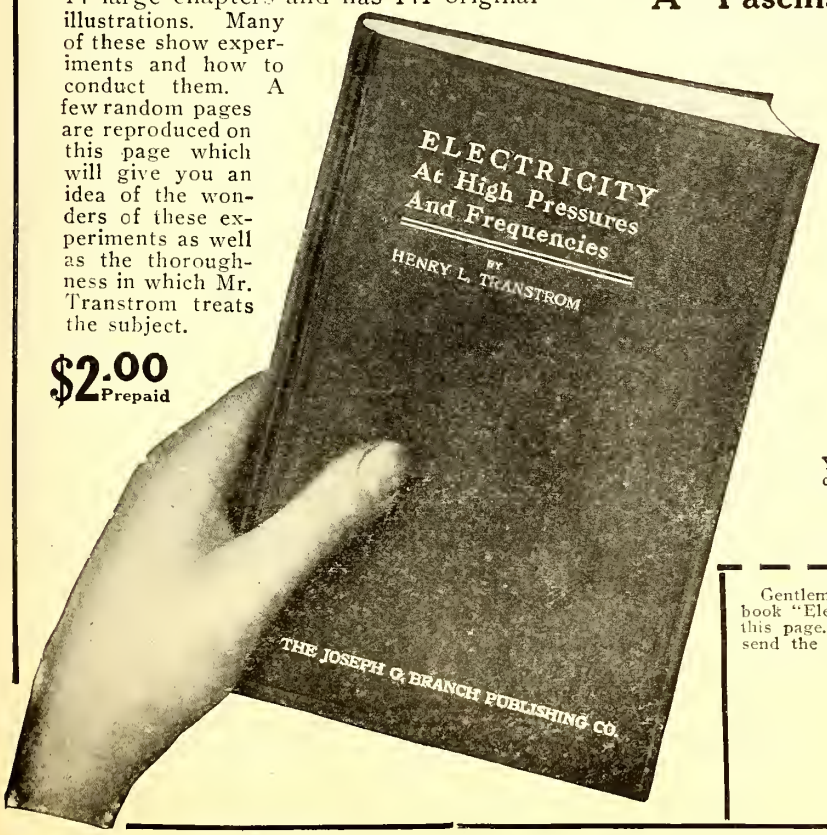
Spectacular Tesla Experiments



High Frequency Currents

There is possibly no more fascinating branch of the electrical art than the high frequency currents or electricity at high pressures and frequencies. The subject is one that fascinates every student of electricity. Moreover these most wonderful experiments can be performed by anyone at but small expense.

The trouble in the past was that very little has been printed how to actually conduct these experiments outside of magazine articles. Few books are in existence today that treat on the subject.

It will therefore come as a pleasant surprise that Henry L. Transtrom, an expert on high frequency currents, has written a comprehensible book of 250 pages on high frequency currents, which we know will be in every laboratory of every experimenter worthy of the name. Mr. Transtrom's book contains 14 large chapters and has 141 original illustrations. Many of these show experiments and how to conduct them. A few random pages are reproduced on this page which will give you an idea of the wonders of these experiments as well as the thoroughness in which Mr. Transtrom treats the subject.

$2.00 Prepaid

A Fascinating Book that EVERY Experimenter Needs

The book itself is very cleverly written, explaining all the fundamentals of high frequency currents, devoid of any obtruse mathematics and technicalities, which would only hamper the average student

The fundamentals of high frequency currents are carefully explained, so that the student will have a good insight into this fascinating art.

The book itself is bound in blue linen and measures 7½ x 5½ inches.

Order Your Copy To-day

You can not afford to be without this book. Fill in the coupon today and the book will be sent to you prepaid at once

The Jos. G. Branch Publishing Co.,
Dept. EE, 542 S. Dearborn St., Chicago, Ill.

Gentlemen:—Please send me at once your Mr. Henry L. Transtrom's book "Electricity at High Pressures and Frequencies" as described on this page. I enclose herewith value of $2.00, for which you are to send the book prepaid at once.

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,500 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Special Automobile Ignition Course

We have just installed a special automobile ignition course for auto mechanics, garage men and owners. The course covers completely ignition, starting, lighting and other electrical equipment in connection with automobiles, motor boats, etc.

Let us explain our complete courses to you in person. If you can't call, send now for 64-page book—it's FREE to you.

New York Electrical School
29 W. 17th St., New York, N. Y.

Please send FREE and without obligation to me your 64-page book.

NEW ARC RIVALS SUNLIGHT

Moving Picture Photography Obtains Remarkable Results Thru the Use of 100,000 Candle-Power Arc

UTILIZING arcs for the taking of motion pictures and for general illumination in theaters has long been possible. However, the old style arcs consumed too much current, and did not meet the demands of the photoplay producers. This new "sunlight arc," however, is superior to anything yet produced along the line of illumination, inasmuch as one single unit will give the same amount and better illumination than the sixteen units which are now used in producing a photoplay. By its use photographs may be taken by day or night, and the same effect obtained as if the sun were shining brightly. In proof of this, one of the accompanying photographs is of Marguerite Clark, the famous moving picture actress, enjoying the beautiful "sunlight," thanks to the Sunlight Arc which made this possible.

The Sunlight Arc is a mechanism arranged in such a manner that an operator can handle several arcs at the same time, unless it is necessary to shift them constantly. The arc itself consists of a positive carbon of special composition, which is rotated by a motor, and a negative carbon, which is likewise of special composition. When a 24-inch parabolic mirror is used in order to throw a *spot-light*, the extent of the beam spread may be adjusted to wide limits; in other words, the beam can be made to cover a distance of 130 degrees, and by moving the lamp arcs, in respect to the reflector, this tremendously strong flood-light, which can be used for interiors of ball-rooms and the larger stage sets, can be narrowed down to three degrees. The maximum candle-power of each beam is 120,000,000. This beam has been photographed while passing thru the air, and has been used to wonderful advantage in producing fog, moon and sunbeam effects. Motion pictures have been taken with this lamp, *one-fourth mile away*, shining upon the scene of action. If the ground glass and iris diafram are used, and the diafram is stopt way down and then gradually opened so as to form one of those fade-in pictures in which the head of the person is first seen, the picture then gradually developing itself, the illumination from the smallest opening to the largest is absolutely equivalent; in other words, there is no change whatever in the intensity of illumination as the stop is opened. One very re

The Eiffel Tower Illuminated

Photo—France-America Corporation

The Famous "Eiffel Tower" in Paris, France, Illuminated on the Night of the Bastile Parade, and Forming a Veritable Blazing Torch of Liberty and Victory, 1,000 Feet in Height.

The accompanying photo shows something of interest to all Americans, especially at this time when the bonds of friendship and patriotism between the two great republics—La République Française and the United States of America—is many times stronger than it ever was previously. This photograph shows the sky-piercing *Eiffel Tower*, one of the greatest engineering masterpieces in all Europe, illuminated at night and forming veritably a blazing torch of liberty and victory, nearly 1,000 feet in height. The illumination here shown occurred on the night of the Bastile parade in Paris. The gigantic steel structure of the Eiffel Tower was illuminated by thousands of lamps, both of the incandescent and arc type, and due to the rays of light shining thru the steel work, a very beautiful and inspiring sight was the result. It represents, when illuminated, undoubtedly one of the finest examples of modern engineering in Europe, even in the world.

How would you have liked to have been in Paris the night peace was signed, the day—*le jour de la victoire?* You can bet your last dollar you would, for nobody can beat the French when it comes to entertaining and enjoying themselves. Take it from an ex-marine, who told the writer a short time ago that he never saw anything like it in his career. The American, French, Belgian, Italian and British soldiers hauled the great camouflaged German field guns down the boulevards while the French mademoiselles mounted the gun barrels. Searchlights flashed across the sky until it was as bright as day. The restaurants and cafés were illuminated as never before, and believe the story, friends, of one of your own all-American "devildogs"—the French cognac ran up hill and down again. They say liquids never run up hill, but this was a night of exceptions.

Sun Signals for Fighting Forest Fires

By Frank C. Perkins

THE accompanying illustration shows the heliograph used by the Forest Service lookouts for sending sunlight signals in fighting forest fires.

Herbert A. Smith, Editor of the *Forester* of the U. S. Department of Agriculture, states that the heliograph is ordinarily used only at stations where telephone communication is impracticable and that its great value consists in establishing a system of communication with isolated forest fire "lookouts" on the tops of high mountains where the expense of building telephone lines would be prohibitory.

These lookout stations are used by the Forest Service to detect forest fires. They are placed on the tops of the highest peaks and during the fire season are occupied constantly by trained observers. Each "lookout man" has before him the best obtainable map of the surrounding country, on which the exact location of his station is shown. Around the point representing the station there is a circle graduated in 360 degrees. When a smoke is seen the lookout man ascertains its exact bearing upon his station and at once gets into communication with headquarters. Every effort is made to have at least two lookout points overlook the same section of country, and consequently it is usually possible to ascertain almost the exact location of a fire by the intersection of angles.

It is, of course, highly important that the lookout points be kept in close touch with headquarters, since success in fire-fighting depends largely on getting at the fire while it is small. For this reason the heliograph is not altogether satisfactory, because it can be used only on sunny days, and is of no use during cloudy weather or at night.

Attention is called to the fact that the heliograph instrument as a means of communication has been used for a great many years, but its use has been almost entirely restricted to the Army. Interesting and successful experiments, however, were recently conducted by the United States For-

Married by Radiophone While Flying

"I DO"—answered the blushing bride, by wireless telephone, as she flew thru the air, piloted by her newly acquired husband.

Fifteen hundred feet above Sheepshead Bay Speedway Park, the two airplanes circled together slowly, like bird mates. On the ground below 200,000 people watched them and listened to the droning of large megaphones attached to the ground station of a wireless telephone. At 5:40 o'clock a woman's voice was transmitted to them and her words were, "I do." The first aerial wedding ceremony had been performed.

Miss Emily Schaeffer of Sea Gate, L. I., and Lt. George Burgess of Brooklyn, N. Y., were the principals in the ceremony that featured the second of the two Police Field Days recently held at Sheepshead Bay, near New York City. They flew in a plane piloted by the groom, who is an aviator attached to the Mineola forces. In the second plane the Rev. Alexander Wouters of the Edgewood Dutch Reformed Church, the first real "sky pilot," flew, with Lt. Eugene Barksdale, the best man, as pilot. A long streamer of bunting indicated the bride's plane.

The two planes rose from the inclosure of the speedway at 5:10 o'clock, each being supplied with a wireless telephone transmitting and receiving outfit. In front of the grandstand was a third station, at which Miss Doris K. Schob, the bridesmaid, sat. Extensions carried receivers to other members of the bridal party, Mrs. Katherine Schaeffer, mother of the bride; Mr. and Mrs. Andrew Mills, Sgt. William B. Stewart, U. S. M. C., and others. A fourth station connected with amplifying 'phones distributed among the boxes.

At 5:25 o'clock the 'planes had reached 1,500 feet altitude, and began to circle above the field. The wireless telephone began to talk.

"Station 3, can you hear me?" asked the groom of the minister's machine.

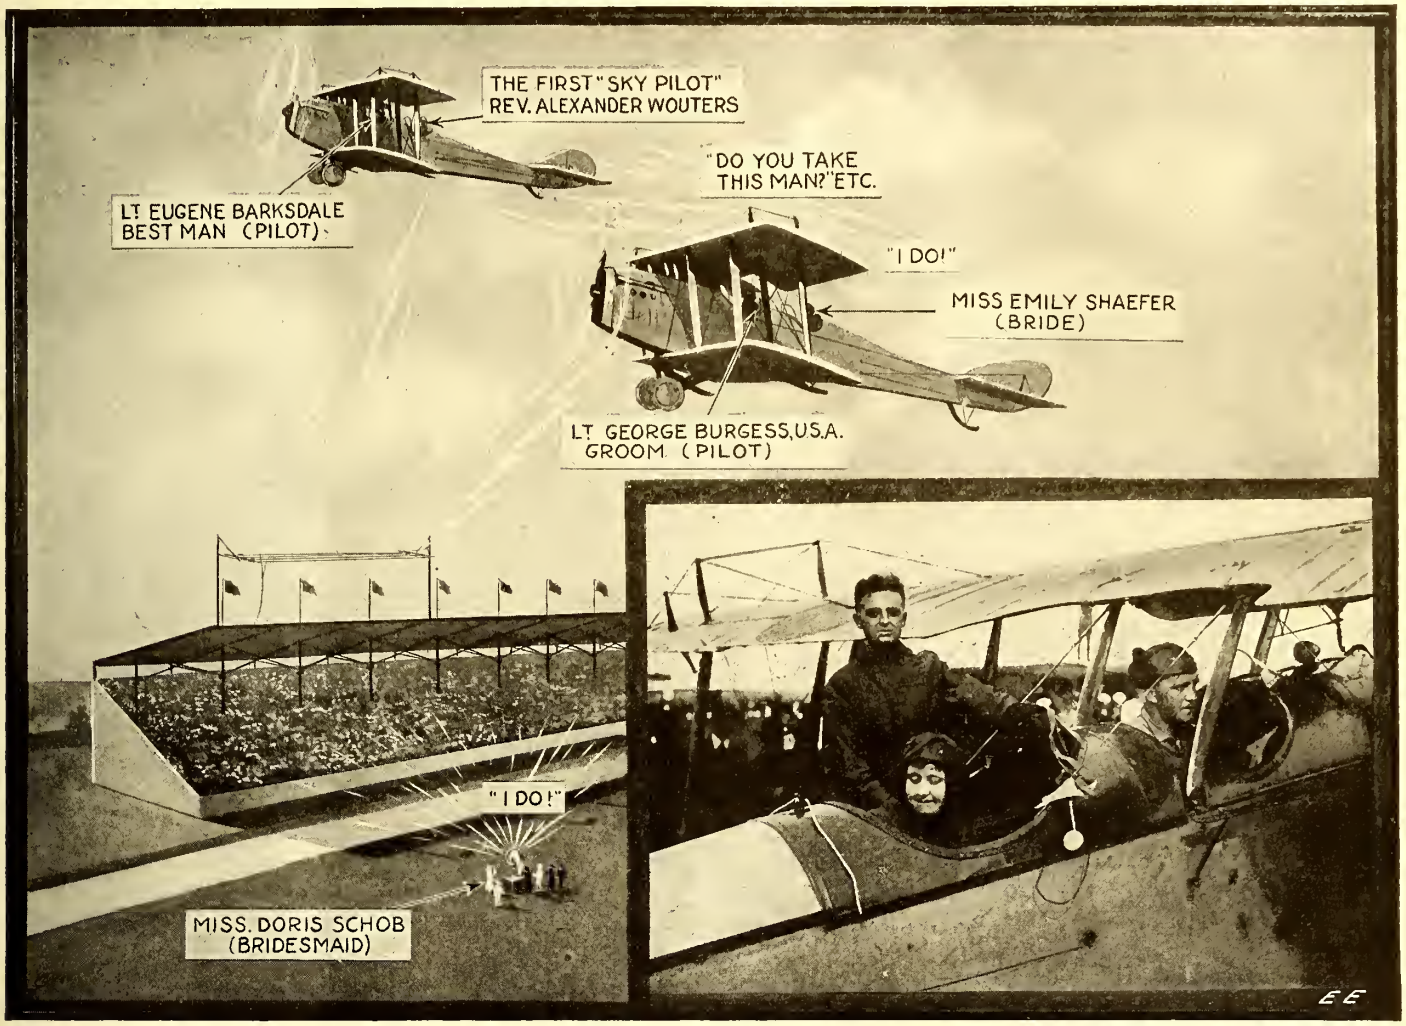
"Station 1 is O. K.," responded Lt. Barksdale, speaking for Dr. Wouters.

"Hello, Dr. Wouters," spoke the groom, "we are now ready."

"Hello, George," came again from the best man. Speak to Dr. Wouters."

"Dr. Wouters, we are ready for the ceremony," replied Lt. Burgess.

Without further conversation, Dr. Wouters began to read the ceremony from the Common Prayer. The voices came distinctly to the telephone listeners on the ground, and every response from the couple was carried clearly to the section of the boxes immediately adjacent to Gov. Smith's box.



At 5:40 o'clock Dr. Wouters' voice came: "Do you take George Burgess to be your lawful wedded husband?"

The bride responded: "I do," and a cheer arose from the enormous throng that must have reached the two planes. "I pronounce you to be man and wife," said Dr. Wouters. Then followed a prayer and finally—"Amen." Then congratulations and responses between the two planes were passed, mostly unintelligible to the listening congregation. Then silence.

"We are coming down," called the 'planes to the ground station.

Circling slowly, lower and lower, the two planes, now escorted by two more, past over the grandstand twice and each time they were greeted with applause and a sea of waving hats and hands. From the 'plane with the streamers, a white-gloved hand waved its greeting to the ground. Then the 'planes glided to the field, and Lt. and Mrs. George Burgess stept out and awaited the congratulations of Dr. Wouters and Lt. Barksdale.

Then, for the third time, the bridal party, now riding in automobiles, past the stands while the Police Band played the wedding march.

Copyright, 1919, by E. P. Co. Photo (C) by Underwood & Underwood

Lt. George Burgess and Miss Emily K. Schaefer, the First Couple to Be Married in Air. The Ceremony Was Performed by Chaplain Alexander Wouters Who Was Flying in Another Plane. The Ceremony Was Conducted by Wireless Telephone. The Wedding Was the Feature of the Police Field Day Meet at Sheepshead Bay Speedway, near New York City.

The Electrically Driven U. S. S. New Mexico

By Brewster S. Beach

I RECENTLY paid a visit to the battleship *New Mexico,* which is one of the latest dreadnoughts to join the fleet and the first and only one of any nation to have *electrically operated* propelling machinery" said Josephus Daniels, Secretary of the Navy, in recent testimony before a congressional committee. "On this account she has been an object of surpassing interest to the officers of our own navy and to those of foreign navies as well, and to electrical engineers in general.

"The result was satisfactory from every point of view and confirmed the judgment of all who were in any way concerned in its design and adoption. There was not the slightest mishap with any part of it, everything worked to perfection, and the crew was as enthusiastic over the performance of the machinery as is the department proud in the possession of such an efficient dreadnought.

"When we entered into contract for the machinery of the *New Mexico,* we stipulated that, in addition to being capable of developing the maximum power, she should also give an economy at cruising speed very much superior to that obtainable with the turbine installations that we had previously used, and I am happy to say that this stringent requirement was also met. As a matter of fact, the *New Mexico* will steam at 10 knots on less fuel than the best turbine-driven ship that preceded her.

"On the whole, I think the country has cause to be proud of this achievement in engineering not alone because of the pronounced success in this particular instance, but because of the assurance it gives us of the superiority of our capital ships to those of foreign nations."

Secretary Daniels' expressions noted above, have served to create of late considerable interest in the electrical propulsion of ships. Altho the subject has been discussed widely in the technical press for several years, no popular explanation of this invention has appeared.

One of the oldest practical examples of the electrically propelled vessel in this country is to be found in the fire boats of the city of Chicago, Ill., where the first boat was equipt in 1908. Chicago was the first municipality to accept the theory of electric drive for boats of this class.

Now the popular mind, no doubt, conceives an electric ship as like an electric automobile or truck—something that stores the energy necessary to its operation, carries it along and draws upon it as occasion may demand.

But this is not so. It may, therefore, be of interest to explain briefly what an electric ship really is.

WHAT Secretary of the Navy Josephus Daniels Thinks of the Electrically Driven U. S. S. "New Mexico"

WHAT AN ELECTRICAL SHIP IS.

In the first place, electric current must be generated within the ship in order that this energy may be put to its proper use in propelling the vessel.

The current is usually produced by a steam turbine which turns a generator. The apparatus is called a *turbo-generator* and this unit together with the usual engine room auxiliaries constitutes the power plant. The electric current thus generated is led thru copper cables and suitable control apparatus to electric motors and it is these motors which actually drive the propellers of the ship. Thus electricity acts as a connecting link between the steam or other motive force and the propellers. The internal combustion engine, which is somewhat similar to ordinary gasoline engine, is also coming into prominence as a power for the generation of electricity. This apparatus, whether it be a steam turbine or an oil engine, is called the *prime mover.*

The question, "What is a steam turbine?" may well be asked at this point. Conceive an enclosed water-wheel with steam playing against the paddles instead of water and you have a simple elementary idea of what a turbine is and how it operates.

NO MECHANICAL GEARS.

Next, there need be no gears in the electrically driven ship. The function usually performed by gears (that is, to make a connection between the turbine, which to be efficient must revolve at a relatively high speed, and the propeller, which to be also efficient must rotate relatively slowly) is accomplished electrically, thus permitting both turbine and propeller to operate at high efficiency.

Just as in the automobile it is desirable to "shift gears," it is also desirable at times to accomplish the same result on board ship, though not necessarily for the same reason.

Electricity lends itself admirably to effecting these changes, whereas no practical means has yet been found to accomplish this mechanically in large ships.

In addition to this factor, electric drive has appealed especially to naval men from a military point of view.

NAVAL ADVANTAGES OF ELECTRIC DRIVE.

The primary naval advantage of the electric ship, as recently pointed out by Commander S. M. Robinson, U. S. N., rests on the ability to arrange the propelling machinery in a number of separate watertight compartments thruout the ship placed near the center so that they may be protected from damage due to torpedo attack, shell fire, grounding, collision, etc.

The U. S. S. battleship *New Mexico* weighs 32,000 tons and requires 28,000 H. P. —nearly one H. P. for every ton of weight.

She is of the oil burning type with a total oil capacity of 3,400 tons, or 6,800,000 pounds, or about one million gallons.

The oil burners heat nine steam boilers, each of which can deliver 4,000 H. P. at a pressure of 250 lbs. to the square inch. The steam from these boilers operates two turbo-generators which constitute the power plant, each capable of producing 14,000 H. P. The current generated from the turbines operates 4 motors—one for each propeller. The motors are twelve feet in diameter. They are operated from a central switchboard or control station, where the engineers, on receipt of instructions from the ship's bridge, can start the ship forward, or backward, run the propellers at different speeds in either direction. They can run all four motors from one turbo-generator or they can run the two port motors from one generator and the two starboard motors from the other generator.

If one of the propellers breaks down, by simply disconnecting the motor circuit, the power of the two power plants can be used to operate the remaining three propellers. There are only a few of the various combinations of control and operation which form one of the main features of the electric ship.

Among other battleships being equipt with electric drive are the *California, Tennessee, Maryland, West Virginia, Colorado* and *Washington.*

The large calibre guns of the *New Mexico* are fired by electricity; ammunition is hoisted from the magazines by electric motors and some of the guns are loaded by electricity.

The ponderous rudder is moved into any desirel position by the simple turn of a controller on the navigating bridge, which sets in motion machinery in the hold of the vessel for this purpose. There are several steering stations located in various parts of the ship where this operation may be performed in case one station should be disabled. In all, there are five different ways of steering the *New Mexico,* one of which is the hand method, *which requires the exertions of six men.* Think of it!

The ventilation and heating of the ship is by air—cold air forced into the vessel in warm weather and hot air during the winter months. The air is forced thru pipes by blowers operated by electric motors.

There is a completely equipt electric carpenter shop, machine shop, foundry, laundry, hospital operating room, and bakery where bread is baked in electrically heated ovens, while the galley or kitchen is steam operated, the ranges burn oil instead of coal, and there are big steam pots for heating.—*Photos courtesy of General Electric Company.*

"Cold Fire"

By H. Gernsback

Charging the Body with High Frequency Currents.

EVER since Nikola Tesla began experimenting with the high frequency currents which bear his illustrious name, the world has stood aghast at the many and wonderful effects made possible only by his discoveries.

Most of our readers are no doubt familiar with nearly all high frequency "stunts," emanating either from the stage or from the laboratory, and not much that is new can be written upon the subject.

But not so long ago the writer, while waiting for an electric train out on Long Island, amusedly watched two boys who took turns in jumping upon a live third rail, carrying 500 volts. They would jump upon the rail with both feet at once, and then balanced themselves upon the rail. There is, of course, no danger to this as long as *both* feet are on the rail. One foot on the rail with the other foot on the ground means certain death. The explanation, as most of our readers know, is that when you stand on the rail with both feet, there is *no return circuit*. The body in this case takes on a charge of 500 volts, which, however, is not felt at all by the experimenter, the same as you are not conscious that over 14 pounds of weight are pressing down upon your body on every square inch of you at all times, due to atmospheric pressure.

This made the writer wonder what would happen if you stood on one pole of a very powerful Tesla coil. In a recent conversation with Dr. Nikola Tesla, the inventor pointed out that he had indeed performed many such experiments in his Colorado laboratory many years ago. The currents which he then used were far greater and higher than those produced anywhere now. Thousands of horsepower were used by him at that time. Dr. Tesla explained that he frequently stood upon one pole of his mastodonic coils while the full current was on. Of course, he had to stand upon a metallic plate, but he had to be careful so that no sparks jumped from his body to other objects or to the ceiling. This would have meant instant electrocution. Dr. Tesla pointed out that as the human body has a certain capacity, it radiated a good deal of energy into the surrounding air. Due to the tremendous current the sensation was anything but comfortable. The current heating the blood vessels raised the bodily temperature, and the experiment for this reason alone could not be extended for any great length of time. Dr. Tesla explained that during the experiment sparks and long spark-streams would envelop his entire body. At the extremities, elbows, knees, hip bones, nose, ears, etc., the spark display was most pronounced. Streams five to ten feet long would shoot out from the extremities with a crackling noise. Due to the exceedingly high frequencies used, however, the sparks did neither sting nor burn the flesh. Mr. Nikola Tesla's own words, his body, indeed, was enveloped in "cold fire." Dr. Tesla also explained that during the experiments his hair would rise on end, producing the same effect as if a large static machine had been used, with the well-known result, on the hair.

The other day we endeavored to repeat Dr. Tesla's experiments, and the illustrations shown here are the result. We called upon the Electrical Testing Laboratories of New York, who have one of the most powerful high frequency machines in the country. Altho but a pigmy alongside of Dr. Tesla's Colorado thunderers, the machine gives 500,000 volts and uses 20 kilowatts. The transformer is sunk into oil, and when the full load is on throws streams six to seven feet long. The noise of the tremendous sparks can be heard for blocks.

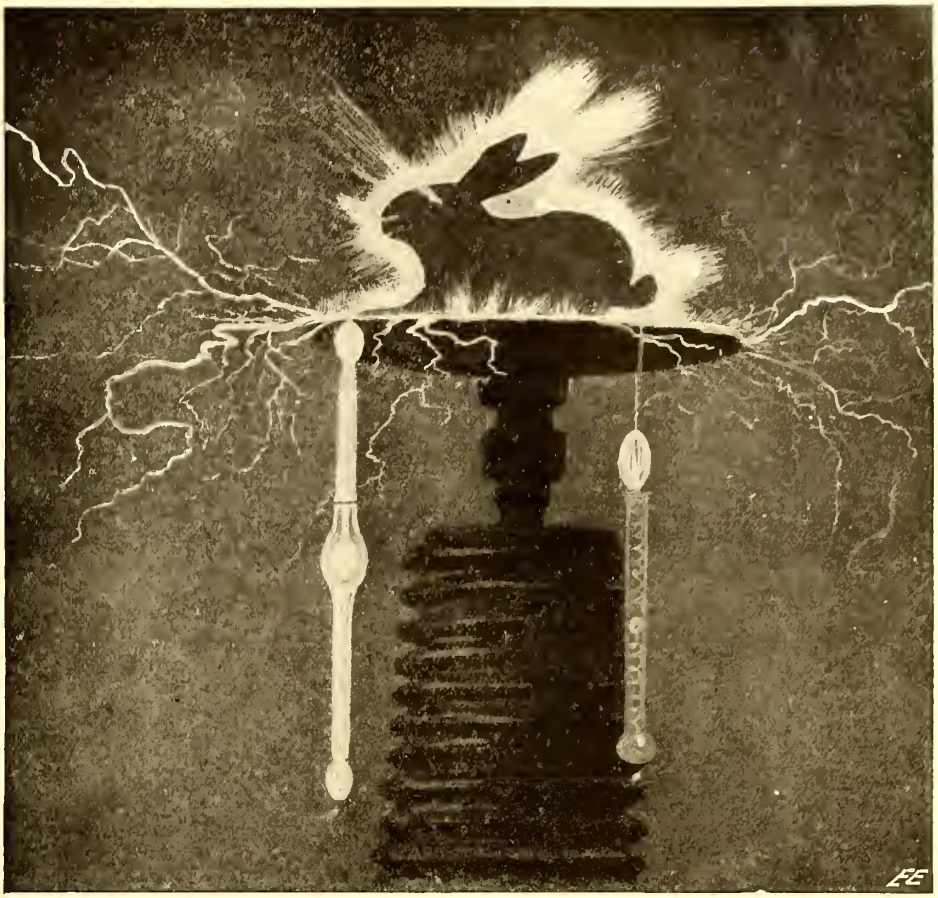

Fig. 1. A dry bath with "cold fire." Altho millions of volts are used in the process, this form of bath is quite pleasant. The currents throw off all dead skin, scale and dirt clinging to the skin. Besides the treatment is distinctly invigorating, leaving the skin rosy and all a-tingling. Every home will soon be equipt with a huge Tesla coil.

We first took a rabbit and placed him upon the metal plate of the "high" terminal of the transformer. At first he was much frightened and jumped off the plate at about 5 kilowatts. Long sparks had shot out from his nose and above his eyes and at the end of the ears. So the writer wetted the platform with water, because he thought that sparks might be jumping into the rabbit's belly and legs which insulated the fur part of his body, giving rise to stinging sparks. An improvement was seen immediately. The rabbit now held perfectly still for about 20 seconds, taking the full charge of 20 kilowatts at 500,000 volts. Long spark streamers, four or five feet long, shot from brer' rabbit's nose, ears and back, and, curious to note, immediately above the eyes. Here the sparks were so hot that they singed the hair. So the writer wetted the spots above the eyes, and after that the rabbit took the full charge, never moving once for twenty seconds at a time. See Fig. 2. Altho long streamers came principally from the nose, the photograph does not show it. After awhile the rabbit seemed to enjoy the performance, and right after his séance

www.americanradiohistory.com

he was as lively as ever, eating a big carrot at once. He is still well and about now.

We next wished to try a human being instead of the rabbit, but the management of the laboratory, due to possible danger, would not grant permission. It was explained that the frequency of the big machine was too low for the experiment, which had never been tried before on a human being, so we desisted. The photograph shown in Fig. 1 was made with a regulation Tesla coil of a very high frequency, but of comparatively low power. Only 1 K.W. was used. The subject, Mr. Joseph Kraus, field editor of this publication, experienced hardly any sensation worth mentioning. Only at the extremities, such as the ears and the nose, a slight prickling sensation, not at all uncomfortable, was felt. The feet were wetted with salt water to insure perfect contact.

Bre'r Rabbit taking a trifling 500,000 volts at 20 kilowatts, and liking it well, thank you! He held still for 20 seconds, only blinking once in awhile. He was not chained nor held down otherwise. "Movie" operators were at hand and filmed him, too. He is still alive, so Sis needn't worry that we killed him. Fig. 2.

And the value of these experiments? As Dr. Tesla points out, if these machines come into daily use, and duly invade our homes, it will be possible for us to have a dry bath, more sanitary and infinitely better than our present water baths. If the current conditions are right, the body will throw off scale, dead skin, dust and dirt particles, hurling them far from the body. For it should not be forgotten that Tesla currents travel mostly over the skin, ridding it of all impurities. But that is not all. The unquestioned therapeutical effects to the human body are of great value, not only to the muscles but to the entire nervous system. Tesla currents, by softening the arteries, make the old feel younger, and the young, younger and more aggressive. Women, particularly, should derive great benefits from their future high frequency dry baths.

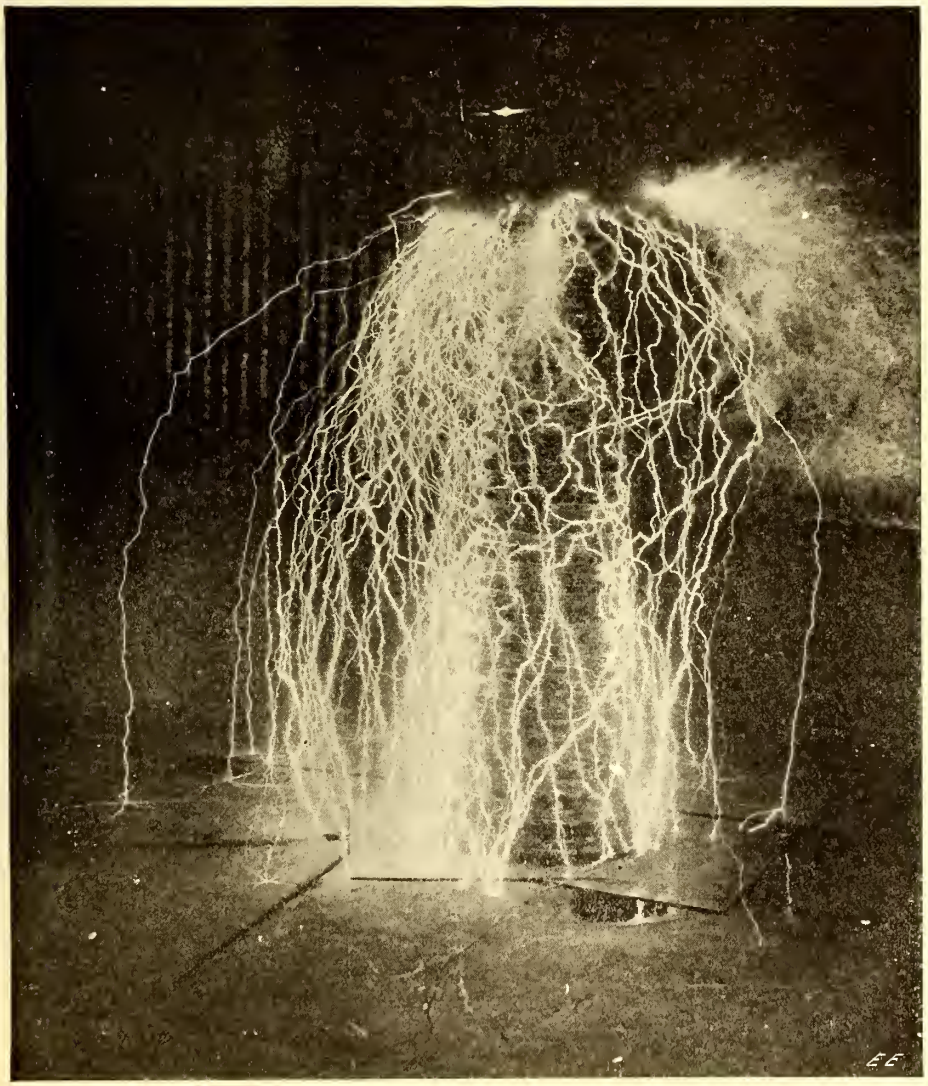

Fig. 3. This shows a wonderful corona and flash-over on a 37-inch porcelain pedestal insulator. This corona is occurring at a potential of 234,000 volts and 51,000 cycles per second.

Largest High Frequency Laboratory of the World.

The insulating of apparatus for voltages of from 100,000 to 150,000 at sustained frequencies varying from 15,000 to 500,000 cycles per second, such as used in radio telegraphy, is a far more difficult problem than that of insulating for the same voltages at "commercial" frequencies, such as 60 cycles per second.

To study this problem, the Federal Telegraph Company built at its plant at Palo Alto, California, a high voltage laboratory, in which it is possible to duplicate the high voltage and high frequency phenomena which have to be met with in operating a high power radio station.

The laboratory is unique in that it is capable of generating a potential *to earth* of a half a million volts, which is about as high as is obtainable in any of the 60-cycle high voltage laboratories of the country, and at the same time this voltage is generated at a sustained frequency of 50,000 to 100,000 cycles per second. Thus, this laboratory is the largest of its kind in the United States, and, as far as is known, the largest in the world.

Photograph No. 3 shows a corona and flash-over on a 37" porcelain pedestal

"ODD PHOTOS"

A MOVIE PHOTO THAT "RAN."

We have often heard of the "run" of motion pictures, but the brilliant phantasy gracing the top center of this group of "Odd Photos" is a motion photo that "ran" on one hot summer day in the Pathé film studios. It originally represented a scene from the "Isle of Jewels," a photo play of note, but this plate of a "still" view was overcome with the heat and so distorted the faces and forms of Stuart Holmes and Frances Mann that they now look most grotesque. The effect was produced by accident, of course, the emulsion on the plate having become distorted, due to trying to force rapid drying by artificial heat, before the photographer caught it, "freezing" the graceful forms of the actors in the poses here portrayed.

This is liable to happen to those who indulge in an overdose of 2.75 Bock. This is what the editors would call an "Ideal" type of "Odd Photo." So all those interested in our "Odd Photo" contest take notice, that what we desire is novelty, snap and something different!

IS SHE TRIPLETS?

Triplets? No! Just one girl having her picture taken three times on the same plate. The black background turns the trick.

Contributed by A. J. VIKEN.

A REAL GHOST PHOTO?

The accompanying *ghost plate* was produced to convince a steadfast believer in spiritualism that photos of ghosts were not genuine, but only fakes, easily produced by making double exposure using a black background.

The lady in the picture by posing as both ghost and a living person in the same photo succeeded in convincing a lady friend that photos of ghosts are not always what they seem!

Contributed by A. J. VIKEN

TORPEDO TUBE IN FRONT OF MUSEUM.

This clever superimposed or double exposure photo shows two of Uncle Sam's blue-jackets mounting a full-size, honest-to-goodness torpedo tube, and right in front of the New York Museum of Art—the naughty boys. Old "Pop Knickerbocker" sure will be sore when he finds it out.

Contributed by F. E. ZIESSE.

PAUL BRAS IS "2" ELECTRICIANS, ALREADY YET.

Herewith is a photo for your "Odd Photo" contest. Although it has nothing to do directly with electricity, it is odd. This is a photo of an electrician, or rather two of him, in front of a switchboard. It is a double exposure, of course.

Contributed by PAUL BRAS.

A NOVEL "LIGHTNING" PHOTO.

I am sending you herewith a photo for your "Odd Photo" contest. It shows a great forked "ribbon" lightning discharge which was a very pretty sight. It seemed to start in the lower right-hand corner of the picture and streamed upward, splitting into three very brilliant and several less brilliant "ribbons."

Contributed by A. J. VIKEN.

STANDING ON THE "3RD RAIL."

The picture, as you will see, shows two boys standing on a "live" third rail, which proves that as long as a person stands on the rail with both feet at the *same* time they cannot be harmed unless they place one foot on the ground and the other on the rail, which causes a circuit, thus killing or severely shocking the person.

Contributed by EDWARD HINES.

THE "ELECTRIC TOP" AT NIGHT.

I herewith submit an "Odd Photo." I took this photo while out at Riverview in Chicago. It is a picture of "The Top" at night. It was a time exposure. It is the same "Top" that you described in one of your back numbers of the ELECTRICAL EXPERIMENTER.

Contributed by ROBT. H. FREEMAN.

Cheesit! Willie! The Electric Spanker

It's kind of rough on Willie to tip off his dad this way, but news is news and it's got to be printed.

Next time Willie smashes the neighbor's kid on the nose, or sticks a surreptitious finger in father's wallet, or chucks the cat in sister's bath, he's in for it. He can't go out and brag to the gang.

"Shucks," says Willie, "I don't care. The old man will take me to the woodshed and massage me with his palm, and then he'll get tired and let me go."

The "old man" will give Willie the walloping of his young life, but he won't have a streak of red on an overexerted palm when the woodshed dialogue is done. For dad will merely thumb a button on the wall, tie Willie in a chair or on the table, apply this new "Electric Spanker," and sit by smoking a pipe or playing solitaire while Willie's heels kick in the air and Willies vocal cords contract and expand.

There was exhibited at the New York Electrical Show a mechanism that Willie will vote nefarious and his dad will proclaim a blessing. It is the Electrical Spanker!

A small motor, which retrieves with passionate vigor what it lacks in size, is the substitute for irate dads biceps. It is connected by a four-inch rod to a broad applicator that performs the painful function of liason between spanker and spankee. It is about the breadth and length of the parental palm, but packs a more violent wallop.

It has the advantage or disadvantage, according to the point of view, of deadly accuracy. Dad's palm, when fatigued, sometimes misses a few spanks. The applicator lands "smack!" every jolt. It is to be considered, too, that whereas at about the twenty-second onslaught fathers hand becomes weary, the electrical device can continue delivering a regular, rhythmic and impressive chastisement so long as the "juice" holds out.

Indeed, by tying Willie to the chair or table, father can go out for a beer, or go to the office and saunter home, to find the applicator still applicating.

Now, father's adamant determination to wallop Willie may undergo an emotional softening and regret, stimulated by Willie's tears and wails, and may cause him to quit spanking Willie with his palm. The machine, on the other hand, is relentless. Willie can howl until the moon melts and the device will keep on earning its keep until father shuts off the current or mother sneaks into the woodshed to help sonny out of his predicament.

There is only one advantage accruing to Willie. He can say with truth hereafter, "That's a lot of bunk," when dad pulls the old bromide that "this hurts me worse," and so forth.

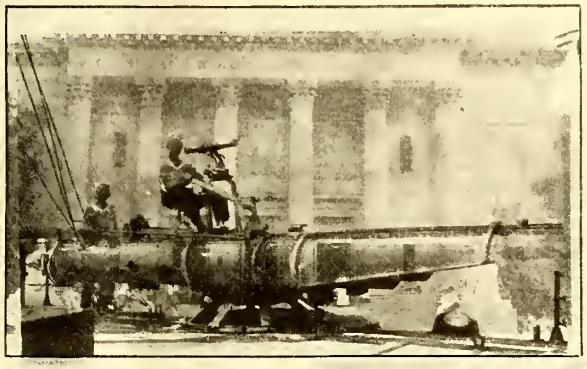
ODD PHOTOS

These Three Triplets—Excuse Us Please, They Are All the Same Girl. Fine Sample of Triple Exposure.

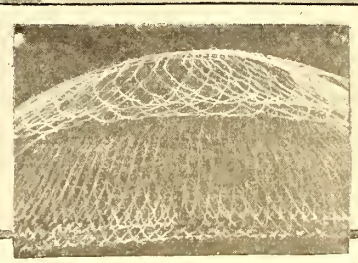


A "Real" Odd Photo—A Pathe Photo of a Photoplay Still, Which, Due to the Unexpected Creeping of the Emulsion

Looks Like a Sure-Enough Ghost—But Its Not. Just an Example of Double Exposure on the Same Negative.

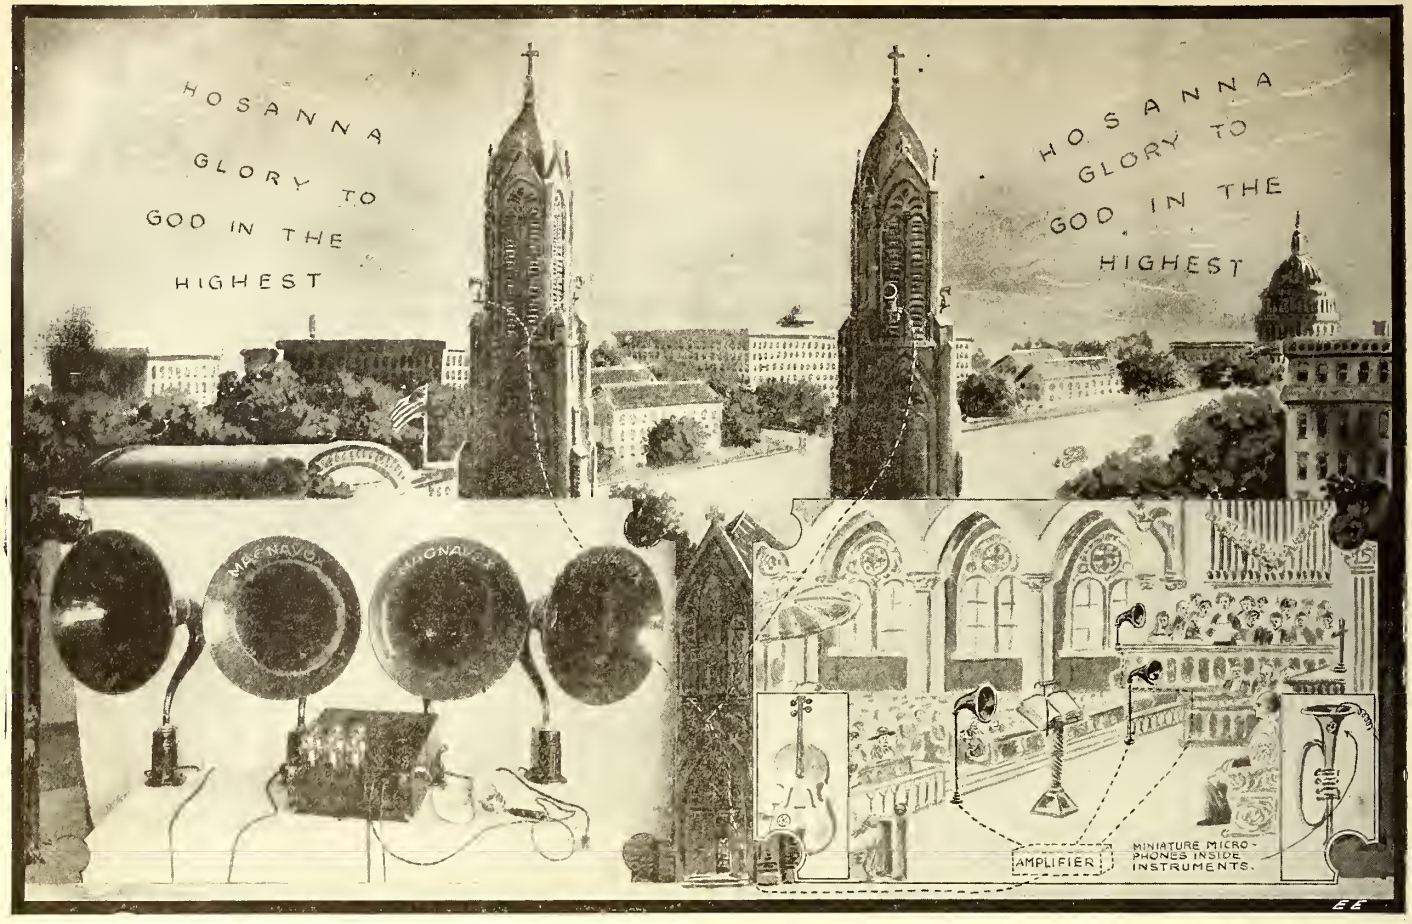
Caused by the Forced Drying of the Negative by Heat. Resulted in the Grotesque Effect Here Portrayed.

Ever See This Torpedo Tube in Front of the New York Museum of Art? Neither Did We. Two Exposures on the Same Plate Explains It.



This Electrician was able to Project His Inner Self to a Distance of Several Feet. So a Psychical Expert Told Us. Only We Know That a "Duplicator" or Double Exposure Cap is Responsible for This.

An Extra Fine Photo of Ribbon Lightning. It Takes Patience to Obtain a Picture of the Bolts of Thor as Good as This One.



Is the "Third Rail" Dangerous?!! Not if You Jump on It With Both Feet Simultaneously Like These Boys.

A Night Photo of—Guess? Yes, Its "The Top," Snapt While Spinning, at Chicago.

www.americanradiohistory.com

Recently, in the City of Washington, D. C., a Minister Had the Satisfaction of Broadcasting His Voice Over an Area One Mile in Diameter. His Sermon, Also the Choir and Organ Music, was Thus Heard One-half Mile Away from the Church, Thanks to the Magnavox, the Wonderful Sound Amplifier. People Eight Miles Away Heard the Voice, and it Wafted One and One-half Miles Heavenward to an Airplane Flying Overhead.

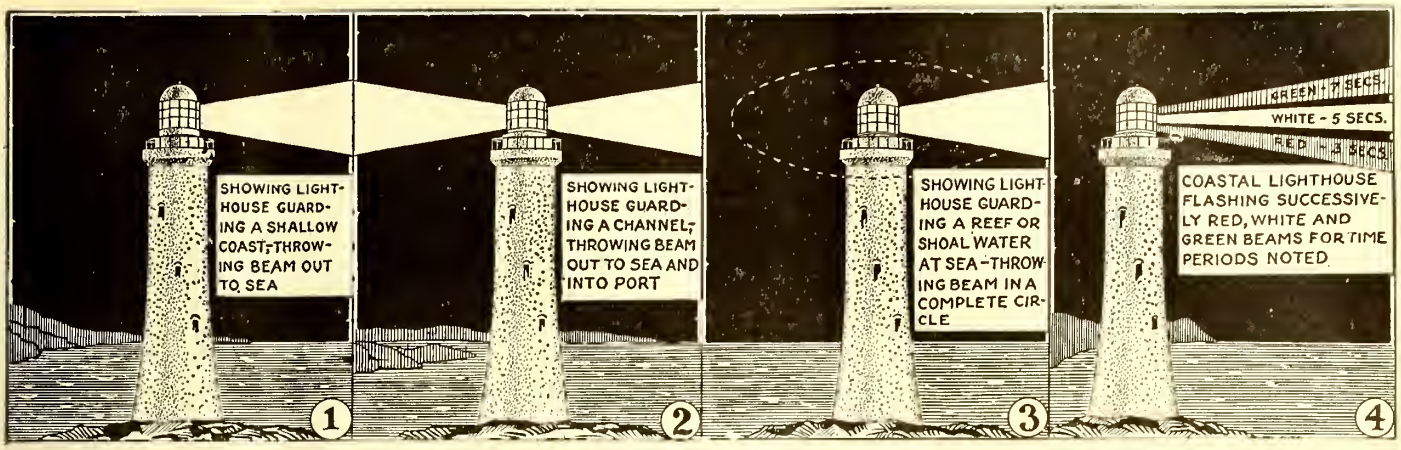
Church Sermon Heard Over One-Half Mile

HAVE you ever been in the country on a quiet Sabbath morning and endeavored to note how far away from a church you could hear the minister's voice,—or for that matter, the choir singing, or the organ? Not very far you will say, if you have ever tried it. But in Washington, D. C., recently, a minister had the satisfaction of speaking to more people than any other minister, possibly, in church history. His voice, as well as the singing of the choir and the organ music, were amplified to such a tremendous volume, thanks to the newest electro-mechanical amplifier, known as the Magnavox—that the sermon was clearly audible over a circle whose diameter measured one mile, or over an area having a radius of about one-half mile. The Magnavox amplifier, which has been described several times in recent numbers of this journal in connection with public speaking events, was used on the present occasion in connection with a vacuum tube or audion amplifier, which is connected to the microphones and horns; these gathered the sounds of the minister's voice and the choir singing, in the manner here illustrated. The microphones, or sound detectors with the horns, were mounted as inconspicuously as possible about the pulpit and choral gallery, and concealed wires led to the large vacuum tube amplifier, shown in the accompanying illustration at the left. This was in turn connected up with wires and a suitable source of current, which led up to the belfries atop the two church spires, where there were placed on the outside of each belfry two of the Magnavox special amplifiers, fitted with large horns of the type shown at the left of the photograph just mentioned,

The minister spoke in an ordinary tone of voice, and in fact it was somewhat uncanny to be walking down a shady Washington street, when suddenly out of the very air above you, there came the command—"Thou shalt not steal!" in stentorian tones. Verily it sounded as if the prophets had come down to earth, and that the Day of Judgment had surely arrived. While it perhaps, would not prove beneficial in a strictly ecclesiastical or religious sense to think of conducting our church services in such a broadcast manner as this, it would not seem a bad idea if in forthcoming years, our churches looked carefully into such matters, and considered the practice of broadcasting their pastors' sermons, organ and choral music by means of telephonic amplifiers, which it would seem, would surely have a beneficial effect and would do no harm, that is certain. Talking on the lighter side, there will probably be but one regret, and that will be on the part of the board of trustees of the church, which let us say has installed at some expense one of these amplifying outfits. Mr. Stay-at-Home who is enjoying the sermon may make his remittance to the collection basket when His Reverence pronounces the all important words—"The usual Sunday offering will now be received," by contributing a weekly or annual amount for maintaining the equipment and its operating expense! If he *heard* the sermon.

General Layout of Amplifiers.

Two Magnavox loud-speakers are installed on the belfry of each tower of Trinity Church, corner "D" and Third Streets, Washington, D. C. A special three-step amplifier using a special combined audio and radio frequency circuit, is employed, so arranged that the output is 250 watts of voice modulated current. The input current can be any ordinary telephone current, radio, or the voice, spoken into special transmitters which are attached to the instrument.



Six volts are used on the filaments, and 300 to 600 volts are used on the plate circuits, depending on the volume of sound required. A special set of attachments are furnished, such as a minute transmitter utilizing a silk cord, which can be placed inside of a violin, cello, banjo, or other string musical instrument; also a small transmitter button can be attached to horned or other instruments. Any of these attachments *will magnify the original instrument one hundred times' by actual measurement.*

In the church are installed special transmitters, one along each side of the pulpit, also one for each section of the pipe organ. These transmitters are equipt with papier-maché horns, 18 inches long and 14 inches at the opening of the bell. They will pick up a speaker's voice three to four feet away from the horn and reproduce it faithfully.

Preliminary tests were made with an Ingersoll watch touching one of the transmitters, and with the three-step amplifier, the *ticking of this watch was heard two blocks away* thru normal street traffic. Pipe organ music, choir singing and special solo pieces

Lighthouses--How They Signal

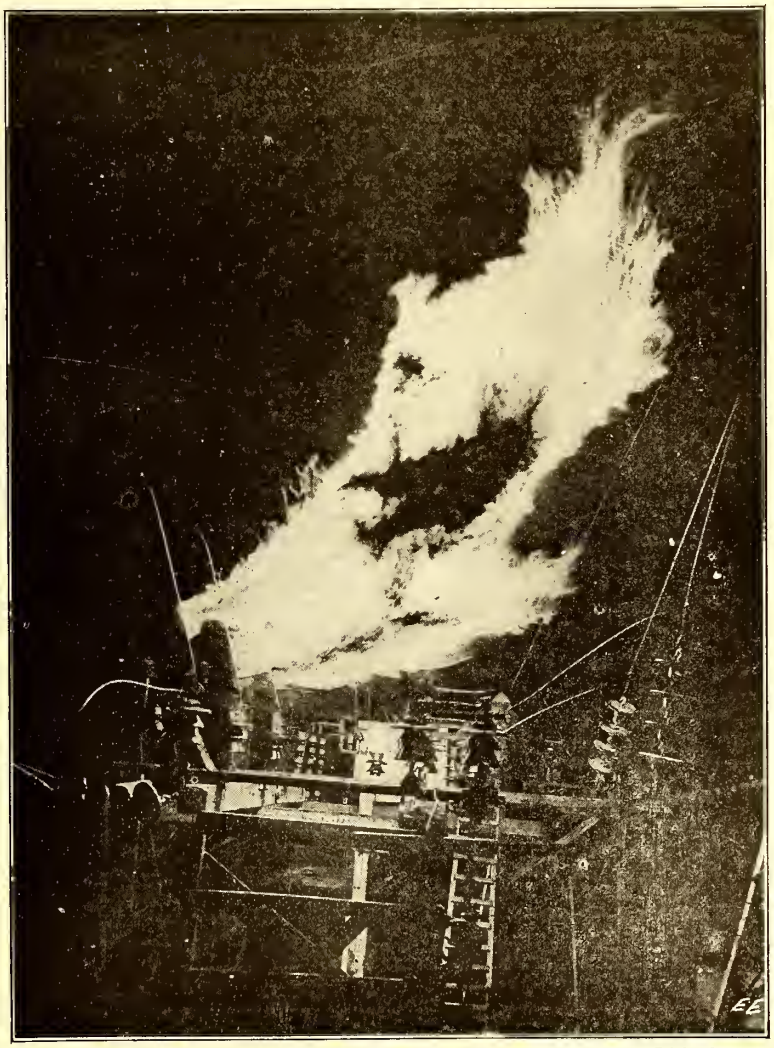
By A. H. Whedon
Ex-Radio Electrician, U. S. Navy

EVERYBODY knows what a lighthouse is, and what its duties are supposed to be. But how many know how they work?

To begin with, lighthouses are not always on the coast, many times they are a number of miles at sea and entirely out of sight of land. And the keeper is very rarely an old retired sea captain with a beautiful daughter. More often he is an energetic young man who is not afraid of good, hard work, or the possibility of it, and in many cases also, facing the probability of being left alone for three or four months at a time.

A lighthouse on the coast line is usually in a wild and lonely spot that nobody ever comes near without a very good reason. The keeper's supplies are brought to him by land or by boat whichever is most convenient for the authorities, and are brought when it is most convenient for them.

It is of course, imperative that the keeper know all about gasoline engines and electricity. For the motor whereby the light is rotated is usually run by a gasoline engine supplemented by hand gear in case the engine breaks down. In some houses the light is an electric one, instead of gas.



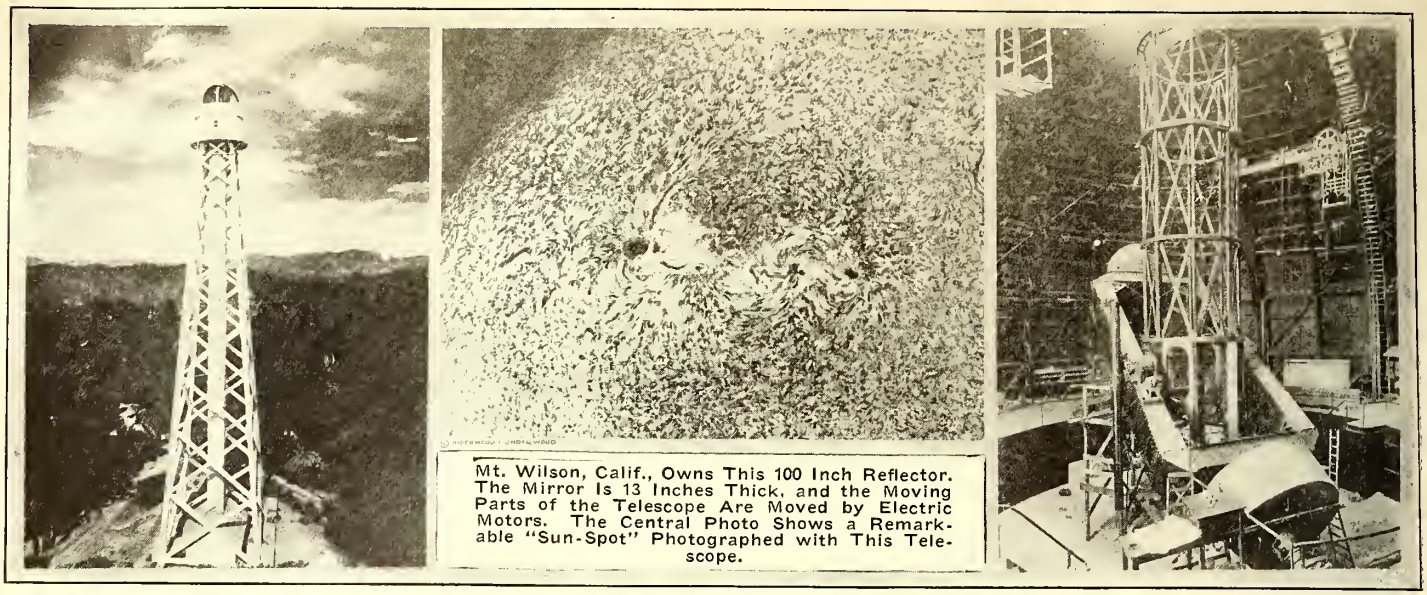
There are in general three types of lights—*steady, flashing and occulting.* The "steady" light is easy enough to understand. The lighthouse simply burns a steady red, white or green light, according to how it is marked on the navigator's chart.

The *steady light* may be fixt so that its light may be seen from all points of the compass, or its beam may be trained to any point or to several different points, if desirable. For instance, a lighthouse guarding a reef at sea would throw her beam to all points, so as to warn ships to keep off. But a lighthouse guarding a sandy beach would only throw her beam seaward, for there would be no advantage in throwing it on land.

The *flashing light* requires a little more care, for the light is mounted on a platform and rotated slowly, so that a ship at sea would see a flash every few seconds, depending upon the length of time it took for the light to make one complete revolution. This light also may be flashed in white, red and green, using a combination of two colors, or perhaps just one. For instance, it may be flashed as follows: "red, red, green," "red, white, green, white, red," —and so on. By varying these combinations and by varying the time of flash, it may be seen that endless combinations may be obtained. Thus it is made possible for each lighthouse to have its own particular flash and code designation, so as to be instantly recognized by the skipper.

Now we come to the last of the three general classes—the *occulting light.* Instead of rotating and having its beam sweep the whole horizon, it is simply lit for a few seconds and then extinguished for a time. It is seen only from certain angles, according to the position of the dangerous object it is guarding. If the object lies in a channel running North and South, then the beam will show only North and South.

And here, as before, the light may flash "red, green, red, green," or any other of a thousand possible combinations. Each combination together with the length of time of the flashes, is placed on the navigator's chart, and is also listed in all nautical tables, so that the navigator can, by timing the flashes and observing the color, look it up and at once obtain his exact position.



Looks Like Lightning, Doesn't It? It Is—Man-Made Lightning. This Gigantic Sheet of Flame Occurred When a High Tension Feed Wire Switch Was Suddenly Opened. It Lasted But a Few Seconds.

18-FOOT ELECTRIC ARC

The size and power of an electric arc was recently shown in an unusual photograph taken by the Superintendent of a power-house at Tallulah, Georgia, at night, when the switches were opened on a 110,000 volt transmission line that carried no load at the time. The arc, as shown in the accompanying picture, jumped 18 feet and appeared as a huge flame. It disappeared almost instantly and caused no damage. Contrary to expectation, however, these flaming arcs are very dangerous as they evolve considerable heat and will burn any person or combustible material in their path. These giant switches are controlled from the ground or other position by long handled levers, as the operator could not of course stand anywhere near it when opening a circuit carrying a hundred thousand volts or so—veritable man-made lightning.

Mt. Wilson, Calif., Owns This 100 Inch Reflector. The Mirror Is 13 Inches Thick, and the Moving Parts of the Telescope Are Moved by Electric Motors. The Central Photo Shows a Remarkable "Sun-Spot" Photographed with This Telescope.

Mt. Wilson 100 inch Telescope

By ISABEL M. LEWIS

OF THE U. S. NAVAL OBSERVATORY

World's Largest Telescope

THE one-hundred-inch reflector of the Mt. Wilson Observatory on Mt. Wilson, Cal., is the largest telescope in the world. The mirror, which is one hundred inches in diameter and thirteen inches in thickness, weighs four and one-half tons, and the moving parts of the telescope, which are electrically controlled, about one hundred tons.

The glass for the mirror was manufactured at the St. Gobain glass works in France after many attempts covering an interval of three years, as it was difficult to find a piece of glass large enough and sufficiently free from imperfections for the purpose. It was then shipped to the optical shops of the observatory in Pasadena, Cal., where it underwent a long grinding and polishing process for seven years. All of this work was done by Prof. George Ritchey, a member of the staff of the observatory. As the work progressed the mirror was subjected to frequent and rigorous test, and finally, on July 1, 1917, the completed mirror, which had been pronounced practically perfect in form, was packed in an octagonal-shaped box lined with paraffin, placed on an automobile truck geared to a maximum speed of two miles an hour and taken up the steep and winding mountain road to the summit of Mt. Wilson at an elevation of nearly 6,000 feet.

The huge sections of the iron castings for the telescope were made at the Fore River Shipyard at Quincy, Mass., and shipped around Cape Horn, as they were refused shipment by the railroads on account of their great size.

All smaller parts of the great telescope and those that required special care were designed and constructed in the instrument shops of the Mt. Wilson Observatory in Pasadena.

The huge reflector is now housed in a steel building designed for that purpose with a 100-foot dome that weighs five hundred tons and is quickly and easily moved by electricity.

The 100-inch mirror lies at the base of the telescope tube and simply acts as a support for the silver coating that is placed on its upper concaved surface. The rays of light from the stars do not enter the mirror, and therefore it was not necessary that the glass be entirely free from imperfections. It is the form of the upper surface of the mirror that is of chief importance, and this must be practically perfect.

Reflector Resilvered Every Six Months.

Every six months it becomes necessary to resilver the mirror. This is done very quickly and easily by means of an electric elevator which lowers the great mirror from its position at the base of the telescope to the resilvering room below and returns it after the process is completed.

The parallel rays of light from the stars pass down the telescope tube and fall upon the silvered surface of the great mirror and are reflected back in the direction of the upper end of the tube, coming to a focus on a secondary mirror near the top of the tube, which reflects them to the photographic plate or observer stationed at one side of the tube.

Preliminary tests of the instrument in the fall of 1917 revealed a slight flare of the star image, due partly to temperature effects and partly to lack of rigidity in the support of one of the secondary mirrors. The latter difficulty was overcome by adding a compression ring to the tube carrying this mirror, and the temperature effect was also looked into and overcome.

Shows Extraordinary Details of Moon's Surface.

These necessary changes were greatly delayed by the fact that the staff of the observatory was largely occupied with war work of an urgent nature and the instrument shops were needed for the same purpose.

The great instrument is now fully prepared to enter upon its observing career, however. Test observations of the moon, Saturn and other celestial objects have shown the wonderful light-gathering power of the huge reflector and revealed an extraordinary amount of detail on the moon.

Its work will be largely photographic and spectroscopic and comparatively few direct visual observations will be made. It is expected that it will soon be storing away on photographic plates light from stars and nebulae that lie far beyond the reach of all other telecopes in existence and that as a result of these observations our knowledge of the form and extent and nature of the universe will be materially increased.

QUESTIONS AND ANSWERS.

Q. 1. Will you explain what astronomers mean by "the cepheids"?

A. 1. From the context of your letter I should judge that you refer to the cepheid variables, tho the cepheids is also an expression for a swarm of meteors whose radiant point lies in the constellation Cepheus.

The cepheid variables constitute a very important class of variable stars. They receive their name from Delta Sephei, a well-known star of this class.

The light of a cepheid variable fluctuates periodically in a most peculiar manner. There is a sudden rise to maximum brightness that occupies about one-third of the entire period, followed by a much slower decline of brightness which usually has a more or less pronounced pause. These light changes are performed with the greatest regularity and have been likened in effect to a revolving light in a lighthouse in which there is the same sudden increase to maximum brightness, followed by a slow and gradual decline repeated over and over with absolute regularity.

The periods of light changes of the cepheids range from less than a day to forty-five days and there is a close connection existing between the *period* of the *light variation* and the *actual size or luminosity* of the star.

The discovery of this fact has led to some very far-reaching results and made this class of stars of the highest importance in determining the distance of the globular star clusters.

Dr. Shapley's revolutionizing discoveries concerning the distances of these objects are founded upon the simple relationship found existing between the periods and luminosities of the variable stars in these clusters, which are simply short period cepheid variables.

It has been found that cepheids whose periods are less than a day are giant stars whose absolute magnitude is constant at one hundred times the light-giving power

New Electrical Gyro Compass

UNTIL recently the *magnetic compass* has been relied upon as a means of indicating direction to mariners at sea. In doing so it utilizes the directive forces of the earth's magnetic North Pole. In indicating direction the magnetic compass is subject to a great number of errors and influences which make its indications unreliable. When used on board a ship, especially a steel ship, many devices and precautions must be taken to obtain a compass indication which is anywhere near accurate.

It is well known that the direction of magnetic fields upon which the compass relies vary in different localities of the earth. Magnetic mountains will distract the needle—magnetic and electric storms also influence it.

INACCURACIES OF THE "MAGNETIC COMPASS."

On board a steel ship the change in character or displacement of a cargo seriously influences the magnetic compass. Even a slight change in wind will cause the smokestack to change its magnetic characteristics by changing its temperature. The magnetic compass will show deflection—it is caused when the ship rolls. The compass needle is caused to oscillate as the mass of the ship is displaced to either side of the compass needle.

An altogether different force is now used to indicate direction. This force is as old as the earth itself—the earth's rotation. The earth's rotation is made to indicate direction by utilizing the new Sperry gyroscopic compass. The Gyro Compass is nothing more than a small electrically driven wheel rotating at a high speed.

Scientists have discovered that any small wheel rotating about its own axis and freely suspended to move in any plane when placed upon a larger wheel, will place its axis in the same direction as the axis of the larger wheel. This principle has been demonstrated, proven, and in practical use for years. The Gyro Compass forms the smaller wheel referred to, while the earth forms the larger wheel. As the earth rotates it combines forces with the small rotating gyro wheel and causes the axis of the compass to point *true north*.

The captain or navigator of a ship in using the Gyro Compass does not have to take into consideration any variation or deviation. He does not have to compensate his compass. He does not have to check the compensation of his compass.

Instead of encountering the disadvantages outlined, he is free to steer a true course and to keep his ship on the straight line course.

Perhaps the greatest feature of the use of the Gyro Compass is the safety factor. Many ships have been wrecked due to inaccuracies of navigation resulting from the use of the magnetic compass. The Gyro Compass insures against such contingencies, thereby insuring the ship, passengers, crew and cargo.

HOW THE GYRO COMPASS WORKS.

When used on land one wheel, or element, is sufficient to show the *true North* Pole. When used on board ship, however, the roll, pitch and yaw of the ship introduces forces which would tend to throw the wheel from off its indication. In the

Four Important Wartime Developments Described by the Eminent Scientist and Inventor of the Parsons Steam Turbine—Sir Charles Parsons—before the "British Association for the Advancement of Science."

Sir Charles Parsons on War Inventions

THE work of scientists in the war occupied the greater part of the Presidential address delivered before the *British Association for the Advancement of Science* at its meeting at Bournemouth by Sir Charles A. Parsons, inventor of the marine turbine engine.

British scientists, he said, "worked in close collaboratiou with the men of science of the allied nations and eventually produced better war material, chemicals and apparatus of all kinds for vanquishing the enemy and the saving of our men than had been devised by the enemy during many years of preparation, planned on a basis of total discregard of treaties and the conventions of war.

As illustrating the immense difference between the recent and all preceding wars, Sir Charles gave some interesting figures. At Waterloo 9,044 artillery rounds, with a weight of 37.3 tons, were fired, whereas in the last offensive in France on the British front alone 943,837 artillery rounds, weighing 18,080 tons, were fired. Again, in the entire South African war 273,000 artillery rounds, weighing 2,800 tons, were fired, while on the British front in France during the entire war over 17,000,000 rounds were fired!

SOUND RANGING AND LISTENING DEVICES.

Many of the new war devices Sir Charles left to be discus' in the meetings of the sections, but he dwelt on *sound-ranging* and *telephonie listening* methods. By the end of 1916, he said, the whole front in France was covered by devices which enabled the British to locate the position of the enemy's batteries merely by sound. In 1918 more batteries were thus detected than by any other means, and a single good set of observations could give the position of an enemy gun at 7,000 yards range to within about fifty yards. Listening devices were also largely used at sea, but it was found that the motion of the vessel carrying them when the sea was rough, and also the noises caused by dragging the devices themselves thru the water made them useless.

HOW THE WHALE HELPED PERFECT SUBMARINE DETECTORS.

"So," Sir Charles went on, "the assistance of eminent biologists was of invaluable help at this juncture. Experiments were made with sea lions by Sir Richard Paget, who found that they have directional hearing under water up to speeds of six knots. Also Professor Keith explained the construction of the hearing organs of the whale, the ear proper being a capillary tube too small to be capable of performing any useful function in transmitting sound to the relatively large aural organs, which are deep-seated in the head. The whale, therefore, hears by means of sound waves transmitted thru the substance of the head. It was further seen that the organs of hearing of the whale, to some extent, resembled a hydrophone.

"The course now became clear. Hollow towing bodies in the form of a fish or porpoise were made of celluloid, varnished canvas, or very thin metal, and a hydrophone suitably fixt in the centre of the head. The body is filled with water, and the cable towing the 'fish' contains insulated leads to an observer aboard the vessel. When towed at some distance behind the chasing ship the disturbing noises are small, and enemy noises can be heard up to speeds of 14 knots and at considerable distances."

Other listening devices made use of the echo, and were developed until they could pick up a submarine a mile away. Sound-ranging stations were established ashore, and from them ships steaming in a fog were informed of their positions accurately for ranges up to 50 miles.

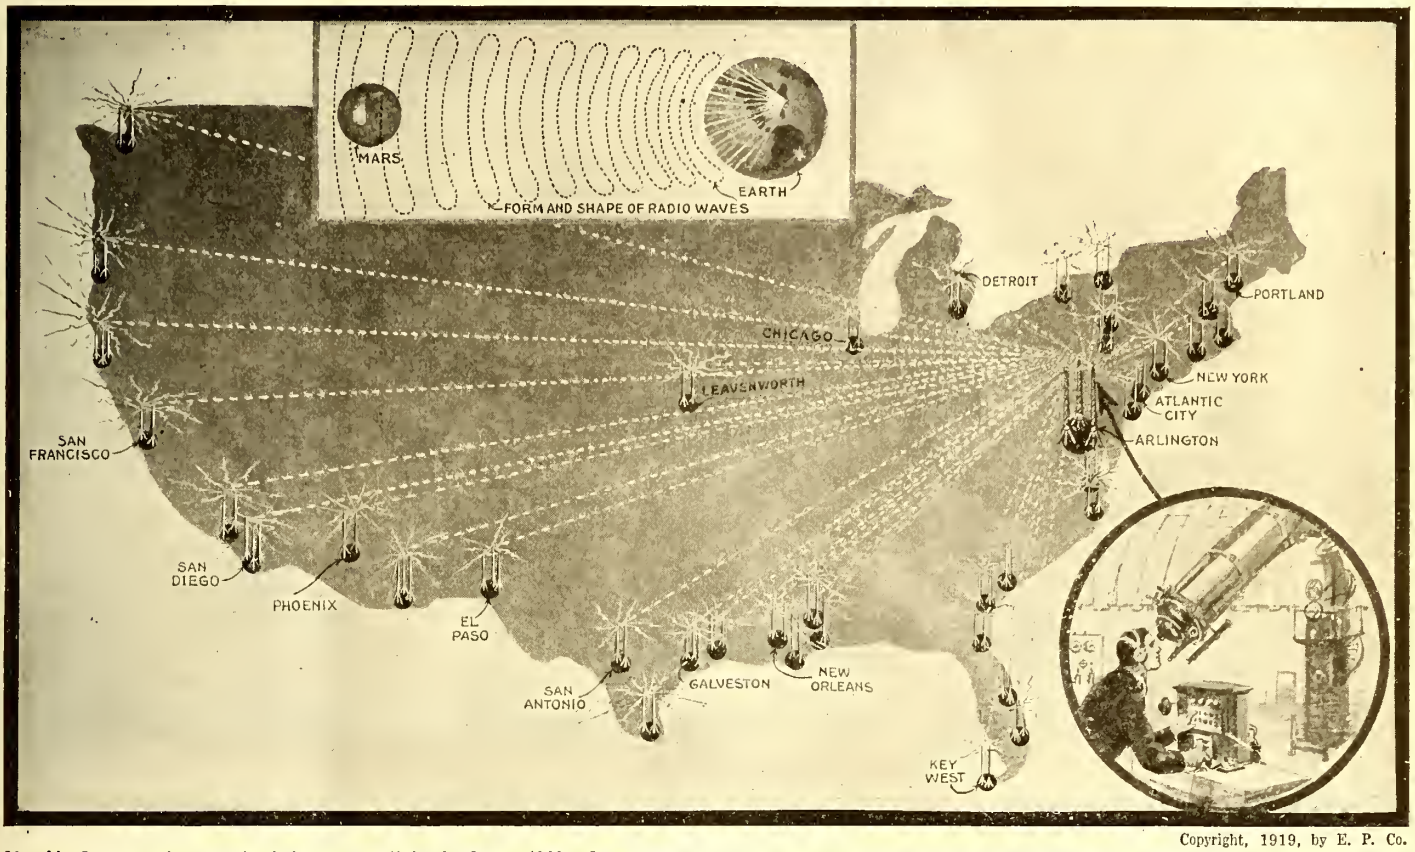
Interplanetary Communication

By Dr. C. S. BRAININ, Ph.D.
Of the Columbia University Observatory



THE tremendous advances made by wireless telegraphy and telephony during the last decade and particularly in connection with the activities of the great war have given renewed impetus to the already considerable speculation as to the possibilities of pushing this method of communication beyond the limits of man's earth and using it for the purpose of "speaking" with other inhabitants of the universe with which the popular imagination has peopled cosmic bodies. The subject falls naturally into two divisions: Are there in space or within the confines of the solar system other inhabited spheres, and secondly, is radio a suitable means for interplanetary communication? And in the discussion we must distinguish clearly between that which is science—knowledge—and that which is merely speculation based upon science.

The first division of our subject presents the bigger IF. Astronomy is not as yet so far advanced as to be able to speak with finality. Much has been learned about the physical and surface conditions of the earth's fellow members in the solar system, but not enough to decide the question. Should we wish to extend our field to outside space, instead of limiting ourselves to the planets of our own system, we may speculate with safety. Every star in the heavens is a sun, more or less like our own sun, and multitudes of them must possess planetary systems. No doubt upon many of these planets conditions have been such as to be favorable for the development of some kind of life. But the question of life in other systems can be left here; it need hardly be considered further in connection with the problem of communication for the distances are too great. In the first place, too much of the original energy of the emitted signal would be squandered unless it were possible to make the transmission truly undirectional, and secondly, the time between the emission and the receipt of the signal at the other end would be too long. Even the *nearest* star is so far away that it would take the electric waves about *four and a third years* to reach it: and only a very small number of stars are within even a hundred years by wireless from us.

There has, of course, not as yet been found any direct, unimpeachable evidence of the existence of inhabitants upon the other planets, and we are limited, therefore, to a consideration of the planets' physical conditions and to a discussion as to whether these are favorable for the development and maintenance of life. We ourselves are the products of the terrestrial conditions of temperature, atmosphere, humidity, etc.; a different combination of these factors would no doubt have produced an entirely different form of life. We cannot, however, discard a planet as uninhabitable because its condition differs somewhat from the earth's, but we are safe in discarding the major planets, Jupiter, Saturn, Uranus and Neptune. It is certain that conditions upon these are unfavorable. The temperature seems to be far too high and the surfaces of these planets have not yet reached the state of solidity attained by the surfaces of Mars and earth. Undoubtedly, the temperature is far too high, also, for the existence of the very complicated organic chemical compounds necessary for any imaginable form of life, different tho it be from ours. Of Mercury we know very little, indeed; it is so close to the sun that observation is extremely difficult and unsatisfactory. Venus and Mars remain.

Mars has been the favorite playground. Since the first announcement of the "canali" by Schiaparelli and the subsequent observations and speculations of W. H. Pickering and Percival Lowell, much has been written and said on both sides of the question. We may briefly sum up the affirmative: The surface of Mars is declared to be crost by a network of straight lines, some of them double; the poles of the planet show at their respective winters, broad sheets of white, very like the terrestrial ice-caps, which decrease rapidly in area with the coming of the summer, and at the same time the "canals" broaden, "germinate," as they say. Evidently, then, Mars is an arid planet with very little water and these "canals" have been constructed by the Martian engineers to carry the water from the melting polar caps to different parts of the Martian surface. Therefore, Mars is inhabited, and by advanced beings, too, for their engineering feats are of the greatest difficulty. But the observations upon which all this rests are not accepted by the astronomic world at large. The great majority of observers, among whom are the most skilled and experienced in the whole world, have declared themselves entirely unable to see this complicated network of straight lines. Streaks and patches are seen by all but nothing like Lowell's maps; nor do published photographs reveal them, and we are reluctantly forced to decide in the negative. There is

Combination Airplane and Blimp

THIS clever invention, combining some of the characteristics and qualities of the airplane with the blimp or gas-filled balloon, is due to Mr. James N. Lewis, of Detroit, who has recently taken out a patent on it. There are many military as well as other features, which seem to give great promise in this combination of the lighter-than-air flying machine or balloon, with the heavier-than-air craft or airplane.

For one thing, the airplane is attached to the blimp or gas-filled balloon by means of a special and powerful design of quick-acting clutch; by simply throwing a lever attached to this clutch, the aviator, seated in the airplane, may at any time release the clutch and sail off, having, of course, started his engine going before doing so, altho he can in emergency and if necessary, cut loose from the balloon and volplane to earth without the engine running. This would seem to be one of the principal features of Mr. Lewis' invention, particularly where aircraft are used for artillery observation, etc., over the battlefields, where balloons were frequently set afire by incendiary shells or balloons, or else attacked by enemy aircraft. Under such a condition, the observer, if he were seated in an airplane carried by the balloon could cut the plane loose and descend to earth safely, much more safely, we believe, than is the case where the observer has to depend upon a parachute, for in some cases the parachute fails to open and the observer is killed.

Another purpose of the invention, as pointed out by Mr. Lewis, is the feasibility of using the airplane with the attached gas-bag to provide auxiliary buoyancy, the airplane being operated or propelled in the regular manner by its usual engine and propeller. Naturally, of course, the speed of the airplane in this case would not be as great as if it were flying without the attached balloon, owing to the great bulk of the gas-bag, which would have to be propelled thru the air. At this juncture we perceive another very fine point of interchangeability and adaptability, which would seem very useful and commendable for war-time requirements, and which is here made evident in our estimation, for it would not be necessary to build expensively equipt blimps or balloons of the dirigible type if this idea be put in practice. For example, by providing these special clutches on simple forms of balloons with no gondola gear, or other attachments, then by simply attaching the balloon onto the airplane we would have a dirigible which could be driven at 30 to 40 miles an hour and maneuvered in all the regular ways in which dirigibles are steered. Suitable control ropes or cables may lead down so as to be readily accessible to the airplane pilot, so that so long as he is flying attached to the blimp, he may have control of the relief valves for the gas compartments, air valves, et cetera.

Another very important feature of this invention lies in the fact that it should prove one of the greatest advances yet brought out in safely training aviation pilots for the army and navy service. As is well known, it is very risky to send aloft a young pilot or aviation student who is not very familiar with the idiosyncrasies of the machine he is trying to fly, and this was very forcibly brought out at the army training fields during the war. The seaplane pilot has much more chance to save himself in such an emergency than the land plane pilot or student, for with the seaplane he can always land on the water, and, with the present design of this aircraft, the machine will safely volplane down from any height with the engine dead. Landplanes may also volplane down in most cases, even if the engine should go dead. But with the seaplane the landing area is not restricted as long as it is over water. With the land plane, the angle at which the volplane occurs is dependent upon the height at which the plane starts, and, before he knows it, the student may find himself headed directly for a group of trees or several high, piercing church spires with a few dozen brick chimneys and iron fences thrown in for good measure. All of what we have just said is intended in its application to the embryo aviator, while he is learning the graces of ordinary or trick flying. Ever imagine what a difference there is when his buoyancy is not dependent upon the exact movement of his hands and feet, when a slight misjudgment may spell death to him. Now, with this invention he simply throws on the clutch, so as to secure the plane to the gas-bag, and at the command, "Let go!" he is hauled skyward by the buoyancy of the balloon.

Copyright, 1919, by E. P. Co.

No Need to Fall Any More While Learning to Fly an Airplane, if You Are Equipt with This New Balloon Release Clutch. You Can Enjoy the Safety Afforded by the Superior Buoyancy of the Gas-Filled Balloon. When Sufficient Skill Has Been Attained by the Student Aviator, He Can Cut Loose from the Balloon and Fly in the Plane Alone. The Combination Forms an Ideal Observation Unit for Military Work, In That the Balloon Is Under Control of the Pilot. In Case of Attack the Observer Can Also Cut Loose and Descend Safely to Earth in the Airplane, Which for This Work Need Not Have a Very Powerful Engine.

THOMAS A. EDISON

will talk to you in our December issue. This important as well as unusual feature should not be mist by any reader of the Electrical Experimenter. Mr. H. Gernsback, who interviewed the famous inventor, asked Mr. Edison a multitude of important and timely questions, which, with the inventor's answers, will be presented to the world for the first time next month.

We have also secured many new and unique photographs about Mr. Edison and his work, all of which will be publisht for the first time in our December issue.

There being no oil-painting in existence of Mr. Edison—altho several attempts were made by great painters, but their paintings having been rejected and destroyed by the great inventor—a well-known artist was selected by us to execute Mr. Edison's portrait. Upon completion of the work, Mr. Edison was highly elated over the painting and exprest himself as well pleased with the excellent likeness.

The cover of our December issue is an artistic reproduction of this historic painting and should not be mist by any reader.

The next issue being heavily advertised thruout the country, regular newsstand readers should order at once from their newsdealer to be sure of their copy.

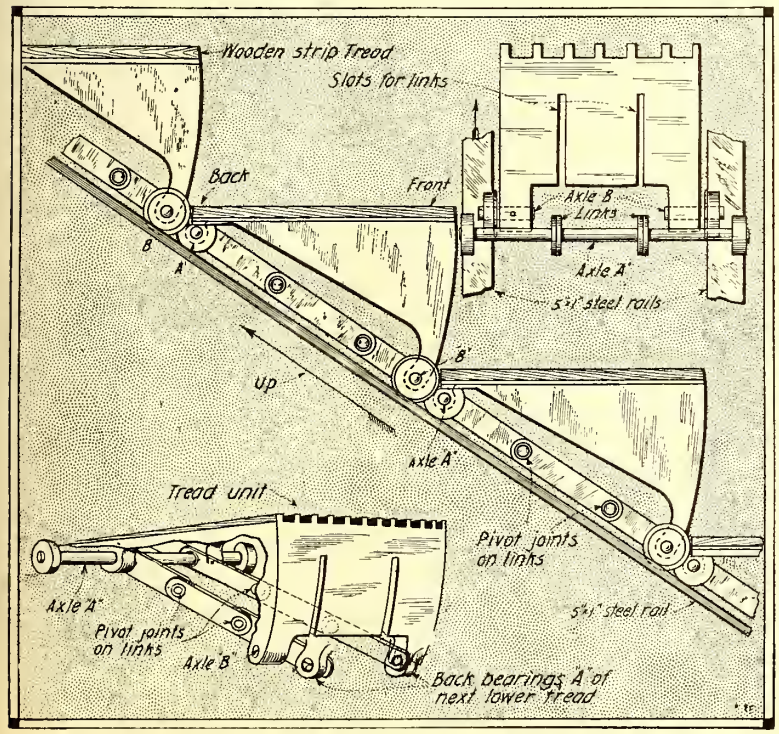
A Hair-Raising Razor

Users of faradic electric coils, such as used for medicinal purposes and shocks, may have thought that the day of the faradic coil had about reached its zenith. But such is not the case, for behold in the present illustration we have the very latest in tonsorial arts and sciences—the *faradic electric razor,* invented by Frank White of St. Louis, Mo., which not only shocks the little hairs into a vertical position so that they can be cut off painlessly, but also the application of the mild electric current to the patient's physiognomy produces the effect of an excellent massage, and not only do these two wonderful phenomena take place, but thirdly, the inventor makes another strong claim in his recent patented invention on the faradic razor—wherein he states that the current flowing from the razor to the face has the effect of aligning the metal fibers on the keen edge; in other words, the faradic current flowing thru the razor acts on the steel fibers, particularly at the edge, with the same effect as when the razor is stropt.

The apparatus required with the faradic razor outfit here shown, is quite simple and comprises a dry battery or other source of electric current, and an induction coil provided with primary and secondary windings. One terminal from the secondary or faradic current circuit is connected to a metal part of the razor, which may be a safety razor; while the second terminal from the faradic coil leads to a suitable electrode or contact plate, strapt to the wrist of the shaver. Sweet dreams of Ossining's electric chair!

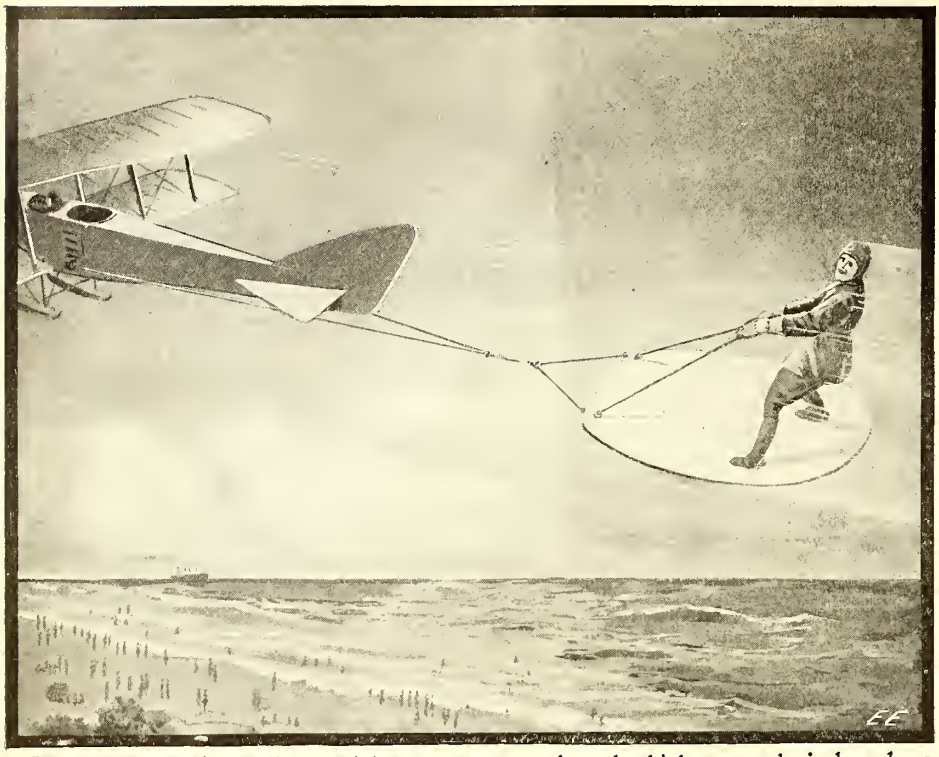


The accompanying illustrations show precisely the effect "before and after" the application of the faradic current to the lathered skin—before a current is applied, the hairs lie down—Fido-like—and a little while after the current is turned on and the razor applied, the hairs stand in line just like a platoon of soldiers, so that when the razor blade waltzes along over the skin the hairs are *guillotined* at the roots, not lynched, as with the present-day un-faradized—or should we say un-paradized—razor! Watson—the needle!!

Eureka! We Have Found It!! After a Long Many Years of Searching Thru Patent Gazettes from All Over the World, We Had to Dust Off Our Glasses Carefully to Make Certain That We Had Not Been Foozled: For What Did Our Eyes Behold!!! Sure Enough, the Electro-Faradic Razor That Makes Papa's Little Whiskers Stand up on End as Here Shown, so That the Keen Edge of the Razor Can Zip Them off without Mangling Them, Heretofore Causing Papa to Ejaculate Profanely.

More About New York's Subway Escalator

In the May issue of the ELECTRICAL EXPERIMENTER there appeared a feature article with special illustrations on page 20, showing the four motor-driven escalators being installed at the Park Place station of the New York subway system, which is one of the most elaborate and highest lift escalators anywhere in the world.



In the May issue of this Magazine there was publisht a sectional illustration and description of the new duplex escalators, installed at the Park Place subway station in New York City. This new escalator presents several novel features, and the accompanying detail illustration shows the ingenious design of the treads or steps. Each step is made in the form of a casting, and it travels up the inclined rails on four wheels. The steps are linked together by a series of link belts, which give sufficient flexibility for the series of steps to round the curved return-bends of the escalator at top and bottom, in order that the returning steps may follow in their reversed position on the underside of the escalator. These escalators are electrically operated, and mark the very latest advance in the design of moving stairways.

The details of the steps used on these escalators, which are four in number, are very interesting, and the accompanying illustration shows how the steel plate steps, which are fitted with wooden tread strips, are linked together by an endless chain, so as to be carried by the escalator upward and over the toothed-end drums in the usual manner.

The steps are independent units. This is due to the novel arrangement of the small iron wheels on which they they are carried up the escalator tracks. These tracks are flat steel members measuring about 5 inches by 1 inch. The rear wheels are flanged and travel on the inner edges of the tracks, while the front wheels of each step unit are plain flat wheels without flanges. The step units are held rigidly in line owing to the link belt or chain construction followed in connecting up one step with another, as the illustration shows clearly. The links are made of light steel about 3 inches by ½ inch in section, which gives great solidity and ruggedness to the construction, while at the same time preserving the necessary degree of flexibility, so that the step units will properly intermesh in passing over the cogged drums at the top and bottom of the escalator. Each of the four escalators is driven by means of a powerful electric motor mounted at the top of the structure and properly geared to the cogged drum at the top, over which the moving stairway belt passes. The steps return to the base of the structure under the rising treads, within the enclosed stairway provided for it as shown in the illustration in the May issue.

Surfplaning in Mid-air

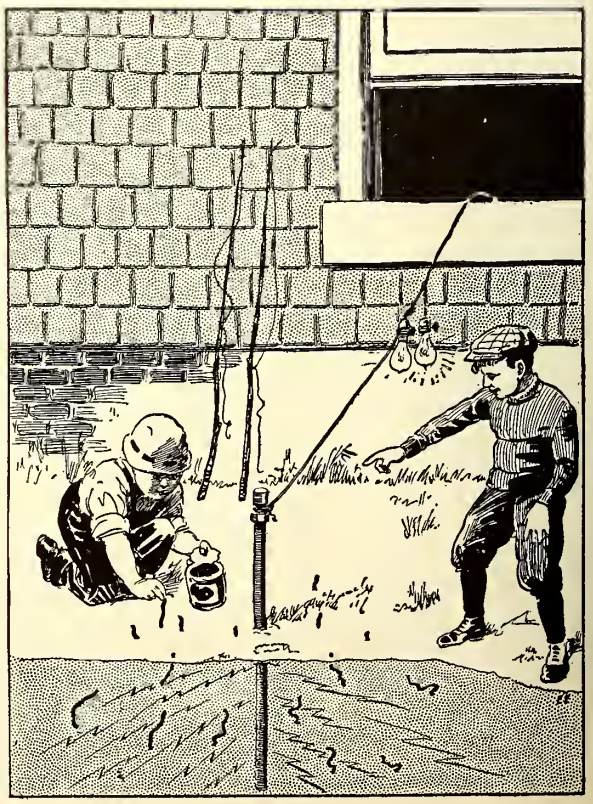
Sensations! That's What We All Crave These Days. And Here's One That Will Make You Stare for Some Time. Surfplaning in Mid-air, from the Tail of an Airplane. As the Magician Said—"It's a Good Trick If I Do It—and it's a Good Trick If I Don't Do It." We'll Say So.

Imagine yourself standing upright on a piece of plank in mid-air, and skimming thru space at a speed of 100 miles an hour, while the green fields, rivers and houses flit along beneath you with dizzying speed. "How did I get out there?" you will say, "on that skimming board in mid-air? I have seen the natives at Wakakee beach ride the surf boards—'Surfplaning' they call it in that part of the world—but this stunt has sure got me." Well, it all happened this way. The planing board was secured to the high-powered airplane by a small, strong wire cable secured to a quick-acting reel. This board was held close up under the fuselage or body, with release clips, so that when the pilot pushed a button, the board swung loose, and you proceeded to scramble on it and hold fast for dear life. The next minute the pilot unlocked the cable reel, and before you got your second breath, you found yourself standing up vertically in mid-air on the planing board and being hurtled thru space at a terrifying velocity, with the wind whipping by you with an exhilarating, yet awe-inspiring velocity.

Planing thru the sky in this fashion promises to become one of our newest hair-raising "air circus" stunts. The inventor, Frank H. Ellison, of New York City, guarantees to bring out all the people in any town or city, including his own home town, wherever this death defying air trick is performed. We said it!!—*"Wherever" it is performed,* with the accent on the whole four words.

In describing his invention, Mr. Ellison, goes on to say: "A skilful rider can manipulate a planing board in the air as many ways and even more than on the surface of the water, balancing himself with his feet placed in the toe-clips on the top of the board, and using the ropes and ring as a rein. In carrying out this astounding feat, the observer releases the board from the side of the airship, holding it edgewise to the wind as he climbs on board, holding on to it with one end and grasping the hand support on the fuselage of the airplane with the other. The pilot lowers the prospective steeple-jack of the air by means of an automatic reel, a sufficient distance to clear the ship. By this time the wind has caught the board, turning it flat in the air, after which time the airplane pilot opens up his engine and proceeds to drive his machine at such a speed as to hold the rider in a vertical position on the planing board. Yes, boys, its some sport,—take it from us land lubbers.

Catching Worms by Electricity



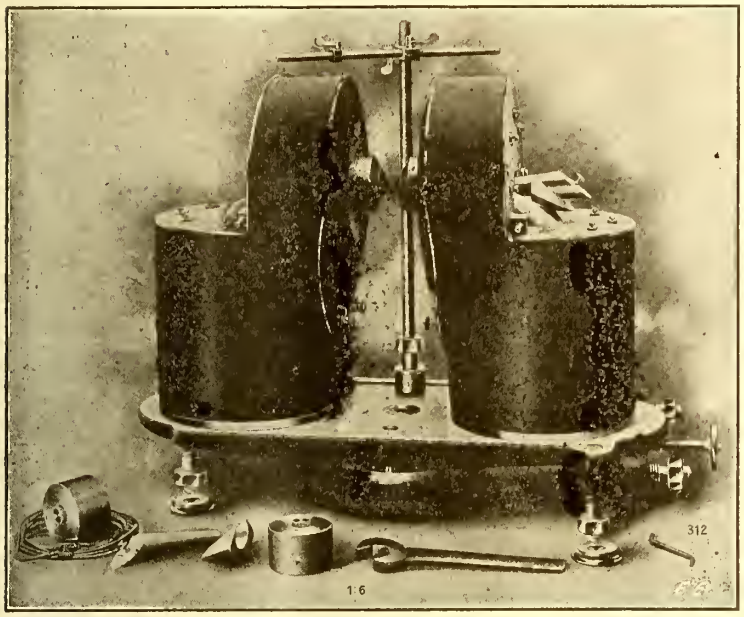
Ever want to go fishing and couldn't catch enough worms? "Many's the time," says you. Well, right here we have something new and original in fish worm enticers. I have recently found that by driving a piece of iron pipe down in the ground a few feet (and, by the way, it should be good, damp ground), and then connecting a wire to the house electric light circuit (with a 110 volt lamp or two in series), the current passing over this wire to the earth and spreading thru the soil about the pipe, will tickle Mr. Worm and his fellow reptiles so that they will come out of the ground helter skelter and post haste,—not by ones and twos, but by the dozens!

The worms are so glad to get out of the ground, that they fairly jump out of their holes into your hand. Don't believe me, I suppose, but go ahead and try it. But before you start, be sure and get a sufficient number of large 40 quart milk cans, in which to put the worms. With this remarkable electric worm catcher, you can safely invite the whole neighborhood to go fishing, for there will be plenty of worms to go around. There is only one bad thing about it, and that is when the office boy finds out how beautiful it works, he will be out fishing five days a week, and will be in on Saturday to spend those immortal three hours between nine and twelve o'clock with us.

One more word of caution before you try out this stunt. You may find that in order to have a current pass thru the lamps and down thru the pipe to earth, that you will have to reverse the wire where you connect it, owing to the arrangement of the electric light circuit, one side of which only is *grounded,* while the other is not. It is to the *ungrounded* side that you will have to connect the wire, and you can immediately tell when you have the right side of the circuit hooked up, as the lamp or lamps will immediately light up as soon as the connection is made.

Contributed by
TOWNSEND BROWN.

Do You Have Trouble In Catching Fish Worms? Of Course, You Do. Well, Here's a Trick Taught the Editors Recently by a Youthful Electrical Experimenter. Quoth He—Ever Try Sticking a Charged Electric Light Wire In the Wet Earth, and See the Worms Come Wiggling Out; Oodles of them? No, Said We. Well Try It. And We Hereby Confer on the Esteemed Inventor, the Croix de Angleworm, Pour la Merit.



www.americanradiohistory.com

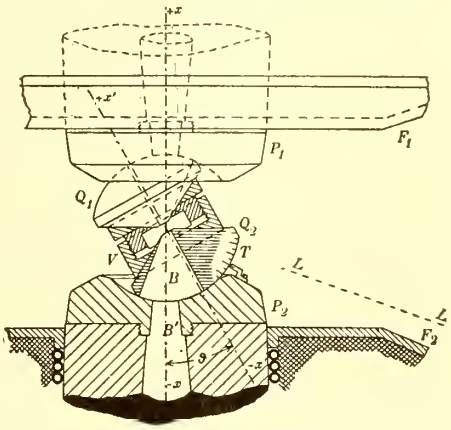
New Laboratory Electro Magnet

Frank C. Perkins

The accompanying illustration and drawing show a new laboratory electro-magnet designed by Dr. Du Bois for making various physical tests. With these coils a half ring core is provided besides various shapes of pole-pieces. It is possible to produce an extremely powerful magnetic effect and one of the strongest fields ever obtained. Provision is made for a very narrow air gap when desired and swivel poles in cylindrical sockets may be used so as to turn about at any angle. This magnet may thus be utilized to great advantage for effects of light beam and magneto-optical investigations upon different substances put in the air gap.

For Laboratory Researches an Electro-magnet Must Possess Many Unusual Features. The One Here Shown, Designed by Du Bois, Permits Experiments in Magneto-optics as Well as Those at Very High and Very Cold Temperatures.

It is possible to send the light thru the poles by means of axial holes or crosswise in the air gap. Interesting experiments can be made at different temperatures and provision is made for using liquid air contained in leather bellows mounted on the magnet or by surrounding the poles by a porcelain heating vessel.



It is possible to work between temperatures of 200 degrees Centigrade and 1300 degrees in a very strong magnetic field. This powerful magnet allows of observations of all kinds of effects in a very strong magnetic field and a widely different degree of heat, and microscopic apparatus may be utilized to great advantage with the attachments provided.

NEW RADIATOR TYPE, SELF-COOLED X-RAY TUBE.

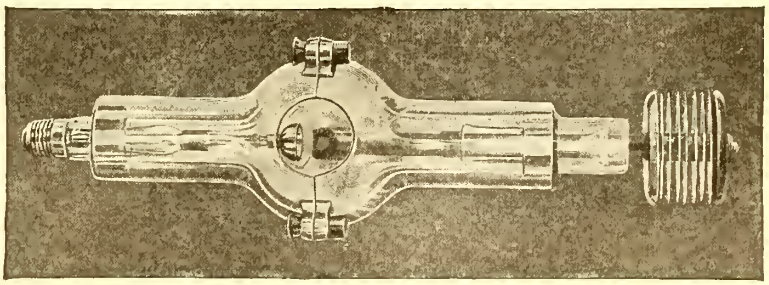
A new self-cooled, radiator type X-ray tube is described by Dr. W. D. Coolidge, in the *General Electric Review*: The type of tube described in this article was developed specifically for military use in the portable Roentgen-ray outfits at the Front. Its characteristics are such, however, that it seems ultimately destined to supplant the earlier type of hot-cathode tube for all diagnostic work.

The earlier form of hot-cathode tube having a solid tungsten target is capable of rectifying its own current; but only for such amounts of energy as do not heat the focal spot to a temperature approximating that of the cathode spiral. As soon, however, as any part of the focal spot is heated to a sufficiently high temperature, it emits electrons copiously, and, therefore, when supplied from a source of alternating potential, it permits so-called "inverse" current to pass. The "inverse" cathode-ray stream comes out from the focal spot in a direction perpendicular to the face of the target and proceeds, in the form of a narrow pencil, straight to the glass wall of the bulb close to and slightly behind the cathode. The glass at this spot fluoresces vigorously, becomes locally heated, and usually cracks. As air enters the bulb, a spark discharge passes thru the opening and it is then easy, for one who has not studied the phenomenon, to conclude that the tube failed by *puncturing* under electrostatic strain.

The essential condition to be fulfilled was that heat should be more rapidly withdrawn from the focal spot. This could have been accomplished by water-cooling, but this method clearly involved undesirable complications for portable work. Experiment showed that the most effective simple method consisted in providing a target having a large heat capacity and high heat conductivity, and then in arranging to effectively cool this mass of metal during the interval between radiographic exposures. The importance of having the target cold at the start is shown by the following experience with a tube having a 3.2 mm. focal spot and a solid tungsten target: With the maximum allowable energy input, it was possible when beginning with the target at room temperature to run four times as long before "inverse" current appeared as when the experiment was started with the target at dull red heat.

Detail of Swiveling Pole-pieces on New Laboratory Magnet Shown Above. They Are Calibrated and Can Be Swung to Any Angle Desired—a Very Important Feature.

The considerations which are described finally led to the *anode* design shown. The anode stem consists of a solid bar of copper 5/8 inch in diameter which is brought out thru the glass of the anode arm to a multiple wing *copper radiator*. The head of the anode consists of a mass of specially purified copper which is first cast in vacuum onto a tungsten button and is then electrically welded to the stem. The tungsten button, which is destined to receive the cathode ray bombardment is 2.5 mm. (0.1 in.) thick and 9.5 mm. (3/8 in.) in diameter.



The complete target, with radiator, weighs 860 gm. and has a heat capacity of 81 calories per degree Centigrade; while the present standard solid tungsten target, complete with molybdenum stem and iron supporting tube, has a heat capacity of less than 10 calories. Because of its greater heat capacity, it takes much longer to heat the radiator type of target to a given temperature than it does the solid tungsten target. What is much more important, however, is the fact that between radiographic exposures the target in the new tube cools comparatively rapidly owing to the large copper stem and the radiator.

In the standard hot-cathode tube with the solid tungsten target, the target gets very hot and radiates thru the glass walls of the tube the greater part of the energy it receives. As a result, the glass becomes strongly heated. In the new *radiator type* of tube, by far the greatest part of the energy imparted to the target is conducted to the radiator. It, therefore, becomes possible to make the glass bulb *very small*. For portable work, a diameter of 9.5 cm. (3¾ in.) has been standardized.

For some applications it has been found best to enclose the X-ray tube in a lead glass shield. Glass of good quality and containing sufficient lead is satisfactory material from which to make such a shield. The ordinary X-ray protective glass with which the author is familiar does not have as high a lead content as seems desirable. However, the author was finally able to obtain glass containing enough lead that, for the same protective effect, the glass layer has to be but four times as thick as sheet lead.

As seen from the photograph, the lead glass shield has a round opening thru which the Roentgen-rays can pass. The two halves of the shield are bolted together.

Two portable Roentgen-ray generating units have already been built around the first model of this tube. These are the "U. S. Army Portable Unit" and the "U. S Army Bedside Unit."

Interesting Form of Improved X-ray Tube Fitted with Radiator Flanges so as to Be Self-cooling. It is Encased in a Lead-glass Shield, the Desired Rays Issuing Thru a Circular Opening at the Center.

www.americanradiohistory.com

"Old Phonograph Record" Contest

OUR old phonograph record contest as announced in our *August* issue proved to be one of the most popular contests that we have ever held. Hundreds and thousands of letters were received and many clever as well as ingenious and practical suggestions poured in upon the editors. It was no easy task for the judges to pick out the winners, and in making the first prize award the following was taken into consideration by them.

While perhaps many of the other suggestions were more ingenious, it struck the judges that a new idea tending to improve our health should receive first consideration, and this is why the first prize was awarded to Mr. F. R. Spindler. Not only were the judges prompted to award the prize on account of this feature, but also because the suggestion is not only new, but is eminently practical.

Furthermore, the bar bell as well as the dumb bells *can be made adjustable* by adding only two records at a time. Thus, as the user becomes accustomed to it, he can add more and more weight as he sees fit. This is an important consideration, as at the present time there are no bar bells or dumb bells on the market that are adjustable to such a fine degree.

On the opposite page we have endeavored to illustrate a few of the good ideas; there were of course thousands of others, but most of them were either duplications of similar ones publisht herewith, or were not very practical to the minds of the judges.

Many contributors suggested the use of phonograph records as fan blades by heating the record in hot water and then shaping the blades. This was not a bad idea. However, the danger of the blades breaking is very great and while flying thru the air might seriously injure people.

Our wireless enthusiasts, to be sure, came in with a rush and had many good ideas. There were loading coils, switch-board panels, oscillation transformers, adjustable transmitting condensers, tuning coils, bases, condensers, fixt, variable and otherwise, lead-ins, washers, scales for rotary condensers, loose coupler ends, etc.

Then we had knife sharpeners, a great number of Tesla water turbines, many formulae how to melt the records and make various compounds from them, switches, panels for wireless instruments, covers for all sorts of chemical bottles and otherwise, rheostat bases and even clock dials. One ingenious contributor even showed us how to make a mantle clock casing made entirely of phonograph records, bent and worked into shape.

One contributor from the middle west sent in an elaborate design for a colored disc apparatus to show the changing colors of rotating discs. There were of course a number of so-called omnigraphs, using the record to make the dots and dashes by cutting notches around the rim for the dots and dashes. There were a great number of electrical switches as well.

Some of the wireless ideas and several others were so good that we will run them in our other departments shortly. Particular mention should go to Victor H. Tegge, of Haddonfield, N. J., who succeeded in making a synchronous telegraph which he calls a codeless telegraph. A very good idea, which will be publisht later.

Mr. W. L. Lyndon, of Lyndon P. O., Alta., Can., showed us how to make a large switchboard panel in four layers by shellacking together a great number of records.

Frank J. Pastern, of Chicago, takes the cake by submitting an idea how to bend a record in the form of a horn so it can be used as a bicycle or automobile horn, using a buzzer in the back to make the noise.

FIRST PRIZE.

ADJUSTABLE BAR BELL AND DUMB BELLS.

By F. R. SPINDLER,
83 Saranac Street, Rochester, N. Y.

Every Experimenter needs physical as well as mechanical or electrical training, therefore he can make a real muscle builder from cast-off or worn-out phonograph records.

A steel bar about ¾" diameter and approximately 4 ft. long, threaded 12" from each end, will serve as the support for the records.

Variable diameter records are used to give it a fairly spherical appearance. The amount can be varied to suit the user. Steel washers are placed on each side of the series of records, which are held in place by the hexagon nuts. The weight can be made adjustable by simply increasing or decreasing the number of records. A bar bell too heavy is not practical as it tires the user. About 50 lbs. is a good maximum weight for the average athlete.

The second illustration shows how dumb bells are made by using a short steel bar, threaded at ends, and a number of 10c or else 7" records.

Prize Winners

First Prize—$25.00. F. R. Spindler, 83 Saranac St., Rochester, N. Y.

Second Prize—$15.00. Jackson H. Sterrett, 1001 Walnut St., Erie, Pa.

Third Prize—$10.00. E. M. Williams, 301 Main St., Salisbury, Md.

SECOND PRIZE.

CHEMIST'S TEST TUBE RACK.

Herein is shown a revolving test tube rack which the writer has constructed and considers a very practical and useful application for phonograph records which have outworn their welcome.

Several points about its practicability are:

1. It is very easy to construct.

2. It will hold a great number of tubes, especially if large discs are used.

3. Being made of the phonograph discs, it is quite impervious to most chemicals.

No dimensions are given, as the individual will invariably desire to construct it according to his own requirements. Single face records with the blank faces up, will look best; otherwise the name plates may be enameled black.

All small holes were drilled with a twist-drill, and those in the lower disc were reamed out to accommodate the bottoms of the tubes nicely. Having no twist-drill large enough for the holes in the upper disc, a hole just large enough to pass the threaded part of a bit was first drilled with a twist-drill; then the bit was carefully applied from both sides, until the piece could be pushed out.

The Experimenter who possesses a lathe can make many improvements over the very simple construction here suggested.

Contributed by Jackson H. Sterrett, 1001 Walnut Street, Erie, Pa.

THIRD PRIZE.

RADIO SET MOUNTED ON RECORD.

The accompanying photograph shows my idea of one use old phonograph records can be put to. This is in the form of a combination Radio Receiving and Practice Set, fastened on an old phonograph record with a tuning coil on the back. Very accurate tuning can be accomplished by moving knobs up or down which extend out at each side. Arms which contain knobs extend to the center of record on back, and by means of a flexible wire are connected to each slider, so that the set can be tuned to any desired pitch.

Contributed by E. M. Williams, 301 Main Street, Salisbury, Md.

FIRST HONORABLE MENTION.

Novel Lamp Shade.

I submit herewith a description for using old phonograph records in constructing a beautiful electric lamp shade. The bracket supports were made out of ⅛" galvanized iron wire in the following manner:

First measure the radius of a record to be used, double this length, then find the distance wanted between opposite records at the top. Add these dimensions together and add 1" for making loops at ends of wire.

Now cut two wires, each being the total length just measured, and bend as shown in diagram. When this is completed they are then placed to cross each other at centers and fastened with thin wire so as always to remain at right angles to each other. Now obtain four small store bolts about ⅛" x ½" and bolt on phonograph records, one to each of the four loops on the wire supports. Then get a shade support which can be placed over the electric bulb, fasten it centrally on the bracket and the shade is completed.

Contributed by Jacob Keener, 3145 West 54th Street, Chicago, Ill.

SECOND HONORABLE MENTION.

Tool or Bricabrac Stand.

The photo herewith shows how to build a useful tool or bric-a-brac stand, of service in every shop or parlor, respectively.

To make this stand you should collect (it sounds much better than swipe) a number of records, seven spools 3" long, one spool 1½" long, two pieces of wood 10½ x 1¼" x ½", and one long rod that is to pass thru the holes in the spools and records with a nut on top to tighten them. Then take the two pieces of wood and cut out a piece ½" from the side and about 1" from the ends. In the center of one of these pieces cut a piece ⅜" deep. Cut out a piece ⅜" deep from the bottom in the other piece. Then put these pieces together. Drill a hole ¼" in diameter thru these pieces so the rod can pass thru. The next thing to do is to take the rod, pass it thru the base, put on the small spool, then a record, then a spool, etc., until they have reached the top of the rod. Put the nut on and tighten it. Many variations of this design will suggest themselves. The stand may, for instance, be composed of gradually decreasing sizes of records. Then again, it is well to drill holes in the records to fit some of the tools, especially those that tend to roll off easily. This makes a nice stand for small articles.

Contributed by George Kostka, 2347 S. Ridgeway Avenue, Chicago, Ill.

"PLAN-T"

By JOHN WHITE

"LARNELLE! and have all on fifth and taken here s. Bordinage."

The clipping scissors ran swiftly up the margin of the daily newspaper and neatly cut the foregoing from its personal column. With a little murmur of satisfaction, such as a naturalist might give upon the capture of a new and interesting specimen, Paul Stevenson viewed the latest addition to his collection. Paul Stevenson was a hobbyist. Owing to former experience in the U. S. Secret Service, he was more or less adept in the solution of codes, and gathered material for this pastime from the personal advertisements in newspapers. These deciphered excerpts formed a collection of human and unique interest. His other hobby, possibly more practical, was that of Radio telegraphy, and his he had profitably turned to the benefit of the government when his fine six-foot physique gained him easy admittance to the navy as a Radio-man. During the war he had been injured in U-boat patrol, and, tho not slightly, he had been forced to abandon his work with the navy. Upon complete recuperation he hoped to continue in his former capacity as detective for the nation.

As he fingered the "personal" it appeared to offer no formidable obstacle to decodation. Opening an album, which he had removed from the polished oak shelf over his desk, he disclosed any number of personals ranged alphabetically, in regard to the recipient, while on the opposite page under corresponding names were their deciphering.

Stevenson's careful perusal assured him that he was the possessor of no other advertisement directed to a "Larnelle" by which to be guided in his solution of the present excerpt.

Replacing the volume he applied various methods to the solving of the cipher. He attempted the solution by the assumption that each word was an individual letter, then rearranging the order of the words and the letters themselves. As a last resort he applied the dictionary, hoping to discern its actual meaning by a definite number of words above or below those of the code, or in possible alternation. Having vainly endeavored to do this with several universal editions of dictionaries, he finally considered the possibility of the message—for such he assumed it to be—being void of code and understandable only to one cognizant of its reference. However, he decided that its very lack of unity and coherence proclaimed that this was not the case, and that the message was really conveyed in a very subtle code at present impervious to his attempts to decipher.

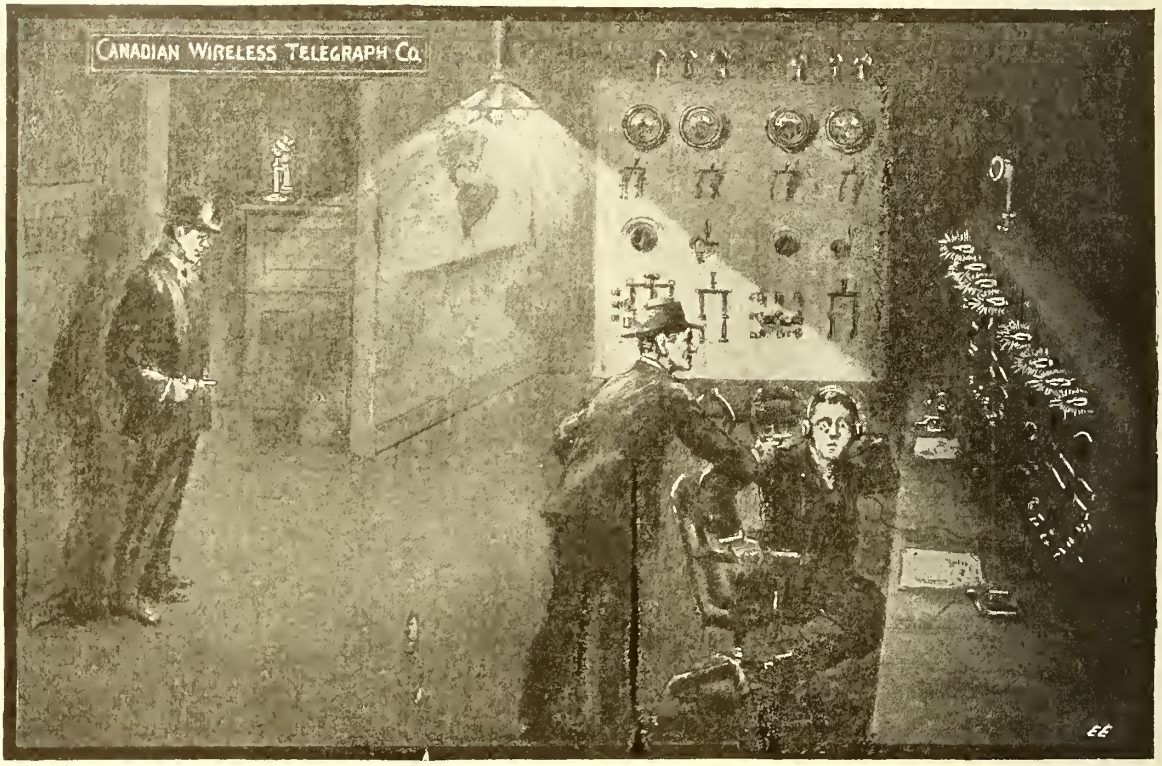
That evening, after another futile endeavor at solution, he diverted to his other hobby in despair. At one extremity of his study his instruments were arranged in panel formation, the majority of them hidden within a highly veneered oak cabinet. On a desk, adjoining the instrument table, reposed magazines relating to radio work, many containing articles f his own, dealing comprehensibly with the subject.

The night was damp and the ether seething with the invisible pulsations. Orders and conversation raced back and forth between the battleships in the lower Hudson. One of the men-o'-war was experimenting with wireless telephony and the *Marseillaise* chimed with bell-like clearness in his telephone headset. The Brooklyn Navy Yard roared in with a running jargon, and Stevenson, in attempting to copy it, realized that it was code. Disgusted with code, he tuned them out instantly.

He noted the time—nine-forty-five—and threw on more meterage with the intention of receiving the *time signals* within the next quarter hour.

Suddenly the clear, quenched note of a high-powered station other than Arlington reached his ear. Stevenson's face depicted his astonishment as the air screeched out the uncommon name of "Larnelle." He quickly and with increasing surprise, penciled down the remainder of the message:

"……and have all on fifth and taken here s. Bordinage."



It was identical with that of the "personal."

As he was puzzling over this startling coincidence, the possible answer, calling "Bordinage" broke in upon him.

"Damn fool," it read, "that's the same thing. Wait now."

There was silence, then Arlington dashed out the time and Stevenson threw down his headset in the midst of the weather report.

The first was the sending of an expert, and from the sound he judged it to be that of a professional station, while the reply was more slow and amateurish and possest the coarseness of other than a quenched gap

"Then Back Crashed the 'O. K.' in the High-Pitched Tone of the Q— Station. The Operator at Q— and Bordinage Were the Same! The Light from the Powerful Nitrogen Bulbs Flooded the Transatlantic Radio Station at Q—. One of the Secret Service Men in the Outer Office Replaced the Long Distance 'Phone. The Radio Operator Moved Nervously, as for the Fifth Time He Had Tried to Call the Unresponsive 'Larnelle.' Feeling a Hand on His Shoulder, He Whirled About, and Faced — a Representative of the Canadian Secret Service."

Replacing the receivers he listened on the same wave length for a possible solution to the enigma. However, the ether was still as the grave in regard to the call of "Larnelle" or "Bordinage." Again scanning the response, it dawned on him that the wrong communication had apparently been transmitted, and that the first operator was to wait, probably until the morrow, before rectifying his mistake and sending, as Stevenson thought, the correct key to the cipher.

The next evening with little excitement the ex-secret service man adjusted his instruments to two-thousand, five-hundred meters, the Arlington wave length. It was not until the evening was well over and the hour was close at hand for the *time signals*, that his vigilance was rewarded. The high-powered station screeched in his ears:

"-.-- .- .-. -. . .-.. .-.. . . Larnelle Larnelle, Bordinage."

Stevenson listened with unnecessary tenseness for the signals rushed in with the tone and loudness which marks only the professional of great range:

"...watkins short delivery send four the danger directions up s."

www.americanradiohistory.com

Will These Perpetual Motion Schemes Work?

By JOHN D. ADAMS

IT usually requires but the most elementary knowledge of physics to detect the fatally weak point in most "perpetual motion" devices. In the three schemes illustrated in the accompanying illustrations, however, the inherent defects are rather hidden, and the writer has known not a few practical mechanics and electricians who have been led astray by them. As the youthful and enthusiastic inventor will find it instructive to uncover the underlying errors, we will not expose them here, but will confine our remarks to a brief description and incidentally point out why they "ought" to operate.

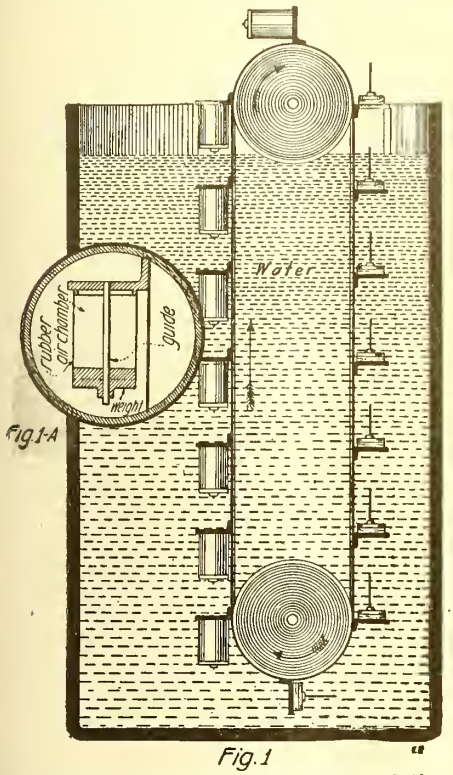

Fig. 1

A Proposed Hydrostatic Perpetual Motion Machine Which Would Appear to Offer Several Advantages Over Simpler Types. The Expansive Rubber Chambers Have Weights Fitted to Them, Which Weights Cause These Chambers to Collapse as They Descend Down Through the Water on One Side of the Belt; While as They Start to Ascend on the up Side of the Belt, the Chambers Open up and Present a Considerable Amount of Buoyancy. Imagine What a Tremendous Amount of Buoyancy a Series of These Air Chambers Will Give! It Looks Like Free Power, Sure Enough!!—But Will It Work? Think It Over!

SCHEME I.

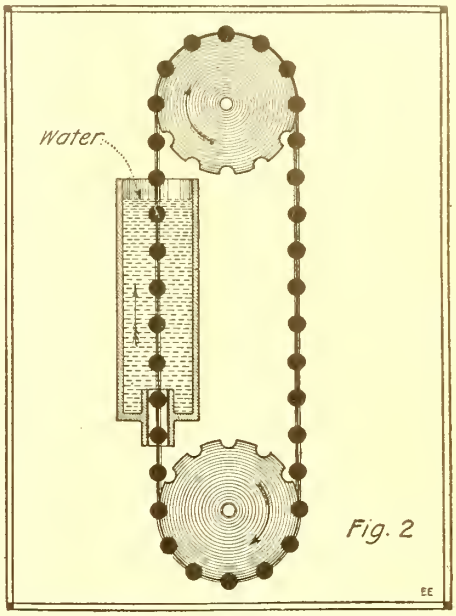
In the first one, Fig. 1, a large pulley is placed at the top and another at the bottom of a deep vertical tank of water. On these pullies a belt is placed, and at regular intervals along this belt brackets are attached. To each bracket a guide rod is secured, and along this rod a heavy circular weight is arranged to slide. The weight and the bracket are connected by a suitable length of soft rubb r tube of large diameter. The bracket, weight and tube, when all assembled constitute an airtight pocket or cylinder, as illustrated in the detail sketch, Fig. 1-A.

It will now be evident that the weight will tend to distend the pockets on the left-hand half of the belt and to compress them on the right-hand half, as the weights in the latter position are on top. Imagine, then, the enormous buoyant effect of all the submerged air pockets on the left side, and it will readily be seen that this side of the belt will have a very strong upward pull. As each pocket comes up out of the water and starts to descend on the right side, it will collapse, and the whole series of collapsed pockets on that side will present just so much dead weight, which will accordingly add to the turning effect on the pullies. Most perpetual motion machines depend on one force being stronger than another, but the fundamental principle here employed has the distinct advantage of having all the forces involved act in the same direction.

SCHEME II.

In scheme number 2, Fig. 2, the water is contained in a vertical stand-pipe, and, by providing one several hundred feet high and attaching it to the back of a skyscraper, it will be apparent that enormous power may be generated as long as the force of gravity remains on the job.

$10.00 CASH PRIZE FOR THE BEST ANSWER.



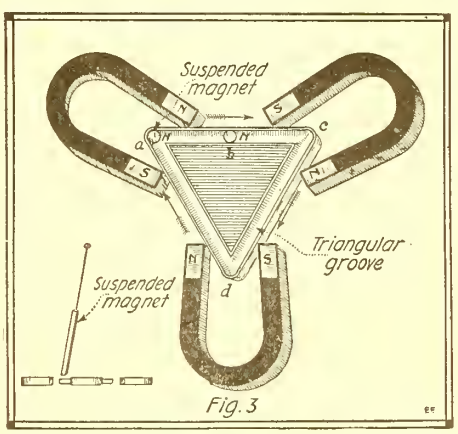
What is your opinion as to why the three proposed "perpetual motion" machine schemes here described and illustrated will not work? Here are the rules by which to write your answer to this problem:

Typewritten replies preferred, or else hand-written letters in ink, but not in pencil. Try to make your reply as short as possible—about 150 to 200 words should cover it easily. As thousands of replies will be received, this will greatly expedite the work of examining all the answers which come to hand. No mathematics are required or desired in explaining the fallacy of the machines here illustrated. The answers received will be past upon by a board of experts, including the following:

Mr. John J. Furia, A.B., M.A.; Mr. H. Gernsback, editor, and Mr. H. W. Secor, associate editor. This contest will close January 15.

Address all letters to "Perpetual Motion Contest."

At the top and bottom of the stand-pipe are two large sprocket wheels, and around these is operated a continuous belt composed of light, hollow copper balls connected with suitable links. These balls enter the stand-pipe thru a tube placed in the bottom, the accuracy of fitting being such that no appreciable leakage will occur If the reader will now suppose our illustration extended in a vertical direction several feet, and will form a mental picture of the string of several hundred submerged air pockets, the tremendous upward pull will be appreciated. For every ball that passes out of the water at the top, another will take its place at the bottom, so that the motion will necessarily go on perpetually. If one should feel alarmed lest the motion become *too rapid and violent* at light load, there would be no objection to providing a *governor!*



Another Water Power Perpetual Motion Idea Which Is Out of the Ordinary Class. This Promising Design of "Everlasting Motion" Machine Utilizes a Series of Hollow Balls Mounted on a Continuous Belt. Gravity Helps the Downward Motion of the Balls on the Right Side, While as Soon as They Enter the Water Chamber at the Left, There Is Realized a Considerable Amount of Buoyancy Created by the Long Series of Hollow Balls Which Are Pushed Upward by the Water. Again We Say, "Think It Over." You May Win a TEN DOLLAR Prize!

SCHEME III.

In scheme number three, shown at Fig. 3, permanent magnets are employed in a horizontal position in the manner illustrated. A long slender bar magnet is suspended from above on a swivel in such a way that the lower end—the North pole—can move freely about in the same plane as the three horseshoe magnets. A triangular groove is provided so that the free North pole can only move along its three sides.

First, consider only the upper left-hand of the three magnets, and start with the free North pole at the point "a." It will be evident now that the North pole will tend to move in the direction indicated by the arrow, because there is no point along that side of the triangle which is not nearer to the North pole of the horseshoe magnet than to its South pole, in consequence of which repulsion will prevail over attraction. When the point "c" is reached (still forgetting the two other magnets) the motion will tend to continue in the direction of the arrow because motion in that direction tends to move the free North pole further from the North pole of the horseshoe magnet and slightly nearer to its South pole. True enough, there will not

(Continued on page 712)

A Magnetic Pendulum Arranged in the Manner Shown, so That a Suspended Magnet Reacts in a Field Created by Three Horseshoe Magnets. The Lower End of the Suspended Magnet Runs in a Triangular Groove, as Shown. Apparently, the Pendulum Magnet Should Keep on Rotating Around the Groove, and In the Direction of the Arrows Perpetually! Is It So?

Popular Astronomy

By ISABEL M. LEWIS
Of the U. S. Naval Observatory

The Earth's Atmosphere

IT is a fact, well known to all of us, that no form of life could exist upon our planet earth for the briefest interval of time if the light and heat-giving rays of the sun were suddenly withdrawn.

Yet an equally vital factor in the maintenance of terrestrial life is the earth's atmosphere. Were the thin veil of gases that envelopes our planet to drift away into interplanetary space, all life upon earth would cease as suddenly and as effectively as if the rays of the sun were to fail us.

This Illustration Vividly Depicts How Thin Our Earth's Atmosphere Really Is. Note That Three-Quarters of the Entire Atmosphere Is Only 7 Miles Above the Earth. Even at This Moderate Height It Is Impossible for Man to Live, Unless He Brings His Own Air with Him.

If we should take for a model of the earth a ball, two feet in diameter, the highest mountain on the earth (Mt. Everest, 5½ miles high) would be no more than a grain of sand on its surface, since on this scale one-fiftieth of an inch represents six and two-thirds miles.

The extent of the earth's atmosphere on the same scale would be represented by an outer shell about one-third of an inch wide, assuming that the limits of the atmosphere are practically reached at one hundred miles above sea level.

As we rise above the surface of the earth, the density and pressure of the atmosphere decrease with great rapidity. At sea level, the pressure of the earth's atmosphere is about fifteen pounds upon every square inch of the surface. At an elevation of only three miles it has decreased to such an extent that the average human being would find it impossible to live and breathe at this heighth for any length of time, soon becoming violently ill from "mountain sickness" as a result of the reduced pressure to which the human system cannot suddenly adapt itself.

Aviators who fly high above the surface of the earth are also apt to be overcome by the effects of this reduced atmospheric pressure. So earth-bound is man even in his aerial flights that very moderate atmospheric heights are as inaccessible to him as the moon and the summit of Mt Everest, represented by a grain of sand on our two-foot model of the earth, lies beyond the reach of man and could not be capped by him in his flights thru the air

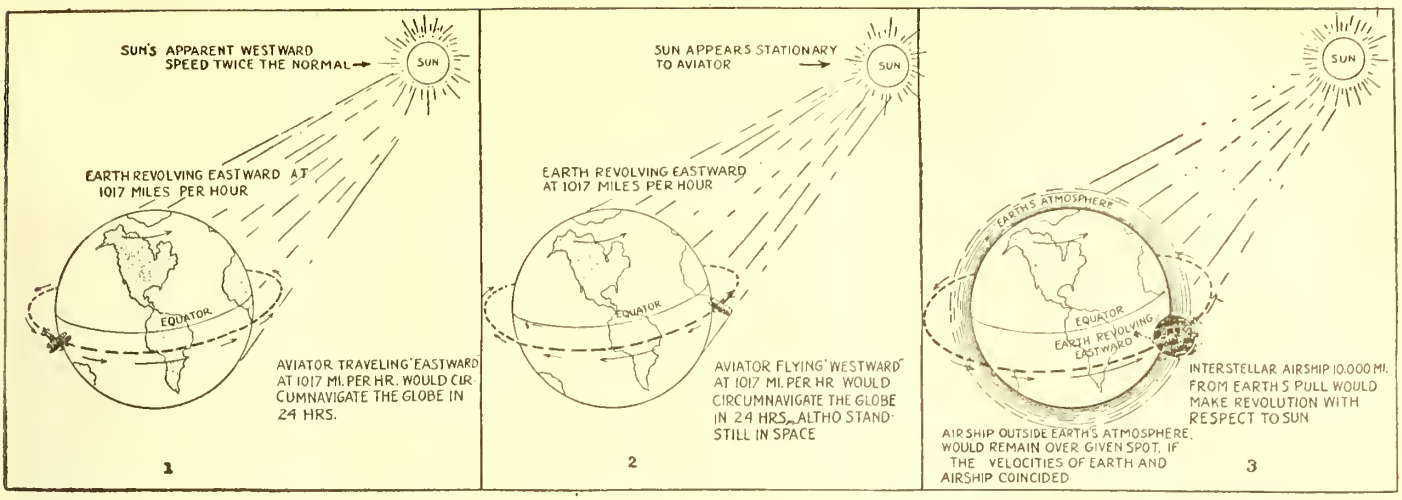
It can be shown, in accord with the law that governs the decrease in density of the air with altitude, that *one-half of the earth' atmosphere lies within three and one-half miles of the surface,* one-half of the remaining atmosphere within the next three and one-half miles, and so on until the atmosphere becomes so rare that this law no longer applies.

Three-fourths of all the earth's atmosphere, therefore, lies within seven miles of its surface.

It is an interesting result of this rapidly decreasing density that celestial objects shine most brightly when they are overhead for their rays then strike the earth's surface more vertically, and, therefore, have a much shorter path to travel thru the lower densest layers of the atmosphere than when the object lies close to the horizon. (See Fig. 1.) We are all aware of the fact that there are always more stars visible overhead than at low altitudes, the light of the fainter stars being blotted out by the densest lower strata lying close to the horizon.

No reliable observations of the heavenly bodies are ever made within ten or fifteen degrees of the horizon, and whenever star positions of great accuracy are desired the object is observed at the highest altitude possible. This is owing to the fact that the path of a ray of light is changed by refraction as soon as it enters the atmosphere and bent more and more toward the vertical as it penetrates the denser layers. Rays from objects directly overhead or in the zenith suffer no refraction, for they strike the earth vertically, but the nearer the object lies to the horizon the more are its rays refracted by the atmosphere and the more is it thrown out of its true position. (See Fig. 1.)

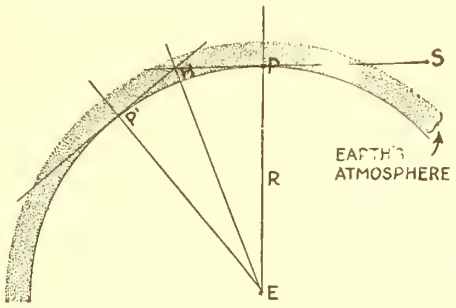
Refraction at the horizon amounts to more than one-half a degree, varying with the changing temperature and density of the air, and decreasing very rapidly with altitude above the horizon.



Since the diameter of both sun and moon about equals the amount of refraction at the horizon, it follows that these bodies appear to be just *above* the horizon when in reality they are just *below*.

The oval shape of the sun or moon so noticeable at the time of rising or setting is an atmospheric effect that is due entirely to the fact that the amount of refraction increases so rapidly in the immediate vicinity of the horizon. As a result the lower limb of the sun or moon is raised more than the upper limb and the vertical diameter is shortened while the horizontal diameter is unaffected and the disk, therefore, appears oval.

The apparently greatly increased size of the sun or moon at rising or setting is not generally considered an atmospheric effect, but due to the fact that we then unconsciously compare them with nearby terrestrial objects, such as houses and trees; but this explanation seems hardly satisfactory.



At the earth's surface the atmosphere, measured by volume, contains 78 per cent

www.americanradiohistory.com

nitrogen and 21 per cent oxygen, with less than 1 per cent argon and minute quantities of helium, krypton, xeon, neon and other rare gases, as well as such impurities as soot, ammonia, etc. It contains, in addition, water vapor and carbon dioxide. These two constituents of the atmosphere represent scarcely 3 per cent of its weight, but they are absolutely essential to all living organisms upon our planet.

Fig. 2. To Show How the Height of the Earth's Atmosphere Is Found from the Duration of Twilight. An Observer at P for Whom the Sun is Just Setting at S is Carried by the Earth's Rotation to P', the Last Point from Which He Can See the Twilight Effect Produced by the Sun's Rays Shining on the Earth's Upper Atmosphere After the Sun Itself Has Disappeared Below the Horizon. It Has Been Found as a Result of Many Observations That the Angle PEP', Thru Which the Observer Passes from Sunset to the End of Twilight, Is About 18 Degrees and Therefore the Angle PEH, Which Is Half of This Angle, Is 9 Degrees. Knowing the Value of the Earth's Radius R in Miles, It is Now an Easy Matter to Find H, the Height of the Atmosphere That Produces the Twilight Effect. This Comes Out Almost Exactly Fifty Miles. Therefore the Earth's Atmosphere Exists to a Height of Fifty Miles in Quantities Sufficient to Produce Twilight. The Duration of Twilight Depends on the Angle at Which the Ecliptic or Path of the Sun Cuts the Horizon and Upon the Altitude of the Observer Above Sea Level as Well as Upon the Height of the Atmosphere; Therefore It Varies with the Time of Year and with the Latitude of the Obesrver. It Is Shortest at the Equator, Where the Ecliptic Rises Most Sharply from the Horizon, and at High Elevations Where the Quantity of Air Above the Observer Is Less in Quantity and Charged with Fewer Impurities.

It is the tempering effect of these two compounds in the atmosphere that protects us from the great extremes of heat and cold that would otherwise exist on the day and night side of our planet.

About 40 per cent of the sun's rays are reflected away into space by the earth's atmosphere. Of the remaining 60 per cent, one-fifth is absorbed by water vapor suspended in the atmosphere between sea level and an elevation of five miles, while two-fifths are absorbed by clouds lying one or two miles above the surface. *As a result, only 20 per cent of the rays that enter the atmosphere actually arrive at the surface of the earth.* These estimates are the results of measurements of the solar radiation made at sea level and on mountain heights.

The heat-rays that are radiated from the earth's surface also suffer powerful absorption by the water vapor and carbon dioxide in the atmosphere. According to estimates made, fully half the radiations from the earth's surface are absorbed by clouds and three-fourths of the remainder by water vapor and carbon dioxide in the atmosphere, so that barely *10 per cent* of the earth's radiations escape directly into space, tho by continual radiations from one place to another within the atmosphere the heat gradually seeks higher levels and tends to escape.

Were it not for this blanketing effect due almost entirely to the water vapor and carbon dioxide in the atmosphere, preventing too rapid radiation into space, as well as the effect of the atmospheric currents which are a most powerful factor in equalizing the extremes of temperature all over the globe, it is very doubtful whether either animal or vegetable life would be found to any extent upon our planet. It is well known that there are much greater extremes of heat and cold between day and night on the mountain peaks than in the valleys, owing to the greater rarity of the atmosphere and the comparatively small amounts of water vapor and carbon dioxide.

It is also well known that early frosts will not occur when there is much water vapor in the air or when clouds are plentiful.

(Continued on page 691)

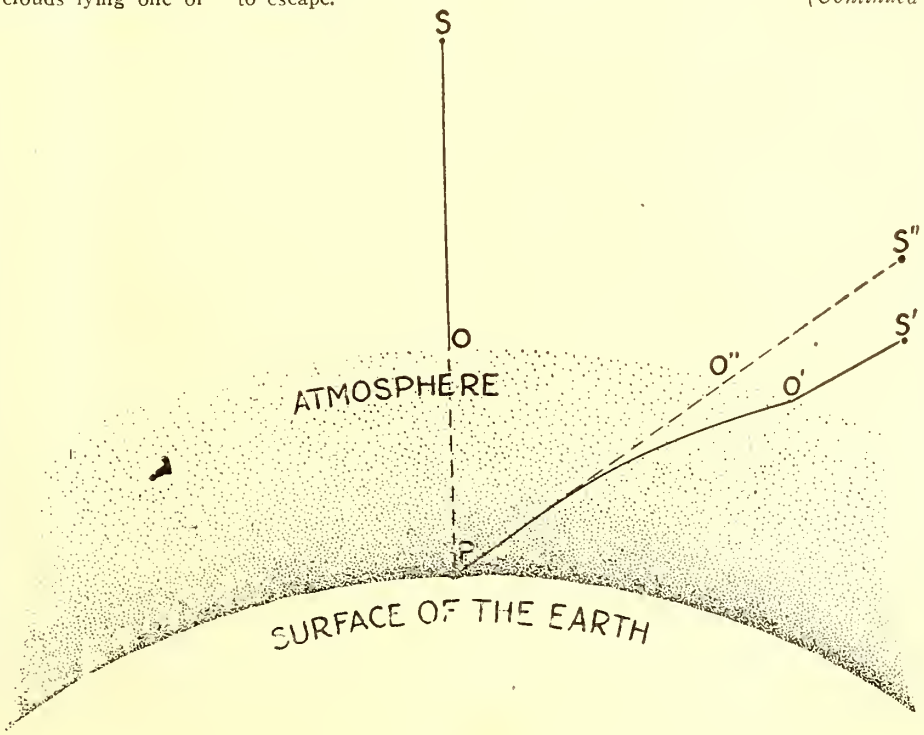


Fig. 1. When Rays of Light Pass from a Rarer to a Denser Medium, as from Interplanetary Space Into the Earth's Atmosphere, They Suffer Refraction, That Is, They Are Bent Out of Their Course in the Direction of the Vertical. Since the Atmosphere Increases in Density Toward the Earth's Surface, the Rays Are Bent More and More from Their Course the Further They Penetrate Into the Atmosphere. The Light from a Star S in the Zenith Suffers No Refraction Because Its Rays Strike the Atmosphere Vertically at O, But the Light from a Star S' Striking the Atmosphere Obliquely at O' Is Bent More and More from Its Course as It Passes on Thru the Atmosphere. The Observer at P Sees the Star S' Not in Its True Direction PO'S', But in the Direction of the Rays at the Time They Enter His Eye, That Is, In the Direction PO"S". The Effect of Refraction Is to Displace the Star from Its True Position and to Increase Its Altitude Above the Horizon. Refraction Is Greatest for Stars at the Horizon, for the Length of the Path Thru the Atmosphere Increases Toward the Horizon. The Line O"P Is Longer Than OP and It Passes for a Greater Distance Thru the Dense Lower Layers of the Atmosphere, Where It is Most Bent from Its Course. Also Stars Shine Most Brightly When They Are Overhead. The Path of Their Rays Thru the Atmosphere Is Then Shortest and They Are Scattered and Absorbed Less by the Atmosphere. The Twinkling of Stars Which Is Due to the Unsteadiness and Changing Density of the Atmosphere Is Also Greatest Near the Horizon.

. . . AUTOMOBILE NEWS . . .

VARIABLE CARBON RESISTANCE FOR BATTERY CHARGING.

It is often desirable and necessary to give a long low rate reforming charge to ignition and other storage batteries.

Small batteries for motorcycles, mine lanterns, time clocks, etc., require a low ampere charging rate because of their low

A New Variable Resistance for Battery Charging Composed of High Resistance Carbon Rods Connected in Series. The resistance Is Adjusted by Moving a Slider Along the Carbon Rods.

ampere-hour capacity. In the laboratory where there are a great variety of uses for a variable current in experimental and research work this form of variable resistance proves very useful, and, in fact, indispensable.

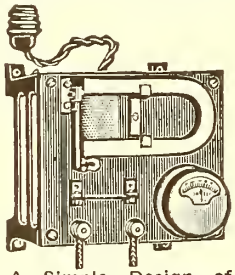
When connected in the charging circuit between the rectifier and the storage battery, this rheostat will give any ampere charging rate between a very low rate and the maximum current output of the rectifier by simply moving the spring clip along the carbon rods.

This resistance is non-corrosive and infusible; cannot melt, disintegrate or break from overload or continuous service, claim the makers.

It is constructed of special high resistance carbon rods. It weighs about 5 pounds.

A TOOL FOR REGROOVING PISTONS.

Fitting of piston rings properly requires that the grooves into which they fit be true. The new regrooving tool here illustrated makes possible the easy truing of the grooves. The device is wired to the piston and turned around so that the cutter removes the high spots.



Ever Have to Regroove Your Piston When Fitting New Piston Rings? A Mean Job, Isn't it? Well, Here's a New Tool that Does the Work in a Jiffy. It Cleans Out and Trues Up the Piston Grooves Accurately.

A NEW BATTERY CHARGING RECTIFIER.

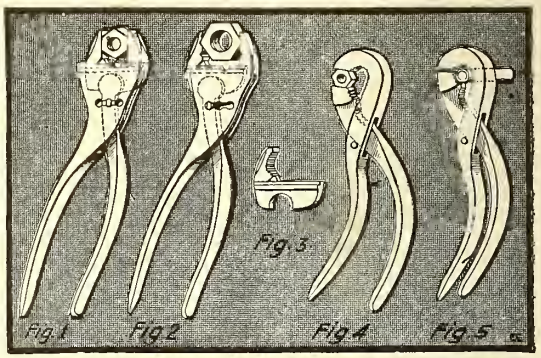
Since the demand of low voltage storage batteries for lighting and starting has become so universal there is an ever growing need for a device to keep these batteries fully charged, and especially a low-priced, efficient A.C. and D.C. rectifier. The rectifier here illustrated is very simple as well as inexpensive. They are practically automatic, requiring little or no attention whatever since they operate from 110-volt alternating current, which makes them very convenient to use, as they are portable and can be operated from any convenient lamp socket, each machine being equipt with a cord and screw plug, which can be readily attached to any lamp socket.

A transformer is assembled to each and every machine which steps down the 110 volts to a proper low voltage. This is done by means of two separate windings on the transformer, each winding being well insulated, making it entirely safe and independent of the other. A permanent magnet of the high-grade magnet steel is fastened to the slate base opposite the armature, which causes the armature to vibrate at the same frequency as that of the alternating or line current. To one end of the armature is attached a platinum point, which makes contact with another point of the same material, mounted on an adjustable contact screw. It is automatic in its action, being self-starting. When the current starts up again the rectifier starts up.

A Simple Design of Battery Charging Rectifier.

NEW PLIER-WRENCHES OF CLEVER DESIGN.

A Chicago inventor brings out two new ideas in Plier-Wrenches that will fill the long-felt want in any mechanic's tool kit. These wrenches are quick-acting, self-adjusting, always taking a firm grip on any object that may be clamped in the jaws.



The main features that Mr. Allan, their inventor, claims for these wrenches are: that they are self-adjusting, and that the jaws are always parallel when clamping objects of various sizes, or when the jaws are closed or wide open.

It does not matter whether the jaws are closed or wide open or clamping nuts, pipes or objects of various sizes, the *grip* of the handle is always the same.

Referring to the above cuts, in Fig. 1 the jaws are shown clamping on a medium size nut, while in Fig. 2 the jaws are seen clamping on a large size nut, and the jaws nearly open. If you will carefully notice, you will observe that the handles are in about the same position, irrespective of the jaw opening.

Fig. 3 shows a pipe jaw that is interchangeable with the regular jaw used for nuts, which comes in handy for loosening nuts that have had the corners all rounded off. It also shows that this can be used as a pipe wrench.

Referring to Fig. 4 you will observe this form of a plier gripping a medium size nut. Note that the jaws are parallel, and that the position of the handles do not lose their grip. This plier-wrench has no adjustments. It is absolutely automatic and self-adjusting to any size object, such as nuts or pipes that may be wished to be clamped in the jaw. All that has to be done to operate it is to open the jaws, place the hook jaw on a nut or pipe or any other object wishing to be clamped in the jaws, then simply grip the handle, which will cause the jaws to adjust themselves rapidly to objects of various sizes.

New Plier-Wrenches for Autoists. Fits Round, Square and Hexagon Shapes.

Referring to Fig. 5, the jaws are shown nearly closed and gripping a small size pipe. Note that the jaws are parallel the same as they are in Fig. 4, gripping a medium size nut. On this style of a plier, length 8 inches, it will take in as large as a three-quarter-inch pipe and has a parallel jaw opening that will take in any flat object such as a nut; the flat parallel opening being three-quarters of an inch.

IMPROVED STORAGE BATTERY HYDROMETER.

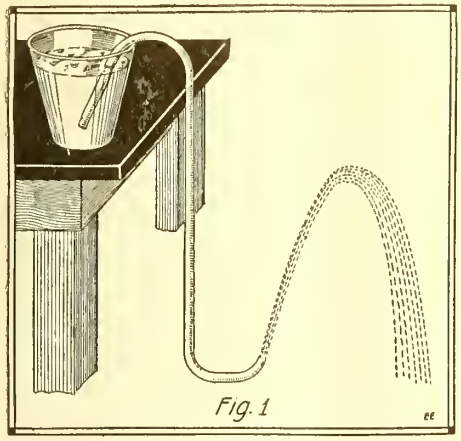
You can easily test your battery and know that it is receiving proper care by using this improved hydrometer, which contains the following special features:

The rubber collars at each end of hydrometer protect it from striking and breaking, if accidentally dropt. The square collar at bottom prevents rolling off.

The float is always in plain view. There is no plug in bottom to drop out, spilling the acid and breaking the float. All rubber fittings are made of special high-grade stock. The graduations on scale are guaranteed accurate.

This hydrometer consists of the standard hydrometer described above fitted in a glass jar. This jar is to be filled with distilled water or pure rain water, making a safe and handy receptacle for both the water and hydrometer. The large rubber collar on hydrometer fits the top of jar, making it dust and evaporation proof. After testing the battery the hydrometer is placed back in the water and acid is rinsed off.

Instructions for testing the battery and for its proper care during both winter and summer are printed on the label.



An Improved Storage Battery Hydrometer for Testing Ignition Cells.

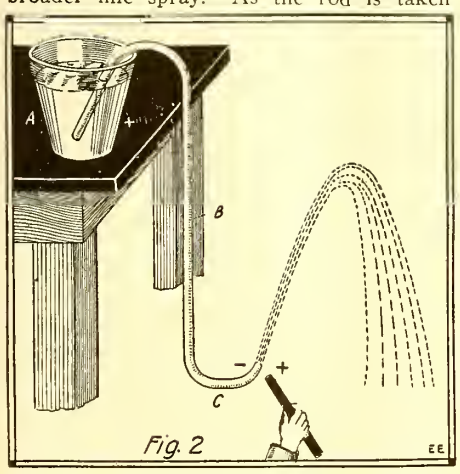
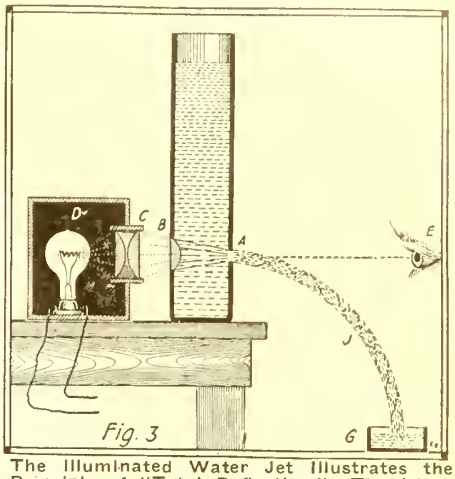
Experiments in Physics

By JOHN J. FURIA, A. M.
DEPARTMENT OF PHYSICS, N. Y. UNIVERSITY



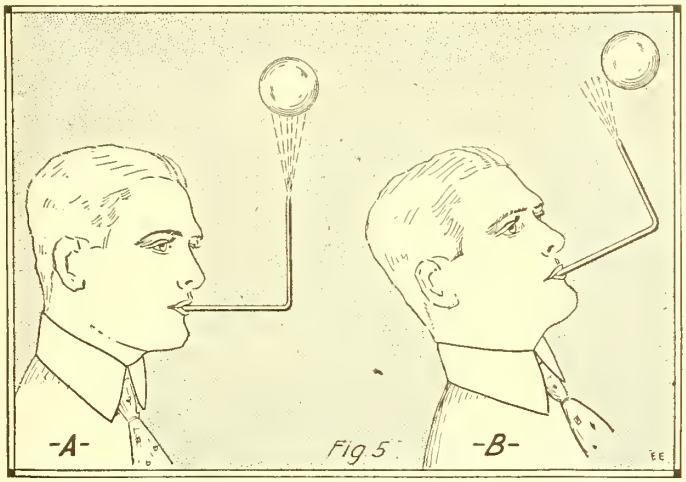
4--Water Jets and Air Jets.

An Ordinary Water Jet Such as Produced When Siphoning Out Water from a Receptacle at a Higher Level. Not Electrified.



SEVERAL very interesting experiments can be performed with the ordinary water jet. Among the best known are the electrified water jet, the illuminated water jet, and the Bernoulli air jet, each demonstrating a fundamental principle in physics.

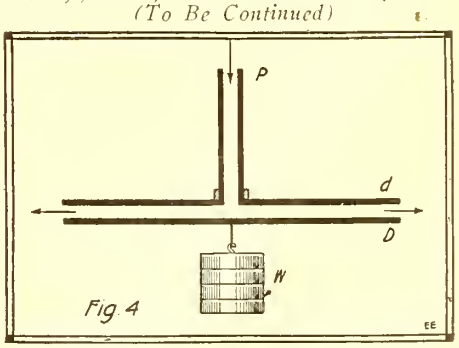
The electrified water jet illustrates the principle of *electrostatic induction* (see figure 1). A is a pail of water; B, rubber tubing, and C, a small nozzle. On creating suction at C, we siphon out the water from A in the form of a jet. The jet is inclined at a small angle from the vertical as in the figure, and we find that the stream breaks up into drops a small distance above the nozzle C. Electrify a rod (ebonite rubbed with cat's fur, sealing wax rubbed with flannel or glass rubbed with silk), and bring it near the nozzle as in figure 2. As the rod approaches nearer and nearer to the nozzle, the jet breaks up into a broader and broader fine spray. As the rod is taken away again the stream becomes compact again as in figure 1. The rod, when held near the jet, causes the water to be electrified with the opposite charge just as it breaks up into drops. The drops, since they all have the same charge, repel each other, forming a broad spray. The system from the pail to the jet is electrically neutral when the rod is not near. As the rod approaches the jet, the charge similar to that of the rod is repelled to the pail and the opposite charge is attracted to the jet. This is induction. (The jet becoming charged without coming in contact with the rod.) When the rod is removed, the pail-jet system becomes neutral again (the positive and negative charges distributing themselves uniformly thruout the system). By allowing the spray to fall against an insulated metal plate and then bringing the plate into contact with the electroscope we may test the nature of the charge on the spray. The nature of the charge of the water in the pail can be tested by connecting the water to the electroscope thru a conductor (copper wire).



When a Charged Electrode, Such as a Fountain Pen Barrel Rubbed with Cat's Fur, Is Approached to the Water Jet, the Stream Breaks up Into a Broader and Broader Fine Spray, as Here Illustrated. The Water Becomes Electrified.

The illuminated water jet illustrates the principle of *total reflection*. A vessel about 3 feet high, having a circular opening A, about ½ inch in diameter, and a lens B, opposite to it that concentrates upon A the light coming from the condensing lens C, is filled with water. The room is darkened and the stopper removed from A. The water is heard striking the floor but nothing is seen while the lamp D is switched off. When lamp D, enclosed in a light-proof box, is turned on, we see the jet J illuminated, the rest of the space around it remaining dark. Even if the eye is placed at E, directly in line with the lamp lenses and opening, no light is seen. However, if a piece of glass G is placed anywhere in the path of the jet and the eye behind it, a brilliant spot is seen. It is evident, then, that the light from the lamp *travels only in the path of the jet*. The rays of light coming from D are concentrated (on opening A) thru the lenses C and B and strike the jet on the inner surface at an angle greater than the *critical angle*, so that they are totally reflected and none of the rays emerge into the surrounding space. When light strikes a surface so that the angle it makes with the surface is greater than the critical angle, it is all reflected just at is is from a mirror; and just as no light passes thru the mirror, so no light passes thru the jet surface into the surroundnig space.

The Illuminated Water Jet Illustrates the Principle of "Total Reflection." The Light Beam Is Reflected Down the Jet.



A Similar Phenomenon to That Illustrated by Experiment Shown in Fig. 4 Is That Here Shown. The Rubber Ball Is Held Suspended in Mid-Air by the Air Blast from the Blowpipe.

The Bernoulli jet illustrates the *Bernoulli principle*, which is sometimes stated as follows: In any fluid (liquid or gas) the pressure is least where the velocity is greatest. Figure 4 shows a cross-section of a pipe P, connected to a disk D, thru which a jet of air is being blown under high pressure. D is another disk to which a weight W, is attached. The greater the velocity of the air between the disks, the less the pressure between them and the more they are forced together, and hence, the greater the weight W, which can be supported. On a small scale, a spool may be substituted for pipe P, and disk D, and a small card may be substituted for D and W, the air jet being formed by blowing thru the spool.

The same principle is illustrated in figure 5. At "A" we see a vertical jet supporting a light ping-pong ball up in the air. If, now, the jet is gradually inclined almost to the horizontal, we still find that the jet keeps the ball in the air in spite of the attraction of gravity. The velocity of the air at P_1 is greater than at P_2, and, therefore, the pressure on the ball at P_1 (downward) is less than the pressure at P_2 (upward); hence, the ball remains suspended.

(To Be Continued)

In Any Liquid the Pressure Is Least Where the Velocity Is Greatest. This Device Proves It. If Air, at High Velocity, Is Blown Down Thru the Pipe P, the Two Discs d and D Are Held Together, Supporting the Weight W.

THE CONSTRUCTOR

A Model Electric Theater

By EDWARD K. JEWETT

FEW boys indeed realize the fun and entertainment furnished by building and operating a model theatre. The purpose of this article is to describe the construction of a miniature playhouse and the method of electric illumination used in such a model to produce the wonderful effects seen in modern life-size theatres.

The first step in building the theatre is to procure a strong wooden box, measuring about 1 foot high, 20 inches long and from 10 to 12 inches in depth. A common soap box is just the thing, and in using such an article one has the frame of his theatre ready made and does not have the trouble of making one. The box should stand on its side on the table. The entire bottom is removed, and the back half of the upper side, as shown in Fig. A. A small table-like structure is next built by joining the removed half of the upturned side with a small piece of wood 20 inches long, 2 inches wide and ¼ inch in thickness.

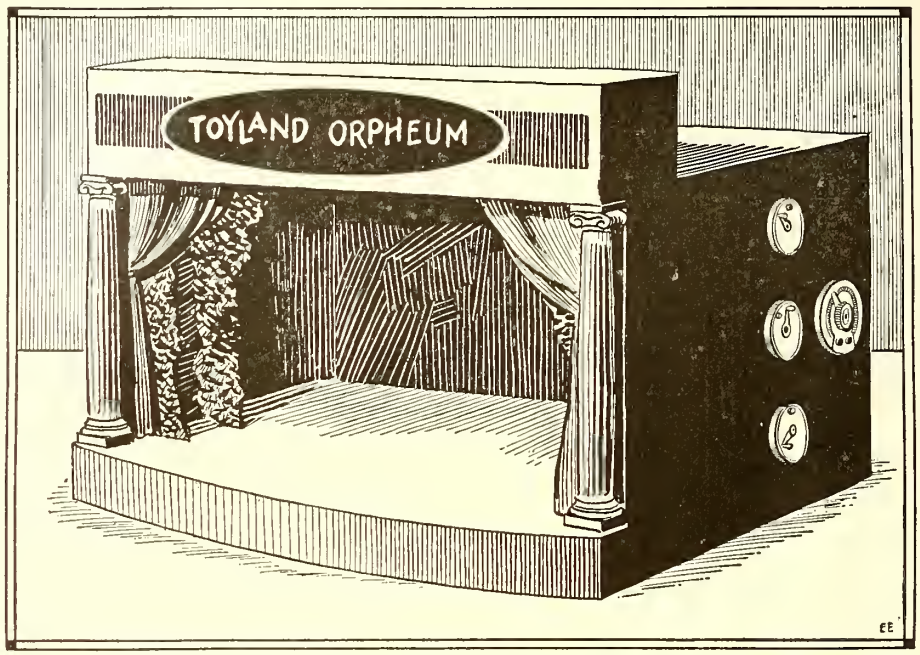

Fig. 1C. A miniature Theater Provides Lots of Amusement and Instruction During the Winter Evenings. Some Experimenters Give Quite an Elaborate Show with One of These Theatres. By Means of Electro-Magnets Under the Floor of the Stage, "Soldiers" Can Be Made to March; Cannons and Tanks Operated by Motors, Etc. The Curtains Can Be Raised and Lowered by Motor and Orchestra Music Supplied Via a Phonograph.

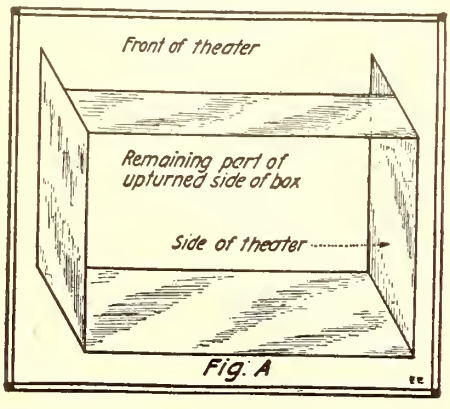

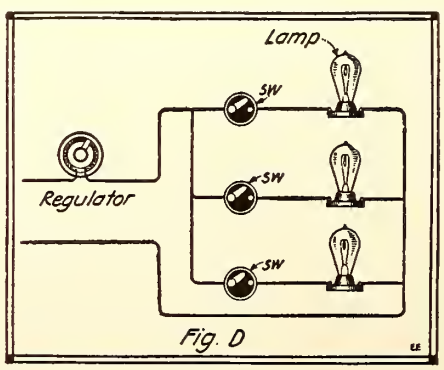

Fig. 1-A. Forming the Frame-Work of the "Home" Theatre. A Good Sized Soap Box Makes a Nucleus for the "Stage."

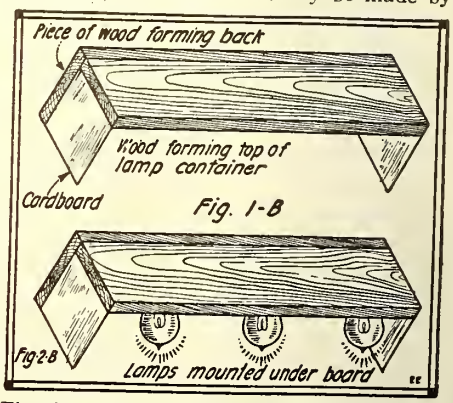


Next, go to a store dealing in electrical goods and buy three small colored incandescent "Christmas tree lamps" and miniature sockets to fit them. The bulbs come in many colors, but the best to choose for the theatre are red, blue and green. Having procured these miniature lamps, screw the sockets on the under side of the upper board forming the top of the table-like structure mentioned above, as shown in No. 2, Fig. B. The next step is to paint the inner walls and floor of the box with some very black substance, such as lampblack, etc. This is done to prevent any reflection of light from the walls and floor when the lamps are turned on. This paint being thoroly dried, begin to wire the instruments and lamps as shown in the lighting diagram D, shown elsewhere. The most convenient location for the instrument is on the remaining half of the upturned half of the box. The instruments are, respectively, one small rheostat or current regulator, and three one-point wood-base switches; by means of these separate switches any single one or any combination of the different lamps may be turned on, and by means of the regulator any degree of brilliancy may be obtained at will.

Having tested the three colored lamps, and having found that they operate satisfactorily and are easily controlled by their respective switches, start building the stage scenery. Let me say here that it is practically impossible to state just what scenes to make; the builder must decide that.

One of the most beautiful types of scenes is the "forest." This may be constructed very easily. For a background, go to some wallpaper dealer or paper hanger and ask him to sell you a yard or two of "forestry" wallpaper. This paper is usually printed with a representation of a forest or jungle on it, and makes a most excellent background for the model theatre. The easiest way to hang scenes in the back of the theatre is to cut the scenery to the exact dimensions of the back of the stage, then take some small sticks of wood (preferably flat pieces) and form them into a square of the same size as the dimensions of the scene, then paste the scene across the "frame" and hang it on the back of the theatre by means of miniature hooks or brads. (Be sure that you hang the scene on the theatre with the "frame" on the *rear* of the scene and not on the *front*, as in the latter case the frame would be visible and would tend to spoil the effect of the scene). Of course, "side scenery" and "ceiling scenery" are necessary, but these can easily be made by cutting them out of the "forestry" wallpaper described above.

Wiring Diagram for the Model Theater. Each Battery (or 110 volt) Lamp Has a Switch and All Three Lamps, Red, Blue and Green, Can Be "Dimmed" by the Rheostat.

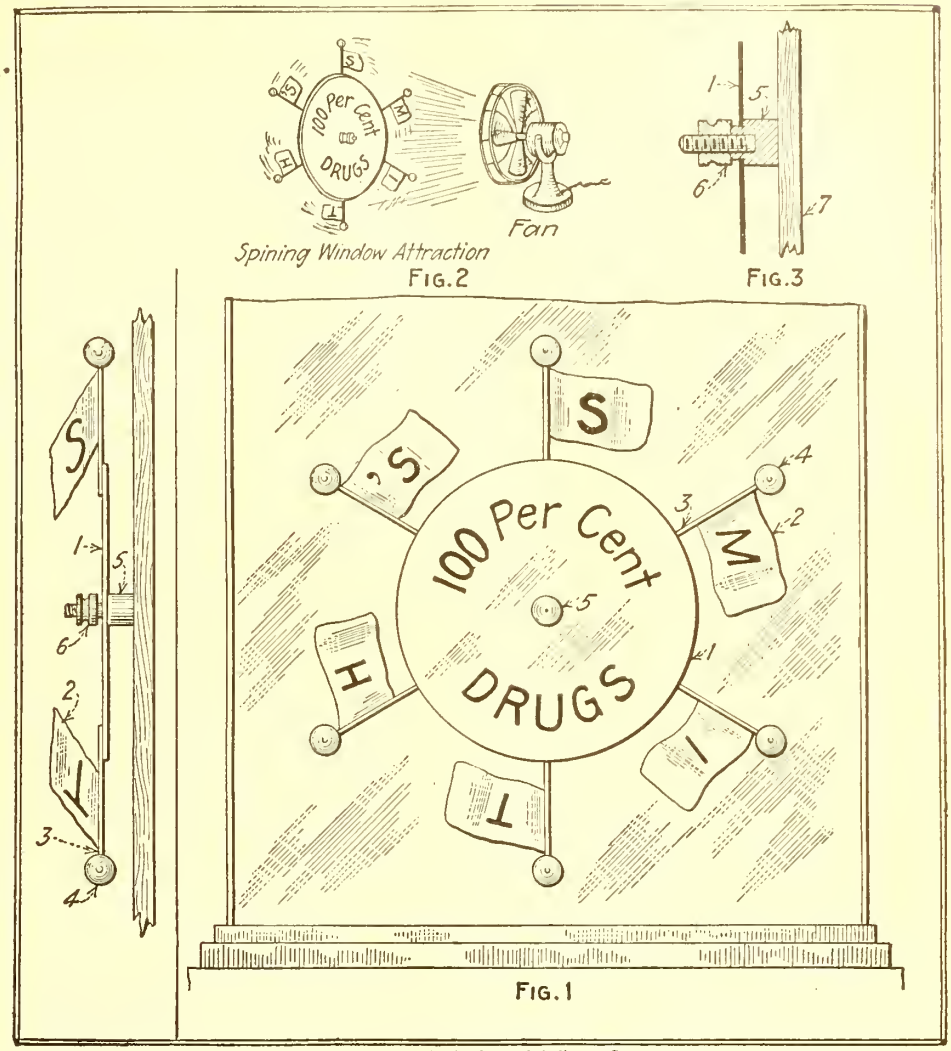
The Red, Blue and Green Lamps Can Be Mounted In a Small Box Like That Shown, and Mounted on Top the Stage Frame As In Fig. 1-C.

The side view of the complete theatre is shown in No. 1, Fig. C. The method of making the back scenery is more clearly illustrated in No. 2, Fig. C.

The main scheme in having the different colored lights and switching arrangement for them is to have different "effects" and various intensity of light to correspond with the change in the scenery. For instance, for a "forest" scene in which "dawn" is supposed to be the time, a faint blue, gradually becoming more brilliant, is suitable. For a "sunset" a combination of strong red and faint blue is necessary.

www.americanradiohistory.com

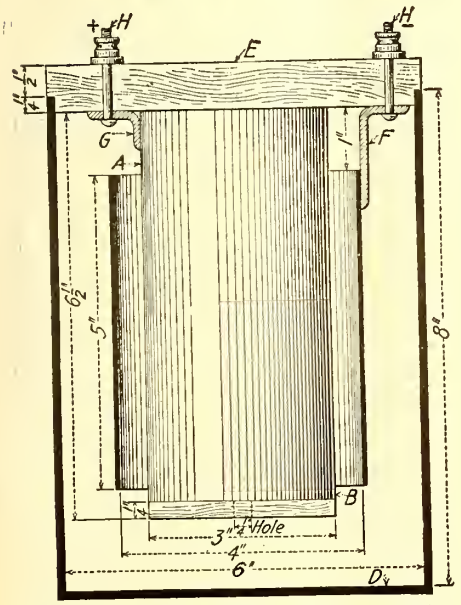
A Fan-Operated Show Window Attraction



Many store-keepers use their electric fans during the winter months to keep their show windows free from frost, and no doubt an effective animated attraction that is easy to make and will utilize this breeze from the electric fan for its motive power will be of interest. Such a device is described herewith.

It consists of a sheet metal disk upon which the desired advertisement is painted. This is left to the originality of the user, but it is suggested that it should be of few words and the lettering large and arranged in the form of a circle. Bright contrasting colors will help to make it conspicuous. The disk turns on a pivot fastened to the inside surface of the window glass at such a height, that it comes in direct line with the vision of a person walking by on the sidewalk. It is revolved by the current of air against the driving vanes which can be made in any desired form, such as a flag, broad arrow, etc. The pitch of these vanes should be adjusted by trial until the disk revolves at a speed that permits the advertisement to be read easily.

Referring to the drawings Fig. 1 is a front view as the device appears from the outside of window. Fig. 2 is an end view and Fig. 3 is a detailed sectional view of bearing. 1 is a disk of light sheet metal (aluminum) about 8 inches in diameter. 2 is a driving vane in the form of a light metal (1/64" aluminum) flag. 3 is the flag staff soldered to disk. 4 is a small metal ball for a neat finish and is the means whereby the device is balanced. 5 is a binding post forming the bearing for the disk and which is glued to the inside of window glass 7. 6 is the thumb nut of binding post to allow the disk to be quickly and easily removed so that the display can be easily changed from time to time. As shown in detail in Fig. 3, the bearing for the disk is made by turning down a portion of binding post so as to form a smooth projection just long enough so that when the thumb nut is tightened against the end of it there is enough play to allow the disk to turn freely. In operation this bearing should be oiled occasionally.



This attraction is very effective even when the source of energy is visible, but when the fan producing the breeze is concealed from view, the element of mystery adds wonderfully to its ability to attract attention.

Contributed by J. A. WEAVER.

A Window Attraction That Revolves at High Speed When Operated by the Breeze from an Electric Fan.

A Home-Made Edison Primary Battery

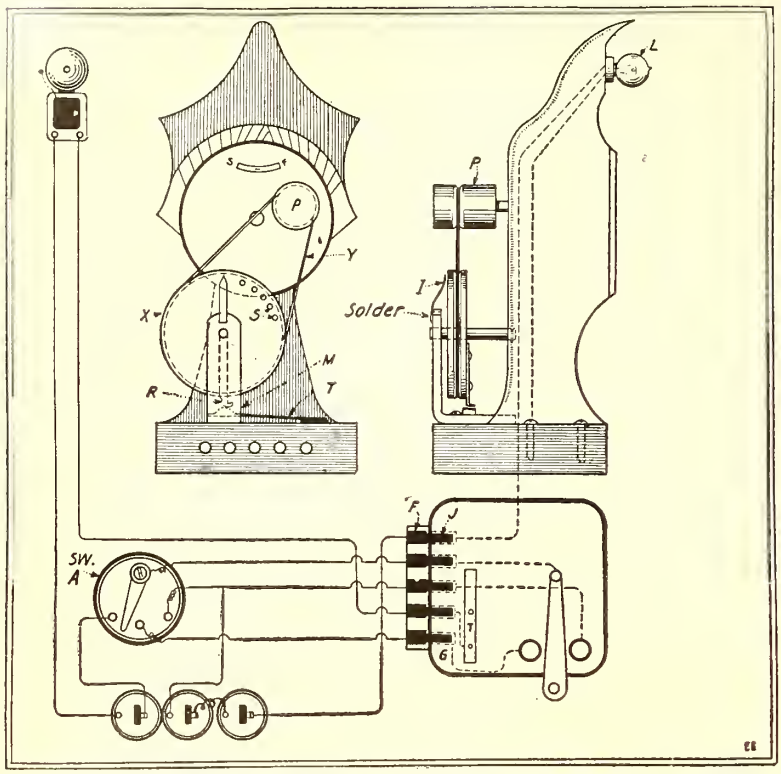
Home-Made Edison Primary Battery, Using Copper Oxid and Zinc Electrodes in Caustic Potash Solution.

The battery which I am about to describe will give good service and is not expensive to build.

This battery is of the Edison type and consists of a perforated copper pipe A, filled with red oxid of copper as the negative element and a zinc cylinder C as the positive element. (The positive *element* gives the negative *pole* and vice versa.) The exciting fluid is a 25 per cent solution of caustic potash in water, which means one pound of potash in three pounds of water.

The battery container is a glass jar D, which is 6 x 8 inches. E is a cover for the jar, and to this A and C are fastened by the lugs F and G. There are three lugs similar to F, and three to G. They are arranged around the top of the jar at an angle of 120 degrees with each other in the same set. To one of each set of these lugs, which are soldered to A and C, a common dry battery bolt H is fastened, as shown to the terminals.

The negative element A is a copper tube 3 x 6½ inches. It is punched or drilled full of ⅛-inch holes, and the bottom is closed by a piece of wood, B, which has been boiled in paraffin fifteen minutes. This is fastened in by taking a large nail and denting in the tube A on the wood. When you have finished the cylinder solder on the copper lugs F, which can be of copper strip, strong enough to hold up A, place these lugs around the cylinder at a distance of 120 degrees.



The positive element is made of zinc sheet rolled into a tube 4 x 5 inches. This has lugs F soldered on as shown, and must be well amalgamated, which can be done by rubbing the cylinder with dilute sulfuric acid and mercury.

Make top as shown in drawing of some soft wood. Boil this in paraffin for fifteen minutes, and then assemble the battery. Make a 25 per cent solution of caustic potash (be careful, as one drop might cost you your eyesight) and fill two-thirds of the jar. Now fill the copper element with red oxid of copper or cupron, which is a higher form of the ordinary commercial copper oxid. Then place your elements in and pour a layer of paraffin oil to a depth of ½ inch on top of solution. The battery is then ready to use. The E.M.F. of this Edison-Lalande cell is approximately .7 volt and the internal resistance 0.03 ohm. A 300 ampere-hour cell requires about 2¼ lbs. cupric oxid, yielding 1/5 horsepower-hour.

Converting a Dresser Clock to an Electric Alarm Type

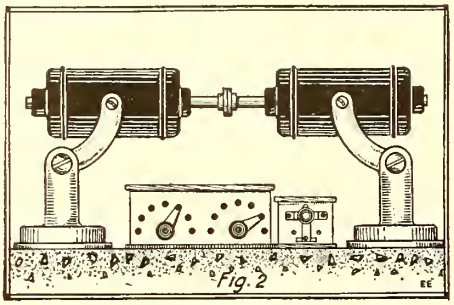
The ELECTRICAL EXPERIMENTER is one of those interesting chaps, who is forever telling us about some new-fangled electrical do-funny. In an earnest effort to make our lives more livable, but one thing he never does forget to tell us about is how to make an electrical alarm clock. But if we do say it ourselves, Mr. Beasley, the author of the present article, has really shown us something new in an electrical alarm clock which he has devised and constructed, so as to be a suitable attachment to any ordinary dresser clock. He also shows us how to rig up a most desirable night lamp on the front of the clock, so that by means of a switch on the base, or else mounted on the wall near the bed, one can turn on the light at any time of the night, so as to note the time, —the lamp serving besides as a bed-room light. The alarm can be set for any hour desired by the simple dial device shown.

The sketch illustrates how to make an electric alarm from a small dresser clock, and circuit for lighting lamp on dial from two different locations regardless of position of other switch; it allows alarm to be turned off from bed without getting up when switch "A" is placed near enough. A small grooved wood pulley "P" attached to the winding key of clock, rotates pulley "X" with rubber band "Y." Pulley "X" is of sufficient size to rotate only once in 24 hours. Alarm can be set for any time by setting marks "S" on pulley "X" to pointer "I." Marks "S" can be numbered if desired with two numbers each, one number to determine time to be set, and another indicating time it will give the alarm. The bell ringing contacts "R" and "T" close when pulley "X" is in position shown. Contact arm "R" is soldered to shaft to insure good electrical connection. Plugs "F" are tips from telephone cords inserted into receptacles "J" made from copper line wire sleeves, allowing clock to be detached from circuit. Wire at "G" is grounded to the clock frame. The circuit is self-explanatory.

The alarm clock device as here worked out, makes a very attractive and at the same time very useful apparatus, which anyone handy with tools can make. It is not necessary to obtain an extra battery for the operation of this alarm attachment; the regular house-door bell battery may be used.

Contributed by B. F. BEASLEY.

An Experimental Motor Generator



The diagram herewith shows the construction of a small motor-generator set, which may be used to generate direct or alternating current. First I will tell you the advantages of this set. Most all radio amateurs have had experience with spark coils and interrupters used on direct current. With this arrangement you put a heavy load on the 110 volt line, draw an excess amount of current which registers on the meter and increases the electric light bill considerably. Also you may notice that every time the key is prest the lights grow dim, and the larger the coil or transformer, the dimmer the lights will grow. This is very annoying to the other members of the household.

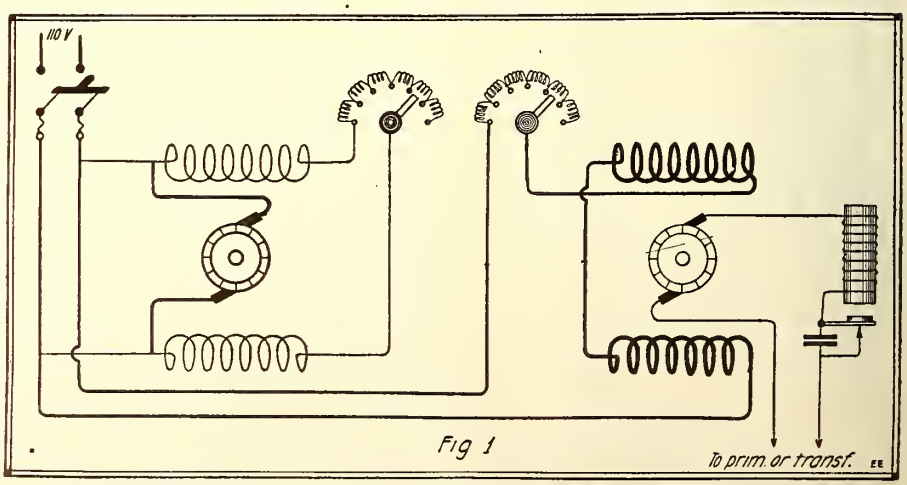
With the set here described you are getting your current from the armature of the second motor and the load on the 110 volt line is always the same. We all know that it takes more current to start a motor than to keep it going, after being started, so when your motor is started you have a constant load on the line, which is smaller than if the coil or transformer was connected in series with the line.

The articles required to build this set are a base 24" x 12" x 1½" and two discarded 110 volt fan motors, which may be bought from any electrical repair shop.

Fan motors are usually series wound. As constant speed is required, the field coils of the motor may be connected in shunt with the armature thru a rheostat. The field coils of the generator may also be connected in shunt around the armature, thus giving us the desired constant voltage.

The speed-regulating resistance found in each motor may be used as a field rheostat, or other resistances may be wound for the purpose. These may be placed in a box with two multiple switches, with desired number of contacts to act as a field rheostat for the motor, and one for the generator. The box may be placed beneath the coupling of the two armatures.

A Home-Made Motor-Generator Constructed from Two D. C. Fan Motors



If both are direct current motors and alternating current is required, this may be done by making an interrupter and placing it in series with armature current of the generator.

An interrupter may be used to a great advantage in increasing the frequency, if properly made. A core made of soft iron wire from three-fourths of an inch to one inch in diameter, and about two inches long, with about five turns of number 14 wire, will be sufficient. If the magnet is too large it will act as a reactance or resistance, and also the self-induction will cause a large arc at the vibrator contacts.

The vibrator can be made of a piece of spring steel cut to suit the maker. To be sure of good, durable contacts a piece of silver may be soldered onto the vibrator.

If the set is used on a 110 volt direct current line, the voltage taken off of the generator will be from 65 to 80 volts. If an A. C. machine is used the frequency will be low and may be calculated.

Measuring Resistance in Direct Current Machines

By Gustav E. Jansson
Associate Member A.I.E.E.

IF the resistance of a direct current machine is to be determined, the simplest way is to connect the armature to a source of low potential D.C. Then measure the potential between two commutator segments, each segment located under brushes of opposite polarity, as indicated in Fig 1. The segments are best marked with a punch so that the resistance is always measured between the same segments. The armature should, however, be turned so as to obtain a position to give as near as possible the mean value of the resistance.

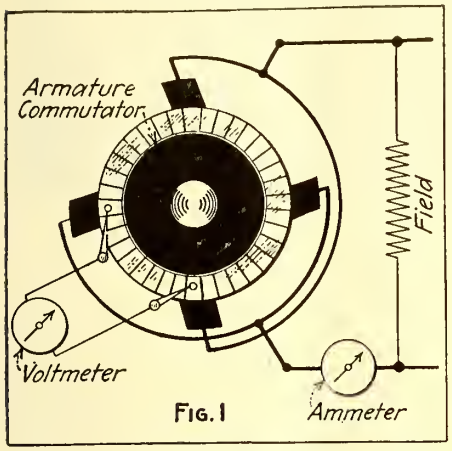

FIG. 1

To Measure the Resistance of a Direct Current Machine, the Current and Voltage May Be Determined by Means of Volt and Ammeter, in the Manner Here Indicated.

If the voltmeter indicates "E" volts and the ammeter "J" amperes, then we have:

$$R = \frac{E}{J} \text{ ohms}$$

and hence if "I" denotes the normal load current then $I^2 \times R$ denotes the copper losses in watts.

If it is not convenient to obtain a low potential source of ample capacity to measure the resistance as per above, then the resistance can easily be obtained in the following way, using a few storage batteries or ordinary dry cells as the source of energy.

Fig. 2 indicates the connection in detail. Now if,

P = Number of poles
P/2 = Number of pole pairs = p
a = Number of circuits in parallel, depending on armature connection (a = p for usual parallel connection, a = I for series-connected armature)
R_m = Measured resistance
R_t = Total resistance of winding
R_a = Actual resistance of armature to imprest voltage on brushes in running (Ohmic resistance only).

$$R_t = \frac{4p^2 R_m}{P - I}$$

$$R_a = \frac{R_t}{4a^2} = \frac{p^2 R_m}{a^2 (P - I)}$$

Now if the average temperature rise of the winding at full load is wanted it can be found as follows:

Let "R_c" be the resistance at a temperature of the surrounding air = t_c. Care being taken that the machine has been standing without load long enough to assume the same temperature as the air.

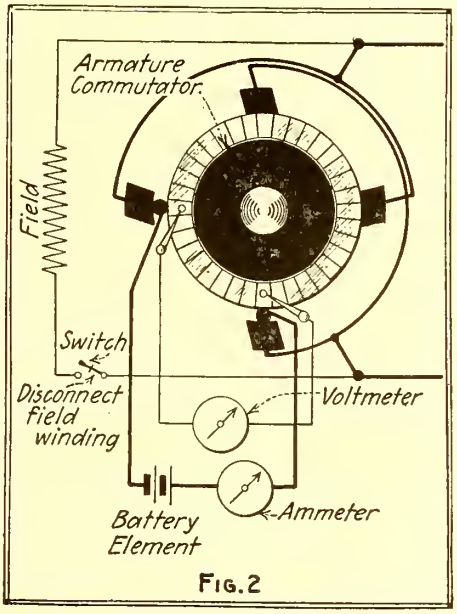

FIG. 2

Measuring the Resistance of D. C. Machinery on a Low Potential Source of Current, Such as a Battery, a Volt and Ammeter Giving the Necessary Readings.

R_h = Resistance of hot machine
t_h = Temperature of hot machine
k = Constant = Resistance increase per degree temperature increase
From equation $R_h = R_c (1 + k (t_h - t_c))$ we get

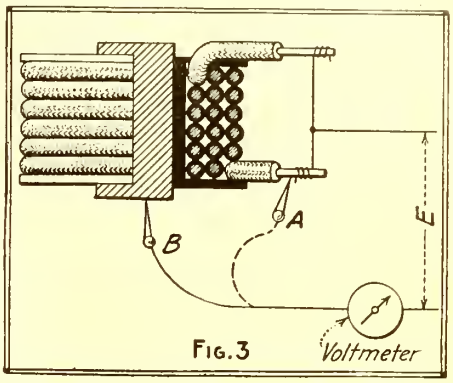

FIG. 3

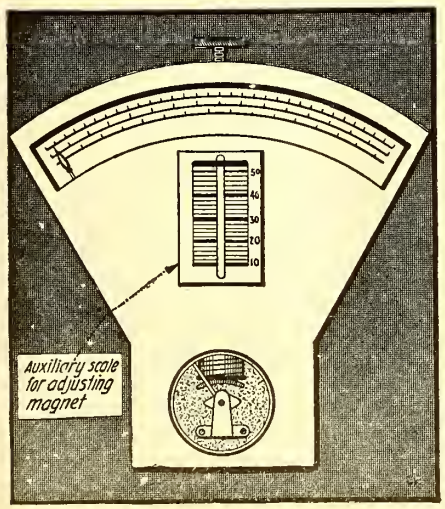
The Resistance of the Coil Insulation to Iron Core Can Be Measured With An Ordinary Voltmeter of Known Inherent Resistance.

$$t_h - t_c = \frac{R_h - R_c}{k R_c} = \text{The average temperature rise of the winding above the air temperature.}$$

This gives for copper winding about 2 — 1/2 degrees Centigrade or 4 — 1/2 degrees Fahrenheit for each per cent resistance increase.

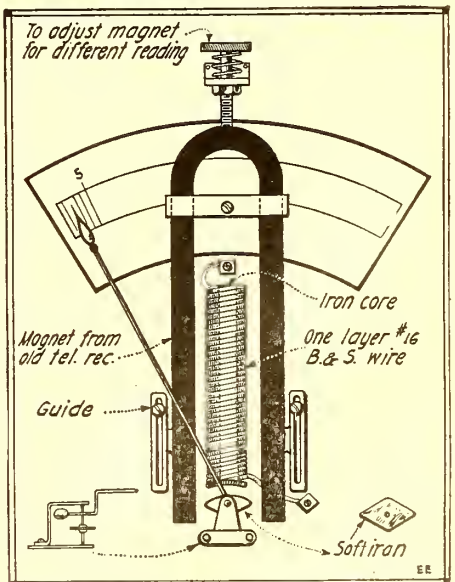


The resistance of the insulation to iron can be measured with an ordinary voltmeter of a known inherent resistance as shown in Fig. 3. Connect one pole of a suitable D.C. source to the winding as shown in figure. The other pole is connected to the voltmeter terminal. Complete the connection first to "A"; we obtain the imprest voltage "E" then connecting to "B" we get the voltage "E_2" and the resistance of the insulation is then

$$R_x = R_v \left(\frac{E - E_2}{E_2} \right) \text{ ohms, where } R_v = \text{voltmeter resistance.}$$

Care should be exercised, however, as a high potential will often arc over a much higher resistance than a supposed safe insulation resistance measured as outlined above.

A Home-Made Adjustable Ammeter



Needing an ammeter recently, I thought I would try to make one that could be adjusted to read any ordinary amperage. To adjust this instrument, all you need to do is turn the thumb nut which moves the steel magnet up or down. The further away from the magnetic vane the magnet is, the greater the sensitiveness of the meter. To graduate this instrument, I used an ordinary pocket ammeter with dry cells. First I screwed the magnet clear down, then connected the meter in circuit with the pocket ammeter which showed twenty-five amperes. This moved the other meter needle about three-sixteenths of an inch. I marked this point and divided the distance between said point and O into five parts, each part representing five amperes, and so on, until I finally had the scale calibrated for *four different readings.*

Front View of Home-Made Adjustable Ammeter.

In many cases the experimenter will find it convenient to utilize the moving element from a discarded pocket volt or ammeter for the instrument here described. With a little care and ingenuity he can thus refit this moving element into his new meter, and when this is done it is usually more satisfactory than a home-made armature and needle.

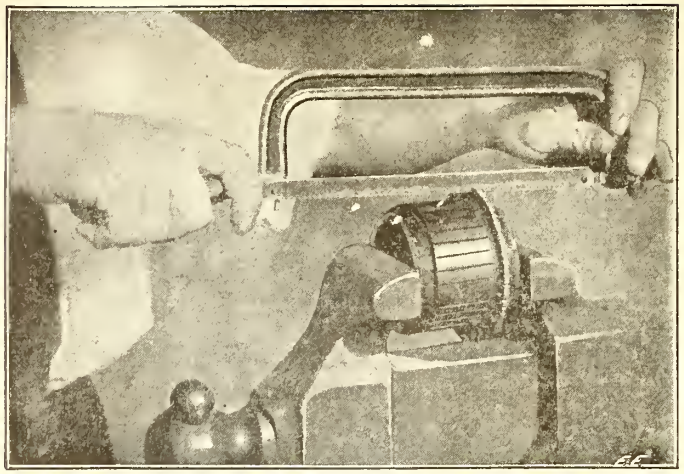

Fig. 1. Slotting the Connecting Lugs of a Commutator with a Hack Saw.

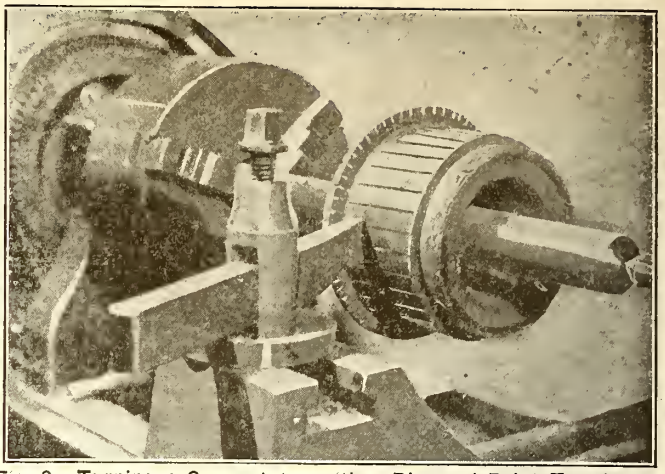

Fig. 2. Turning a Commutator with a Diamond Point Tool in the Lathe.

The Electrical Machinist

By H. WINFIELD SECOR

No. 1 Commutator Work

THE Electrical Machinist' for as such he is generally known to-day, is usually a machinist or electrician who has done a great deal of machine work, and who generally performs his work in an electrical repair shop or a machine shop, which does a certain amount of electrical repair work. One of the most delicate pieces of electrical machinery which the electrical machinist or experimenter who dabbles in mechanics encounters, is the *commutator*.

Fig. 1 shows the simple operation which has to be performed on many commutators, and a handy little wrinkle in this connection, will be mentioned. This consists of slotting the rear extensions or lugs on the copper commutator segments in which the lead wires from the armature coils are to be soldered. On small commutators of 1½ to 2 inches in diameter, a single hack-saw blade will usually give a sufficient width of slot, and this slot need be only about ⅛-inch deep, or sufficient to accommodate the two or more leads which have to be soldered in them. Where a wider slot is necessary on larger size commutators, two or more hack-saw blades are used in the frame of the saw, care being taken to see that all the teeth face away from the saw handle or in the same direction. The Star hack-saw blades which are tempered very hard, are generally used in all machine shop work, and a medium tooth pitch is desirable. If the pitch of the tooth is too fine, then the saw does not work fast enough, and a waste of time will result. If the pitch is too coarse, the teeth are easily shattered and broken out, thus wasting too many blades. The larger commutators, 4 to 5 inches in diameter, have their slots in the connecting lugs, milled out on a milling machine. An improved method for doing this in some shops is to place a milling cutter on an arbor, which is secured in the live chuck on a lathe. The commutator may be mounted on the moving carriage of the lathe, and is preferably secured by a stud and nut thru its center, so that after each slot is cut, the nut can be released and the commutator moved to bring the next segment in line with the milling cutter.

The *turning down* of commutators, illustrated at Fig. 2, is one of the commonest operations performed by the Electrical Machinist, and one which is liable to cause dismay to the embryo mechanic if he is not very careful as to how he sets about the operation. It must always be borne in mind that a considerable pressure is exerted at right angles to the direction of rotation of the commutator in the lathe while being turned, and also that commutators are not always as strong as they look. They consist of a large number of copper segments separated by mica insulating strips which are held under compression by the drum and clamping ring, which together form the commutator *shell*. If too much pressure is exerted by the tool on the commutator perifery, or if the turning

(Continued on page 717)

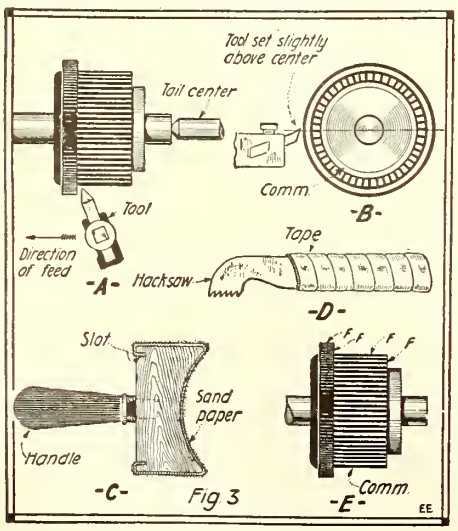

Fig. 3. Several Wrinkles of Value to the Young Electrician and Machinist Are Shown

ANNOUNCEMENT OF NEW SERIES, "THE ELECTRICAL MACHINIST."

For the past fifteen months, the publishers have been running a series of "Experimental Mechanics," which our thousands of readers everywhere who are interested in Machine Shop practice, either in an experimental or vocational way, have undoubtedly found both educational and instructive. This series of articles having now been completed, and in view of the fact that we have received many letters of commendation on our mechanical department in the Electrical Experimenter, and one that is eagerly looked forward to every month, the publishers have decided to start a new series of articles on Mechanics; especially written for the benefit of the Electrical and Radio Experimenter.

A new series of articles will appear, beginning with this issue, entitled "The Electrical Machinist," by H. Winfield Secor. Mr. Secor is an electrical and mechanical engineer of extensive experience, and his series of articles entitled "The Electrical Machinist," will undoubtedly appeal to all classes of readers, who not only are interested in a general way, but, should they intend doing any serious experimental work, MUST become interested in the mechanics of everyday shop practice. The trade of the Electrical Machinist is a recognized one everywhere today, and in the forthcoming articles Electrical and Mechanical shop wrinkles will be woven together so as to render the articles of the utmost practical value to the man who has to do the work. The readers interested in the pure mechanics of modern shop practice, will do well to procure back numbers containing the fifteen original articles entitled "Experimental Mechanics," and there are also a host of valuable books on the market available at nominal prices, which cover the orthodox details of the machinist's trade in a very thoro and complete manner. —THE PUBLISHERS.

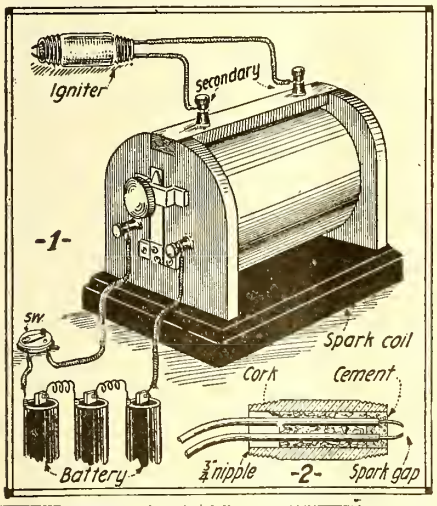
HOW-TO-MAKE-IT



This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

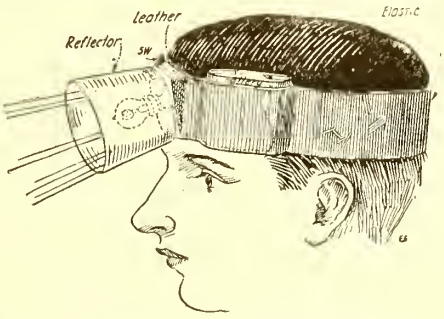
FIRST PRIZE, $3.00

AN ELECTRIC STOVE LIGHTER.

The above sketches are descriptive of a very easily constructed stove lighter, which is operated from the bedroom some distance away. All that was used were a few batteries, some double insulated wire and a small coil taken from the engine of a discarded motorboat. Fig. 1 shows a layout of the arrangement. Fig. 2 shows the igniter end. This was made out of a long cork driven into a short three-quarter inch pipe nipple. The cork was left about one-quarter of an inch from the point ends of the wire, and the space filled with an incombustible cement. The wires were pushed thru the cork, which afforded a very satisfactory insulation.

It was, of course, necessary to prepare the fire the night before, as shown by Fig.

Useful Home-Made Electric Stove Lighter.



3. The grates were covered with a thin layer of oily waste, a small wisp of which was drawn thru the grate teeth near one of the damper door openings in front. Into this was laid the igniter nipple, around which some of the waste was prest. The coil never failed to generate hot enough a spark to immediately fire the waste in contact with it, which instantly spread to that on the grates above. In turn the wood and the coal were rapidly ignited.

FRANK W. BENTLEY, JR.

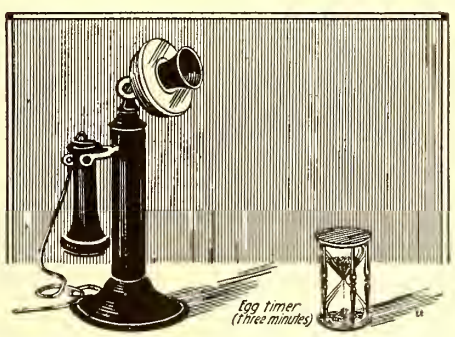
SECOND PRIZE, $2.00

MINER'S OR TROUBLE BATTERY LAMP.

This light is very handy where you are continually moving about and both hands are engaged in some kind of work, as it fits over one's head and no matter in what direction the eyes are turned, the object

A Trouble and Diagnostic Lamp.

is illuminated. Best of all, it can be made very cheaply.



The band around the head is made of leather with a piece of elastic sewed into it, to make it fit firmly and tightly about the head. The piece of wood screwed on the band is to give the light a slanting position, so that the rays of light will shine on the proper spot before the eyes. The socket is screwed to this piece of wood. The reflector is but a piece of shiny tin rolled in the shape of a cone and fastened on as shown. It not only reflects the light, but shades the eyes from the strong light above them. The batteries can be carried in the pocket, but it is more convenient to make a pocket in the head-band which will accommodate one or more flash-light batteries. Also make a switch as shown.

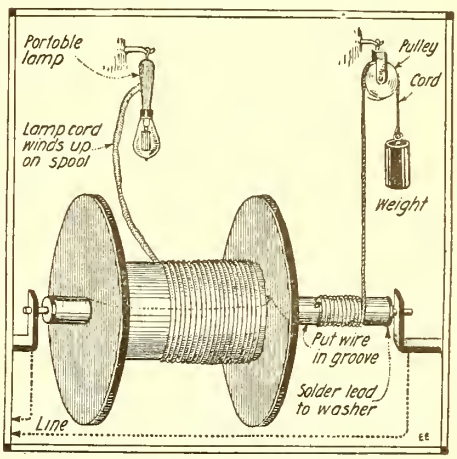
RAYMOND WENSINGER.

USE EGG-TIMER FOR LONG-DISTANCE 'PHONE CALLS.

A very handy timer for the usual three-minute long-distance telephone calls is the common sand-glass or egg-timer. This set on a shelf near the telephone is always ready for use and saves much bother, arguments and overcharges.

Contributed by FREDA POTTS.



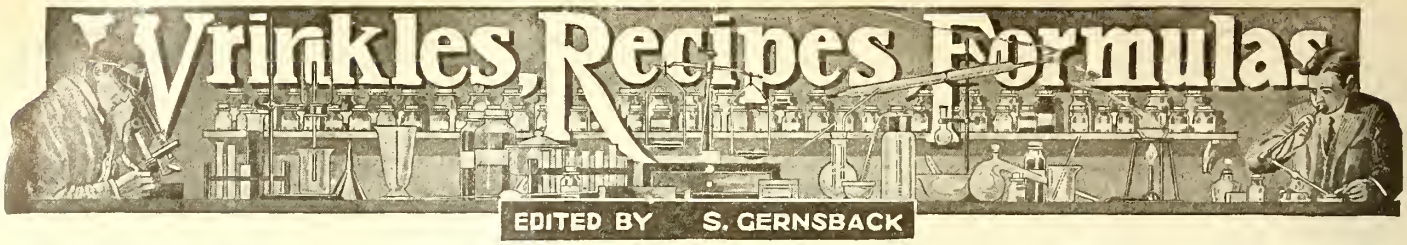
Using the Egg-Timing Sand-Glass for Timing Telephone Calls.

THIRD PRIZE, $1.00

AUTOMATIC REEL TO REWIND EXTENSION LAMP CORD.

The materials needed to make this useful device are—an empty wire reel, about ten inches in diameter, a piece of shade roller about three inches longer than the width of the reel, two shade brackets and two pins from the ends of shade rollers. Place the piece of roller in the reel to act as a shaft and drive the two pins, one into each end, with a metal washer underneath. One end of the roller is made flush, but the other end is allowed to extend. This is to form a place for the string to rewind, which has a weight attached and forms the motive power. The correct length of string can be found by experiment. Two leads are taken thru the reel, one on each side, and soldered to the washers on either end. The circuit is made thru the brackets, which act as bearings. To give this reel a finished appearance, it should be put in a box with holes cut at the proper places for the cord. The string which is used for motive power can be suspended over a pulley to take up some of its length. The diagrams will better explain the constructional details.

Contributed by W. E. CONWAY.



Making Automatic Reel to Rewind Extension Lamp Cord.

MAKING MAGNETIC CHARTS.

A permanent chart of the magnetic lines of force surrounding a magnet can readily be made as follows: A sheet of thin cardboard of suitable size is evenly coated on one side with paraffin wax, and over this is spread an even layer of fine grade iron filings. The magnet is placed against the under side of cardboard and the filings are agitated by lightly tapping the cardboard until their arrangement clearly shows the *lines of force*. Then they are "fixt" by holding over a hot stove or over a gas flame near the wax surface until it softens. When the wax is cool the magnet is removed and the filings, being imbedded in the wax, will retain their position.

DETERMINING THE MELTING POINT OF SOLIDS.

In accurately obtaining the melting point of some solids it is difficult to determine the exact instant at which the substance goes into a fluid state. This is particularly true when working with fats and crystalline masses.

A simple manner in which to make such a test is to place a small amount of the substance on the bulb of the thermometer. The thermometer is then past thru a cork and in this manner suspended in a test tube which forms an air bath. The test tube may be immersed in water or glycerol while being heated.

The material on the bulb will be clearly visible due to the refraction of the light while in a solid state but as soon as it becomes fluid the bulb will clear up.

Fats and waxes may be scraped with a knife, a few shreds put on the thermometer. Crystals should be powdered and the bulb immersed in the powder so a few grains will adhere to the bulb.

SILENT DISCHARGE OZONE APPARATUS.

First procure a Liebig's condenser. After all traces of dust have been removed from the Liebig's condenser a coating of tinfoil is placed upon the outside, two inches from each end, by means of shellac, and also another coating is placed upon the inside surface of the inner tube. If this is found difficult the inner tube may be filled with fine shot or iron filings, which will answer the same purpose as the tinfoil.

The condenser should now be clamped to a support and the secondary of a good induction coil connected to the two tinfoil coatings. An oxygen generator is now connected to the condenser and the coil started.

The working of the apparata is as follows: A stream of oxygen gas is past slowly thru the condenser while the induction coil is in operation, the discharge taking place silently. This gives ozone best, as it does not involve any rise in temperature, which would cause the ozone formed to change to oxygen, as may be seen from the equation:

$$3O_2 \leftarrow 2O_3$$
$$3O_2 \rightarrow 2O_3$$

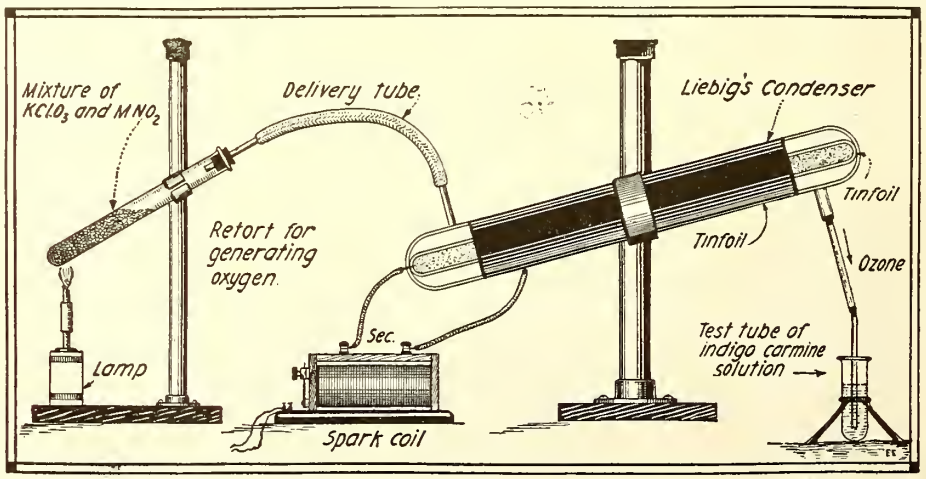
The reaction being a reversible one.

Ozone, its Properties, Test and Use: Ozone is a gas of deep blue color with a peculiar odor. It is more easily liquefied than is oxygen, and it is more soluble in water. Its density is one-half greater than that of oxygen, as seen by the formula O_3.

Ozone is an allotropic and an unstable form of the element oxygen. It oxidizes the same substances as does oxygen, but more vigorously. It rusts silver to black silver peroxide, Ag_2O_2

$$2Ag+2O_3 \longrightarrow Ag_2O_2+2O_2$$

If ozone is allowed to bubble thru a dilute solution of indigo carmine, a yellow substance of much paler tint known as *isotin* is formed:



$$C_{16}H_{10}N_2O_2+2O_3 \longrightarrow 2C_8H_5NO_2+2O_2$$
Indigo+ozone———>isotin+oxygen

If a bottle or empty test tube be substituted for the one shown in the drawing, ozone may be collected mixed with oxygen, and various other properties of the gas may be observed.

Ozone is used in some cities, as Paris, Florence and Petrograd, for purification of water. It is used commercially for bleaching purposes.

Ozone oxidizes sulfur dioxide to sulfur trioxide and sulfurous acid to sulfuric acid, as shown:

(1) $SO_2+O_3 \longrightarrow SO_3+O_2$
(2) $H_2SO_3+O_3 \longrightarrow H_2SO_4+O_2$

A Simple Apparatus to Produce a Silent Discharge of Ozone, Easily Constructed by Any Experimenter Who Wants to Study This Interesting Gas.

EXTEMPORIZED FRACTIONAL WEIGHTS.

Weights of small denomination—grains, and fractional parts of a grain or gramme—are generally too small to be conveniently handled, unless one uses a pair of forceps. The writer has found it convenient to make a fresh set of small weights from copper wire of small gauge. It is only necessary to find the exact length of wire required to balance a given weight, when a simple calculation will show the length needed to make weights of any required size. After cutting off the correct lengths for weights of 2, 3, 4, or 5 grains, the wire may be bent into a helix or cylindrical form, the number of turns serving to indicate the number of multiples of a grain. Similarly, a one-grain weight may be made in the form of a ring, while the fractions may be gridiron-shaped, each prong representing one-tenth of a grain.

Contributed by H. G. GRAY.

SYMPATHETIC INKS.

Euchlorin: Add to two or three crystals of potassium chlorat a few drops of hydrochloric acid and heat a moment. When the tube fills with gas add water and shake. This when used as ink and the writing heated will turn a golden yellow. Euchlorine can also be used as a test for iodin—proceed as follows: Make a solution of element to be tested and add some starch and a few drops of euchlorin; the blue color shows the test.

Sympathetic Inks: 1. Make a mixture of 1 part hydrogen peroxid, 1 part euchlorin, and 1 part Barium chlorid solution; when heated, the writing will turn black.

2. Write on a piece of paper with some undilute sulfuric acid and while the writing is wet, heat it in a flame, but do not let the paper get on fire, and the writing will appear in lines like engraving.

Cont. by STEVENS SANDERSON.

SOLDERS FOR ALUMINUM.

The use, serviceability, method of application, and composition of solders for aluminum are discussed in the light of special tests made at the Bureau of Standards on commercial and other compositions of solders. All soldered joints are subject to rapid corrosion and disintegration and are not recommended except where protection from corrosion is provided. Suitable compositions for solders are obtained by the use of tin with the addition of zinc or both zinc and aluminum within wide percentage limits. Solders are best applied without a flux. The higher the temperature at which the "tinning" is done, the better the adhesion of the tinned layer. A perfect union between solder and aluminum is very difficult to obtain, but the joint between previously tinned surfaces may be made by ordinary methods and with ordinary soft solder. Only the tinning mixture need be special. Tables of the composition of many solders are given.—Bur. Stand. Circular No. 78, 1919,

CHEMICAL TESTS OF MILK.

Artificial Preservatives in Milk—Put about 10 c.c. of milk in a beaker and add about 10 c.c. of concentrated Hydrochloric Acid in which a few grains of Iron Chlorid have been dissolved. Heat gently, and stir constantly. If the milk contains some artificial preservative (in this case, Formaldehyd), a purplish color will result.

Fat in Milk—Dip a piece of filter paper in some milk and carefuly dry, allowing no dust to come in contact with it. After it has thoroly dried, soak it in Carbon Di-Sulfid until all the residue is dissolved in it. Pour the liquid onto a watch-glass and carefully evaporate over a water bath. The substance remaining in the watch-glass is the fat.

RADIO DEPARTMENT

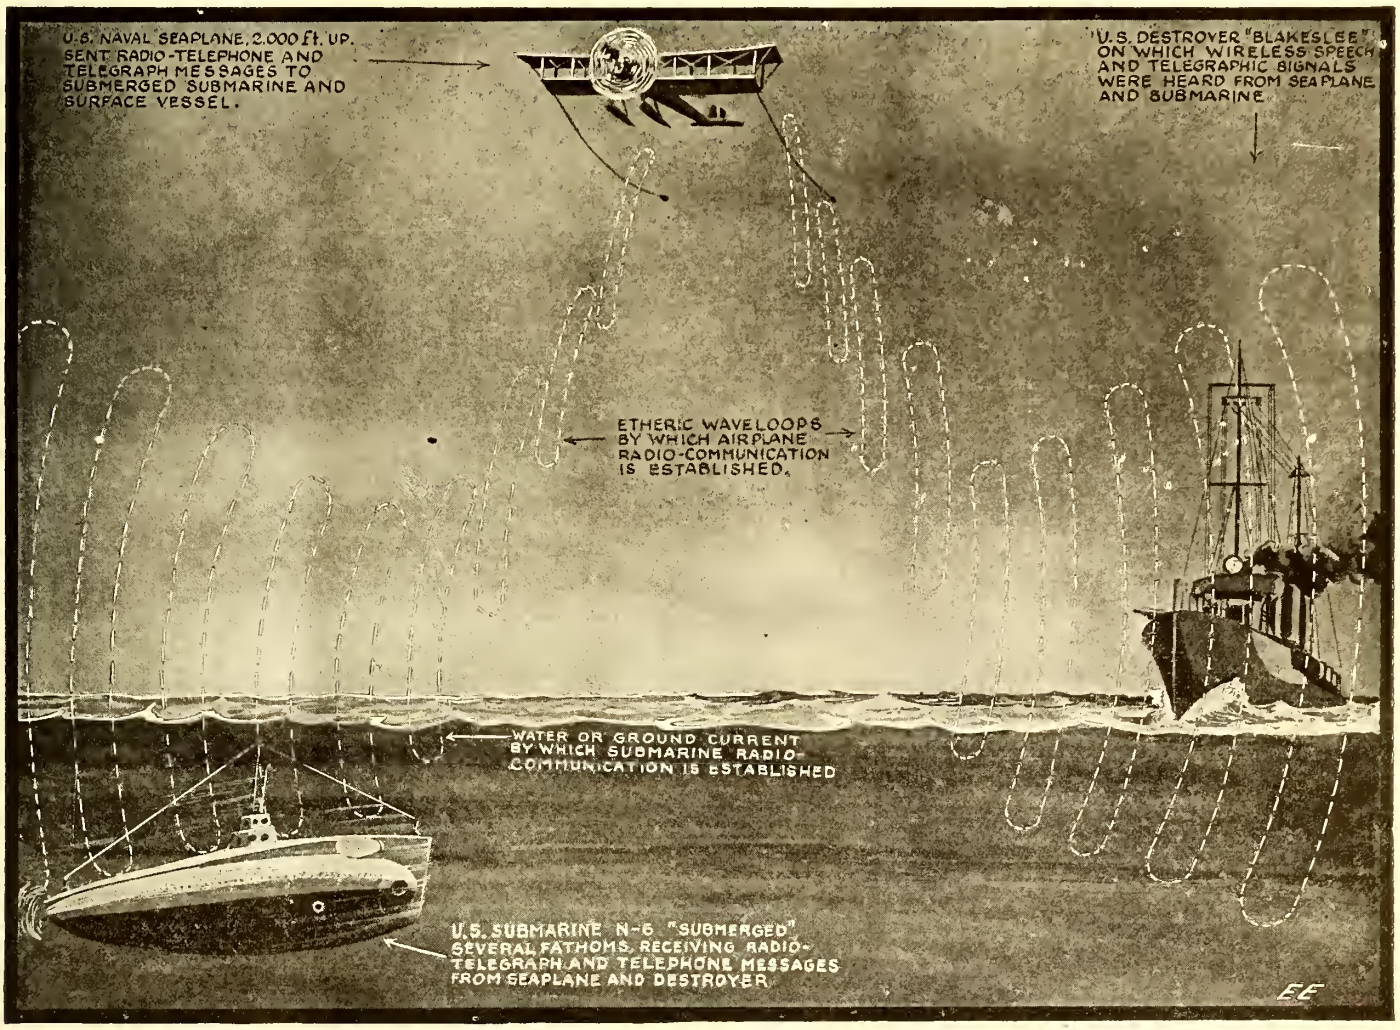
The Submarine's Under-Water Radio

AN American hydroplane, 2,000 feet up, talked recently with a submerged submarine at Fisher's Island, six miles from New London Harbor, off New London, Conn. The conversation from both plane and submarine was listened to by a party of 250 engineers, members of the Edison Society of Electrical Engineers.

As guests of Captain J. R. De Frees, commander of the experimental station, about one hundred of the engineers boarded the destroyer U. S. S. *Blakeslee*, while others boarded a subchaser. The submarine N-6 dived several fathoms, and the water craft established both wireless and wireless telephone communication with her. At the same time a hydroplane established radio communication with the surface craft and with the submarine. The conversations were plainly heard by the engineers aboard the surface craft.

The system of radio communication thru both air and water was worked out at the local station, and will be made a part of the regular naval equipment when final tests are made. *The system enables an airplane, which can see submerged submarines, to direct a friendly submarine to the accurate firing of a torpedo at the enemy submersible.*

The airplane carries on radio-communication by means of an antenna wire, or wires, trailing down from the wing tips or else from the fuselage. These wires have weights at their lower ends, and are generally arranged to be quickly reeled in or out as desired. The aerial on submarine destroyers comprises several wires supported between the two masts.



Considerable experimental work has been carried on in the past year with submarine radio, and the tests between the airplane and the submerged submarine marked the culmination of a series of important researches in this direction by the government. The experiments have shown that communication at sea can be carried on under all conditions, more efficiently with an insulated closed loop than with an ordinary antenna now in general use. The loop is of simple construction, requires no mast and therefore does not interfere with submergence. Under storm conditions or during a submergence where the ordinary antenna is useless, communication by means of the closed loop is perfectly practicable. Details and results of the official tests were given in full detail in the *October* issue.

The design and specification of the submarine closed loop antenna are given below:

DETAILS OF SUBMARINE LOOP ANTENNAE.

The loop antenna consists of two insulated wires *grounded* at the extreme ends of hull carried over suitable supports to the bridges, and thence thru radio lead-ins to the apparatus.

Nauen Radio Opened Again

THE powerful German radio telegraph station located at Nauen, Germany, and from which during the war, thousands of messages were sent broadcast, both of an official military nature, and also in the form of propaganda to the outside world, is shown in the accompanying photographs.

The main building is of special brick as may be perceived in the photograph, and is quite an imposing structure. It is of typically German architecture and quite severe in some of its details,—in fact, in some ways it looks more like a fortress of mediaeval style than it does a modern wireless power station. These photographs are

The Vossische Zeitung, Quoting Official Sources, Recently Gave Details of the Arrangements of Wireless Communication Between Germany and America. The Newspaper Says Efforts Will Be Made to Induce the United States to Release Other Wireless Stations Than That at Belmar, N. J., for Service with Nauen. The Imperial Post Ministry Has Established a Special Department to Solve This and Other Wireless Problems Under Herr Bredow as Director. He Will Attempt to Make the Wireless Cheaper Than Cable Communication.

very interesting indeed to us, as they are the first to be taken of the Nauen wireless plant since the declaration of war by Germany in 1914. Visitors to this great radio plant, one of the most powerful in the world, even at the present day, will hardly recognize the grounds or the antenna system, as many changes were made by the ex-Kaiser's radio experts during the war. These changes were made from time to time as new improvements and greater ranges were necessitated by the exigencies of military operations. The Nauen station has a large number of the latest style masts stretching out for a great distance on all sides, from the tops of which there extend vast aerial wire net-works which are connected with the radio station building. Some of the steel masts tower 600 feet into the air, while other masts measure 400 feet in height. These latest style towers rest on massive glass insulators at their feet, and they are guyed in position by one-inch stranded steel cables which are broken up into short sections, by means of large strain insulators, so as not to permit a loss of energy either in receiving or transmitting, due to these different lengths of guy wires being in tune with the fundamental wave length used, or possibly upper or lower harmonics of the fundamental wave.

One of the accompanying photographs shows a very interesting view of the interior of one of the transmitting apparatus rooms of the Nauen Station. As will be noted, the station building which was erected before the war is quite ornate and somewhat resembles the interior of American radio and central stations. The ceiling is covered with glass panels thru which light is transmitted as well as thru the windows from the side walls.

Several motor generator sets, as well as tuning helices and high tension step-up transformers, are shown on the main floor of this room. The floor as well as the side walls are of colored tile, which is a very attractive and sanitary finish for the interior of such a building. The Nauen radio station has employed from time to time different transmitting apparatus, including arcs, quenched gaps and high frequency alternators. At one time the Nauen plant was reported to be using a 200 kilowatt Goldschmidt alternator.

GREAT GERMAN WIRELESS STATION RESUMES COMMUNICATION WITH AMERICA—The Great Wireless Station at Nauen, Germany, the Largest and Most Powerful in the World, Has Resumed Uncensored Radio-communication with American Stations. The Photo at Left Shows a Part of the Gigantic Aerial Wire System Erected During the War at the German Station. The Photo Below Shows the Interior of the Generating Plant of the Nauen Station, Rated at 600 Kilowatts.

The receiving apparatus used at this station is provided with recording as well as very efficient amplifying intsruments, and messages from all parts of the world are daily received and recorded at this station. The amplifiers now in use, and also those employed during the greater part of the war, utilized vacuum tubes similar to the

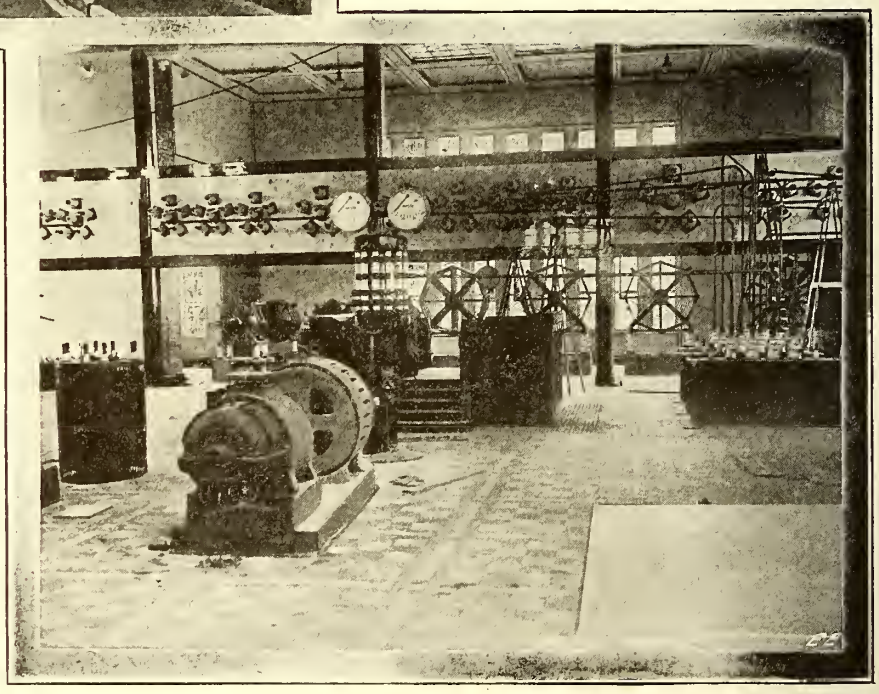

Photo Copyrighted by International Film Service.

De Forest audion, but the electrodes of which are coated with metallic oxides so as to give a very powerful electronic emission when heated. These bulbs were devised by Lieben and Riez, and are claimed to have a very high amplification factor,—in fact, superior to any other vacuum bulb amplifier in the world. But this hardly seems to be the case from the evidence which we have heard against it from time to time, gained from radio experts and officers who have become familiar with the German form of tube. Many of these tubes

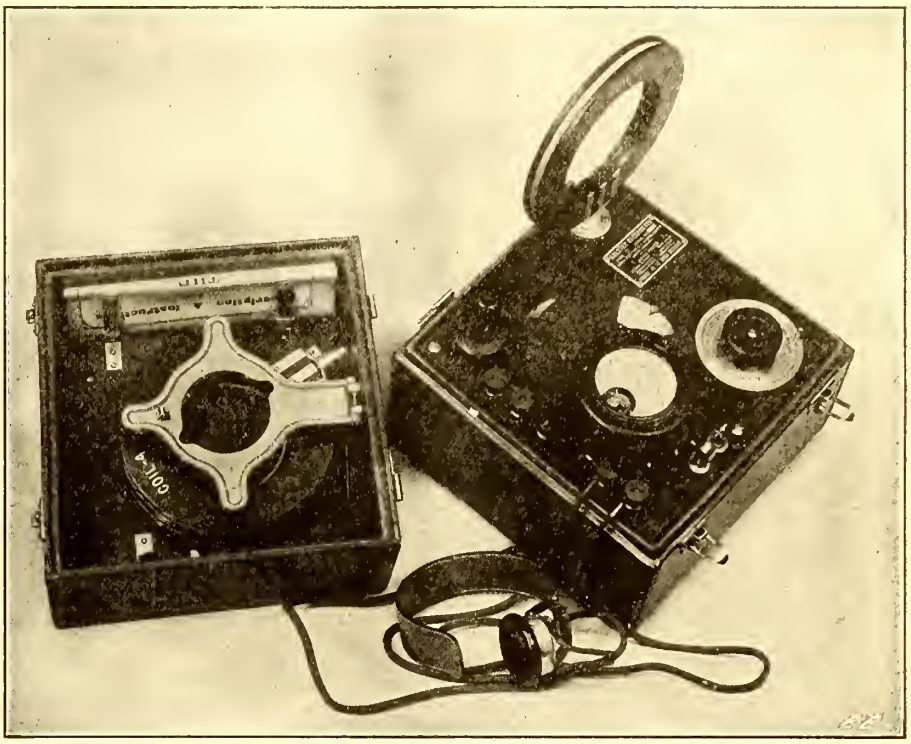
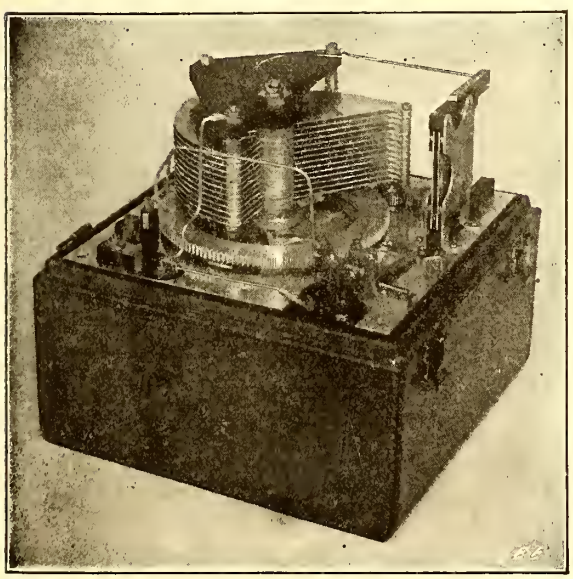
The New Kolster Decremeter and Wave Meter



THIS instrument was designed for the purpose of facilitating the measurement of wave length and logarithmic decrement of radio circuits. It is portable and of rugged construction and may be used for field work as well as for laboratory purposes. The instrument is essentially a wave meter consisting of a variable condenser, four inductance coils and a sensitive hot wire indicating device, the readings of which are proportional to the square of the current passing thru it. A crystal detector and head telephone are provided and wave-length measurements may be made either with the crystal and telephone receivers or with the hot wire instrument. A buzzer is attached to the instrument in order, that it may be used as a transmitter for calibrating purposes.

The inductance coils are connected in the circuit by placing them in the holder near the back of the instrument. The condenser may be varied by turning the knob, on the right-hand side of the instrument, care being taken to see that the lock on the opposite side of the case is released. The condenser scale, reading from 0 to 180 degrees, appears in a depression near the back.



For the measurement of wave length, four scales are provided. The scale which is to be used with a given coil is indicated by a pointer which operates automatically by the insertion of the coil in position.

Beneath the condenser knob is a scale which is marked off to the right and to the left of the zero line from 0 to 0.30. These scale divisions represent the sum of the logarithmic decrement of the transmitter and of the decremeter, $\delta_1 + \delta_2$, δ_1 being the decrement of the transmitter under test and δ_2 the decrement of the instrument. δ_2 is given for each of the inductance coils for various settings of the variable condenser.

There is an index mark 0, which is movable about the knob and which may be rotated until it is in line with the zero on the scale. The hot wire instrument is connected in the circuit by placing it so that its lugs fit into the lugs on the top of the instrument. When the hot wire instrument is removed, its terminals are short circuited so that the wave meter may be used with the buzzer or crystal detector. Extending above the glass of the hot wire instrument is a small screw for adjusting the zero of the instrument.

Lower Case and Cover of New Direct Reading Kolster Decremeter and Wave Meter. The Four Inductance Coils Are Retained in the Lid by a Special Clamp as Shown.

View of Variable Condenser, and Other Parts of New Kolster Decremeter and Wave Meter Obtained by Turning the Lid of Cabinet Upside Down.

Measuring Wave Length.

In making wave-length measurements the instrument should be placed as far away from the coils of the transmitter as practicable, beginning with a minimum coupling, between the wave meter and transmitter, as the hot wire instrument is sensitive and will burn out if too much current is past thru it. When making wave-length measurements, it is not necessary to get full deflection of the hot wire instrument needle and it is best to use as small coupling between the antenna circuit and wave meter as possible.

The wave meter is in resonance with the transmitter when the deflection of the hot wire instrument is a maximum, as indicated by the fact that the deflection becomes less when the condenser is turned in either direction from this position. The wave length is then indicated by the pointer on the wave-length scale.

More accurate measurements of wave length may be made by observing the reading on the condenser when the instrument indicates resonance. The wave length may then be determined by referring to the calibration curves which accompany each instrument.

Separate calibration of the instrument when it is used with the crystal detector and with the buzzer are furnished.

When the instrument is used with the crystal detector, the telephone receiver should be connected to the binding posts so designated and the hot wire instrument and buzzer battery removed. The condenser scale should be observed and reference made to the calibration curve.

Measurements of Logarithmic Decrement.

The well-known Bjerknes method of obtaining the *logarithmic decrement is used.* The task of making experimental observations and the necessary calculations required by the Bjerknes formula is, however, eliminated by the use of this instrument. The sum of the decrements, $\delta_1 + \delta_2$, is read directly from the scale under the condenser knob after proceeding as follows:

1. Before connecting the hot wire instrument to the decremeter set the needle to zero by means of the adjusting screw.

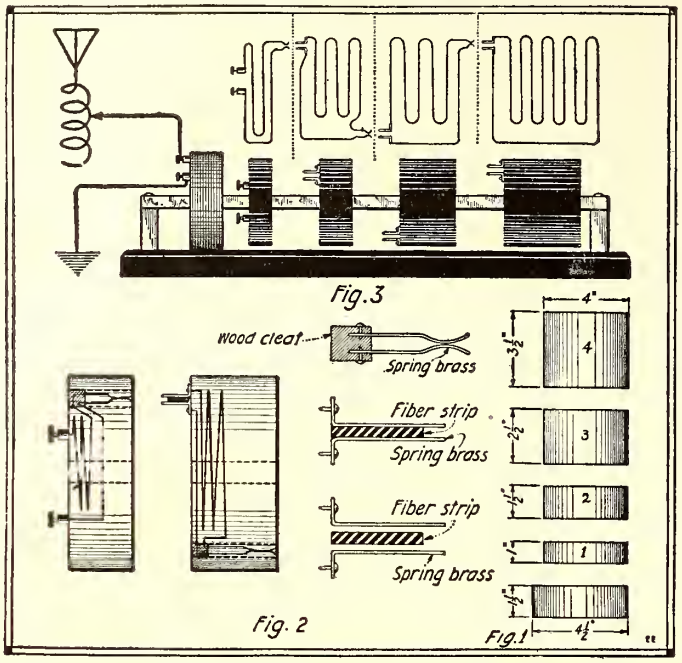
2. See that the detector point is not in contact with the crystal and that the buzzer battery is removed.

3. With very little coupling between the wave meter and the transmitter, adjust the variable condenser until a maximum deflection of the hot wire instrument is obtained.

4. Increase the coupling until the deflection of the hot wire meter is somewhat more than half of the scale, if this is possible without making the coupling too tight. In case the current in the transmitter is small the deflection used must also be small, otherwise inaccurate results will be obtained.

5. Carefully turn the condenser handle in either direction until the needle of the hot wire instrument drops to one-half of the maximum deflection.

6. Rotate the movable index mark around the scale surrounding the condenser handle until the two zero marks are exactly in line, taking care not to change the position of the handle.



7. Carefully turn the handle back until the needle of the hot wire instrument makes a complete excursion from half deflection thru the maximum and back again to half deflection. The reading on the scale now opposite the indext mark O, will be $\delta_1 + \delta_2$, or the decrement of the transmitter plus the decrement of the instrument.

Improving the Amateur Receiving Set

By EDWARD T. JONES

IN ordinary Amateur Radio receiving sets constructed by themselves the coupling coils which connect the detector and antenna circuits are a great source of loss of power, due to poor design and faulty construction principally. For these reasons I take great pleasure in laying before the everyday experimenter plans and specifications of a receiving set which will undoubtedly mark the line of *Efficiency* thruout its circuits and operation. A few words as to the reasons for such results will not be amiss. Absolutely no sliding contacts should be used, owing to the fact that they are of high resistance, gather dirt, and the filings produced by the sliding process lodge in between turns and short-circuit them. Taps should not be taken off the coils for the purpose of varying the inductance; this produces "dead-end" losses and results in a considerable weakening of the incoming signal. The coils should be wound on separate tubes or spools, as shown in the diagrams. Arrangements are made to connect the coils together when more inductance is necessary, and all windings are of stranded wire (Litzendraht) to minimize the high-frequency resistance.

New Sectional Loose-Coupler for Amateur Work. PRIMARY: Form —4½" diameter, 1½" wide, 1" winding, Turns 30, Feet 35, Six Strands No. 36 S.C.C. SECONDARY WOUND WITH 3 STRANDS OF No. 36 S.C.C. CORE DIMENSIONS—No. 1: 4" x 1"; No. 2: 4" x 1½"; No. 3: 4" x 2½" and No. 4: 4' x 3½". Winding Space—½"; 1"; 2" and 3", respectively.

THE LOOSE COUPLER.

Litzendraht was produced for the primary and secondary in the following manner: Three strands of No. 36 were twisted together for the secondary windings, and six strands of No. 36 for the primary winding. The primary consists of only thirty turns and arrangements are provided in the elementary circuit for cutting in either the loading coils or the variable condenser in series with the same, each at a time, in order to make it possible to increase or decrease the wave length beyond that of the tuner primary itself.

The wooden cores shown in Fig. 1 are the forms upon which the windings are placed, and in the same figure are shown means of connecting them together when necessary.

THE DETECTOR.

The detector is a great energy-consuming and generally a energy-wasting device of the receiving circuit, and can hardly be avoided. Of course if the audion is to be used in place of the crystal rectifiers conditions are greatly changed and amplification instead of loss of received energy is the result. Crystals vary immensely in resistance, but in order to obtain as little loss as possible, low resistance crystals should be used, providing, however, their rectifying qualities are good. Owing to the fact that measurements taken on the Wheatstone bridge will not show anything, because the high-frequency resistance will differ greatly when the crystal is under operation, the only thing to do is to get an assortment of different crystals and try them until a good one is obtained. The crystals should be fastened in the cup with copper-mercury amalgam, and all posts supporting either the cup or point should be strong and firmly held to the base so that when a good adjustment is arrived at there will be little chance of losing energy thru faulty connections.

CONDENSERS.

In the receiving set we have very low voltages, and for this reason our condensers are generally quite efficient. Nevertheless, a few hints as to its operation may be of value. The condensers should be dust and moisture proof to protect them from *short-circuits* and *leaks*. They should be kept away from tuning inductances to avoid losses by induction. The dielectrics used should preferably be those having little hysteresis loss, as in some dielectrics this loss does not depend on the stress under which the dielectric is placed, but is always constant and a source of loss.

TELEPHONE RECEIVERS USED IN RADIO.

The factors of efficiency in receiver telephones are chiefly the following: The diafram should be placed as close as possible to the pole pieces to keep magnetic leakage low; however, space for variation should be provided. It should be as light as is consistent with sturdy construction. Heavy enamel should not be used for painting, owing to its increased weight without increased efficiency. The magnetic field in a receiver is quite weak, and the lighter a diafram is the greater will be the amplitude of its vibration, consequently the louder the tone. Also, the smaller the diameter of the diafram the easier will it move. Every article possesses a natural period of vibration, i.e., the number of times per second an object will vibrate if struck a blow. From the foregoing it will be easy to see that if a force acts upon it which strikes in the same number of times per second as is the natural period of the object (diafram in this case), it will vibrate to a much greater extent than if the period of the force were something else. Since a diafram vibrates in response to an external force (the pulsating magnetic field in the 'phone proper), if the natural period of the diafram is the same as that of the magnetic field, the resulting amplitude of vibration will be much greater than it ordinarily would be.

For instance, if we are receiving a message which is sent on a 500-cycle spark set, which gives a tone of 1,000 sparks per second, and the diafram of the receiver has a natural (vibrating period) of about 1,000 per second, the result will be a much louder note in the 'phones than would result from using a different diafram or one having, say, a vibrating period of 600 or 800.

The sensitivity of a receiver is the smallest current which will give an audible response when past thru it. A good, practical test for this is to tap the two telephone cord tips lightly on the end of the tongue; if they are what is termed *sensitive* they will produce a click in the 'phones, thus detecting a very slight amount of current generated by placing the two tips in saliva. The usual method of testing 'phones for their sensitiveness is to connect a buzzer to the primary of your loose coupler and the receivers to the secondary, making note of the distance which the two coils were separated when practically no signal was audible. The sensitiveness of two different receivers may be measured by the above mentioned method. The receiver which permits the greatest amount of coupling between the two coils is the *more sensitive one.*

CONNECTIONS.

All connections should be stranded wire and well soldered. All switch contacts should be good, especially in button switches, and kept free from oxid and dust. No steel or iron should be permitted in any part of the set (not even steel screws) to avoid hysteresis losses.

A GOOD STRAIN INSULATOR

This strain insulator is cheap and efficient and easily constructed. Its efficiency is due to the glass petticoat keeping the insulator free from rain and snow. The insulator is a fiber rod ¾ inch in diameter and about 7 inches long, one end of which is turned to a taper to fit in the neck of a wine bottle which are usually long and slender. The bottle having been cut off near the bottom by tying a string around the bottle where the cut is desired, saturating the string with alcohol, igniting, and when flame is extinguished plunging in cold water. Each end of rod is drilled deep and tapt to take a ¼"-20 thread eye-bolt. The eye-bolt used in the tapered end is a little longer than the other, and is screwed in so that the eye just touches the neck of bottle. This holds the bottle in position. Pitch is poured in the space around eye-bolt and also around the fiber rod on the inside of bottle, to make it water-tight and more rigid.

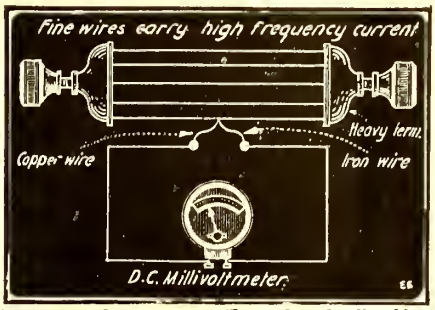
THE THERMO-COUPLE RADIO AMMETER.



A very important commercialization of an old principle is made in the new thermo-couple ammeter for measuring high frequency currents, such as are met with in wireless work. Its superiority over the old hot-wire instrument is so great that it admits of no comparison.

The indicator used may be any high-grade moving coil-permanent magnet type of meter operating on the D'Arsonval principle, but it must be very carefully designed, for it must give full scale deflection on about 10 millivolts.

The "couple" consists of a straight wire of high resistance, preferably *nichrome*, connected to suitable terminals, and forms the path of the high-frequency current. Welded to the center of the wire and to each other are two fine wires, an iron and a copper, which are connected with their free ends to the meter circuit.

As the current passes, it heats the wire, and consequently the couple. The heat causes the couple to deliver a small direct current voltage, which is proportional to the effective value of the high-frequency current, which deflects the pointer. Consequently the scale may be marked to read in "amperes."

Up to about 10 amperes the resistance strip and couple may be placed inside of the instrument case, forming a self-contained meter, but higher currents are best measured by making the heating or resistance strip in the form of an external shunt. The terminals are of heavy copper, the same as a regular direct-current shunt, but

A Handy Instrument Fact for Radio Men. High Frequency Currents Are Measured by the D. C. Millivoltmeter Connected to a Copper-Iron Thermo-Couple as Shown.

instead of a single heavy conductor several fine wires are stretched between the terminal lugs so that each wire presents the same inductance and "skin effect" to the high-frequency current, thus insuring even division of current and enables the "couple" to be placed on one wire only, which is essential to the quick heating and cooling necessary to make the meter indication follow the changes in current.

The shunts may be made interchangeable to measure various current strengths with the same meter, and are connected to the meter with flexible leads, exactly the same as an ordinary direct-current meter. The accompanying sketch shows how the meter, heater and couple are arranged.

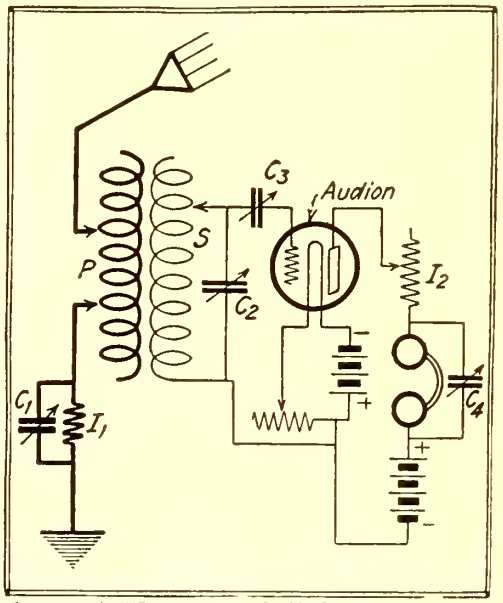
CODE TEACHER MADE OF KNOTTED STRING.

A simple yet effective device for learning the telegraph code may be made in the following manner:

Screw two pieces of brass or other metal (A and C) to a block, allowing one screw in A to project thru the block. B is a thin piece of spring metal, fastened to the block with a screw that projects thru the block. Wires from the sounder and battery are attached to the long screws holding A and B. Small reels D and E are mounted on the block.

Take an ordinary white cord and tie knots in it, using a single knot for a dot and four knots close together for a dash. The alphabet or messages may be made in



Simple? Well We Should Say So. A Code-Teaching Instrument Comprising a Knotted Cord Drawn Between Contact Making Members.

this way: Roll the string on reel D and fasten the loose end to reel E. Place the string between the B and C contacts and turn reel E. When a small knot passes between B and C, a brief contact is made between springs A and B, closing the circuit and causing the sounder to make a dot. When a group of knots passes the contact remains longer and causes the sounder to make a dash. The reel may be turned at any speed to suit the learner.

DAMPED AND UNDAMPED AUDION HOOK-UP.

Since the ban upon radio reception has been lifted I have done a great deal of experimenting with undamped wave reception. I do not know whether this has ever been developed before or not, but for the sake of those that have not seen it before, I would like to make the following suggestion in regard to undamped wave reception. I have never received any results with the Ultraudion, Chambers or any other hook-up as I have always been troubled with the flexibility of the tones, not being able to "hold" a tone that was readable. I am now using this book-up for both damped as well as undamped wave reception, and it

Improved "Damped and Undamped" Audion Hook-Up for Radio Receiving.

is giving me fine results.

PS is the loose coupler.

I1 is a fixt inductance, 3" diam. 56 turns No. 22 S.C.C.

C1 is a variable condenser		.001 mfd.
C2	"	.001
C3	"	.0005
C4	"	.001

I2 is a tuning coil 3" diam. 30" long, No 22 enameled wire; the inductance is varied with a slider which gives minute adjustment. I2 makes the audion oscillate while C1 and C4 change the tone of spark signals. The sizes need not be followed exactly, but if the general scheme is followed I am sure the operator will be delighted with the results. For any further information, write me, fellow "Radio-Bugs."

OPERATING AUDIONS ON A.C. 110 VOLTS.

Radio operators, both commercial and amateur, will do well to read the fine article on operating audions on A.C. circuits, prepared by Elliot A. White, former instructor in Radio, Air Service School for Radio Mechanics, Carnegie Institute of Technology, in the July, 1919, issue. The day of expensive high voltage "B" batteries, and the still more troublesome storage cells required for the filament current, is rapidly passing. The efficiency is too low. Better to operate audions from a D.C. or A.C. 110 or 220-volt circuit, even if you have to drive a small dynamo from a water wheel.

A Loose-Coupler Wrinkle

By Thomas Reed

THE freedom of wireless is here—its in the air (where it belongs), and the inmates of the "Radio - Bughouse" are beginning to rave of novelties in loose-couplers, just as the girls, on the approach of Easter, begin to study the fashion magazines and plan yet more bewildering styles.

The loose-coupler is such an efficient and willing little worker that it seems like "painting the lily," as Shakespeare says, to think of bettering it. It's only because we love it so much that we try to improve it still further—as Father used to say when he unrolled the trunk-strap and beckoned toward the shed.

Here's a wrinkle. If it's new, the "Ed." will publish it, and perhaps it'll become the fashion, like last Spring's tight skirts. Who knows?

As we make bigger and bigger couplers to deal with the longer waves, we seem to need some smoother and easier means of moving the coils than the present slide-rods provide. Well, why not make your secondary coil the stationary element, instead of the primary, and move your primary instead? It's the relative position of one to the other that counts, not the moving of either one especially.

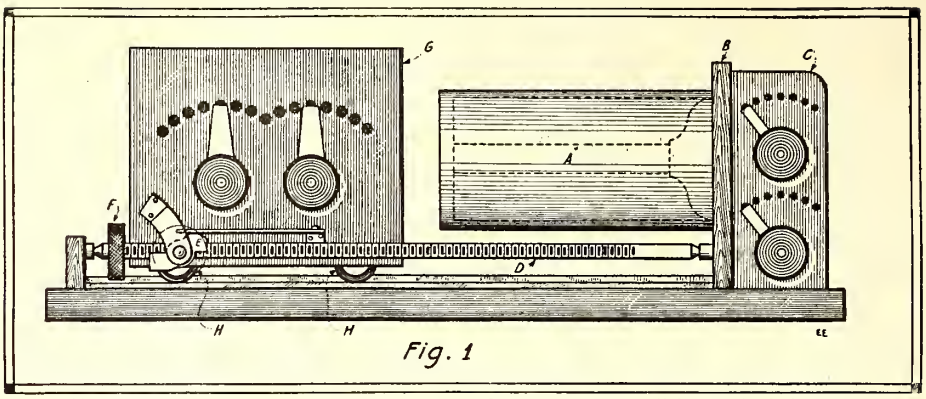

Fig. 1

Why Not Make an Innovation—Slide the Loose-Coupler "Primary" Instead of the Secondary. Sure! Why Not?

But the primary is heavier and more awkward to move than the secondary, isn't it? Yes and no. If you move the primary, you can mount it—coil, box, switches and all—on four grooved wheels, and let it run back and forth on a track, like a typewriter carriage. There's no reciprocating movement easier and more accurate than that, is there? No, he says, reluctantly but with conviction.

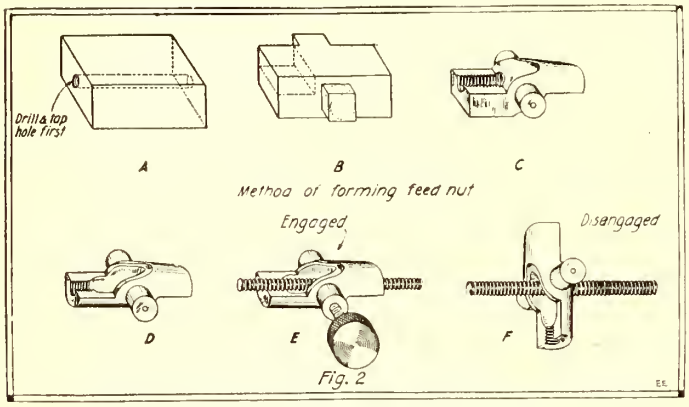
Fig. 1 shows a fixt secondary, mounted on a big stiff wooden dowel A, and this in turn on a stout backboard B, braced by the switchboard C. No wobble or sag to that secondary. There is also shown the primary G, running back and forth on the wheel H H. No wobble to that, either, so you can have a pretty *close fit* between your two coils.

But you want a fine adjustment, too? All right, what's more satisfactory than the feed-screw of a lathe? Rig up a miniature feed-screw D (must be brass) with a split nut like E to grip it or not, as you determine. (E has a knurled head attached, not shown in the figure, as it would obscure the clear view of the nut.)

Now you can roll your primary on its wheels into nearly the right position, turn the nut E till it bites the feed-screw, then roll the knurled wheel F back and forth, varying the coupling with extreme *precision*. Or in an instant you can disengage the nut, and without removing your hand, push the primary back and forth with a wide sweep, as you pursue some new and fleeting signal.

Fig. 2 (A, B, C, etc.) shows the action of the feed-nut, and the successive stages of forming it from a block of brass; not too much work, when you once get at it.

What do you think of the idea? As Nora Bayes used to say, "Will we kill it, or leave it live?"



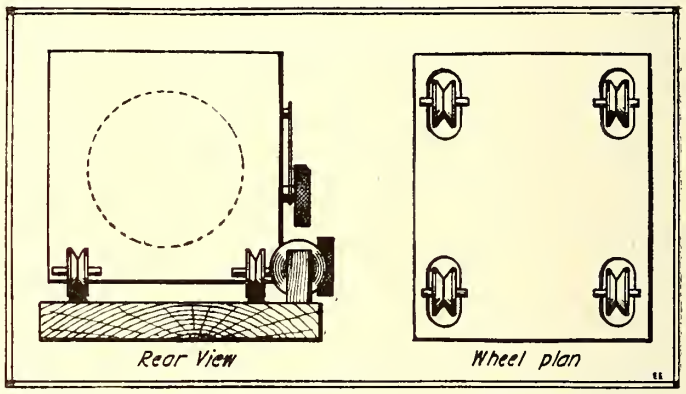


Fig. 2

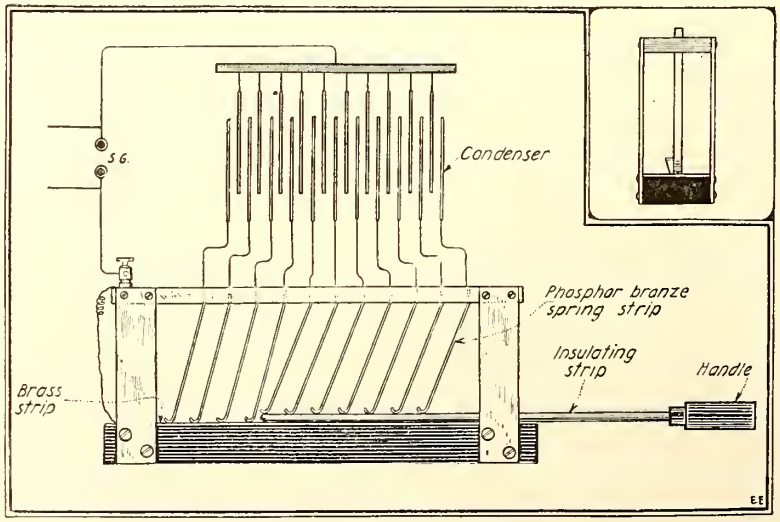
Clever Disengaging Primary "Slide" Control.

How the "Primary" Is Mounted on Small Wheels and Tracks.

High Tension Condenser Switch



The following little arrangement will provide a means of connecting a (FIXT-VARIABLE) high tension condenser in the manner practiced in the various types of commercial devices.

Phosphor bronze or spring brass strips are mounted so as to rest tightly on the brass strip on the base; a thin strip of fiber or other (insulating) material has a handle and is forced between the spring contacts and the brass strip, thus serving as a means of increasing or decreasing (connecting or disconnecting) the plates of the condenser.

This switch can be used to connect batteries in parallel as well as any other apparatus. It furnishes a simple and efficient type of switch, which is well in the reach of the everyday experimenter, and the readers of the wireless fraternity will appreciate this timely article, where such switches can be advantageously employed to connect the condensers used in audion control panels, et cetera. The type of switch employed by commercial concerns to fulfill this purpose is beyond the average amateur's skill, while the switch described will prove an easy instrument to construct and will at the same time perform its duty efficiently. I have used them successfully in the radio laboratory.

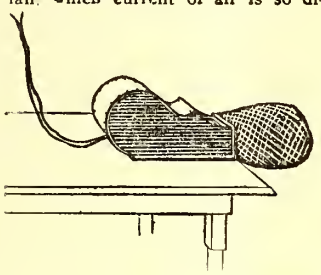
LATEST PATENTS

Variable Tone Bell.

(No. 1,312,610; issued to P. E. Chapman and R. H. Robinson.)

A method of building bells such that the tone of the device can be

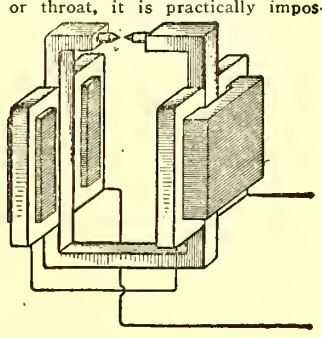


altered at will. The gong may be cast or else punched with several projections as here illustrated, one or more of which can be cut off as desired to give a different tone. The striking hammer is provided with several projections also, so that the degree of "loading" on the hammer can be changed, thus altering the rapidity of the beats.

Suction Fly-Catcher.

(No. 1,313,203; issued to Harry Pakeman.)

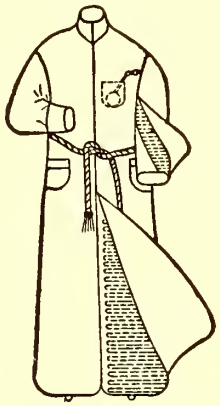
A suction type of flycatcher intended to be driven by an electric motor or other means, and providing a scheme whereby a swiftly moving air current is created by a fan, which current of air is so di-



rected as to cause the entrapment of flies in such a way that they cannot escape. The flies are caught in a removable basket, which can be detached and emptied at any time. A bait holder is provided in which molasses, honey, sugar water, etc., or other similar fly bait may be disposed to attract toward the suction distributor millions and millions of the ever-pestiferous fly.

Electric Welding Machine.

(No. 1,312,845; issued to James H. Gravell.)

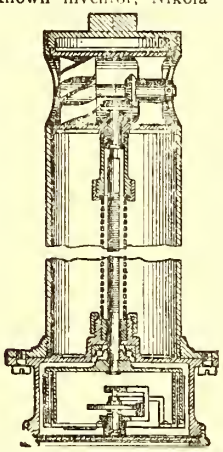


In the ordinary type of electric welding machine, having long jaws or throat, it is practically impos-

sible to secure a satisfactory weld at any great distance in from the edge of the work, owing to the fact the current, flowing in the arms of the machine, tends to produce a magnetic field in the work and space between the arms, which opposes the flow of the heating current. This reduces the efficiency of the welder. In the present design the inventor provides a special primary magnetic winding on an open core frame, which produces a magnetic field between the arms. This sets up a counter-current in the arms, which offsets the self-induction or bucking currents, and this permits the arms of the welder being extended for any length desired.

Electrically Heated Garment.

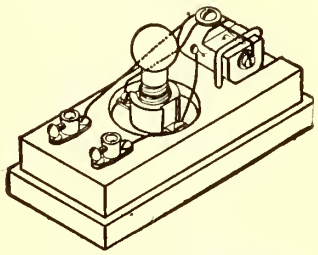
(No. 1,312,830; issued to Charles E. Camm.)



The inventor has devised a clever form of weave for producing a special fabric, in which the electric resistance or heating wires are interwoven. An automatic thermostat is provided in the garment in such a position that it will be actuated and controlled by the temperature of the garment.

Electric Ship's Log.

(No. 1,314,718; issued to Nikola Tesla.)

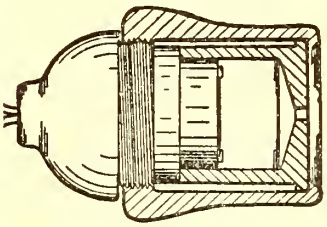


A very clever invention is this latest design for indicating the speed at which a ship is moving thru the water as devised by the well-known inventor, Nikola Tesla.

As the ship speeds along thru the water, a small turbine, mounted at the lower end of a tube extending down thru the bottom of the ship, is actuated, and the faster the boat speeds along, the more rapidly the turbine rotates. The revolutions of the turbine are conducted thru a flexible or other shaft to a revoluble head or drum in the top of the tube, and placed at the deck level, for instance. At this point there is mounted the indicating instrument of the log, with the dial marked in knots or miles per hour. The indicator of the instrument is moved by the friction or viscosity of the air between the shaft-driven drum and a similar shaped drum secured to the indicator and in close proximity to it, there being no direct mechanical connection between the two.

Electric Gas-Detector.

(No. 1,313,323; issued to Milton A. Nobles.)

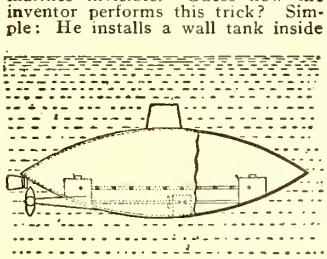


The device will detect and give an unmistakable alarm whenever certain gases are present in predetermined quantities. The construction comprises a lamp operated from a battery, such as the miners' headlight battery, which lamp is blinked on and off whenever gases are present. The complete device comprises a circuit-closing device involving the use of a catalytic element, such as a fine platinum wire and also a thermostatic bar. The instrument is not affected by changes in temperature.

Thermic Telephone.

(No. 1,312,504; issued to Robert Aernout Baron Van Lynden.)

The prior types of this device utilized a very fine platinum wire, which the voice currents

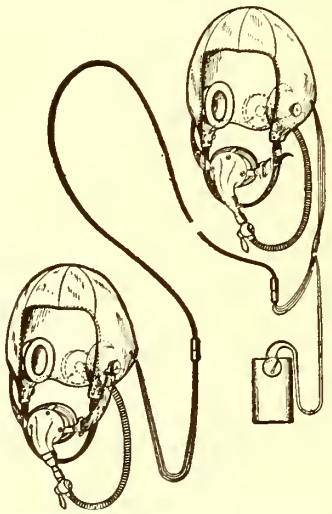


caused to become heated and cooled in correspondence with the voice undulations. But in the present design the conductor is in the form of an "S" and may be formed upon the base electrolytically, or it may be formed of a fine metal sheet or foil laid upon the supporting surface. Also, the conductor may comprise a mark on the porcelain or other support, such as that created by painting or printing the same upon the support surface.

Making Submarines Invisible.

(No. 1,312,595; issued to Henry H. Suplee.)

At last we have the master invention of the war, rendering submarines invisible. Guess how the inventor performs this trick? Simple: He installs a wall tank inside

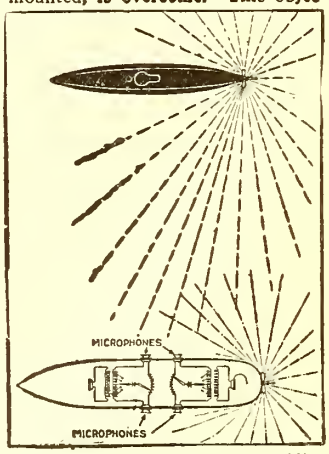


the "sub" from which pipes lead to a series of nozzles placed around the hull. Airplanes and blimps can spot "Mr. Sub" even when submerged 100 to 150 feet. But they will have to try a new one, for Mr. Suplee opens his valves and hides his little hornet by shooting out a colored liquid into the sea water that effectually nullifies the transparency of the water without making a smudge. Nigrosin may be used, mixed with water.

Helmet Telephone Set.

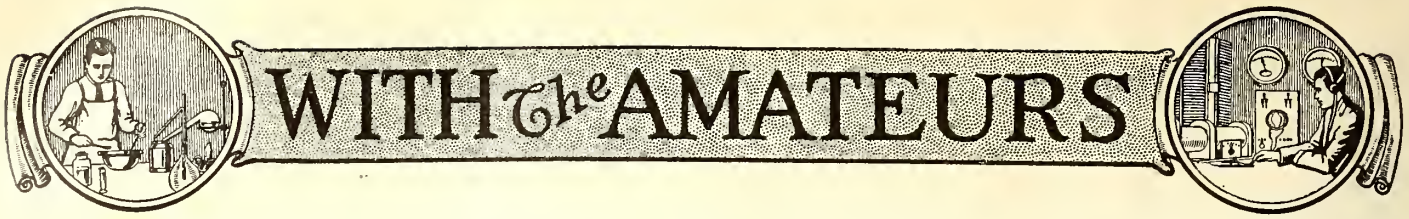
(No. 1,314,819; issued to Charles H. Lehman.)

The speaker's voice does not act on the microphone direct, but is carried thru a mouthpiece and speaking tube to this device, which is placed at the rear of the helmet. The usual telephone receivers are mounted in the sides or ear-flaps of the helmet. In the



earlier forms of telephone and radio telephone devices of this type, the microphone was frequently mounted on a breast-plate, but when the aviator or pilot turned his head the voice was no longer impinged on the microphone.

Submarine Signal.



(No. 1,312,809; issued to C. E. Scribner and J. L. McQuarrie.)

Improved submarine signaling system in which the noise or sound from the propeller of the local ship, on which the microphones are mounted, is overcome. This objec-

tion is here overcome by providing two detectors, one of which is relatively insensitive and both of which are differentially related to a common telephone receiver. This makes it readily possible to balance out the noise due to the local propeller, whereas the distant propeller affects the sensitive microphone more than the insensitive microphone, and produces a resultant effect in the telephone receiver.

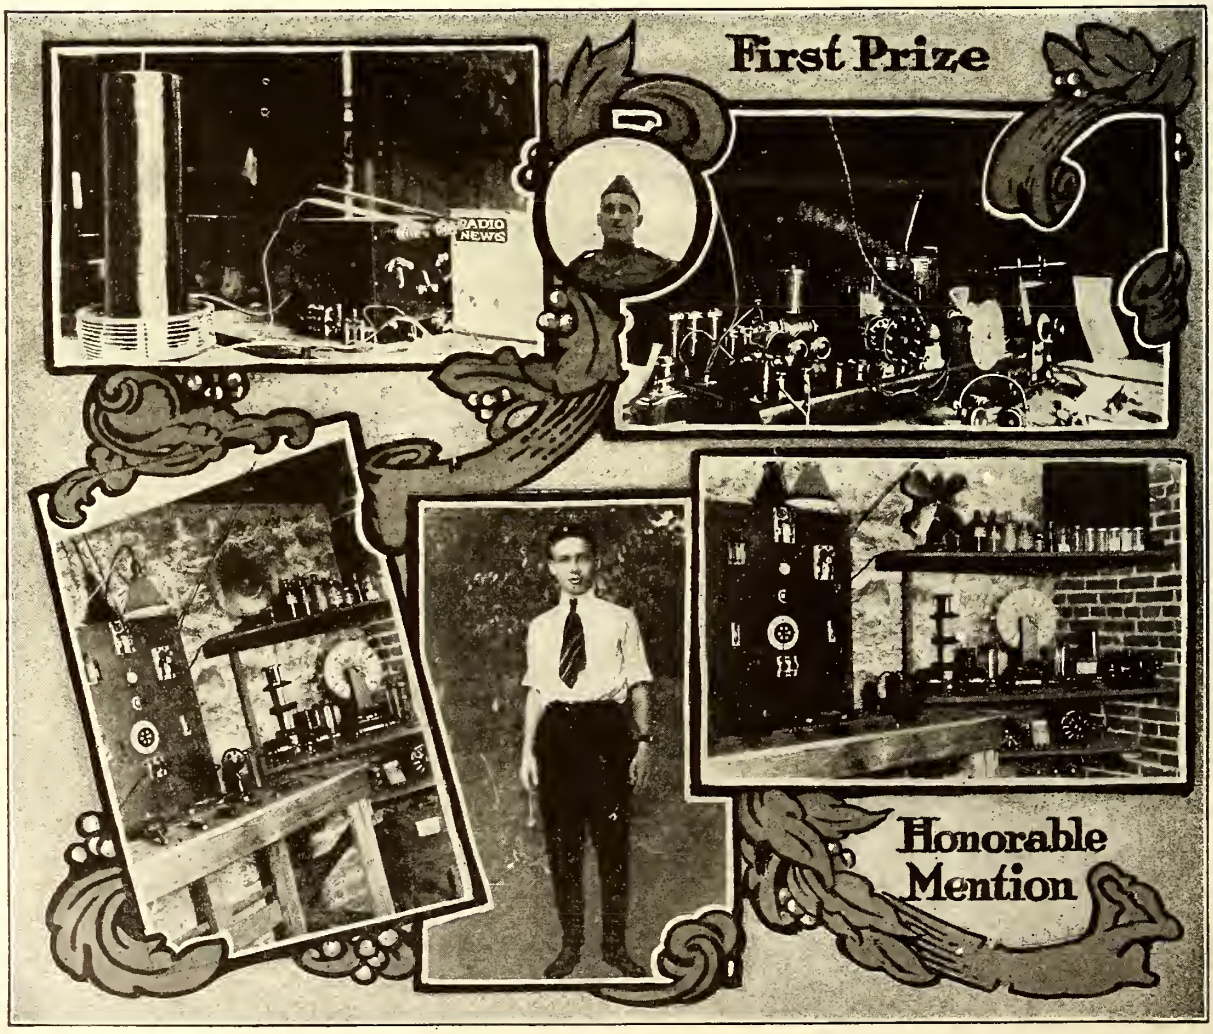
www.americanradiohistory.com

Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $5.00 each month for the best photo or photos and $2.00 to each "Honorable Mention." Address the Editor, "With the Amateurs" Dept.

The Editors desire to call to the attention of all owners of "Electrical and Chemical Laboratories" the fact that hereafter the MONTHLY PRIZE WILL BE $5.00 CASH, instead of $3.00. ALSO $2.00 CASH WILL BE PAID TO EACH "HONORABLE MENTION" ENTRY PUBLISHT. We have not received any "Laboratory Photographs" of late. So "go to it" and send us your photo, together with that of your laboratory. If they are particularly good we may list some new and bigger prizes. So get busy, Boys!!! It's up to you. Here's a way to earn some greatly wanted laboratory apparatus at no cost whatever. Don't be afraid to send in too many photos, Boys.

"Amateur Electrical Laboratory" Contest

THIS MONTH'S $5.00 PRIZE WINNER— KENNETH STRICKFADEN



THE photos herewith show my electrical laboratory at Coney Island, New York. It's good to be back again in the good old U. S. A. and my "experiments," after a sojourn in France with the A. E. F. My "layout" at present comprises a photographic dark room, chemical "Lab." and electrical "Lab." One of the photos shows the large Oudin high frequency coil, which is excited by an 18-inch induction coil, seen at the extreme right of the photo. I have a goodly collection of telephone, telegraph and radio apparatus—some home-made and some standard stock. The Oudin coil outfit is excited by the 18-inch spark coil operated by an electrolytic interrupter on 110-volt circuit. A rotary spark gap is used. My radio receiving set includes amplifiers. I have a Ford car, specially fixt up and decorated, in which "Yours Truly" and all the "junk" will attempt to fly across the continent to sunny California, my old home town—Santa Monica.—Kenneth Strickfaden (home address, 1217 11th Street, Santa Monica, Cal.).

HONORABLE MENTION—ELLWOOD R. RUTENBER $2.00 PRIZE PAID EACH "HONORABLE MENTION"

THE accompanying photos show my experimental electrical laboratory. I am sixteen years of age and have been experimenting for more than six years. My laboratory equipment includes the following:

15 V. 10 Amp. D.C. Generator; 6 V. 3 Amp. D.C. Generator; 110 V. 175 Amp. D.C. Motor; 1/20 H.P., A.C. Motors; 1/6 H. P., A. C. Motor; 6 cylinder Auto Magneto; 6 V. 40 Amp. Storage Battery; Combination Volt-Ammeter, 24 V. 50 Amp.; Electric Fans; Home-made Static Machine; Home-made Medical Coil; Switchboard; Ammeter,, 30 Amp. Capacity; Rheostat; Test Buzzer 1½, 6, 8, Volt Transformer.

I have spent many happy hours in this laboratory performing experiments of all kinds with the apparatus here described. I have a variety of chemicals and acids for experimental purposes, also three mining trays and other paraphernalia necessary for the work. I also have a number of small motors, batteries, switches of various kinds, spark coils, bells, and how-to-make-it odds and ends. I have a very useful home-made low-voltage rheostat which I will describe for the benefit of other laboratory owners, at the earliest opportunity, in the columns of the ELECTRICAL EXPERIMENTER.—Ellwood R. Rutenber, 127 N. Washington Street, Marion, Ind.

www.americanradiohistory.com

Science in Slang

By EMERSON EASTERLING

"I SAW in a magazine some time ago some guy's idea about entering into a gab-feast with the Martians, or Martonians, or Marites—or whatever you want to call 'em," remarked one of our crowd as we sat in the Union Depot at Portland, Oregon, waiting for a train to Pendelton.

"Yes," replied Jazz, "I saw that. It struck me as being sort of sensational stuff. I guess it is alright—in some respects—but there is a lot of stuff evidently overlooked."

"How is that?" asked Punk, looking up from his *Police Gazette*.

"For one thing," began Jazz, "did you see the write-up?"

"Oh," returned Punk. "I have seen some of the bird's stuff on the subject O. K.—but all that stuff is so far from home that I never paid much attention to it."

"Well," continued Jazz Stokes, "as I was going to say—the late Percy Lowell gazed up at the Martian bunch of dirt and discovered that it was stript all over with stringy marks. If you had seen them without any explanation you might have pronounced them railway tracks, or road ways — but old Lowell must have been awful 'dry,' or something; so he thunk up the canal idea. It took."

"I thought that a bird by the name of Schiaparelli—a German wop, or something — discovered the canals." put in Bender.

"I believe you are right," returned Stokes. "It was Sarsaparelli that dug up the canals and Lowell that extended the theory and kept them open to the astronomical public.

"Anyway, a Harvard 'Proff' by the name of Pickering got it into his head that we could construct a huge mirror and do flash light stunts on them and take chances on them catching on. and some more on our getting them if they do catch on."

"He was not a proff in finance, was he?" questioned V. Dago Hule, with a sort of a smile.

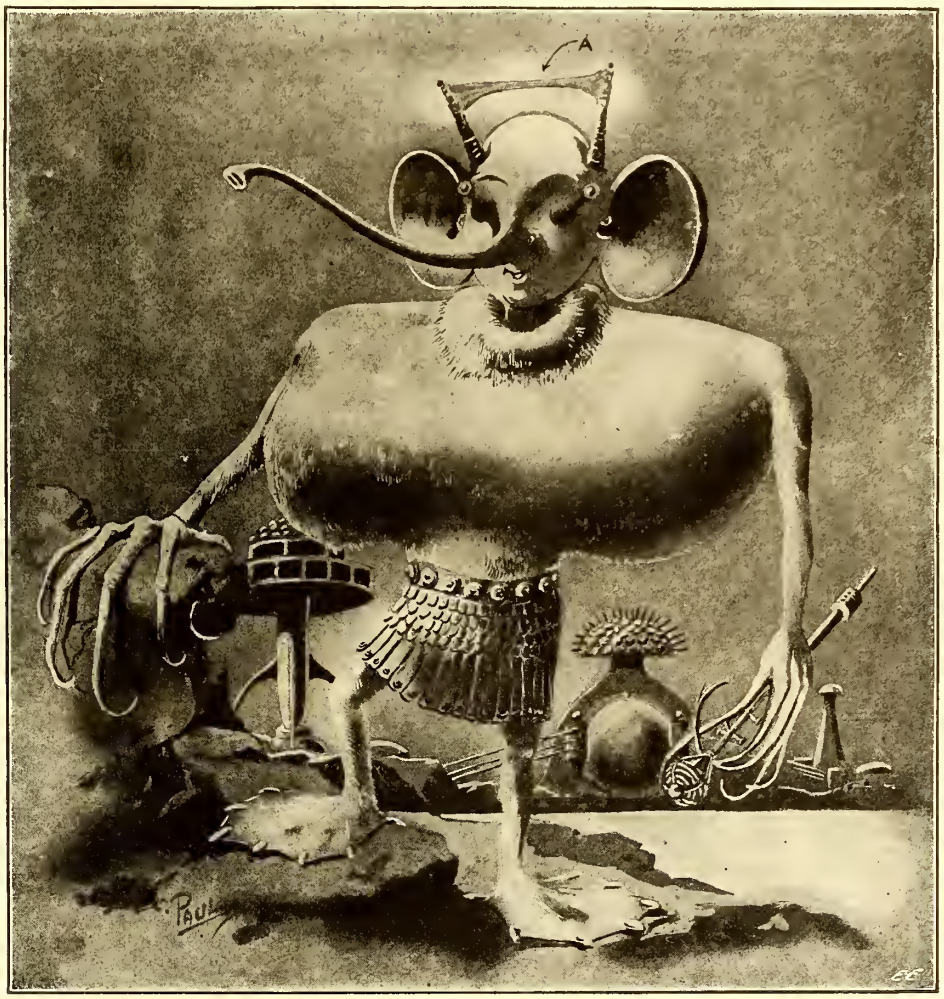
"Proff Wood (not referring to his head exactly) figured out a plan wherein we would stretch a few hundred acres of black cloth over some blinding sands of the great African desert and have some monster motors to roll and unroll the 'window shades' in such a fashion as to give them an optical impression that we are kidding them into saying 'Hello' to us by some such way. Of course such a stunt would cost the price of a young war—but what's a billion or two to a scientist's young life! Wood himself didn't intend to foot the bill."

Talking with Mars

"Don't you think that that was just a sort of figure of speech? I don't think that he really thought of doing exactly what he said. He probably proposed that as some example of how it could be done—don't you think?" rattled off Bender.

"More than likely—I don't know—besides I don't much care. But both the men are exceptionally intellectual specimens of our modern breed.

"A Frog by the name of Flammarion, a 'proff' in some *La Belle Universite* or something, let's out some of his think tank juice and proposes to have an immense bank of incandescent globes layed out on a dark stretch of land and let some official throw in and out the switch to the tune of 'Do you get us, Mars?'"

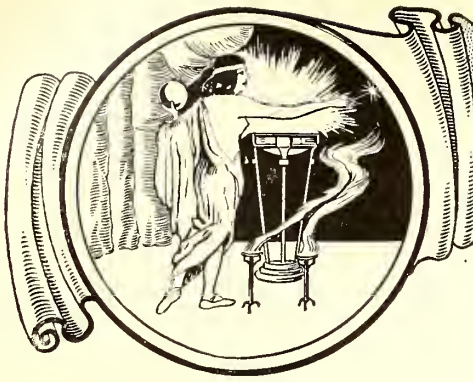


"Well," interrupted Punk, handing his *Police Gazette* to a preacher, "have you any better hunch for our transetherial communication? Why tear down when you can't put up a better castle than you ripped out—even if the one that you propose is warmer than the one you jerked out of commission?"

"Well," replied Jazz, "can't I kid the kids? They are smart men and have a few smart faults They have it all over the rest of us in many ways — but they cannot be perfect in all ways. In one or two respects they have fell down in their hypothetical proposals. Some of us who sit back and find fault with the Peace Treaty and so forth see a weak joint in their pipe dreaming and up with the 'heehaw.'

"Now will you let me rave?

"In the first place how are we to know that the beings that inhabit Mars — if it is inhabited — are gifted with a physical and mental combination that results in what we explain as sight? We don't know but what they have evoluted past us—if we are evoluting—and are getting into their knowledge what we do with sight by some other sense? As the dog, for instance, has its sense of smell developed to a much greater degree than has the human race, so might we have our sense of sight developed to a much greater degree than have the Martians. And are we sure that they have developed up in the same way that we have? Take the different forms of life on our own planet: how different



(Continued on page 699)

AS SCIENCE SEES THE MARTIAN.

Due to the very rare Martian atmosphere, the Martian's chest must be enormous to accommodate his ponderous lungs, necessary to supply his oxygen. Rare atmosphere conducts sound very poorly, hence the large ears, required to catch the very weak sounds. Due to the poor atmosphere, it is exceedingly cold on Mars, except at the equator. Hence Martians are covered with a while polar fur from head to foot. A rare atmosphere conducts odors but poorly—hence the elephantine nose, which goes to the odor, as the odor can't come to the Martian. Gravity on Mars being much less than on earth—1 lb. on earth weighs 0.35 lbs. on Mars—the pull on his body is very small. Therefore, his height is from 10 to 12 feet. To support such a tall body where gravity is small, better footing is necessary, hence the big feet. The tremendously civilized Martian always rides or flies from place to place; his legs are thus almost useless, hence devoid of muscles, consequently thin. The Martians stopped all physical work millions of years ago; machines do his work. His arms thus are weak and thin. But the hands and eyes—the Martian's most important organs—are used and worked constantly—therefore are developed wonderfully. As his food is all taken in highly concentrated form and as he does not talk, the Martian's mouth has shrunk to very small dimensions. Talking in a rare atmosphere being almost impossible, the Martian communicates by his telepathic organ, "A," a sort of sensitive skin stretched between antler-like prominences on top of his head. The same organ sends out the telepathic waves.—H. G.

www.americanradiohistory.com

THE ORACLE

The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be publisht. Rules under which questions will be answered:

1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered. Your correct name and address must be signed.
3. Sketches, diagrams, etc., **must** be on separate sheets. Questions addrest to this department cannot be answered by mail free of charge.

4. If a quick answer is desired by mail, a nominal charge of **25 cents** is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

VOLTAGE DROP IN RAILS.

(1027) Chas. Hora, New York, N. Y., rites us:

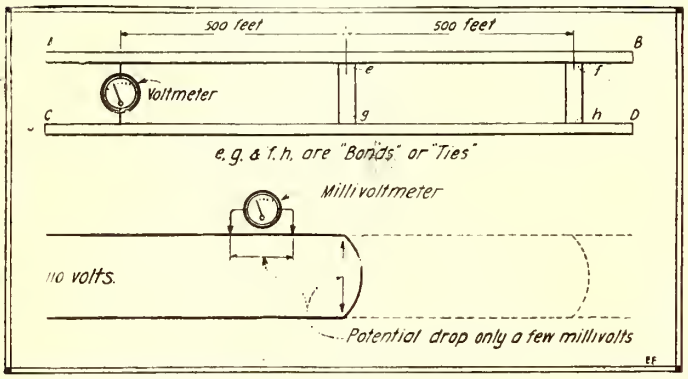


Diagram Showing How Drop in Voltage Across Rail Bonds Is Measured.

Q. 1 The problem I wish you to solve is this: Two rails, A, B,—C, D, are charged with 110 volts; what would be the voltage at e g and f h if the voltmeter is put across these two points? Will it register the same at A C, e g or f h, or will there be a drop in the current, and if so, how much? The rails are 1,000 feet long (such as are used on the Elevated Railroads).

A. 1. If we understand your problem correctly, what you wish to determine is the drop in milli-volts across the two bonds e g and f h on a track system such as is used on the elevated railroad, and which are of the same polarity. We can assure you that the drop along these rails or crossing bond such as e g or f h is very small in any case, and for a three-foot section of track, or measuring across a good bond, the drop should be but a few millivolts. The drop in potential on a 1,000-foot length of track will of course, in proportion, be greater than that measured across a bond or cross-section of, say, three feet of track, but would be quite small in any event.

AUTOMATIC TRAIN STOP.

(1028) E. M. G., of New London, Conn. inquires:

Q. 1. What is your opinion of the "M-V all weather train controller" as shown and described in ELECTRICAL EXPERIMENTER for February, 1918?

A. 1. In answer to your query asking our opinion on the "M-V all weather train control" as illustrated and described in the February, 1918, issue of the ELECTRICAL EXPERIMENTER, would advise as follows:

We have had no chance, of course, to see this invention in actual practise in order to see for ourselves just how it would work out under various weather conditions, but from a theoretical point of view we would say that the device should certainly work out very well. The electrical operating theory of the invention is correct so far as we can see, and an electrical engineer who has done some work along similar lines with magnetically operated train stops, which have been tried out on the Pennsylvania Railroad recently, so we understand, has spent a great deal of time and money working out a device quite similar in principle. Engineering reports which he showed us demonstrated that the device possest considerable merit and some features heretofore not fully realized, or at least their practical significance for such a difficult task as this. This experience has tended to all the more reinforce our opinion as to the practicability of such magnetic train controls.

The device you are interested in would seem to be all right if properly developed and applied. We understand that heretofore, and even now, there are one or two objections to all such automatic train stops and controls of an electrical and magnetic nature, which the railroads object to, and that is that the currents passing thru the rails are liable to conflict or nullify the electric currents operating the block signals.

WANTED!!!

"ODD PHOTOS" AT $1.00 EACH.

Here's what we want! What have you got?

ELECTRICAL PHOTOS—
New photos of Lightning; new and unusual Electrical Apparatus and Machinery; Electric Signs; Electric Autos; Electric Clocks.

SCIENTIFIC PHOTOS—
New Scientific Apparatus; Results; Effects; Motion Pictures; Stunts.

OPTICAL PHOTOS—
Peculiar stunts obtained with various lens arrangements; odd film effects caused by unusual conditions; novel micro-photographic subjects.

ASTRONOMICAL PHOTOS—
New eclipse photos; star and moon effects caught by the camera; comets; shooting stars; progressive moon studies.

FREAK PHOTOS—
Odd double and triple exposure effects; novel and striking effects due to unusual exposures.

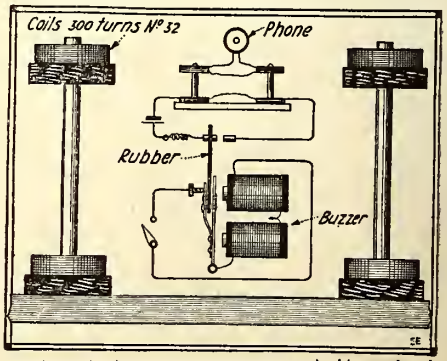
MECHANICAL PHOTOS—
Electrical and Mechanical apparatus of unusual news interest.

RADIO PHOTOS—
New stations, both commercial, government, and private. Owners of private or amateur stations will find a special contest for these photos on another page of this issue.

And don't send us plate or film "negatives"; send unmounted or mounted "prints" preferably a light and dark one. Enclose stamps if photos are to be returned.

Address photos to—Editor "Odd Photos", Electrical Experimenter, 233 Fulton Street, New York City.

HUGHES BALANCE CONSTRUCTION.

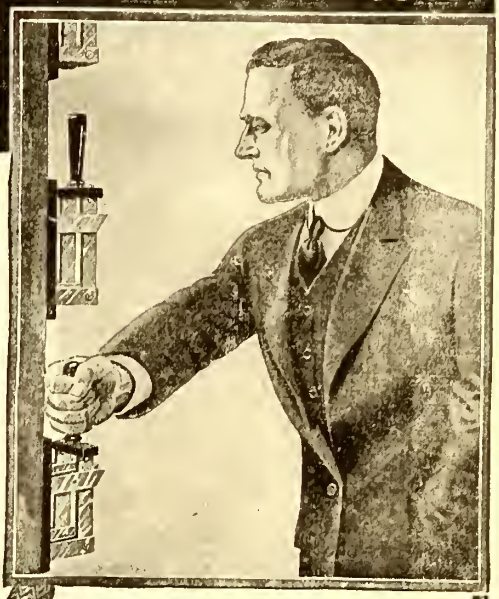


(1029) C. H. Jones, McAllen, Texas, asks:

Q. 1. For data on building a Hughes induction balance.

A. 1. We give herewith diagram showing a Hughes balance constructed with an ordinary buzzer as the exciter.

The coils are wound with No. 32 silk-covered wire. About 300 turns are necessary for each one. This winding must be placed on the spools very evenly, and great care should be taken to have all coils precisely alike. The lower two coils are connected in series with the buzzer, the upper two with a telephone receiver of about 75 ohms. A more sensitive receiver will, of course, give more efficient results. These coils are placed so that the winding opposes that on the coil beneath it on two upright posts, spaced the desired distance apart. The exciting buzzer is now started and the coils above shifted until no sound is heard in the phones. If a metallic object is now placed between the two coils, the phone instantly responds because of the disturbed balance.



The buzzer is a very simple device, made by riveting a piece of hard rubber to the armature. Said hard rubber has a metal contact, which is connected with another screw, so that the excitation of the coils is entirely dependent upon these two contacts, and only one cell is necessary in this coil circuit, whereas two are used to actuate the buzzer.

Hughes Induction Balance and How It Is Constructed.

www.americanradiohistory.com

Why Electrical Workers Are Needed.

Consider for a moment what part electricity plays in every-day life, in the comfort, convenience, pleasure and even health of the whole civilized world.

Think of having to ride in horse cars again—

of writing a letter every time you now phone—

of waiting days for what the telegraph does in a few minutes—

of no automobiles or moving picture shows—

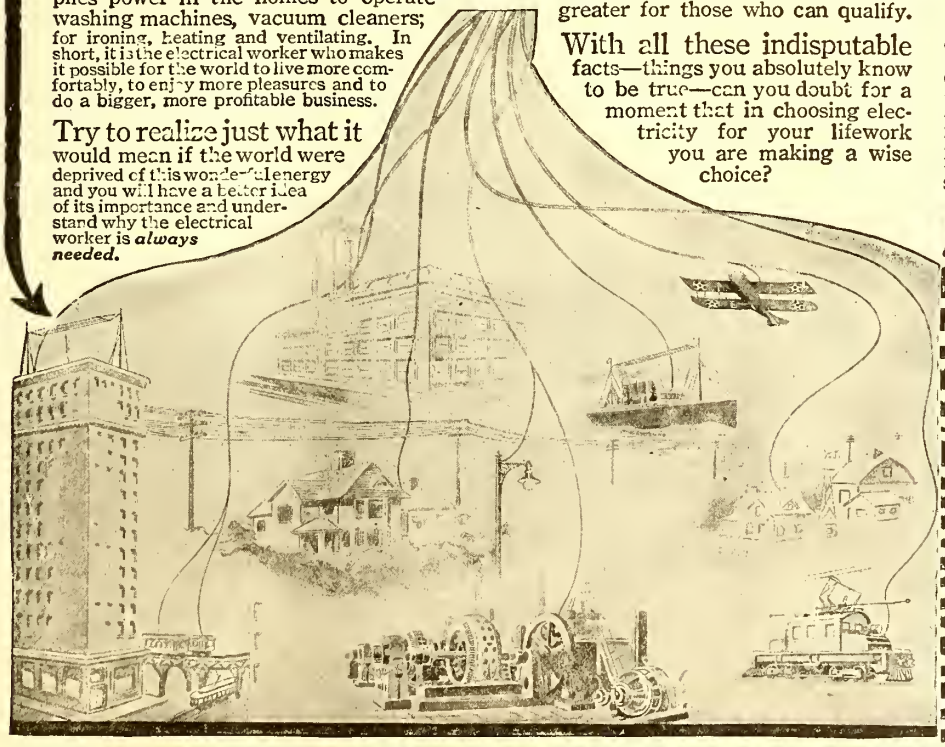
Electricity takes millions to and from work. Without it the automobile and airplane would be impossible—the telephone and telegraph would be useless. All the civilized world relies on it for light, heat, transportation and communication. In a thousand ways electricity is used in factories, offices and in the homes.

Electricity is almost as essential as the air we breathe. Business would be almost at a standstill if deprived of its energy.

To say that electricity is still in its infancy is no exaggeration. Every-day brings into practical use some new method of controlling it, some new device or appliance for using it. In industrial work there are still scores of operations where electricity will be utilized sooner or later. The day is coming when the railroads will entirely replace steam with electricity. Doctors, dentists and scientists are only beginning to realize the possibilities af electrical energy.

These facts merely touch the high spots, yet they prove beyond a doubt that electricity plays a vital part in business, in our individual lives, and that there is unlimited scope for those who make electricity their life work.

The electrical worker provides other men light to work by, the telephone and telegraph to convey their orders, the power to run their machines and transport their goods. He supplies power in the homes to operate washing machines, vacuum cleaners; for ironing, heating and ventilating. In short, it is the electrical worker who makes it possible for the world to live more comfortably, to enjoy more pleasures and to do a bigger, more profitable business.



Try to realize just what it would mean if the world were deprived of this wonderful energy and you will have a better idea of its importance and understand why the electrical worker is *always needed.*

What Electricity Offers You

Once you have mastered the A-B-C of electricity you are confronted with unlimited opportunities for advancement. You can specialize in extending and perfecting the wonders already accomplished in the field. You may take up those branches of electrical and mechanical work which cover the design and manufacture of electrical apparatus or start in to qualify for a well-paid position in the designing, construction, operating or consulting branches of the electrical engineering profession, and to fit yourself eventually for a position as Distribution, Operating, Testing, Erecting or Designing Engineer.

In the automobile, airplane, telephone and telegraph lines there is also great scope for the trained electrician. Many wonders of electricity have yet to be unfolded—its uses multiplied—and opportunities still greater for those who can qualify.

With all these indisputable facts—things you absolutely know to be true—can you doubt for a moment that in choosing electricity for your lifework you are making a wise choice?

How You Can Qualify

You don't have to interfere with your present work while qualifying for a good electrical position. The American School can give you just the training you need in your SPARE TIME. Our electrical courses have been specially prepared for home study—are written so you can understand everything quickly—and from your first lesson until you get your Diploma expert instructors coach you. Our training will enable you to get into the game RIGHT.

Read This Guarantee —Then Act

"We guarantee at any time during the first year of your enrollment to refund the entire amount paid if, immediately upon the completion of ten examinations, you notify the School that you are not satisfied with your course."

Be a Draftsman!

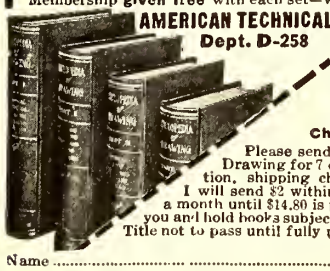
Make $30 to $75 a Week

Your name and address on the coupon brings this great Cyclopedia of Drawing without a penny down. Pay only net shipping charges when books arrive. With these books and a low price "school set" of drawing instruments, obtainable at any store, a man can become master of drawing and earn $30 to $75 weekly.

LEARN AT HOME—Good paying positions open everywhere. Intense activity in manufacturing, railroading, building, etc., calls for more draftsmen.

Shipped on 7 Days' FREE Trial

CYCLOPEDIA OF DRAWING



4 Volumes. 1650 Pages. Thousands of Illustrations.

Bound in genuine American morocco. Pages 6½ x 8½ inches. Covers all branches of Drafting—Architecture, Electrical, Structural Steel, Sheet Metal, etc. Teaches pen-and-ink rendering, lettering, free-hand, perspective, shades and shadows, working shop drawings, machine design, etc., etc.

50c a Week Only $2 a month if you keep the books. Coupon explains offer, good only within borders of U. S. and Canada.

Free Membership in This Society.—A Consulting Membership **given free** with each set—worth $12.00.

Advertising Talks

NUMBER 5

IN my preceding articles I have tried to show you just why it pays to buy advertised goods—given you real tangible reasons proving that advertised articles are always the best and cheapest and wide-awake concerns who advertise always the most satisfactory firms to do business with.

But there is one point I haven't brought up and I want to take it up now. And that is the fact that the systematic reading of advertisements is an education in itself. If you want to keep abreast of the newest and latest developments in your business, your studies or your pet hobby you cannot expect to do so unless you make a habit of studying the advertising pages of your favorite magazine.

More care is taken and more time and money is spent by advertisers in preparing their advertisements than is expended in preparing even the editorial matter that goes into an everyday magazine. With the volume of advertising that is carried each month in a large magazine like the ELECTRICAL EXPERIMENTER, and the great number of advertisers who compete in offering their products in every issue, each advertisement must be prepared, first, to attract your attention, second, to give you the advertiser's story as easily and quickly as possible, and third, to so convince you of its merits that you will want to know more about the article or offer advertised. This being true, it stands to reason that real advertising must make attractive and educational reading. Attractive because of the short, snappy style used in all high class advertising of today and educational because, while reading the advertisements you are learning about all the newest inventions and developments of science, and actually improving your mind at the same time that you are broadening your knowledge.

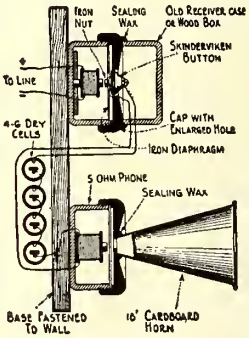
I know a bright, intelligent inventor who somehow never could seem to get along. He was always wasting his time on foolish ideas and impractical schemes. One day I called his attention to the ELECTRICAL EXPERIMENTER, then a much smaller magazine than it is now, and asked him why he didn't read the ads carefully and get an idea as to what was successful in his line and what the people wanted. He followed the suggestion and the last time I saw him he had perfected a revolutionizing invention, the idea for which he had received from an entirely different advertisement in the "Experimenter." If I told you his name you would all know him, most of you have probably used or are familiar with his invention.

This just goes to show that you can never tell in what way an advertisement may help you. Make a practice of reading ads—go through the advertising pages of the good magazines as carefully as you do the text. Don't lay this month's issue of the "Experimenter" aside until you have read every line of advertising. Digest the ads—get all the information you can from the advertisers themselves by writing to them. Keep yourself posted on what they have to offer and when you need anything in their line patronize them.

Advertising Manager.

SKINDERVIKEN TRANSMITTER BUTTON

Most Sensitive Microphone



Actual size

for $1.00

You can easily make a highly sensitive detectophone by using a Skinderviken Transmitter Button to collect the sound waves. You can build your own outfit without buying expensive equipment. Think of the fun you would have with such an instrument! It's very simple, too, and inexpensive.

You can install an outfit in your home and hear the conversation being held all over the house. You can connect up different rooms of a hotel. This outfit was used by secret service operatives during the War. It is being used on the stage.

One of the main advantages of the Skinderviken Transmitter Button lies in its ultra-sensitiveness. You can place it in any position you like. It is the greatest invention in micro-phones and has won recommendations from men of high standing in the scientific world. It is being used all over the world. You can mount it most anywhere. Card board boxes, stove pipes, stiff calendars and hundreds of other places will suggest themselves to you. The buttons can not be seen by any one in the room, as they are so small and light. Only a small brass nut is exposed to the view.

Full directions for connecting up the button for use as a detectophone are given in booklet which is sent with each button.

The only instruments needed to complete a detectophone outfit, in addition to a Skinderviken Transmitter Button are a receiver, battery, and, if desired, an induction coil.

The same circuit connections apply to all experiments, regardless of how the transmitter button is mounted.

The Skinderviken Transmitter Button operates on one or two dry cells. It often happens that two cells produce too much current and the sounds are deafening. We recommend either one fresh cell or two worn out cells.

Send Us Your Order TO-DAY

We have the utmost faith in this transmitter button. We guarantee satisfactory service or we will refund the purchase price. Boys—young and old—send in a dollar bill RIGHT NOW! You can't lose. If you're not satisfied, you receive your dollar back. Isn't that fair?

Be a Draftsman
Raise Your Income

Every Big Construction Job
Must Pass Through the Drafting Room

Do you realize what that means in the way of opportunity with big pay for Draftsmen? Think of the enormous volume of building operations now going forward all over the country with the return of peace—the big engineering, construction and manufacturing projects that must every one first go through the drafting room before the plans are ready for the workmen.

Never before in this country was there such a demand for skilled draftsmen—and this condition is true of European countries in which the destruction of war calls for vast re-building programs requiring the services of an army of draftsmen All this world-wide demand means great prosperity for men who become trained in draftsmanship.

$25 to $100 a Week

All you need is training to be ready to accept a call that should mean $25 to $100 a week easily earned. You have the same opportunity to secure the valuable training in spare time at home or by personal attendance from the Chicago Technical College that many other men had who are now holding fine positions and earning big pay through their knowledge of draftsmanship.

Act Promptly—Now

The longer you wait, the longer you will postpone the time when you will begin to draw a tempting salary as an Expert Draftsman. Manufacturers, Architects, Contractors, Engineers, Builders, Railroads and other big employers of trained draftsmen are ready with the work—when **you** are qualified to handle it.

Come to the College or Train at Home

Whether you decide to take one of the resident courses or to study in spare time at home you will have the personal direction of practical engineers, builders and architects, who give you the benefit of their vast experience and the successful methods they use in their own work. No time wasted. Every minute counts under men like these—every one a specialist!

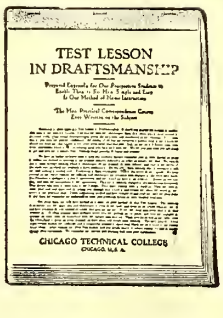
We train hundreds of men by the most modern methods and see them quickly succeed, because we give them a technical preparation that not only makes proficient draftsmen of them, but also enables them to fill higher executive positions in big construction enterprises. There is no limit to your progress after you have equipped yourself with what the Chicago "Tech" can give you.

Drawing Outfit

No Extra Charge

Every student of the Chicago "Tech" Home Study Course in Draftsmanship receives the drawing outfit—set of instruments in case, drawing board, T square, triangles scale, curve, drawing paper, pencils, etc., or a cash credit in case he already has an outfit. These instruments are of the same make and sizes as used by high salaried experts in drafting rooms of factories, shops, railroads, etc. You use them while learning—then take them right into your practical work.

Easy Payment



Chicago "Tech" training costs you little compared to the great benefits conferred, and payment of tuition fees may be made in easy installments, if desired. This splendid training will soon enable you to pay for the course from extra earnings.

Below, in the coupon, we list our principal courses. Just mark X in the ( ) to show which subject interests you and we will send you full information free. **Mail Coupon or write today.**

CHICAGO TECHNICAL COLLEGE
CHICAGO, U. S. A.

Free!

Drafting Lesson

The Chicago "Tech" method is the quickest, easiest way to become a skilled draftsman in spare time, without interfering with your present position. But we don't ask you to decide until you know how well qualified you are for this prosperous profession.

Other institutions ask you to pay first—and then find out later what their instruction means to you. We send the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything. And see for yourself just what Chicago "Tech" offers you in training which will bring a ready market for your services and open opportunities which are closed to the untrained man.

Send Coupon

AUTOMOBILE AND GAS ENGINE COURSE

All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Splendid opportunities open now.

Learn All This in Spare Time

All about the Principles of the Automobile; Gasoline Engines; Power Plants and Transmissions; Carburetors and Fuel Supply Systems; Lubrication and Cooling; Batteries; Magneto Ignition; Starting and Lighting Systems.

Know How To Fix Troubles

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men.

Write—Send the coupon and get catalog and all information now.

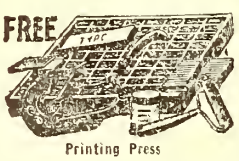
A Modern King Canute

The people who lived in the good days of the wise King Canute thought he had the power to make the ocean recede at a mere word of command. Today the Bell Telephone Company finds itself in a position not unlike that of the ancient king. Its mere word will not hold back an ocean of expense.

Rigid economy and the most modern methods of operation have made it possible for the Bell Company to keep its rates at a far lower level than that of the commodities which it must use in construction and upkeep. But it has felt the rising tide of costs just as certainly as has every business and every family.



The one source of revenue of the Bell Company is the price you pay for service. If this price fails to cover fair wages and necessary materials, then both you and your telephone company must suffer.

For one year the Bell Company was under Government control. The Government analyzed methods and costs; and established the present rates as just. All the Bell Company asks is a rate sufficient to provide satisfactory service to every subscriber.

HELIUM GAS WAS TO AID IN BOMBING ENEMY

Some of the secrets regarding the production of helium, the non-inflammable balloon gas which was developed and produced in considerable quantities during the war, were disclosed recently by a statement based on a memorandum prepared by the Bureau of Steam Engineering. In part the statement says:

"If the war had lasted until Spring, the British and American Governments would have sent helium-filled rigid airships over strategic points in Germany, each capable of dropping a total of ten tons or more of high explosives, either in a single tremendous discharge, or in a number of smaller ones during its passage over a fortress or city. These airships would have carried batteries amply sufficient to repel airplane attack.

"The success won in producing helium has resulted in the War and Navy Departments allotting funds for the production of the gas on a large scale for the use of the military and naval service. It is expected the plant will be in active operation in a few months. It draws its raw material from a natural gas field which is the largest and richest in helium now known in the world. A ten-year lease of this field is held by the Government for practically its entire output. During the war this helium gas was camouflaged under the name of 'Argon.'

"Since helium is noninflammable," said the statement, "an observation or dirigible balloon filled with it cannot be destroyed by incendiary bullets. The only effective method of attack would be by driving an airplane bodily thru the great gas bag. With the fire risk eliminated, the rigid airship or Zeppelin will hence be one of the most powerful weapons known.

"Just prior to the armistice a shipment of 150,000 cubic feet of helium was sent by our Government to Europe. The problem of an ample supply of helium has, therefore, been virtually solved by American energy and resourcefulness. This shipment was made in a relatively brief period after contracts were made for its production.

"The high military value of helium was recognized by the Allies in the early stages of the war, but it was not until the United States began hostilities that methods for obtaining the gas in serviceable quantities could be devised. Helium is a component of natural gases, and the quantity of the richest helium-bearing gases which the British used for their early experiments was relatively very poor, having only one-third of 1 per cent of helium.

"Prior investigation indicated, however, that there were in this country deposits of natural gases far richer in helium than any known to exist in the British Empire.

"The result was that the Bureau of Mines made contracts with the Linde Air Products Company and the Air Reduction Company, both of New York, which were operating organizations producing large quantities of liquefied oxygen and nitrogen, and were hence especially fitted to undertake the production of helium, which is obtained by the liquefaction of the other components of natural gas, leaving the helium free.

"During the experimental period of this work, the Bureau of Mines, assuming that the plants designated by its organization would soon be in successful operation, advised that the experimental work on the two commercial plants should be stopped The War and Navy Departments, and particularly the Naval Bureau of Steam Engineering, which was concerned with the production of helium, insisted upon a continuation of the experimentation of those plants. Their judgment was vindicated within a few weeks, when it was shown that helium could be produced in quantity and at a reasonable price by both these plants.

Free Proof that I Can Raise Your Pay

No matter how much you are earning now, I can show you how to increase it. I have even taken failures and shown them how to make $100—$200, and in once case as high as $2,000 weekly. I am willing to prove this entirely at my risk and expense.

LET'S have a little chat about getting ahead—you and I. My name is Pelton. Lots of people call me "The Man Who Makes Men Rich." I don't deny it. I've done it for thousands of people—lifted them up from poverty to riches.

I'm no genius—far from it. I'm just a plain, everyday, unassuming sort of man. I know what poverty is. I've looked black despair in the eye—had failure stalk me around and hoodoo everything I did. I've known the bitterest kind of want.

But to-day all is different. I have money and all of the things that money will buy. I am rich also in the things that money won't buy—health, happiness and friendship. Few people have more of the blessings of the world than I.

IT was a simple thing that jumped me up from poverty to riches. As I've said, I'm no genius. But I had the good fortune to know a genius. One day this man told me a "secret." It had to do with getting ahead and growing rich. He had used it himself with remarkable results. He said that every wealthy man knew this "secret,"—that is why he was rich.

I used the "secret." It surely had a good test. At that time I was flat broke. Worse than that, for I was several thousand dollars in the hole. I had about given up hope when I put the "secret" to work.

At first I couldn't believe my sudden change in fortune. Money actually flowed in on me. I was thrilled with a new sense of power. Things I couldn't do before became as easy for me to do as opening a door. My business boomed and continued to leap ahead at a rate that startled me. Prosperity became my partner. Since that day I've never known what it is to want for money, friendship, happiness, health or any of the good things of life.

That "secret" surely made me rich in every sense of the word.

MY sudden rise to riches naturally surprised others. One by one people came to me and asked me how I did it. I told them. And it worked for them as well as it did for me.

Some of the things this "secret" has done for people are astounding. I would hardly believe them if I hadn't seen them with my own eyes. Adding ten, twenty, thirty or forty dollars a week to a man's income is a mere nothing. That's merely playing at it. In one case I took a rank failure and in a few weeks had him earning as high as $2,000.00 a week. Listen to this:

A young man in the East had an article for which there was a nation-wide demand. For twelve years he "puttered round" with it, barely eking out a living. Today this young man is worth $200,000. He is building a $25,000 home—and paying cash for it. He has three automobiles. His children go to private schools. He goes hunting, fishing, traveling whenever the mood strikes him. His income is over a thousand dollars a week.

In a little town in New York lives a man who two years ago was pitied by all who knew him. From the time he was 14 he had worked and slaved—and at sixty he was looked upon as a failure. Without work—in debt to his charitable friends, with an invalid son to support, the outlook was pitchy black.

Then he learned the "secret." In two weeks he was in business for himself. In three months his plant was working night and day to fill orders. During 1916 the profits were $20,000. During 1917 the profits ran close to $40,000. And this genial 64-year-young man is enjoying the pleasures and comforts he little dreamed would ever be his.

I COULD tell you thousands of similar instances. But there's no need to do this, as I'm willing to tell you the "secret" itself. Then you can put it to work and see what it will do for you.

A Few Examples

Personal Experiences

Among over 350,000 users of "Power of Will" are such men as Judge Ben B. Lindsey; Supreme Court Justice Parker; Wu Ting Fang, Ex. U. S. Chinese Ambassador; Assistant Postmaster General Britt; Lieu. Gov. McKelvie of Nebraska; General Manager Christeson of Wells-Fargo Express Co.; E. St. Elmo Lewis, former Vice-Pres. Art Metal Construction Co.; Gov. Ferris of Michigan, and many others of equal prominence.

$300 Profit from One Day's Reading

"The result from one day's study netted me $300 cash. I think it a great book and would not be without it for ten times the cost."—A. W. Wilke, Faulkton, So. Dakota.

Worth $15,000 and More

"The book has been worth more than $15,000 to me."—Oscar E. Sheppard, 1117 E. Locust St., Decatur, Ill.

Would Be Worth $100,000

"If I had only had it when I was 20 years old, I would be worth $100,000 today. It is worth a hundred times the price."—S. W. Taylor, The Santa Fe Ry., Milano, Tex.

Salary Jumped from $150 to $800

"Since I read Power of Will my salary has jumped from $150 to $800 a month."—J. F. Gibson, San Diego, Cal.

From $100 to $3,000 a Month

"One of our boys who read Power of Will before he came over here jumped from $100 a month to $3,000 the first month, and won a $250 prize for the best salesmanship in the State."—Private Leslie A. Still, A. E. F. France.

I don't claim I can make you rich over night. Maybe I can—maybe I can't. Sometimes I have failures—everyone has. But I do claim that I can help 90 out of every 100 people if they will let me.

The point of it all, my friend, is that you are using only about one-tenth of that wonderful brain of yours. That's why you haven't won greater success. Throw the unused nine-tenths of your brain into action and you'll be amazed at the almost instantaneous results.

The Will is the motive power of the brain. Without a highly trained, inflexible will, a man has about as much chance of attaining success in life as a railway engine has of crossing the continent without steam. The biggest ideas have no value without will-power to "put them over." Yet the will, altho heretofore entirely neglected, can be trained into wonderful power like the brain or memory and by the very same method—intelligent exercise and use.

If you held your arm in a sling for two years, it would become powerless to lift a feather from lack of use. The same is true of the Will—it becomes useless from lack of practice. Because we don't use our Wills—because we continually bow to circumstance—we become unable to assert ourselves. What our wills need is practice.

Develop your will-power and money will flow in on you. Rich opportunities will open up for you. Driving energy you never dreamed you had will manifest itself. You will thrill with a new power—a power that nothing can resist. You'll have an influence over people that you never thought possible. Success—in whatever form you want it—will come as easy as failure came before. And those are only a few of the things the "secret" will do for you. The "secret" is fully explained in the wonderful book "Power of Will."

How You Can Prove This at My Expense

I KNOW you'll think that I've claimed a lot. Perhaps you think there must be a catch somewhere. But here is my offer. You can easily make thousands—you can't lose a penny.

Send no money—no, not a cent. Merely clip the coupon and mail it to me. By return mail you'll receive not a pamphlet, but the whole "secret" told in this wonderful book, "POWER OF WILL."

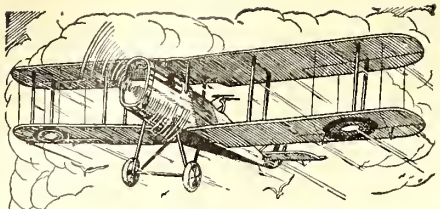
Keep it five days. Look it over in your home. Apply some of its simple teachings. If it doesn't show you how you can increase your income many times over—just as it has for thousands of others—mail the book back. You will be out nothing.

But if you do feel that "POWER OF WILL" will do for you what it has done for over a quarter of a million others—if you feel as they do that it's the next greatest book to the Bible—send me only $3.50 and you and I'll be square.

If you pass this offer by, I'll be out only the small profit on a three-and-a-half-dollar sale. But you—you may easily be out the difference between what you're making now and an income several times as great. So you see you've a lot—a whole lot—more to lose than I.

Mail the coupon or write a letter now—you may never read this offer again.

PELTON PUBLISHING COMPANY
30T WILCOX BLOCK MERIDEN, CONN.



Pelton Publishing Company
30T Wilcox Block, Meriden, Conn.

You may send me "Power of Will" at your risk. I agree to remit $3.50 or remail the book to you in five days.

Build and Fly An

Ideal Model Aeroplane

...an Accurate Scale-Duplicate of a Famous Plane

You can build a perfect Model of a famous Aeroplane, that will look exactly like the real one, and that will rise from the ground or water by its own power and fly in the air. Build one now; it's the greatest sport you ever had! You can learn a lot about Aeroplanes; how they are built; operated and controlled. Ideal Model Aeroplane Construction Outfits make building easy. They contain all parts, fittings, materials, plans drawn to scale and complete building and flying instructions. You put the parts together and build your Model like a real Aeroplane mechanic.

Pick Your Model from These Celebrated Aeroplanes

You can get from Ideal Dealers Complete Construction Outfits to build scale-reduction Models of any of these well-known machines:

N C-4 (Naval-Curtiss Seaplane). The first 'plane to fly across the Atlantic Ocean. 4½ ft. Model. Shown below.

DeHAVILLAND Battle Plane (DeH-4). The fighting 'plane used by the American Aces in the World War. 3 ft. Model. Shown Above.

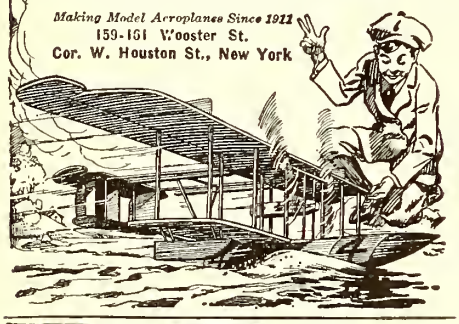
Curtiss Military Tractor. The 'plane used to train our Aviators. 3 ft. Model.

Bleriot Monoplane. The first aeroplane to cross the English Channel. 3 ft. Model.

Nieuport Monoplane. A famous French 'plane used in the War. 3 ft. Model.

Cecil Peoli Racer. A racing-type aeroplane with a record for distance flights.

Ideal Model Aeroplane Construction Outfits for building any of the above Aeroplanes are sold by Leading Toy, Sporting Goods and Department Stores. Ask for them at your store. Be sure you get IDEAL Model Aeroplanes because they are the only ones that are true copies of actual Aeroplanes.



Send for the Ideal Aeroplane Book

Tells all about Ideal Aeroplanes and Flying Toys; gives complete descriptions and prices; contains list of stores where you can get them. Get this 48-page book.

Sent Postpaid for 5c in stamps

THE MIDGET SLIDE RULE will solve any problem in addition, subtraction, multiplication, division and proportion. A Log-Log Scale gives any root or power of any quantity. Gives Logarithms, Sines, Tangents, Cosines, Cotangents and the decimal equivalents of fractions to six figures. It is grease and water proof and will give years of service. This rule is not to be compared with the paper utility rules which sell for $1.00 and are put together with paper fasteners. It is accurate, simple to operate and comparison shows that it is undoubtedly the fastest and most complete rule made. Our refund guarantee protects you from loss or disappointment. An instruction book 16 pages, 12 illustrations, is sent with each rule. Diameter of rule 4 in. Made in two models: Metal (white coated steel), $1.00; White Celluloid, $1.25. Leather Case 50c extra. Send for catalogue of Slide Rules. Your money back if you are not satisfied.

Gilson Slide Rule Co., Niles, Mich.

TELEGRAPHING PHOTOGRAPHS FROM NEW YORK TO DENVER

If you should ask the man in the street as to whether or not he knew about the new method of telegraphing photographs of prominent people and news events across the United States from New York City to Denver, Colorado, daily, he would probably gasp once or twice and let it go at that. Probably many readers of technical journals are somewhat familiar with the Korn system of telephotography, by means of which it is possible to telegraph pictures of scenes, personages, etc., over circuits 300 to 400 miles in length. This, and several other systems which have been developed in Europe, are not very speedy, however, and they have several drawbacks.

An entirely new system, devised by Mr. LeRoy J. Leishman, of Salt Lake City, Utah, is being used daily *to transmit by regular standard telegraph dispatch* over the Western Union wires, at the usual rates, photos of prominent personages and events, from New York City to Salt Lake City and Denver. By this system the photograph, sketch or drawing to be transmitted has to be *coded*. To do this, the photograph is placed on what is known as a *coding board*, which resembles a small drafting board provided with sliding scales, *graduated with the letters of the alphabet*. It at once becomes evident how a given point on the picture can be thus checked exactly by taking the reading from a scale passing thru the point *horizontally*, and then taking a secondary reading on the same point, by taking another reading on the *vertical* scale. It might be thought that these subdivision lines would be numbered 1 to 10, but it has been found more scientific and expeditious all around to use the letters of the alphabet, which gives theoretically 26 letters. However, only 17 letters are used, owing to the similarity of several of the letters, which might be subject to error in telegraphic transmission. Not only has the Leishman system been worked out to give rapid coding and decoding methods, but there are five different degrees of shade lines transmitted by code, *i. e.*, special letters which are transmitted by the use of index letters, so that anyone familiar with sketching, such as an artist, or even a student at the game, can decode the telegram and reconstruct the picture. The inventor, altho he is not an artist, as he stated in a recent interview, can quickly decode the picture and obtain very excellent results.

To give a clear idea of just how the system works, suppose we have a photograph which is to be coded for transmission from New York to Denver. The photo is mounted on the coding board, and the complete telegram giving the positions of the various component points of the picture, is completely worked out by a fairly expert person in about one hour and a half. Then what you get is a string of words like this—"bxfas dmgdq," etc., etc. The average photograph, for example a likeness of President Wilson, will require a telegram containing about 250 words. This may be sent by day telegram rate or by night letter, in order to gain the lower cost of transmission. The telegram, of course, is transmitted practically instantaneously to the western city or other point, and the picture completely reconstructed in a time period corresponding approximately to that for coding the picture in the first place. It may be thought by the reader that such a picture would be nothing but a scratchy looking pen drawing, which would not preserve the exact features of a person very faithfully. But such is not the case. The original master photograph is mailed from the eastern city, arriving several days after the telegraphed picture has been on exhibition. As soon as the master photograph has arrived, it is placed on exhibit side by side with the telegraphic reproduction, and it is practically impossible to tell one from the other.

Boys! Win an Auto-Wheel

In This Interesting Contest

TO THE BOY who can think of the most interesting uses for the popular AUTO-WHEEL COASTER, for earning money and for play, we shall award one of our large models absolutely FREE. It's a mighty generous prize for a few minutes' work. And the following eleven valuable prizes will be given to those sending in the next best uses: **Camera, Camping Tent, Mess Kit, Scout Knife, Fleetwing Steering Sled, Compass, Ingersoll Watch, Axe, Bank, Electric Flashlight, Poncho.**

INFORMATION ABOUT CONTEST

1. Any boy or girl not over 15 years may compete.
2. Contest will be judged by three men well-known in the Boy Scout organization.
3. Write to Business Idea Dept., Buffalo Sled Co., for pamphlet explaining the Contest, and colored catalog telling all about Auto-Wheel.
4. At end of letter write names of three Coaster Wagon Dealers in your town. If any carry the Auto-Wheel put an "x" after name.

YOU CAN DO IT. Any live boy who knows how to get fun and earn money out of a good, strong coaster wagon, has a fine chance to get the Auto-Wheel as a prize. **Here are a few pointers:** The Auto-Wheel is a wagon for work or play. It's built for strength and speed. Has roller bearings, steel axles and tires, body white ash, maple gear.

If there's an Auto-Wheel dealer near you, he'll gladly let you see the Auto-Wheel Coaster in his store, and he'll give you some good ideas for your letter. CONTEST CLOSES NOVEMBER 30, 1919.

HERE'S YOUR CHANCE. GET BUSY.

FLIES 500 FEET

Lightning Racer Experimental Model. This is not a toy. It is a practical, scientific flying model, guaranteed to fly hundreds of feet; designed and built from the finest selected materials, by Model Experts. This machine and our famous "Montauk Flyer" are the only Complete Model Aeroplanes guaranteed to fly 500 ft. selling for less than $5.00. This model, shipped with monoplanes detached, ready and guaranteed to fly, $3.75 prepaid. Send stamps for circular describing this wonderful model.

Blueprints of the following models 1-2 actual size 50 cents post paid in U. S.

Bleriot Racer, flies 600 ft. Manhattan Racer, flies 2000 ft. Montauk Flyer, flies 500 ft. 3 ft. Curtiss or De Havilland Biplane, 75 cents each, postpaid.

HEC Flying Boat guaranteed to rise from the water and fly 500 ft. Two sheets blueprint $1.00 postpaid U. S.

HEC AEROPLANE CO., 300 E. 49th St., N. Y. C.

Build Your Own PHONOGRAPH

It's Easy With Our Help

SAVE OVER HALF

A few hours interesting work saves many dollars and gives you a machine exactly to suit your ideals. We furnish motors, tone arms, case material, blue prints and full instructions. Plays any record. You can make fine profit building phonographs for your friends.

"You've Gone Way Past Me, Jim!"

"Today good old Wright came to my office. All day the boys had been dropping in to congratulate me on my promotion. But with Wright it was different.

"When I had to give up school to go to work I came to the plant seeking any kind of a job—I was just a young fellow without much thought about responsibility. They put me on the pay-roll and turned me over to Wright, an assistant foreman then as now. He took a kindly interest in me from the first. 'Do well the job that's given you, lad,' he said, 'and in time you'll win out.'

"Well, I did my best at my routine work, but I soon realized that if ever I was going to get ahead I must not only do my work well, but prepare for something better. So I wrote to Scranton and found I could get exactly the course I needed to learn our business. I took it up and began studying an hour or two each evening.

"Why, in just a little while my work took on a whole new meaning. Wright began giving me the most particular jobs—and asking *my* advice. And there came, also, an increase in pay. Next thing I knew I was made assistant foreman of a new department. I kept right on studying because I could see results and each day I was applying what I learned. Then there was a change and I was promoted to foreman—at good money, too.

"And now the first big goal is reached—I am superintendent, with an income that means independence, comforts and enjoyments at home—all those things that make life worth living.

"Wright is still at the same job, an example of the tragedy of lack of training. What a truth he spoke when he said today, 'You've gone 'way past me, Jim,—and you deserve to.' Heads win—every time!"

Yes, it's simply a question of training. Your hands can't earn the money you need, but your head can if you'll give it a chance.

The International Correspondence Schools have helped more than two million men and women to win promotion, to earn more money, to know the joy of getting ahead in business and in life.

Isn't it about time to find out what they can do for you?

You, too, can have the position you want in the work of your choice, with an income that will make possible money in the bank, a home of your own, the comforts and luxuries you would like to provide your family. No matter what your age, your occupation, your education, or your means—you can do it!

All we ask is the chance to prove it—without obligation on your part or a penny of cost. That's fair, isn't it? Then mark and mail this coupon.

BOOK REVIEW

Behind the Motion-Picture Screen, by Austin C. Lescarboura. Cloth bound. Over 300 illustrations, 420 pages. Size 6¼ x 9¼ inches. Publisht by Munn & Company, New York City, N. Y. 1919.

The author has attempted to give the motion picture public an interesting and entertaining story of the screen drama and how it is made. The work is elaborately illustrated with scenes taken in various "movie" studios, and practically all the standard types of cinematograph apparatus are illustrated and clearly described. A new and important feature is that there is one picture to every page of text and the story corresponding to each illustration is found opposite it.

The opening chapters tell how the working plans of the motion picture are drawn up, the essentials of a scenario, the photoplay director, the actor, the camera man, how the director coaches the actors. The motion picture camera, the film and the lens. How battle scenes are photographed several miles away. American and foreign "movie" cameras, close-ups, fade-ins and fade-outs, vignettes, double exposures for one film, multiple printing of scenes. An interesting section deals with the scenery and "props" used in making the wonderfully realistic castles, ships, and even whole cities that never existed except in the "land of make-believe." A chapter is assigned to tricks of the "movie" screen, including those "nerve-racking" 'railroad collisions. Then we read just how the motion picture film is developed, printed and checked or censored. The "screen reporter" is an interesting personage—he travels everywhere, in the airplane, motor-boat and on the battlefield. An explanation is given of the talking picture, as well as the cartoon "movie."

Motion pictures taken on the ocean bottom are illustrated and discust, as well as film presentations of fish in action. The motion picture in the home as well as in business receives the importance it deserves, a particularly interesting section describing the various types of "home" cameras and projectors, including those utilizing paper instead of celluloid film. The concluding chapter deals with the future of the motion picture, both for amusement and business. The field of the "movie" is widening daily; the business man and salesman use it to show machinery in actual motion; the scientist and engineer find the cinematograph of inestimable value in studying the many difficult problems.

CENTRAL STATIONS, by Terrell Croft. Cloth covers, 332 pages, 306 diagrams, size 5⅝ x 8¾ inches. Price $2.50 net. Publisht by McGraw-Hill Book Company, Inc. New York.

Mr. Croft has here provided a well illustrated and very clearly explained treatise on central stations, and this work can be confidently recommended to all those interested in central station operation and design. This work is not an exhaustive text book filled with mathematics for the professional engineer, but comprises an exceptionally clear exposition of all the modern factors which influence and concern the design and operation of light and power stations, and the generation and distribution of electric power, whether it is for lighting, heating or other purposes. Some of the first principles treated on in this work are distribution loss and distribution loss factors; maximum demand and demand factors, including demand meters and how they operate, diversity and diversity factors; plant factor and connected load factor; load graphs and their significance—a very interesting and illuminating chapter, written so the layman can understand it at last; the general principles of circuit design, including direct and alternating current circuits.

THE ENGINERS' MANUAL, by Prof. Ralph G. Hudson, S. B. Flexible cloth covers, 316 pages, illustrated with many diagrams, size 4⅞ x 7⅞ inches. Price $2.00. Publisht by John Wiley & Sons, Inc., New York.

A most useful handbook of mathematical formulas and tables covering both electrical and mechanical engineering, for the use of draftsmen, designers and engineers. The first part of the work deals briefly with the various terms and expressions encountered in algebra, trigonometry, mensuration of surfaces, both plane and solid, analytic geometry, differential and integral calculus, differential equations, complex quantities, vectors, etc.

The Cause of Stomach Acidity and Fermentation

How to Remove It in 48 Hours

By R. S. Thompson

IF I were asked to sound a health warning that would be of the greatest possible benefit to mankind, I should say emphatically—"Beware of acid stomach." For acid stomach is the cause of fermentation which, bad enough in itself, is the forerunner of a hundred ills that sap the energy and vitality of its victims. I venture to say that ninety per cent. of all sickness starts with acid stomach. Yet the cause of stomach acidity can be removed in 48 hours!

Nature provides hydrochloric acid as one of the digestive fluids, but too much of this acid causes fermentation, hurries the food out of the stomach, and carries the acid all through the body. As a consequence, poisons (toxins) are formed which are absorbed into the blood, causing autointoxication, nervousness, mental depression, and countless ills of which this is but the beginning.

Every one of the vital organs in time becomes affected—the heart, the liver, the kidneys, the intestines, the nerves, and the brain all decline, for the stomach is the Power Plant of the body. Even the teeth are affected by acid stomach, for the gums recede and pyorrhoea will be the result.

Stomach remedies only neutralize the acid because they are stronger than the acid. This ultimately ruins the lining of the stomach. The acid being neutralized is absorbed into the blood only to come back to the stomach in greater quantities at the next meal.

How much more sensible would it be to attack this disorder at its source. Instead of attempting to neutralize the acid after it has formed, why not prevent it from forming in the first place?

Superacidity is caused by wrong eating, and the remedy must be found in the field of the cause—in eating correctly.

The individual sufferer from indigestion, acidity, fermentation, gas and such disorders has not carried his experiments with food very far. If he had he could easily cure himself, in 48 hours, as Eugene Christian, the famous food scientist, has proved beyond all doubt.

The reason which led Eugene Christian to take up the study of food in the first place was because he himself, as a young man, was a great sufferer from stomach and intestinal trouble.

So acute was his affliction that the best specialists of the day, after everything within their power had failed, gave him up to die. Educated for a doctor himself, Christian could get no help from his brother physicians.

Believing that wrong eating was the cause and that right eating was the only cure, he took up the study of foods and their relation to the human system. What he learned not only restored his own health in a remarkably short space of time, but has been the means of relieving some 25,000 other men and women for whom he has prescribed with almost invariable success, even though most of them went to him as a last resort.

Christian says that all stomach and intestinal disorders, with their countless sympathetic ills, are caused by wrong selections and wrong combinations of food, and that right combinations of food will positively remove every stomach and intestinal disorder by removing its causes.

No one would think of putting salt into an open wound, and yet we do worse than that when we keep putting irritating acid-creating food combinations into our stomachs already surcharged with acid.

The word diet is one which has an unpleasant sound—it makes us think of giving up all the things we like for those we have no taste for. But Eugene Christian's method is entirely different—instead of asking his patients to give up the things they enjoy, he prescribes menus which are twice as enjoyable as those to which the patient is accustomed.

Christian believes in good foods deliciously cooked—the kind all of us like best and which may be obtained at any home store, hotel, or restaurant. He says that most of the things we eat are all right—but that we don't know how to combine or balance them.

Often, one food good in itself, when combined with another food equally good, produces an acid reaction in the stomach; whereas either of the foods alone or eaten in combination with some other food would have been easily and perfectly digested.

Unfortunately, each food we eat at a meal is not digested separately. Instead, all of the foods we combine at the same meal are mixed and digested together. Consequently, if we eat two or more articles at the same meal which don't go well together, there is sure to be acidity, fermentation, gas, and all kinds of digestive trouble.

At Eugene Christian's New York office there is a constant stream of men and women who go to him for treatment after having tried everything else, and rarely are they disappointed in the outcome. Some of the results he has attained read like fairy tales. I know of a number of instances where his rich patrons have been so grateful for their restoration of health and energy that they have sent him checks for $500 to $1,000 in addition to the amount of the bill when paying it.

There have been so many inquiries from all parts of the United States from people seeking the benefit of Eugene Christian's advice and whose cases he is unable to handle personally that he has written a course of little lessons which tells you exactly what to eat in order to overcome the ailment which is troubling you.

These lessons, there are 24 of them, contain actual menus for breakfast, luncheon, and dinner, curative as well as corrective, covering all conditions of health and sickness, including stomach acidity, constipation, and all intestinal disorders from infancy to old age and all occupations, climates, and seasons. They also tell you how to reduce and how to gain.

With these lessons at hand it is just as though you were in personal contact with the great food specialist, because every possible point is so thorough covered and clearly explained that you can scarcely think of a question which isn't answered. You can start eating the very things that will remove the causes of your disorder the day you receive the lessons and you will find that you secure results with the first meal. Many people who have suffered for years from acid stomach find that their ailment vanishes completely in 48 hours.

If you would like to examine these 24 Little Lessons in Corrective Eating, simply write The Corrective Eating Society, Inc., Dept. 16411, 443 Fourth Avenue, New York City. It is not necessary to enclose any money with your request. Merely ask them to send the lessons on five days' trial, with the understanding that you will either return them within that time or remit $3, the small fee asked.

Please clip out and mail the following form instead of writing a letter, as this is a copy of the official blank adopted by the Society, and will be honored at once

CORRECTIVE EATING SOCIETY, Inc.

BOYS

Learn Drafting

Employers everywhere are looking for skilled draftsmen. They are offering good salaries to start with splendid chances for advancement.

Drafting offers exceptional opportunities to a young man because drafting itself not only commands good pay, but it is the first step toward success in Mechanical or Structural Engineering or Architecture. And drafting is just the kind of work a boy likes to do. There is an easy delightful way in which you can learn right at home in spare time. For 28 years the International Correspondence Schools have been giving boys just the training they need for success in Drafting and more than 200 other subjects. Thousands of boys have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon, then mark and mail it. This doesn't obligate you in the least and will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon now.

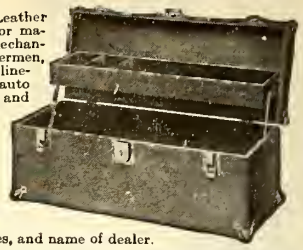
Book Review

(Continued from page 678)

The section on mechanics takes up the subject of kinetics—velocity, acceleration, circular motion and relations of mass and space. This is followed by excellent tables giving the properties of various plane sections with formulae for computing the moment of inertia, radius of gyration and distance to center of gravity. There is also a very excellent table giving the properties of different solids. Another table and the accompanying text cover the calculation and working stresses in various shaped beams, the properties of standard I-beams, standard angles, channels, etc., with fractional differences.

One of the chapters treats on hydraulics and hydrostatics, and practical working formulae are given for the flow of water thru orifices, pipes and wires. Further sections deal with various properties of steam, steam boilers and engines, refrigeration, heating and ventilation. Thence we come to the section dealing with electricity. Only working formulas are included in this section, so as to make the handbook of the utmost value to the practising designer and engineer, who invariably wishes to look up the formula and not a long explanatory text. This section covers electro-magnetism, electrostatics, direct currents, transient currents, harmonic alternating currents, with the various formulas for computing power factor, impedance, current, reactance, etc. The mathematical relations concerned with the functioning of alternating and direct current machinery are given, as well as those for transformers and induction motors. The work concludes with an elaborate series of tables giving the values of squares, cubes, square root, cube root, etc., of numbers as well as logarithms, sines, co-sines and tangents; weight of materials, weir and orifice co-efficients; channel co-efficients for use in Kutler's formula; properties of saturated and superheated steam; and a very excellent and exhaustive table giving the conversion factors for translating all of the usual and commonly employed electrical and mechanical engineering terms, from metric to decimal equivalents and vice versa.

FINAL DIGEST FOR WIRELESS STUDENTS, by J. Henstock. Cloth covers, 88 pages, size 5 x 7⅜ inches. Price $1.25, postpaid. Publisht by James Munro & Co., Ltd., 15 and 60 Brown St., Glasgow, Scotland.



The aim of this manual by Mr. Henstock, which has been written from the English point of view, is to supply wireless students, especially those taking the postoffice examinations in England, with the most pertinent and useful instructions and directions, so as to prepare themselves for the government examination, which is held under the direction of the Postmaster General. During an examination for the Postmaster General's certificate of efficiency, the candidate is often confronted with a radio installation, which a great number of superficial faults have been purposely made in order to test his knowledge, and so by studying such a work as the present one, he may provide himself beforehand with the necessary information so as to be sufficiently grounded in radio matters in order that he may at once perceive what the trouble or difference is in the set placed before him.

It is necessary for all persons operating a wireless telegraph apparatus on board ships registered in the United Kingdom to hold either a first- or second-class certificate of efficiency from the Post-Master General, in accordance with article ten of the regulations annexed to the International Radio-Telegraph Convention. The operator, under such conditions, and holding such a certificate, must be able to send or receive by sound message in plain language in the International Morse Code, at a rate of not less than twenty words per minute, five letters being accounted as one word for a first-class certificate. To hold a second-class certificate, the sending and receiving speed in the International Morse Code is specified at from twelve to nineteen words per minute.

The first part of the book deals with elementary electrical problems, such as magnetism, induction, etc. The author then proceeds to deal with the various salient points in radio-telegraphy installations, such as the power set, its principal component parts and how they function, etc., the method of presenting the work being in question and answer form such as:—What is the main difference between the 5 K.W. and the 1½ K.W. high tension circuit? What does the primary low frequency circuit consist of? etc. Further sections deal with choke coils, fuses, various types of keys, air core chokes, transformers, condensers, jiggers, high frequency or sliding inductances, coupling, aerials, detectors, telephones, emergency set, spark discharger, accumulators, faults in sets, such as:—Q. How do you overcome leaking in aerial due to wet weather? Q. What would happen if the voltmeter were placed in the position of the ammeter in the circuit, and the ammeter transposed to the circuit position normally occupied by the voltmeter?

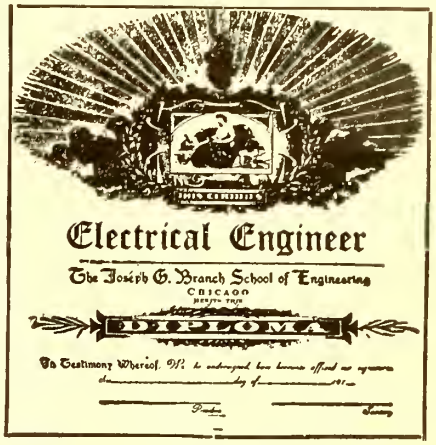
ELECTRICAL ENGINEERING

The World's Demand is for Electrical Engineers

You Can Earn From $3,000 to $10,000 a Year

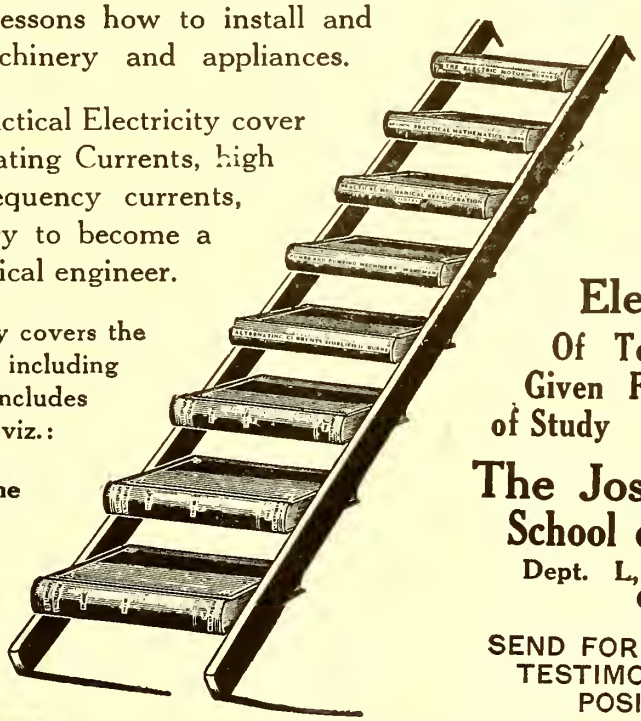
by making yourself a Competent Electrical Engineer.

Our course of training is thorough and most modern, being especially designed for the man whose past education has been limited and who now wishes to make himself a high class Electrical Engineer.



The men who get the **big jobs** are the men who understand the **principles** of electricity and their application.

Our Electrical Course teaches in plain, simple language and with easy lessons how to install and operate electrical machinery and appliances.



These lessons in Practical Electricity cover both Direct and Alternating Currents, high potential and high frequency currents, and all that is necessary to become a proficient modern electrical engineer.

The Course completely covers the field of modern electricty, including power-plant work, and includes the following subjects, viz.:

Practical Electricity, The Electric Motor, Practical Mathematics, Electric Wiring and Alternating Currents.

ARE YOU A PILL FEEDER?

STRONGFORT
The Perfect Man

Are you trying to dope yourself back to health and strength with patent medicine pills and potions? Are you one of the hundreds of thousands of weakened, sickly, discouraged men in the country who have been fooled by lying newspaper ads into thinking they could get honest red blood and virile manhood out of a pill-box?

Don't waste your good money any longer on so-called "remedies" that cost 8 or 9 cents to make and are sold to you at a dollar. There's nothing in it—except for the fat purses of their unscrupulous proprietors—and always the possibility of acquiring some disgusting drug habit that will be worse than your present ills.

Let Nature Restore Your Vitality

Nature is the one great recuperative, revitalizing agent that always can be depended on, if you give her half a chance to get in her good work. She doesn't deal in dope and drugs; she puts up no prescriptions. But she can build you up; free you from your ailments; restore you vigor and vitality—and she will do it, if you will make up your mind to get well and strong again andthen go about it the right way.

Let me show you how the forces of Nature will dig out the causes of the constipation that may be rotting away your body and your brain; how they will relieve you of the dyspepsia, indigestion, billiousness that rake the fuck out of you and make you worthless for any work; how they will develop your muscles, give you the red blood that makes beef and brawn, strengthen all your vital organs, and fill you up again with the vim, vigor and virility that makes life worth living and enables men to DO THINGS in the world.

STRONGFORTISM

Strongfortism is the science of Living Life in Nature's way, and giving the natural forces she has implanted in every human organism the fullest opportunity to get in their healing, rebuilding, revitalizing work. It makes no difference what your condition is now, what brought you to it or how weakened, sickly and discouraged you have become. Strongfortism will take hold of you and build you up. Strongfortism will start you on the road to full-blooded, vigorous, virile MANHOOD. I GUARANTEE to improve your condition 100 per cent, if you will follow my directions for a few months.

Send for My FREE BOOK

The way Strongfortism built me up into the strongest man in the world; the way it has built up and is building up my pupils in every part of the world, is stated in plain, straight-forward talk in my book, **"Promotion and Conservation of Health, Strength and Mental Energy."** It shows you how Strongfortism can and will do for YOU what it already has done for thousands of other men weighed down by chronic ills. You want a copy of this book. You would gladly pay good money for it, if you knew what it contains. IT'S FREE. Send three 2c stamps to cover postage and packing and I will mail you a copy at once.

"Playing the Game"

is a fascinating booklet. It tells how a man accumulated $10,000 in ten years on a total investment of $3,000, putting in an average of $25 monthly.

"Playing the Game" was originally sold at $1.00 per copy, but is now reprinted and we send it free to anyone ambitious to achieve financial independence. It contains nothing for the man who wants to get rich in a hurry, but will be helpful to all who wish to save from $5 to $100 monthly and invest by a safe method.

Book Review

(Continued from page 681)

SECRETS OF THE SUBMARINE, by Marley Fotheringham Hay. Cloth bound, 229 pages, illustrations from photographs, size 7⅝ x 3 inches. Price $1.50. Publisht by Dodd, Mead & Company, New York.

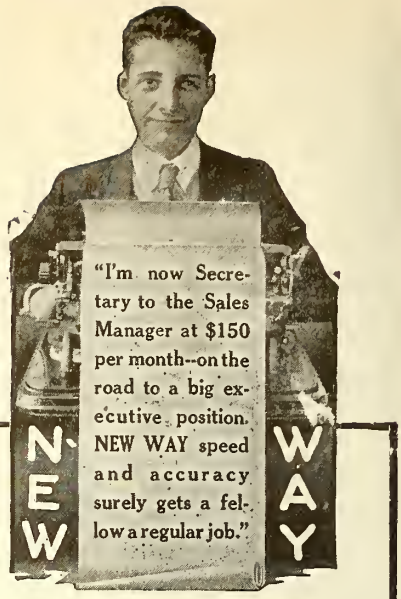
This excellent work is written in non-technical English and tells all about submarines. Readers of all classes may thoroly enjoy it, and at the same time learn the more technical and predominant features connected with their operation and strategy. The opening chapters deal with the design and construction of ubmarines, and give us some very interesting comparison figures as to the buoyancy and also the relative size of the submarines of different navies. Next we learn about the various forms of power plants and motive power which are practicable for submarine operation. Then follows an explanation of the general equipment, including steering gear, diving gear, air system, water piping system, refrigerating system, heating system and navigating appliances.

Chapter five takes up the armament, including torpedo tube and guns and the author discusses these important features in an interesting and non-technical manner. Next we find a discussion on periscopes and methods of range finding; safety devices and how they work; the safety keel as applied to submarines and other features coming under this category, such as the telephone buoy and submarine signaling apparatus, including wireless telegraphy.

EVERYMAN'S CHEMISTRY., by Ellwood Hendrick. Cloth covers, 374 pages, size 5½ x 8¼ inches. Price $2.00. Publisht by Harper & Bros., N. Y.

The author of this popularly written book happily combined an extraordinary gift of writing entertainingly and with authenticity on the matter with which he deals, which is usually the exception and not the rule in text-book writing. On the other hand, the author has shown us that he has the courage of his convictions, in that he was not afraid to carry the student reader rapidly forward as he progresses thru the opening chapters, so that by the time the student reaches the intermediate sections of the work, he will unconsciously have absorbed considerable of chemical lore. Some of the introductory chapters treat of the phases of matter; elements and compounds, chemical names and phrases, inorganic chemistry, air and water; the red-headed halogens; sulfur and sulfuric acid; phosforous, arsenic; sand and clay; lime and magnesia; iron and steel; paraffins and petroleum bodies; olefins; alcohols and some relatives; fats, oils and their products; sugar, starch and gums; aromatic compounds; coal-tar and finished products, etc., etc. The appendix contains a special explanatory table of the elements, which will be of great help to the general reader. It also contains a very useful bibliography of practical chemical books.

AVIATION ENGINES—DESIGN, CONSTRUCTION AND REPAIR, by Major Victor W. Page, formerly of the A. S. S. C., U. S. R. Cloth bound, size 5½" x 8¼", 590 pages, 250 illustrations. Publisht by Norman W. Henley Publishing Co., New York City, N. Y. Price $3.00.



The book is unquestionably one of the finest and most exhaustive treatises of the subject of aviation engines that has ever been publisht. It contains about six hundred pages, full of absolutely valuable data. Not only are the engines themselves discust, but the measurements involved are covered in a masterly and authoritative fashion.

Early in the book, the explanations offered are of great value to the student. Here the essential differences between the single and multiple cylinder engines are explained on a page opposite four illustrations depicting the actions which takes place within the cylinders. This excellent arrangement of reading text and illustrative matter is consistently maintained.

The main portion of the book, however, is what actually makes no apology necessary for the publication of the book. Aviation engines of all makes are here covered by detailed explanations, diagrams and photographs in such a manner that their individual characteristics and methods of function are clear to the aviation mechanic ond the mechanic-to-be.

The Curtiss, Standard, Hall-Scott and other well-known types of airplane motors are described, together with the method of installation, upkeep and repair.

(Continued on page 689)

$25 to $40 Per Week for You

If You are a Really Efficient Stenographer

Expert Typists in Great Demand

Typewrite 80 words per minute or more and you will draw big pay. Wherever you are, increased output of finished work will bring the big money—good promotions—the private secretaryships—eventually the executive positions. Stenographers who are real typists are wanted by employers everywhere. Poorly trained in typewriting means poorly-paid on pay-day. Expert ability means big money—success.

The trouble hitherto has been that stenographers had no way to improve their typewriting. Ordinary methods left them stranded with out a 30 to 40 word ability. There was no way to overcome the handicap.

Now the "New Way" has changed all this—it opens the door for every stenographer to high speed in typewriting—to perfect accuracy—to great ease of operation—to promotions and Big Pay.

Based upon an absolutely new idea—special gymnastic exercises for the definite, cultural training of the fingers *away from the machine!* Marvellously successful. Ten simple lessons, easily completed in spare time. Your daily typewriting improves from the very start. Cost low. Binding guarantee—no pay retained unless expected results are fully realized.

New Way booklet describes this revolutionary new system in full detail—shows you the way to a transformed ability, doubled or trebled salary. Write for it today. FREE.

THE MAN YOU WOULD LIKE TO BE!

He has a commanding appearance, a strong personality and unlimited energy. His strength is supreme and his muscles are splendidly developed. He has broad shoulders, a well-shaped neck, a powerful back, arms of steel and a deep full chest. His muscular legs, untiring, give him the energy and the springy step and the walk of a youth. He possesses everything you lack and admire. He is a master of men.

EARLE E. LIEDERMAN
the Acme of Physical Perfection

WHY NOT BE LIKE HIM?

THE MAN YOU WOULD LIKE TO BE, never has indigestion, but he can eat whatever he likes, for his stomach can assimilate anything. He never suffers from constipation, liver trouble, nervousness, insomnia or any of the common ailments that most of the people have. Neither is he a slave to any habits, but he is master of himself.

ARE YOU MASTER OF YOURSELF?

You cannot expect to control others or command their respect until you can first control yourself.

THE MAN YOU WOULD LIKE TO BE does not heed the temptations placed before him in daily life. He does not waste his best years in dissipation following the ignorant crowd. He takes care of himself and reaps his reward. His offspring are bound to inherit his qualities. His mind and his body are clean. He can do things that others cannot do. **HE IS A SUPERMAN.**

WHY NOT BE LIKE HIM?

YOU ARE JUDGED BY YOUR APPEARANCE. The world sizes you up by your own opinion of yourself—as expressed in your looks, your actions, and the force of your ambition. It is the strong, clean-cut virile man, the man of tireless energy, that gets to the top. You cannot be alert, you cannot have full control of your faculties, you cannot have that inexhaustible supply of vitality and energy that means success in life unless you have perfect health. Your physical condition is the root of your whole life. Build up your body and muscular strength and you build up your mind and vitality and insure success.

Get a good healthy color in your face, feel strong look strong, be somebody—**BE THE MAN YOU WOULD LIKE TO BE.**

GIVE ME A CHANCE TO HELP YOU. I have helped thousands—taken them out of the crowd of physical wrecks and turned them into powerful athletes. I am doing it every day and shall continue to do it, for it is my life's ambition.

I HAVE TRAINED SOME OF THE WORLD'S STRONGEST MEN. My pupils really amount to somebody. You can, too, if you will let me take hold of you and help you make the most of yourself. You don't know what you are missing by not being an athlete. It is a pleasure to feel bubbling over with vitality always—never to feel tired. Think of it! After a hard day's work—and still feeling refreshed!

THE FIFTH EDITION OF MY LATEST BOOK

"MUSCULAR DEVELOPMENT"

HAS JUST COME OFF THE PRESS

I have only 100,000 copies on hand, so if you have not as yet read this interesting and handsomely illustrated book, by all means send for a copy while they last. This book describes my system of training, and contains 20 full page photographs of myself and of some of the finely developed men and boys whom I have trained. After you have received it, you will be mighty glad you sent for it.

I WANT EVERY ONE WHO READS THIS PAGE TO SEND FOR A COPY OF THIS BOOK, for I want to make you the man you would like to be.

Simply tear off coupon and mail to me with 10c, stamps or coin, to help pay cost of wrapping, postage, etc., and you will receive your copy promptly. The sooner you do this, the quicker I can get this book to you, so **TEAR OFF COUPON NOW**—while it is on your mind.

Who wants to be a good Boxer?

Suppose you are walking with your mother, sister, or best girl, and someone passes a slighting remark, won't you be ashamed if you cannot take her part? Well, can you?

Or suppose you remonstrate with a man for striking a smaller man, and the bully turns on you. Can you hold your own? Wouldn't you like to?

Or, if one of your pals says, "Come, put on the gloves and have some fun," can you do it, and get any "fun" out of it?

Less than 2 per cent of all men and boys know anything about the art of self-defense. That means when the test comes, less than 2 per cent are ready. Wouldn't you like to learn to box easily and quickly at half the usual cost?

Marshall Stillman has developed a unique "Shorthand Method" of teaching Boxing. You can learn the fundamentals in six lessons and can outbox older and stronger opponents after two weeks' study. His original principle has enabled him to teach professional boxers difficult blows and guards they could not learn by the old method. Professor Mike Donovan, former middle-weight champion of the world, who taught for thirty years at the New York Athletic Club, endorsed this "Shorthand Method," and helped prepare the lessons we send you. Boxing instructors and Y. M. C. A. physical directors are taking the course to use in their own work. Thousands of men and boys in this country and Canada,—boys as young as 12 and 15, and men as old as 50 and 60 have taken the course both for the boxing instruction and to keep in good physical condition and develop confidence and self-reliance.

It is the first time boxing has been successfully taught by mail, and it is only possible because Marshall Stillman starts with movements you are familiar with—holding out your hand for a coin, the breast stroke in swimming, etc. The first thing you know, he has led you into striking correct blows with both hands, putting the body weight behind them, guarding, ducking, feinting, etc. He teaches you the rudiments in front of your own mirror, before you face your first opponent. When you finally meet an opponent, you know how to hit him, what to expect in return, and how to guard against it.

The special introductory price of the new Home Study Edition is less than you would pay for a single term of lessons by the old method. We will include, until further notice, "Three Rounds of Shadow Boxing," 8 Jiu-Jitsu, or bone-breaking holds and releases, and 8 holds in standing wrestling—how to disarm a man, how to get out of dangerous holds, how to guard against a kick for the stomach, etc.—and also a complimentary copy of Mike Donovan's famous book, "The Science of Boxing." There are 175 illustrations in the course.

Frankly you don't believe that you can learn all these things by mail, do you? All right, we will take you on your own ground, we will send the course on 5-day approval, with the understanding that if you keep it you pay $5, but if you do not want it, you can return it on the fifth day, and end the matter. Simply fill in the coupon—we will do the rest.

Free Approval Coupon

MARSHALL STILLMAN ASSOCIATION
Suite E-11, No. 461 Fourth Ave., New York

You may send me at your risk, on 5-day approval, the complete Marshall Stillman "Shorthand Method" of Teaching Boxing, including all of the instruction described above. I agree on my honor to either return the lessons on the fifth day after receiving same, or else send you $5 on the fifth day in full payment for the complete course.

Church Sermon Heard Over One-Half Mile

(Continued from page 636)

played on the violin could be heard easily for *half a mile*. Preaching from the pulpit can be heard distinctly for the same distance.

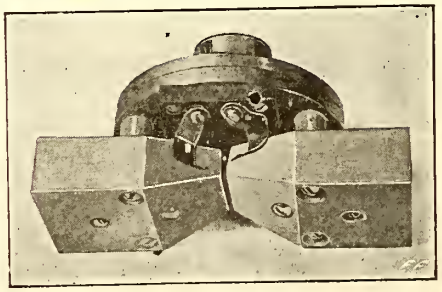
N. Burglund, radio and electrical engineer of the concern manufacturing the Magnavox. Referring to the diagram herewith, we see that this remarkable sound-reproducing instrument is of the *electro-dynamic*

Sectional View of the "Magnavox" Loud-Talking Amplifier.

This installation was a special test conducted by the Signal Corps, U. S. Army, under the personal supervision of Dr. B. W. Burglund.

The amplifier is so constructed that one, two or three steps may be used. The cam switches on the Bakelite panel are as follows: M, master switch, controlling all currents; 1, 2 and 3 are respectively steps of amplification; R, special switch for "cutting in" a radio winding into the first step and cutting out the voice transmitter. Two binding posts are provided for attachment to any radio detector or telephone circuit.

In the circuit diagram are shown the four Magnavoxes (two for each tower) and a small 6-volt storage battery for exciting the magnetic fields of each Magnavox. This is not necessary unless the Magnavoxes are so far away from the amplifier that the drop of voltage would seriously weaken the fields.



For the sake of portability, special plugs are furnished for connecting to storage battery transmitters and plate battery (600 volts). They are not shown in diagram, but attach to the front of the amplifier.

Description of the Magnavox Reproducer.

The following details of the interior mechanism of the Magnavox reproducer are available thru the courtesy of Dr. B. N. Burglund, radio and electrical engineer of the concern manufacturing the Magnavox. Referring to the diagram herewith, we see that this remarkable sound-reproducing instrument is of the *electro-dynamic* type, and in this respect differs from the usual telephonic devices intended for reproduction of speech. The ordinary telephone receiver operates on the electro-magnetic principle, wherein variations in the magnetic field act upon a flat iron diafram about two inches in diameter, causing the diafram to be attracted and repelled alternately, so as to cause it to vibrate. The vibrations of the diafram in the well-known manner give rise to air vibrations corresponding to the originating voice waves at the transmitter end of the circuit.

In the Magnavox, the principle is *electro-dynamic*, and the diafram is not acted upon directly by the magnetic flux from the electro-magnet. Instead, a minute insulated wire coil is placed in a small air gap about $\frac{1}{16}$ inch long between the pole-

Save TIRES LIKE THESE

I Earned $2200 In Four Months

This is Richard A. Oldham

Mr. Oldham was tel graph operator for the Illinois Central Railroad for twenty years. He is fifty-eight years old. One day he read one of my advertisements and the possibilities of making money in Auto Tire Surgery business. In a few weeks he had purchased and installed a Haywood outfit. A short time afterward he wrote us that his income in four months was as much as it had been in Two and One-Half years as Telegraph Operator.

Be a TIRE SURGEON

Make $2,500 to $4,000 Per Year Giving New Life to Old Tires

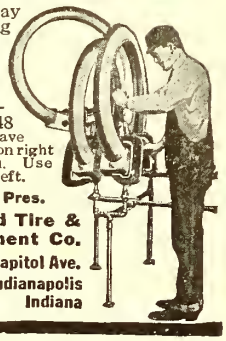
A Haywood Tire Surgeon can do more with old tires than was even dreamed before the war. By the **Haywood Method a Haywood Tire Surgeon** can give 4,000 to 5,000 more miles of new life to a tire that two years ago would have been thrown on the junk pile. And it's easy to learn.

HAYWOOD'S TIRE SURGERY

Stations are Needed Everywhere

20,000,000 tires wearing down every day. By Tire Surgery you can quickly repair, rebuild and give new life to tires seemingly all worn out. Cuts, gashes, tears, bruises, broken fabric, every kind of an accident that can happen to any tire, inside or out, you can repair and save for long service. **The chance to make money is simply wonderful.**

$2,500 to $4,000 a Year is Possible



If we told you all the truth you wouldn't believe it. You would say, "it is too good to be true." But you can see what a great field there is for **Haywood Tire Surgery Stations**—for this better way.

WITH THIS HAYWOOD OUTFIT

Send Today for My Free Book

WRITE TODAY

I have ready to mail you the day I get your request, a fascinating book—all about tires—how to repair them by the Haywood Method—how to start in business—how to build up trade—what to charge. In 48 to 72 hours you can have the whole proposition right in front of you. Use coupon at the left.

M. HAYWOOD, President

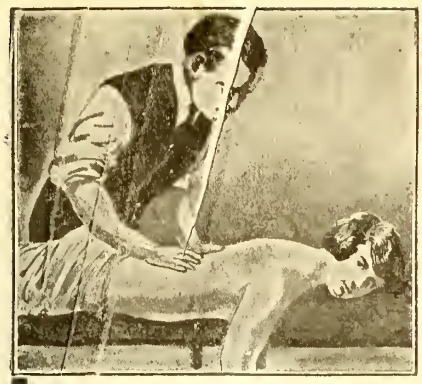
Church Sermon Heard Over One-half Mile

(Continued from page 684)



pieces of the powerful electro-magnet, which pole-pieces are magnetized North and South, as shown in the accompanying drawing. No permanent magnets are used in its make-up. As the fluctuating or alternating currents from the microphone at the distant end of the circuit (or else the oscillatory audio-frequency currents coming from an audion amplifier) are past thru this small coil attaching to the diafram, the coil is acted upon by the powerful magnetic field between the pole-pieces in such a manner as to be either *repelled* or *attracted* alternately (up and down) in a rapid manner, and at a rate corresponding to the voice wave pulsations. The movements of the small coil are, of course, immediately communicated to the diafram, and it is attached firmly to the latter, and in turn the movements of this diafram set up powerful air waves which issue from the sound amplifier horn attached to the instrument, and which is shown in one of our photographs. The odd shape of this horn has a special bearing on the acoustic quality and sonority of the sound waves its sponsors claim. The upright poles of the electro-magnet have one-inch round cores of annealed Norway iron, the pole-pieces and yoke members being of similar material. The magnetizing coils consume a very small amount of current, or about 25 watts, and they are supplied to operate on 6, 8 or 18-volt D.C. from battery, as desired or on 110 volts D.C.

Contrary to the general opinion, no noticeable effect is caused in these speech reproducers when the latter current is used, due to the *commutator ripple,* owing to the high impedance of the windings, which smoothes out the pulsation so that they are not noticeable at all. Another very interesting feature of the Magnavox, which its inventors have ascertained after careful research on the acoustics of the instrument, is the *diafram.* As is well known, no phonograph or talking machine with a small diafram can be capable of producing the full sonorous quality of the average voice, such as a baritone, and particularly the music from string or wind instruments of the medium or lower tonal register. This is because of the fact that the smaller the diameter of the diafram the higher the natural period or pitch at which this diafram will vibrate; the greater its diameter, within certain limits, of course, the lower the natural period or pitch of the diafram and the more quality will it give to the average class of music, especially vocal or instrumental reproductions in the baritone or base register, for example. So the experts who have designed the Magnavox found that wonderful results were obtained by using a large diafram; in fact, it measures three and one-half inches in diameter. The diafram is neither of iron nor mica, but of German silver, and, furthermore, it is not flat, but has a double ogee groove or rib prest into its surface a short distance from the outer perifery. This helps to stiffen the diafram, and together with the peculiar properties of the material with which it is made, also tends to nullify any effects of natural period vibrations of the diafram itself.

It may be imagined from what has been said before that the new sound, music and speech reproducer must be used with an audion or vacuum tube amplifier—but such is not the case at all. This reproducer

CHIROPRACTIC

THE NEW PROFESSION OF DRUGLESS HEALING

A dignified, pleasant and profitable career awaits you in this new, uncrowded field.

Learn at Home---Earn $3,000 to $5,000 a Year

Here is your opportunity to qualify at home in your spare time to become a Doctor of Chiropractic and make a big income. No matter where you live or what work you are now doing, if you are ambitious our Course in Chiropractic shows you how easily you may achieve financial independence. We give you, right in your own home during your spare time, or in class, just the training you must have to succeed.

Never before has the demand been so great for competent Doctors of Chiropractic. The day of Drugless Healing is here, and the masses of people everywhere are eagerly welcoming Chiropractic, the science of restoring health by means of spinal adjustment, as a natural scientific substitute for the old outgrown system of "dosing" by internal medicines.

Read What These Doctors of Chiropatic Say

"My Charges Are $25.00 for 13 Treatments."

American University:

My practice averages ten patients a day, of which many are women. My charges per course are $25 per 13 treatments. The number of treatments varies from one to two courses in stubborn cases. Minor cases take from 6 to 10 treatments. I have your school at heart and will boost it all I can.—DR. W. H. WEDELL, M.T.D.D.C., N. Y.

Heartily Recommends Course—Charges $2.00 per Treatment.

American University:

I have no hesitation in recommending your course in Chiropractic to anyone contemplating such a course, as it is thoroughly practical, well-written, interesting and valuable to the new student and a valuable adjunct to any drugless healer. I receive $2.00 for all treatments.—DR. ANNIE B. McDERMONTT, N. J.

"I Am Proud of Your Chiropractic Course."

American University:

Our regular price for such work is $2.00. Treat on an average of about eight a day, and give all the way from 12 to 24 treatments, which depends on how obstinate the case is. Some are cured with only five or six treatments. I am proud of your Chiropractic Course.—DR. W. H. WOOD, Missouri.

Average 15 Patients Daily—I Charge $1.00 per Treatment.

American University:

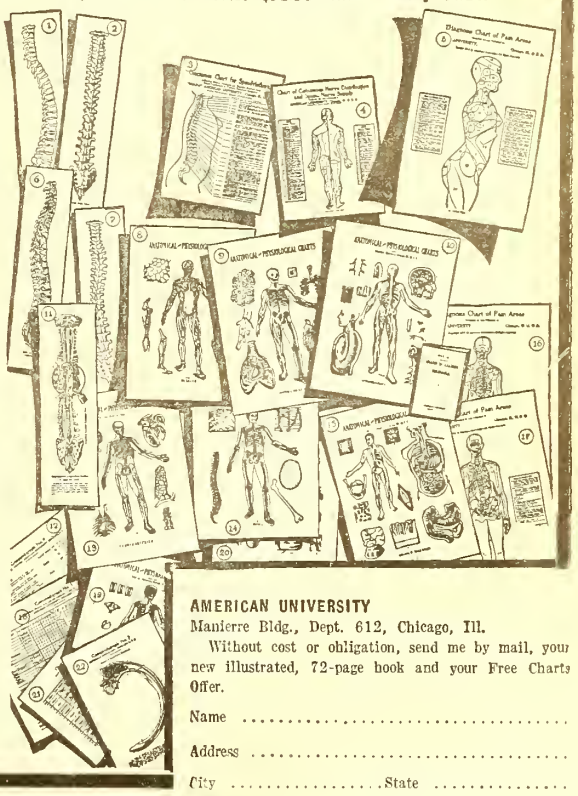
I charge $1.00 per treatment; average fifteen daily. Each patient never takes less than two treatments a week and often one treatment a day for ten consecutive days, and then two or three each week. The cases run from 25 to 100 before considering themselves well. Your Extension Course in Chiropractic has been of great benefit. The lessons are all based on sound scientific principles, and very good.—L. H. ROCHE, D. C.

This Is Your Opportunity

Get out of the rut and qualify now for this splendid profession that offers such remarkable possibilities for making you prosperous and independent. Our Course in Chiropractic will point the way for the attainment of your ambition. Never has there been a more opportune time than now, for never has the demand for competent Doctors of Chiropractic been so great as it is today. Now is the time to get started on the road to success.

Mail the Coupon TO-DAY

Don't delay. Your chances for building a successful career are as great as those of any of the others who are succeeding in the practice of this great profession. Just let us give you all the facts—then judge for yourself. Mailing the coupon places you under no obligation of any kind whatever. All we ask is the opportunity to prove to you that what we tell you is the absolute truth. We have the facts to prove it—facts which you will find mighty interesting. Just send the coupon or a post card for our beautiful new illustrated 72-page book and full particulars of our remarkable Free Charts Offer. Mail coupon or write today SURE.



American University
Manierre Bldg., Dept. 612, Chicago, Ill.

Remarkable FREE Charts OFFER

We want men and women seriously intending to take up professional careers in Drugless Healing to have these charts. Their actual value is $31.50. But on our offer they come free. There are 22 in all, printed in colors. Send the coupon below to get all the facts about our offer.

- 8 Anatomical and Physiological Charts (with Bound Manual Key) Handsomely Lithographed in Lifelike Colors.
- 4 Original Compendigraphs.
- 5 Illustrative Spinal Columns.
- 5 Colored Nerve, Pain Area and Concussion Charts.

22 Magnificent Charts—Value $31.50—All absolutely FREE.

AMERICAN UNIVERSITY

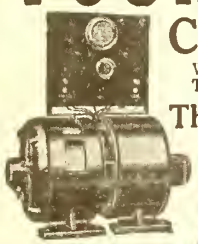
$1.00 INEXPENSIVE ELECTRIC POWER $1.00

The wonder of the twentieth century inexpensive electric power, this is possible with our new electric power system, a new idea in electricity. With the aid of our instruction and chemicals you can make and install a power battery as shown in the illustration, absolutely safe and simple. Stop wasting money on buying batteries, install the new electric power battery. It is not an acid or dry battery, it is a new combination of wet and dry elements which produce electricity. These batteries are powerful and cheap to operate, they produce a direct current of more than 20 volts, cheaper than any other form of battery. They are wonderful for operating all kinds of experimental work, for lighting purposes and for many other uses where electric current is needed. Any user of batteries knows the value of an inexpensive high voltage electric current. These batteries should be in every home, office, shop and factory, no matter how small a current is needed; to reduce or raise the current of the battery, simply move the volt regulator on the switch board. The beauty of these power batteries is, that they do not evaporate or lose current when not in use, therefore, with every day use recharging the battery is necessary about every month or so, it can be recharged at home in a few minutes, no electricity or machinery is required for this operation, recharging material can usually be obtained around your home or can be bought for a few cents. These batteries when charged weigh about 84 pounds and if properly installed will last for years. Each battery making outfit consists of a completely wired switch board, battery connectors, wire, instructions and plan for making, installing and recharging the battery and complete chemicals. Special introductory price, $1.00, prepaid. Outside the U. S., $1.25.

ELECTRIC LIGHT IN YOUR HOME $1.00



The latest electric light, no batteries to buy or electric bills to pay. Anyone can install and maintain this midget electric light. Safe, simple and inexpensive. No more smoke and smell, no wicks or oil, no chimneys to clean or break, just as safe in the barn, garage and clothes closet as in any open room, always ready for use, day or night. A touch on the switch and you instantly have a bright electric light. No matter where you live this light can be installed. It is not affected by heat or cold. Many homes have installed this electric light in their halls, closets, pantries, barns, sheds, cellars, garages, etc., with good results. It is an extremely useful light which no household should be without. The reason for this bright electric light is that the lighting bulb is fitted with a drawn Tungsten filament wire which is much more efficient and durable, besides giving a 300% increase in light as compared with the ordinary carbon lamp. The power system furnished with this lighting outfit is somewhat similar to the electric power battery described above. Each electric light outfit includes the following: Complete directions and plans, copper wire, insulated wire holders, knife switch, drop light fixture with socket, friction tape, battery protector, maroon shade, national mazda globe. Our dry battery compound, which assists in renewing and supplying the current and our current renewing system with which you can renew the current at home without expense. With every day use one recharge usually lasts two to three weeks. This electric lighting outfit is undoubtedly the most practical and durable electric light of low cost and long service ever devised. Special price to introduce these electric lighting outfits $1.00, prepaid. Outside the U. S. $1.25.

Our Guarantee—It is our intention that every article described above will reach you exactly as described, that it will satisfy you perfectly, that it represents full value for the money you paid or we will refund your money.

Just to introduce our new line of goods we are offering them at these greatly reduced prices. We only have a limited number of the above described goods at these prices. Order now, direct from this ad. We guarantee safe delivery anywhere for additional 10 cents on each item.

"The Eastern" is a Large Achromatic Telescope

MADE UPON NEW SCIENTIFIC PRINCIPLES.

Positively such a good Telescope was never sold for this price before. Eastern Telescopes are made by one of the largest manufacturers of telescopes in America; we control entire production; measure closed 9 inches and open over 3 feet in 4 sections. They are nicely brass bound, with scientifically ground lenses. Guaranteed by the maker. Every sojourner in the country or at the seaside resorts should certainly secure one of these instruments, and no farmer should be without one. The scenery just now is beautiful, a Telescope will aid you in taking views. Objects are brought to view with astonishing clearness. Sent by mail or express, safely packed, prepaid, for only 99 cents. Our new Catalogue of Watches, etc., sent with each order. This is a grand offer and you should not miss it. We warrant each telescope just as represented or money refunded. Send 99 cents by Registered Letter, Post Office Money Order, Express Money Order, or Bank Draft payable to our order, or your newsdealer or store-keeper will order one for you. Whether consumer or dealer, send cash with order. To dealers 6 for Four Dollars.

EASTERN NOVELTY CO., 67. 172 E. 93d STREET, NEW YORK.

Church Sermon Heard Over One-Half Mile

(Continued from page 686)

in itself possesses very remarkable amplifying properties and articulates the spoken word very beautifully. It has satisfied the most exacting test of the U. S. Signal Corps at Washington, as well as many experts of the Army and Navy Departments who have heard the instrument and tested it. The loud talker talks in a very loud and clear manner, with no vacuum bulb amplifiers attached. It is simply connected to a microphone, preferably a special microphone designed to be used with it, and comprising four standard microphone buttons connected in parallel, all enclosed in a single casing. In one test made with the instrument in this fashion, using a 12-volt battery current, a single reproducer was successfully employed to talk to 15,000 people, or covering a sound area equivalent to the average city block. In a test made at the Navy Department building at Washington, D. C., Dr. Burglund successfully transmitted the "tick of a watch" so as to be heard *one-half mile away* by experts who were listening for it. These tests proved very interesting, and also the manner of carrying them out. Dr. Burglund hooked up first one stage of a vacuum tube amplifier, and then successive stages. When he hooked on one amplifier he would ask thru the Magnavox that the listeners stationed about one-half mile away lift their right arms to a horizontal position if they heard the voice clearly and distinctly, and to raise the arm vertically if they heard the voice extra loud and clear, which was the case when he connected two and three stages of vacuum tube amplifiers into the circuit with the Magnavox. The amplifying horn used in these different tests mentioned has been invariably a 24-inch quarter-sawed oak horn of the particular curved form as shown in the photograph of the instrument.

One of the most astounding features of the Magnavox is that, contrary to what the reader may at first believe, it is possible when the instrument is talking loudly to place the head directly into the horn with no uncomfortable feeling of having your ear drums shattered, or any rocking of the head, as is generally caused by a very loud sound, and at the same time you can walk away one-half mile and still hear the Magnavox talking to you clearly and loudly, and on a quiet day much farther than this. This instrument has many hundred uses, and one of the applications to which it is now being applied is for use on shipboard, and the ships being built by the U. S. Shipping Board are to be fitted with it for the purpose of giving orders from the officers' bridge, or chart house, to the engine room below decks. This has always been one of the most difficult features to install on any vessel, especially on war vessels, where it was imperative that orders should be accurately reproduced and heard at all times. Due to the peculiar construction of the balanced Magnavox microphone, which has found wide application in Airplane Radio telephony and the Magnavox itself, either of these instruments can be used where there is a perfect bedlam of noise, such as created by the turbine and dynamo running in the engine room, and the noise of other auxiliary machinery, without there being the least effect on the telephonic transmitting and reproducing qualities of the apparatus. In fact, in one instance, the Magnavox was fastened on the reduction gear case of a turbo-generator on a war ship. This, we must concede, is the acid test of any telephonic device.

Book Review

(Continued from page 682)

PRACTICAL AVIATION FOR MILITARY AIRMEN, by J. Andrew White, major, American Guard. Cloth covers, 198 pages. Profusely illustrated. Size 6¼ x 9½ inches. Price $1.75. Publisht by Wireless Press, New York City, N. Y.

The excellent compilation is designed as a textbook for the student of military aviation, and its arrangement makes it highly satisfactory for the purpose. The opening chapter is devoted to definitions of the various terms which enter into a consideration of aeronautical subjects. This is followed by a description of the principles involved in the design of airplanes for various purposes. The author states that airplane design is restricted by opposing essentials which require the aerofoil (lifting surface) characteristics and velocity to produce either maximum climb or maximum velocity. A compromise between the two is affected in all airplanes, and he proceeds to illustrate these principles in a manner so lucid as to require no further explanation to the reader.

After several chapters of design, construction, and assembly of the various types of machines, the author enters upon the field of gasoline engines with which the airplanes are equipt. This section of the work is treated in a very complete manner, as is the rest of the book. The first of these chapters upon gasoline motors is entitled "Fundamentals of Motor Power," and the statements made thruout are so clear as to make one wonder at the inherent simplicity of motors. These chapters on the engines are worth-while reading for themselves, even if one be not particularly interested in airplanes. Major White carries the reader from the single cylinder engine of antiquity to the ultra-modern, high-powered machine which the modern bombing and battle-plane carries.

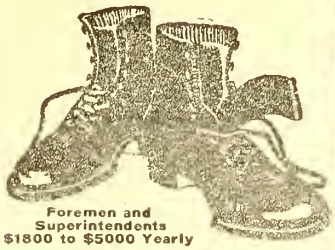
After these purely constructional details come the chapters which deal with the fundamentals and tactics of aeronautical manuvering.

LESSONS IN ASTRONOMY. Revised edition. By Charles A. Young, Ph. D., LL. D. Cloth covers, 420 pages, about 350 illustrations. Size 5 x 7½ inches. Price $1.60 net. Publisht by Ginn & Company.

There is, indeed, cause for rejoicing at this new edition of what may be called the most popular book on Astronomy which has ever appeared in the English language. But slight changes have been made in the text of this new edition—changes which were but necessary to bring the book up to the second and in line with the most modern researches which have displaced older theories.

The book, as a whole, however, remains as it always was: an unsurpassedly concise, clear and comprehensive text on a subject which should be known by all who have any pretentions at all to a knowledge of science. The book is particularly adapted to the needs of those who desire an unmathematical analysis of the Universe.

The section on the Moon is particularly interesting—more interesting, in fact, than the wildest romance that was ever written. This section is also of interest at the moment, because of the recent discussion regarding the motion of the moon as prompted by Tesla's startling revolutionary statements. It should be noted that Professor Young's text is based on the strictly logical, conservative theories.



As to the appearance of the Earth from the Moon, Young is quite complimentary to our planet. He says: "It is easy to see that she (the Earth) would be a very beautiful object, on account of the changes which would be continually going on upon her surface—due to snow, storms, clouds, growth of vegetation, etc."

The entire planetary system is treated in a commendable manner. Each planet is thoroly considered in its relation to the rest of the system, and no reader can fail to obtain a thoro survey of the field during the many pleasant hours that may be spent with the book.

The stars, comets and other bodies are also treated thoroly. The phenomena accompanying comets and nebula are given careful consideration. Here it is of interest to notice the divergence of opinion on astronomical subjects by accepted authorities, as demonstrated by the hypothesis advanced by many men for cometary and nebulary phenomenons—which have caused so many foolish predictions and stupid prophecies among ignorant elements of population.

There is a meritorius appendix which includes descriptions of astronomical apparata in use thruout the world. The use of these instruments, their origin and construction, are described. The appendix also includes a description of the method employed to locate a ship at sea, the determination of time at sea, and various other problems which are well within the realm of astronomy. All presented and demonstrated with the same clarity that characterizes the entire book.

Foremen and Superintendents $1800 to $5000 Yearly

Office Manager or Auditor $1800 to $5000 Yearly

Engineers (all kinds) $2000 to $5000 Yearly

Learn to Fill Bigger Shoes

NO matter what kind of work you are doing now, a set of these great home study books will quickly fit you for a bigger and better paying job. We will send any set you select for one week's FREE examination, and if you want to keep them you pay only the special reduced price—at the rate of 50 cents a week. This is your opportunity to make more money—grasp it NOW. Use these books and a little spare time and LEARN TO FILL BIGGER SHOES.

Carpentry and Contracting
Five volumes, 2138 pages and more than 400 illustrations. Prepares for Contractor, Building Superintendent and Carpenter Foreman. Regular price, $25.00. Special price, $19.80.

Civil Engineering
Nine volumes, 3900 pages and 3000 illustrations, plates and diagrams. Prepares for Civil or Structural Engineer, Transitman, Estimator, Designer or Chief Draftsman. Regular price, $45.00. Special price, $29.80.

Telephony and Telegraphy
Four volumes, 1728 pages and 2000 illustrations, plates and diagrams. Prepares for Telephone Engineer, Wire Chief, Exchange Manager, Trouble Man or Telegrapher. Regular price, $20.00. Special price, $14.80.

Steam and Gas Engineering
Seven volumes, 3300 pages and 2500 illustrations, plates, diagrams, etc. Prepares for Stationary, Marine or Locomotive Engineer or Fireman. Regular price, $35.00. Special price, $21.80.

Law and Practice
(with Reading Course in 25 bound pamphlets). Thirteen volumes, 6000 pages and 24 illustrations. Prepares for all Bar Examinations. A wonderful aid to business men. Regular price, $72.00. Special price, $44.80.

Practical Accounting
Four volumes, 1840 pages and 800 illustrations, plates and diagrams. C. P. A. questions and practical problems. Prepares for Accountant, Bookkeeper or Cost Clerk. Regular price, $20.00. Special price, $14.80.

Pay Raisers

These books are written by well known authorities—the top-notchers in each line. They will help you make more money. You can't fail to understand them, because they are written in plain, everyday language. Thousands of photographs, diagrams, charts, etc., help to make difficult points as simple as A-B-C.

See our Free Examination—no money down offer below

Ask Our Experts

With these books goes free of all charge a $12.00 Consulting Membership in the American Technical Society. If any question puzzles you—write us. Our corps of experts and engineers will solve any problem. Ask all the questions you want for a whole year. This service is absolutely FREE.

Automobile Engineering
Six volumes, 2600 pages and 2300 illustrations. Prepares for Garage Foreman, Automobile Mechanic or Chauffeur. Invaluable to car owners. Regular price, $30.00. Special price, $19.80.

MachineShopPractice
Six volumes, 2300 pages and 2500 illustrations. Prepares for Machine Shop Superintendent or Foreman, Foundryman, Pattern Maker, Tool Designer or Tool Maker. Regular price, $30.00. Special price, $19.80.

Sanitary, Heating and Ventilating Eng'ring
Four volumes, 1454 pages and more than 1400 illustrations, etc. Prepares for Sanitary Engineer, Heating and Ventilating Engineer, Master Plumber or Plumber. Regular price, $20.00. Special price, $14.80.

Mechanical and Architect'al Drawing
Four volumes, 1578 pages and more than one thousand illustrations. Prepares for Architectural or Mechanical Draftsman. Regular price, $20.00. Special price, only $14.80.

Electrical Engineering
Eight volumes, 3800 pages and 3000 illustrations, plates and diagrams. Prepares for Electrical Engineer, Power Plant Superintendent, Substation Operator or Electrician. Regular price, $40.00. Special price, $24.80.

Fire Prevention and Insurance
Four volumes, 1500 pages and 600 illustrations, diagrams, forms, etc. Prepares for Counterman, Rate Clerk, Inspector or Agent. Regular price, $20.00. Special price, $15.80.

The Consolidated Radio Call Book

The most needed book of the hour.

This book is, literally, the right arm of all organizations and persons directly or indirectly connected with the ever increasing radio field.

Compiled and published for the express purpose of meeting a timely and urgent necessity among radio and steamship companies, professional and amateur radio operators, and those having need of authentic and practical information on radio calls; radio, telegraph and cable rates, special signals and general radio procedure.

Every Vessel and Land Station Listed

Every vessel and land station is represented and listed in this book alphabetically, according to names of vessels or land stations, and according to call letters. Revision of American coastal stations under U. S. Naval control, and their new calls.

That new and great aid to navigation—the radio compass—is explained and is a unique feature of this publication and of special value to masters of merchant vessels.

Contains all calls listed in the new book to be published by the Department of Commerce.

Price 75c Prepaid

Consolidated Radio Call Book Company, Inc.

41 Park Row, Room 1420, New York City

This book also contains the advertisements of practically every leading company in the radio field.

MARCONI'S NEW INTERNATIONAL CODE, publisht by Marconi International Code Company, London, England. Publisht in four different volumes, cloth bound at $19.98, net per volume.

The Marconi Company is now putting out a new International Code in nine of the chief languages of the world. It is as simple as it is complete, condensing messages to a wonderful degree. Not only does it facilitate and cheapen communication with English-speaking races, but it also provides a means whereby intercommunication by letter or telegraphy between people possessing no knowledge whatever of the other's language, for it is sold thruout the world.

The work is remarkable in its simplicity of coding and decoding; it is entirely modern, and par excellence in reliability and secrecy. Great care has been taken in compiling and binding these volumes, so as to reduce to a minimum the possibility of mutilation in transit or use, which experience has taught will frequently happen.

In addition, a system is so arranged that by means of the numbered words a "secret cipher" may be compiled whenever required. Also a complete glossary of all kinds of useful business tables and information is given, including a buyer's guide with a list of the ablest producers of all the best known goods.

Undoubtedly, this new code will find instant favor with commercial institutions the world over, assisting to a great degree in simplifying much of the International correspondence handled at present.

ESSENTIALS OF MODERN ELECTRO-THERAPEUTICS, by Dr. Frederick Finch Strong, M.D. Cloth cover, 150 pages, 118 illustrations, size 6¼ x 9½ inches. Price $2.00. Publisht by Rebman Company, New York.

A new revised edition by the well-known authority on high frequency and electrotherapeutics, particularly the application of high frequency current to human ills, providing a practical handbook well illustrated, which proves invaluable and interesting reading to the electrical student, physician and layman alike. Dr. Strong believes in the first principle, that if one is going to write an article or a book, it should be above everything else made so intelligible that the average student can grasp and understand fully what he is talking about without having to assimilate a whole dictionary of high-sounding medical terms, which is not at all necessary, as a perusal of this interesting manual will at once demonstrate.

In this working manual, which everyone interested in electro-medicine should read, the author explains the modern electron theory of matter, as well as the laws and principles of electro-physics, including induction and the induction (medical) coil. Chapter three treats on the subject of physiology from an electrical standpoint and their inter-relations. Chapter four treats of galvanism and galvanic currents, including the electrolysis of warts and moles, as well as superfluous hair. The succeeding chapters deal with faradic currents and their application to various ailments, electro-diagnosis, static electricity and its application by various modalities, high frequency currents, and their diverse applications for different ailments, the Röntgen ray, dental electro-therapeutics, sinusoidal currents, light rays, vibrassage and ozone inhalation apparatus.

Battery Charging Your Biggest Money-Maker

$500.00 a Month Income with This 32 HB Battery Charger

Eureka Storage Battery Co., Houston, Texas, writes—"The first little machine we bought of you has given us the very best of service. With the new large machine, my income per month from charging is $500.00."

You, too, Can Make Big Profits with an HB 32 Battery Charger

Recharges 32-6 volt auto batteries, or equivalent in 12- or 24-volt batteries, at one time, for 10c to 15c each. Customer pays 75c to $1.50. Figure the profits yourself. No electrical knowledge needed. Uses no valuable floor space. Runs 24 hours a day.

Small investment puts this money-maker in your garage. Balance on easy monthly terms. Outfit easily pays for itself. Absolute Money-Back Guarantee. Write TODAY for full information. Send this ad.

THE NATIONAL AUTHORITY ON WIRING FOR TWENTY-FIVE YEARS

STANDARD WIRING

Will Make You an Expert Wireman

EARN $30. TO $60. A WEEK

Over 500,000 Sold

This year's edition, completely revised to date, is the only accurate book on electric light and power wiring and construction, from the Fire Underwriters' standpoint, published.

The National Electrical Code, with all its new rules, is explained and illustrated. 52 of the latest and simplest tables which show, at a glance, just what size of wire is needed for any kind and size of lighting or motor installation, for any voltage, current and drop desired for any system, Direct Current, Alternating Current, single, two or three-phase.

How to install and operate generators, motors and every kind of wiring device with diagrams of connections. Special chapters on illumination, House Wiring, Electrical Units and their Equivalents. The latest lamp data. Proper symbols to use to indicate outlets, etc., etc.

Also a complete directory of the leading manufacturers of officially approved apparatus and supplies necessary for any kind of installation.

350 Pages, Leather Cover, Pocket Size.

Sent to any address on receipt of $1.50

Popular Astronomy
Earth's Atmosphere

By Isabel M. Lewis

(Continued from page 651)

Nitrogen and oxygen, which occupy 99 per cent of the volume of the earth's atmosphere, have practically no absorbing effect on the earth's radiations, but they do strongly absorb and scatter the short solar rays in the blue and violet, and, therefore, produce the intense brightness and characteristic blue color of the sky.

When the sun's rays enter the earth's atmosphere they are diffracted or broken up to a certain extent by passing from a rarer to a denser medium. The short blue and violet rays suffer the greatest diffraction and are largely lost in the upper atmosphere, while the long orange and red rays penetrate to the lower depths of the earth's atmosphere.

The beautiful sunset hues and the reddish tinge so characteristic of the sun and moon when rising or setting is due to the breaking up of the rays by the dense lower strata of the atmosphere and the trapping of the blue and violet rays by the atmosphere.

Were it not for the scattering and diffusion of sunlight by the atmosphere the sky would always be inky black and the stars and solar corona would always be visible in the daytime. All shadows would be harsh and as black as the inky sky.

Without the atmosphere there would be no winds, no clouds, no rainfall, no rainbows, no twilight, no beautiful sunsets, no living beings. The dry and barren surface of our planet would be constantly pelted with the meteorites and meteoric dust that are now almost entirely consumed by friction with the atmosphere, and only in exceptional cases reach the earth's surface. The extremes of temperature between day and night would be intense. The blistering heat of a torrid day would be followed by the frigid cold of an arctic night.

In our satellite, the moon, we see the earth as it would appear without a protecting and life-supporting atmosphere—a dry and barren waste.

One effect of the atmosphere on our planet is to gradually wear down and disintegrate the rocks and mountains thru the action of water vapor and air-currents. This disintegration of the rocks is continually setting free gases that are to a certain extent increasing the atmosphere of the earth. Moreover, many stray molecules of gas exist in interplanetary space and are swept up continually by the earth's atmosphere in our journeys around the sun. These are probably equaled in number by the molecules that escape from the earth's upper atmosphere, so that, on the whole, the atmosphere is probably neither increasing or decreasing appreciably.

The auroral displays, known as the northern and southern lights, are electrical phenomena of a nature not yet clearly understood that are associated with the rare gases of the earth's upper atmosphere. They are rarely seen outside of certain belts in northern and southern latitudes in the vicinity of the north and south magnetic poles of the earth, where they occur in great intensity. The lower streamers are at altitudes of about one hundred miles or less, and the upper streamers reach heights of five or six hundred miles. The aurorae are in some way intimately associated with the sun spot cycle and never occur except when there is unusual activity on the sun in the form of sun spots or prominences.

There is, indeed, a close connection between the conditions of the sun and many atmospheric effects, such as temperature, rainfall, cloudiness and magnetic storms.

Learn Public Speaking
10 LESSONS FREE

Write — quick — for particulars of this extraordinary offer; an opportunity you will never forget if you take advantage of it. Ten lessons in effective public speaking absolutely FREE to those who act promptly, to introduce our course in localities where it is not already known.

We teach you by mail to become a powerful and convincing speaker—to influence and dominate the decisions of one man or an audience of a thousand. We have trained hundreds and helped them to increase their earnings and their popularity. Learn, in your spare time at home, how to overcome "stage fright" and conquer fear of others; how to enlarge your vocabulary; how to develop self-confidence and the qualities of leadership; how to RULE others by the power of your speech alone; how to train your memory. Our

WHAT THE COURSE TEACHES YOU.

How to talk before your club or lodge;
How to address board meetings;
How to propose and respond to toasts;
How to make a political speech;
How to tell entertaining stories;
How to make after-dinner speeches;
How to converse interestingly;
How to write better letters;
How to sell more goods;
How to train your memory;
How to enlarge your vocabulary;
How to develop self-confidence;
How to acquire a winning personality;
How to strengthen your will power and ambition;
How to become a clear, accurate thinker;
How to develop your power of concentration;
How to be the master of any situation.

New Easy Method

perfected and taught only by Prof. R. E. Pattison Kline, former Dean of the Public Speaking Department of the Columbia College of Expression, can be learned in 15 minutes a day. Prof. Kline is one of the foremost authorities in the country on public speaking and mental development. Do not let this chance escape you.

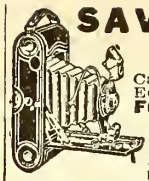
Day or Evening. Individual instruction. No educational requirements. No book or home study. Easy terms. Highest references. Especially attractive proposition to those who write at once for catalog H.

and such progress is now being made in the investigation of the effect of changes in solar activity upon the atmosphere that it is expected that before long certain of the weather effects dependent on the sun spot cycle will become largely predictable in advance.

The earth's atmosphere shares the earth's motion of rotation on its axis, moving eastward with the same speed as the surface; that is, at the rate of 1,017 miles per hour. At high elevations, however, there is a strong tendency for the higher atmosphere to lag behind the solid surface of the earth and lower atmosphere.

Were it possible for an aviator to travel *eastward* in an airplane around the earth at the equator with the speed of the earth's rotation, 1,017 miles per hour, he would circumnavigate the globe and return to the same point on the earth's surface in twenty-four hours, but since he would travel in the direction of the earth's rotation, the sun would apparently move westward at *twice* its usual rate and would rise and set for him *twice* in the twenty-four hours. If, on the other hand, he should take a *westward* course at the *same rate,* he would, as before, return to the same point on the earth's surface after twenty-four hours; but since the earth is now turning in a direction *opposite* to his direction of flying, and *at the same rate,* the sun will move westward at the same rate that he is flying and will, therefore, appear to remain immovable in the sky during the twenty-four hours.

Were it possible for our aviator to pursue his journeys *outside* of the earth's atmosphere under the same conditions, but freed from the effects of the earth's rotation, he would find, if he traveled *eastward,* that he would make one rotation with respect to the sun in twenty-four hours, but the same place on the earth's surface would remain immovable beneath him all the time since the earth would also rotate eastward at the same rate.



If, however, he should turn and travel westward he would make, as before, one rotation with respect to the sun in twenty-four hours (only in the opposite direction), but points on the earth's surface would speed past him at the rate of 2,034 miles per hour and he would pass the same point on the earth's surface twice in twenty-four hours.

Interplanetary Communication

By Dr. C. S. Brainin, Ph. D.

(Continued from page 641)

still another point of view from which we must examine our knowledge of Mars—its physical condition. Mars is so much further away from the sun than the earth that it only receives about *forty per cent* as much solar energy per unit of area. Then, too, calculation shows that its average surface temperature, therefore, must be well below zero, as compared with 60° F. on the earth. There is evidence of the existence of an atmosphere, tho extremely tenuous, for small clouds are seen at rare intervals and sometimes the entire disk is obscured by a haze. It is of the greatest importance to ascertain whether this is water vapor, as on the earth, or not. The presence of water vapor on a planet is the *sine qua non* of our kind of life. The evidence here is again contradictory. The two famous American astronomers, Keeler and Campbell, have failed to discover any traces of it with their spectroscopes, but more recently Lowell's successor at Flagstaff has announced affirmative evidence. We must bear in mind that negative results are never as certain as positive ones, but in any case the amount of water vapor necessary to produce the polar cap phenomena

www.americanradiohistory.com

which have been observed on Mars is very small, indeed, at the low temperature which prevails there and might be absolutely inadequate to support human life; the spring decrease in the polar caps may be due to sublimation and not to fusion.

The final possibility is Venus. Here we know that water vapor is present in abundance, for the planet is always wrapt in a heavy, cloudy atmosphere, the nature of which the spectroscope has divulged. The surface itself cannot be observed. There is some doubt as to whether the daily rotation period is about the same as the earth's or equal to Venus' year. In the latter case, it would always turn the same face toward the sun and there would be a great difference in temperature between the two faces, while along their boundary there would undoubtedly be a region with a moderate, habitable climate. In the case of the shorter rotational period the conditions on Venus would be much like those of the earth, but the average temperature would be higher.

It seems to be the opinion of most astronomers that of all the fellow planets of the earth, Venus is the most likely planet to support life, but, certainly, no evidence of it exists. In the case of Mars, we can only say that IF the observations of the "canals" should be established beyond the preadventure of a doubt, we would be safe in drawing the conclusion that life really exists there. As the matter stands to-day, there can be no doubt in the mind of anyone who will take the trouble to investigate the question that the chances in favor are next to zero. It makes a great sensational story but is far away from the truth. On the other hand, there may be life on Mars, of a kind entirely unknown to us, in spite of the fact that the "canals" are an optical illusion.

We turn now to the second phase of the subject: If there is life on Venus or Mars, can we get into intelligent communication with the inhabitants, particularly thru a wireless method? Our guess is yes. In the case of these planets it would be only a matter of a few minutes between the sending and the receipt of the message, so that the difficulty noted above with planets of other systems does not hold here. We must assume, further, that the Martians or Venereans, as the case may be, have attained the degree of scientific development represented by the possession of wireless, which is by no means a necessary conclusion. A great many more or less detailed plans have been proposed for opening such interplanctary conversations, but it seems to us that they all depend too much on the assumption that these foreign plantearians must necessarily be something like us Earthians. We would suggest, therefore, that if some rash soul makes the attempt, the basis of the code should be something which would of necessity be the same for the other planets as for the earth, *i. e.*, some astronomical phenomenon. In the case of Mars it might be something connected with the satellites, and this is probably the only sure way of getting upon common ground.

Some have suggested gigantic lights as the best way of opening communication between two planets, in the belief that foreign planetarians would be enough like us to have organs like our eyes, sensitive to the same rays to which our retina is attuned. But this does not follow at all; our imaginary neighbors might have "eyes" sensitive to ether waves which "see" ultra-violet infra-red or electromagnetic waves of lower frequency such as are used in Radio. Of course, those who believe firmly in the existence of Martian inhabitants, discarding all the contrary evidence and evading the absence of affirmative proof, are perforce led to the conclusion that these are greatly

Learn Mechanical Drafting

Earn $35 to $100 a Week

"Get into the profession of big pay and Rapid Advancement with the help of the school that has started hundreds on the Road to Success. I am ready to help you." Roy C. Claflin, President, Columbia School of Drafting.

Learn At Home in Spare Time

You don't have to stop work or leave home in order to become a trained Draftsman. Through our practical Home Study Training we teach you in your own home, and enable you to qualify as a practical Draftsman.

No Previous Training Required

Owing to the comprehensive nature of our course, you need no previous training in the subject. Though you have never done any kind of drawing before, you can become a thorough Draftsman by following our instructions.

Can Learn in Short Time By Our Methods

Our course can be mastered in six to ten months. The reason for this is that we eliminate unnecessary theoretical work and concentrate upon the PRACTICAL problems such as confront the professional Draftsman. We do not require you to spend months of your time on "preliminary" work, but start you on REAL DRAFTING at once. That is one reason why our students "make good" so readily.

Our Graduates Get to the Top

The universal success of our graduates as Professional Draftsmen, many of whom have advanced rapidly to positions of Chief Draftsmen, is evidence of the REAL VALUE of the training given by the COLUMBIA SCHOOL OF DRAFTING. Large numbers of our students have secured excellent positions even before completing their courses. We gladly cooperate with our students and graduates in securing desirable positions, which has been easy for us owing to the many demands upon us to supply our "product" for these positions.

Draftsmen Get $35 to $100 a Week

Our graduates have shown their ability to reach high salaries RAPIDLY, owing to their practical training. They secure excellent salaries AT THE START, as high as $2,000 a year. The usual pay of Draftsmen is $35 to $100 a week.

The Demand is Greater Than the Supply

The demand for properly trained Draftsmen has always been greater than the supply, but this is more so today than ever before, owing to greatly increased construction and mechanical development. The Draftsman is an essential connecting link in all engineering work. This great demand is indicated by the long lists of want ads for Draftsmen in the daily papers, especially those of industrial centers.

Not Merely a Corespondence School

The COLUMBIA SCHOOL OF DRAFTING not only trains Draftsmen by mail but is a large local institution of the highest standing. For many years it has been the leader in SPECIALIZING on the teaching of DRAFTING. This is an obvious advantage over teaching Drafting only as a side issue.

Drawing Outfit Furnished

We supply all our students with a drafting outfit for use throughout the course. There is no extra charge for this, and it becomes your personal property when the course bas been paid for in full.

Book of Particulars Sent FREE

If you are interested in becoming a practical Draftsman through the thorough training of the COLUMBIA SCHOOL OF DRAFTING, whereby you can enter a Profession in which your services will always be in demand, you are invited to write us for our free book of particulars, which describes our school and methods. (We employ no solicitors.) For your convenience you can fill out and

DETROIT

The Auto Center is the Logical Place To

LEARN AUTO AND TRACTOR BUSINESS

Young Men of today are fortunate to live in the age of the Auto and Tractor Business. It is the greatest business in the world. Never before has there been such a wonderful future for ambitious men.

Big Demand For Trained Auto Men

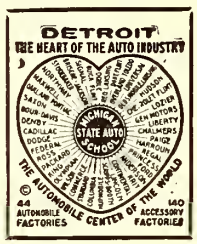
Think of it!—Six million automobiles in use and thousands more being sold daily. Factories are rushed to the limit. Trained automobile men are wanted everywhere. The demand exceeds the supply. That's the business you can learn here at our school,—and such is the opportunity that awaits the trained automobile man.

Earn $100 to $400 Monthly

It is not at all difficult for a trained man to earn those salaries. Hundreds of our graduates are doing even better than that. Auto Factories, Garages, Service Stations and Tractor Factories are continually calling on us for graduates to fill responsible positions. Many of our graduates go into business for themselves. There are thousands of places where good garages and the services of competent, trained men are needed. These opportunities are unlimited.

Money-Back Garantee

We guarantee to qualify you for a position as chauffeur, repair man, tester, demonstrator, auto electrician, garage man, automobile dealer, or tractor mechanic and operator, paying from $100 to $400 monthly or refund your money.



Complete Tractor Course Included

Complete instruction on the care, repair and maintenance of tractors is also included in our regular Auto Course. Tractor manufacturers give full co-operation. International, Moline and Emerson-Brantingham Co.'s have placed machines with us for the benefit of our students.

Brazing-Welding and Tire Repairing Taught in Separate Courses. Big Money Earned by Trained Competent Men in These Lines.

Big Factories Endorse Our School—In fact they assisted in the arrangement of our present Course. They know our equipment and our methods and heartily recommend our School.

Free Catalog—Gives complete information with views of school and equipment, also actual letters from satisfied graduates. Write for it. Better still, jump train and come as hundreds do. Our guarantee protects you.

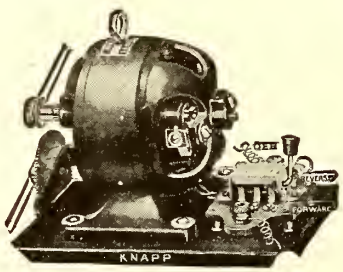
DEPENDABLE KNAPP ELECTRIC SPECIALTIES

Motors and Electrical Specialties Are Best

Knapp Goods have stood the test for 29 years. No detail in construction has been spared to make them the best that money can buy. The complete Knapp line includes Toy and Power Motors, Generators and Dynamos. Specialties and Novelties that amuse and instruct. Fans, Rheostats, Compasses, etc. And Knapp prices are always lowest. Always insist on Knapp Goods.



KNAPP DYNAMO MOTOR

Will electroplate, charge storage batteries, run lamps, motors, train of cars, induction coils,—in fact, the number of experiments it can be used for is unlimited. Runs on 4 to 6 Volts or can be connected to run on 110 Volts through a transformer.

Price, Complete, $8.00

KNAPP "LEADER"

An efficient and reliable motor that greatly resembles the big motors of real power plants. Drives from either pulley. Two speeds and reverse. A motor that you will be proud to own and one that will give you unlimited service.

Price, Complete, $4.00

Order to-day. Or your dealer can secure them for you. DESCRIPTIVE CIRCULAR and CATALOG of celebrated **KNAPP MOTORS** *and Electrical Specialties from 10c up mailed FREE on request.*

advanced over us in scientific attainments, as is proven by the wonderful "canals." If that were the case, we should also be justified in assuming further that these Martians have far surpast us in their development of Radio in all its branches. In fact, as we discard the limits of the science of astronomy why should we put any check on our pleasant speculations? No doubt, then, the Martians possess a perfect unidirectional sending and receiving outfit, and one which is so sensitive that they can easily pick up signals from the earth in spite of the great diminution of energy which these would undergo on their way thru space. And no doubt they can send out signals with sufficient energy to be picked up by us. Some people have announced the reception of mysterious signals which they were convinced were not of terrestrial origin. We do not feel competent to discuss the electrotechnical phase of the interplanetary communication problem. It seems that the most difficult part of the game would be the first conscious interchange of probably meaningless signals; intelligent speech would soon follow.

Often science is more astounding than the greatest romance spun by the most vivid imagination, and sometimes she is a destroyer of pretty dreams. We may conclude with this unsatisfactory statement: There undoubtedly is life on planets of stars other than the sun, but communication with their inhabitants is at present certainly out of the question; in the solar system itself, where interplanetary communication is not without the realms of possibility, no evidence of extra-terrestrial life has been found, tho its existence is not precluded.

HOW WE COULD TALK TO MARS BY RADIO.

In connection with Dr. Brainin's above article in which the professor advocates the use of the radio to bridge the gulf between the Earth and Mars, it is pointed out that in 1919 already Mr. H. Gernsback advanced such a plan. His article which was printed in the May 1910 issue of *Modern Electrics* magazine shows that the idea is not only feasible but eminently practical. In those days it was not possible to cover by radio one thousand miles, unless we had a power of at least 2 kilowatts at our disposal. Today with our sensitive vacuum tube amplifiers, it is possible to bridge one thousand miles with a ½ K. W. with ease, and in exceptional cases ¼ K. W. will bridge the distance. It should be borne in mind that this distance is thru the earth's atmosphere which greatly impedes propagation of radio waves. If radio waves are a manifestation of the lumiferous ether, and few scientists doubt that it is, then the earth's atmosphere not only greatly restricts the sending impulses, but cuts them down enormously.

Take a ray of light, as any astronomer knows the stars overhead are always seen best for the reason that in this case the light ray only passes thru thirty or forty miles of atmosphere. On the other hand when stars are observed low down in the horizon where the ray must pass thru hundreds of miles of atmosphere, it is very difficult and somtimes impossible to see the stars at all. It is a well-known fact that light rays and electro-magnetic waves (such as radio waves) belong to the same family and only differ in respect to wave length.

For that reason, it should be possible to send radio waves thru interstellar space with much greater facility than thru the terrestial atmosphere. Where it takes today one half or one quarter K. W. to transmit radio waves over one thousand miles of Earth, there is no doubt that this distance can be increased ten or twenty fold in the outer space, providing always that it is possible to propagate the waves on the *outside* of our atmophere, which fact we do not know as a certainty. It is a specula-

www.americanradiohistory.com

tion among scientists today if the radio waves can pass beyond the atmosphere at all.

Inasmuch as the light rays pass thru the Earth's atmosphere with ease, however, there seems but little doubt that radio waves will act in a similar fashion. Once we grant this truth, it should be simple for us to telegraph or telephone to Mars. If we figure at the rate of ½ K. W. per thousand miles on Earth thru our atmosphere, it should be possible to telegraph over the space of 35 million miles which separates the Earth from Mars at the time of oppostitution by using anywhere from five to eight thousand K. W.

In his article in May 1919, Mr. H. Gernsback proposed using 70,000 K. W. to telegraph from the Earth to Mars. At that time it was figured that this tremendous energy would be required as then it was necessary to figure at the rate of 2 K. W. per thousand miles. Mr. Gernsback proposed at that time to use all existing radio stations in the United States and Canada, *operating them* simultaneously by means of telegraph lines connecting all the stations together and working them from one central point.

In other words, a station in San Francisco and another one in New Orleans was to be operated from a central key at Washington. This idea would accomplish two things. In the first place it is even today impossible to operate a station of four or five thousand K. W. capacity. No station could hope to handle such a tremendous energy. But by using separate stations, the object can be readily realized providing these stations can be operated simultaneously.

Connecting such stations together by means of a land wire, however, is only a theoretical consideration and is not practical. The reason is that electricity in passing thru a long land line of several thousand miles takes a good deal of time in transmission, sometimes as much as three quarters of a second. For this reason if the key was pressed in Washington, the station at San Francisco *would lag behind* for a fraction of a second from the one in New Orleans. For this reason, except if signals were being sent out at a very slow rate, the scheme would be impractical. In our illustration shown elsewhere, this difficulty has been overcome by connecting these stations together not by means of a wire, *but operating them by means of radio control.* This is a thing not very difficult of accomplishing these days when distant control by radio has been tested out. The scheme would work thus:

An operator seated in Washington would press his master key. This key in turn would operate his own radio station. The impulses sent out from this station will cover the entire globe practically instantaneous, and reaching the various high power stations, *will operate these stations the same as if an operator were seated at each one of these stations.* In other words, instead of using land wires, radio would be used. The advantage of this system is that all stations can be operated simultaneously down to the smallest fraction of a second, and the important part of this scheme is that it costs practically nothing or only a relatively small sum to put the idea into operation any time when we are inclined to make the experiment. The important other consideration is of course that all the stations would have to be tuned to a certain wave length so that all of them would work in unison, the same as if there were only one single huge station. We have enough power in existing stations in the United States and Canada today to bridge the 35 million miles between the Earth and Mars.

K. I. Shorthand hastened his promotion from stenographer to executive; now he depends upon it more than ever

You Need K. I. Shorthand Whatever Your Calling

The wonderful thing about K. I. Shorthand is the way it helps people in all walks of life. Engineers, chemists, contractors, clerks, mechanics, professional men and women, and farmers have learned K. I. Shorthand and are enthusiastic in its praise. At last **you** can learn shorthand **so quickly** and **so inexpensively** that it **is worth your while.**

— **This new, amazingly simple stenography will enable you to put down conversations rapidly as spoken,** take messages verbatim, record board-meeting facts, jot down business-getting ideas, and stand ready to help you every time anything important must be written down fully and instantly. **You do not have to study months to do this.** Just five evenings at home is all that is necessary. Greater speed comes quickly with practice. Learn K. I. Shorthand because it will be the biggest little investment of your life.

You Can learn in 5 evenings

K. I. Shorthand is the ideal system for stenographers or secretaries. You can prepare yourself for a position in weeks as compared to months by the old-fashioned systems—there is so much less to learn and remember. It is the most practical, concise and readable system in the world. Notes years old can be transcribed as readily as when fresh—just like longhand. Would you not give best satisfaction to your employer with a stenographic system that enables you to do that?

30 Days' Approval

Do not doubt for a minute that you can learn K. I. Shorthand in five evenings even though you may not know the first thing about stenography. It is not a bit remarkable for anyone to learn all the lessons in the system that quickly.

Why put in months of grinding study at some difficult old-fashioned system? Save time! Save money! Learn **K. I. Shorthand,** the new easy as A-B-C method of speed writing.

The cost of the course is lower than it has ever been possible to purchase a stenographic education. Everyone can afford it. K. I. Shorthand is used in government service and courts as well as public corporations and private businesses. Preferred for highly technical matter because of its remarkable accuracy and legibility.

Simplified K. I. Shorthand dispenses with all special positions, light and heavy shading and other confusing and speed-retarding rules of old systems. You will be delighted.

Try 2 Lessons FREE

You learn K. I. Shorthand in your own home by our mail tuition course. The lessons are fascinating. Experts guide you in acquiring proficiency quickly. **Send for two free lessons and complete information. You may then continue the entire course on a month's approval.**

"Go ahead! I'm getting it all in K. I. Shorthand"

Here is a complete course—not merely a text-book. Remember, there is no system to compare with K. I. Shorthand in brevity and practicability — and no course giving correspondence instruction obtainable at anything like our price.

We give you a positive guarantee that you can learn or no cost to you. King Institute is incorporated in New York State $100,000.00 authorized capital. Mail the coupon or write a letter asking for free lessons and complete information. Be sure to mention "Electrical Experimenter."

Used In Professions—"I am now past 83 and use K. I. Shorthand for my professional work in making records of cases. I like K. I. Shorthand System very much, indeed, and have recommended it to some who I think will enroll."
A. P. DAVIS, M.D.

In One Week!—"I learned K. I. Shorthand within five hours and in one week afterwards I was able to write 90 *words per minute.* I set down all my notes in K. I. Shorthand and can read them weeks afterwards. I believe that everybody should learn K. I. Shorthand as it is simple and also inexpensive. It is worth ten times what is asked for it. You have done everything you promised."
BYRON W. CREW.

A Pleasure to Learn—"It was a pleasure to learn K. I. Shorthand. Within three hours I could write any word. I can now write over 100 *words per minute* and am positive that by a little more practice I could speed up to 150 words a minute. It is easy to read one's notes in K. I. Shorthand."
(Miss) JOY WADSWORTH.

Professional Stenographer—"Until recently I knew absolutely nothing of shorthand. To-day I am holding a position as stenographer in the office of Inspector of Buildings where the terms apply almost wholly to building construction. I think this sufficient recommendation of your system."
(Mrs.) E. M. FULTON.

Used In Big Business—"I learned your system of shorthand to save time in making notes while passing about the plant. After only slight study I can take down ordinary conversations. K. I. Shorthand is *practical, time-saving* and *simple.*"
S. B. ROPER

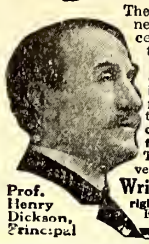
New Arc Rivals Sunlight

(Continued from page 627)



markable feature is the fact that colors can be matched in this light. The quality of the rays is such that when they are analyzed by means of a spectroscope, the spectrum is almost identical with that of sunlight, except for the fact that there is a trifle more ultra-violet. This color is invisible, but photographs may be taken by its means, and hence it is more ideal than real sunlight for the taking of motion pictures. A very small lens opening may be used in the motion picture camera, as the light is always intensely brilliant, and the pictures turned out give a better definition and a sharper focus. It is also fitted with a special diafram by means of which several spot-lights may be thrown into different parts of the room. Another of its marvelous features is the fact that this spot-light can be thrown *without a beam.*

One unit consumes 15 K.W. or 150 amperes. Expensive? No, not at all, when we take into consideration the light produced by this unit and an equal amount of light produced by other units. It would take thirty-two 30-ampere arc lights to produce as much light as one 150-ampere Sunlight Arc lamp; thirty-two 30-ampere arc lights use 960 amperes, compared with 150 amperes of the Sunlight Arc—a saving of 80 per cent. The Sunlight Arc is very appropriately named, inasmuch as the main part of its illumination is produced by a very intense white flame vapor, which is found in the deep crater formed in the burning end of the positive electrode, which electrode as we have said is revolved slowly by an electric motor. As a result of concentrating such a tremendous candle-power in a space as small as the crater in the end of a ⅝-inch carbon rod, there is a brilliancy of 800 candle-power to every portion of vapor therein confined the size of a pin head. This vapor has the great advantage of making the arc non-flickering, and slight drafts will not affect it. In other words, it is the same practically as the vapor surrounding the sun, and as tho we had actually taken a pinch of the sun and thrown it into the lamp to do its duty.

One will realize at once the intense amount of illumination which is necessary in order to take 160 to 200 pictures per second with the *Novagraph* slow movie camera. In one of the photographs is shown the Novograph camera taking motion pictures of the heart-beat of an animal. The camera has its lens focust downward, while the two arc lights, one on each side, are sending their beams down upon the rapidly beating heart of the animal. In taking these pictures, the animal is first chloroformed, then artificial respiration is carried on, so that blood circulation is not stopt or altered, enough chloroform or ether being given to produce complete anesthesia. The thorax is then cut open and held in position by blunt hooks, while the camera grinds out its thousands of feet of film. The pictures produced in this way were remarkable, and absolutely no hitch occurred while the Sunlight Arcs were in operation.

We have already referred to the picture of Miss Marguerite Clark. Examine this picture again and notice the wonderful sunlight effect, the beautiful definition of shadows and the softness of tone. There is none of that vague frightened look which stars generally have under other forms of illumination. She seems perfectly comfortable standing by the window, while the "sunbeams" play on her. Only one arc was used on this occasion. Hence the rays, almost parallel, produce shadows which rival sunlight as no other lamp does.

Stop Forgetting Memory the Basis of All Knowledge

The Key To Success

The secret of business and social success is the ability to remember. I can make your mind an infallible classified index from which you can instantly select thoughts, facts, figures, names, faces. "Old Phonograph Record" Contest.

(Continued from page 646)

turbine can be made with any size records. When finished it may be coupled with a small dynamo. First slip a threaded iron rod thru a record, slip on a washer, then a record, etc. I used five "Little Wonder" records and obtained satisfactory results. When the records are on, screw a nut on the ends to keep them from wobbling. Now make the box. Make it just large enough to fit over the records. It may be made round, but it is easier to make it square and fill in the corners with wood as in the figure. Bore two holes in the sides and put a piece of pipe in firmly to make good bearings for the shaft. On each side put washers and a nut. A pulley can be put on or just couple it with a dynamo, etc. Put two pipes in the housing, one to lead the water in and the other to serve as an outlet.

Contributed by W. P. Jones, 176 Mutual Street, Toronto, Ont., Can.

FOURTH HONORABLE MENTION.

An Electric Egg Tester.

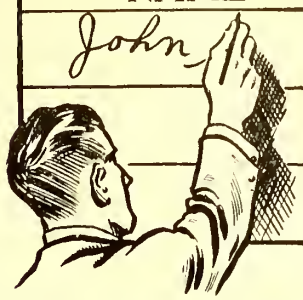
This is an idea for making an electric "Egg Tester" from a 10-cent record. A holder is cut from a piece of tin or brass with a hole in one end to fit on to the neck of an electric light bulb, and fastened to the record as shown. Then a hole is made, either round or egg shape, in the center of the *record*. The light is turned on, and the egg is held over the hole. The record is black and the light coming thru the hole makes the egg show up, and in this way indicates if it is good or bad.

Contributed by Lawrence Bean, Lock Box 7, AuSable Forks, N. Y.

FIFTH HONORABLE MENTION.

Radio Compass Antenna.

The Radio Compass Antenna described on page 328 of the August *Electrical Experimenter* may be constructed by procuring two 10-inch old phonograph discs. On one disc draw diameters at right angles. Cut a perfect square, whose side is 4½", from white paper and draw diagonals. Paste the square on one disc so that the center of the square will be over the center of the disc's circle.



One-sixteenth inch "in" from each corner of the square, drill the holes A, B, C, D, Figure 1, with a No. 27 drill. Bisect each side of the square and drill holes E, F, G, H. Clamp the discs together and drill the second one the same way, using the first as a guide.

Eight 1¼", 6-32 screws are now procured and put thru the holes in the first disc and fitted with fiber tubes ¾" long and just large enough to fit over the screws. The second disc is then placed on and fastened with 6-32 nuts.

This completes the form. A coil consisting of 240 turns of S. C. C. wire is wound on the form. This aerial, properly connected, should prove very useful to those unable to erect a large outdoor antenna.

Work of this antenna as a Radio Compass: Such an antenna, under certain conditions, when properly connected, as is shown on page 328, of the August issue, will operate the radiodynamic "Ionic Machine" described by the writer in the May 1917, issue. In my above mentioned article, the binding posts of the "Ionic Tuners" are shown directly above the "Ionic Tuners" (and rectifiers), which are themselves shown at "7" and "8," Figure 1.

It is to these binding posts that the leads of the "Radio Compass" antenna should be connected. The buzzer of the "Ionic Machine" will then start, as soon as the coil

Ten Reasons

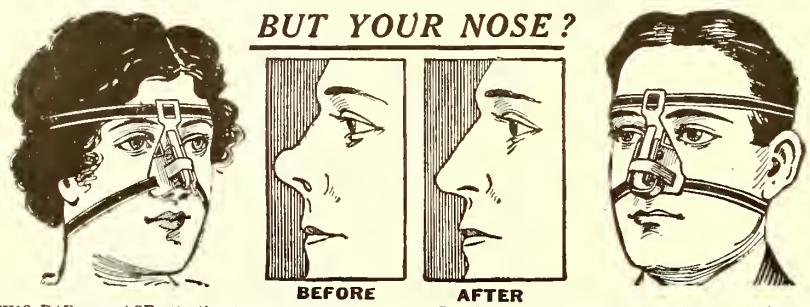
WHY YOU SHOULD BECOME A

Doctor of Chiropractic

1. Because Chiropractic is the foremost drugless profession of the day.
2. Because Chiropractic brings results quicker and with greater frequency than any other healing method now known.
3. Because Chiropractors invariably enjoy greater financial prosperity than practitioners of any other method.
4. Because YOU cannot hope to achieve economic independence and the feeling of security that you desire by working for others.
5. Because YOU thereby become one of the pioneers of a profession than which there is none more promising today.
6. Because Chiropractic is in line with evolution of Science, and is in accord with natural laws.
7. Because Chiropractors are gradually winning, universal recognition thru their achievements.
8. Because the Chiropractic field is absolutely unhampered by competition.
9. Because the demand for Chiropractors is nationwide, and is growing with tremendous strides.
10. Because YOU owe it to YOURSELF and to society to be of maximum benefit to both, potentially and actually.

Do not accept our word for the above.

Write for Booklet X and details, or call personally.



Second fall class registers Nov. 1-15.

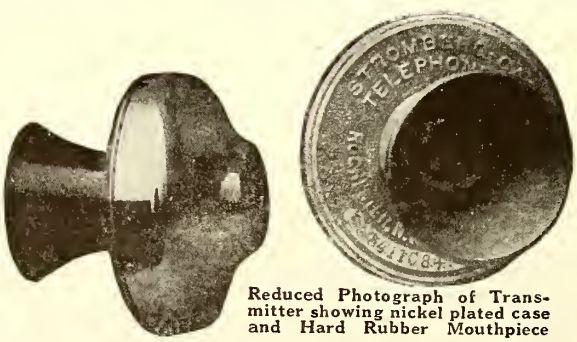
1416 Broadway **New York City**

YOU HAVE A BEAUTIFUL FACE

BUT YOUR NOSE?

BEFORE **AFTER**

IN THIS DAY AND AGE attention to your appearance is an absolute necessity if you expect to make the most out of life. Not only should you wish to appear as attractive as possible, for your own self-satisfaction, which is alone well worth your efforts, but you will find the world in general judging you greatly, if not wholly, by your "*looks*," therefore it pays to "look your best" at all times.



Permit no one to see you looking otherwise, it will injure your welfare! Upon the impression you constantly make rests the failure or success of your life. Which is to be your ultimate destiny? My new *Nose-Shaper*, "TRADOS" (Model 24) corrects now ill-shaped noses without operation, quickly, safely and permanently. Is pleasant and does not interfere with one's daily occupation, being worn at night.

Write today for free booklet, which tells you how to correct ill-shaped noses without cost if not satisfactory

M. TRILETY, Face Specialist **1283 Ackerman Bldg., Binghamton, N. Y.**

of the antenna becomes by rotation directly in line with the plane of the propagation of the wave radiated from any station which is sending.

I thought that it might be interesting to know that the "Radio Compass Antenna" is capable of directional radiodynamic control.

Contributed by Otto E. Curtis, 84 St. Stephen Street, Boston, Mass.

SIXTH HONORABLE MENTION.
Cylindrical Records for Oudin Coil.

The old cylindrical Edison records make a fine form to wind coils on, as the grooves hold the wire in place. Such forms can be used for a small Tesla or Oudin coil, primary or secondary for small loose couplers, tuning coils and loading coils. They give far better insulation than cardboard tubes, which often shrink and then the wire slips or loosens.

Contributed by G. Edwin Smith, Wanchula, Fla.

SEVENTH HONORABLE MENTION.
Transformer Section Translators.

I give nerewith a sketch of a practical use for old phonograph records—for insulating between the "pies" or sections of transformers or spark coils. The drawing, I think, is self-explanatory.

A square hole is cut in the center of the record to receive the core and they are placed one between each pie.

Contributed by Benedict V. K. French, 225 Allen Street, Buffalo, N. Y.

EIGHTH HONORABLE MENTION.
Radio "Loading Coil."

Herewith is a diagram of how to make a "loading coil" out of old phonograph records. You take two 10-inch records, a piece of wood 2" in diameter and 2" thick and then shellac (or bolt) them together as shown. Then wind No. 28 cotton insulated copper wire on it, until there is only one inch space left on the records, take out a tap every layer or so, and bring to a switch point on top of the record. Put on a switch arm and hook it up. I have used this for some time and it works as well as a regular purchased one.

Contributed by Howard B. Bogue, 812 N. Ainsworth Avenue, Tacoma, Wash.

NINTH HONORABLE MENTION.
Sharpening Razors with Old Records.

First take an old record, sandpaper it with coarse sandpaper, then with a fine sandpaper, and finally moisten the record and put a little kitchen cleanser on and with a block of wood rub it until a fine surface appears. When fully cleaned and dry, put it on the Victrola and let it run and hold the razor against it. If razor is very dull put a little "Bon Ami" on and it will sharpen with ease.

Contributed by Jos. Ruhland, Oconomowoc, Wis.

(Our office boy "Fips," who saw this suggestion, barked out thus: Suppose Mr. Ruhland sandpapers the *reverse* side of the record and leaves the music side alone. Then let him cover his Victrola turn-table with leather. Insert the razor between the record and turn-table and one side of the razor will be sharpened, the other stropped! Then don't neglect to play the music on top of the record *at the same time.* I'll apply for patent on this rinktum at once! Bad, eh?)

WIRELESS TAPPING DONE BY BELA KUN.

By "tapping" the wireless exchanges between Paris and Gen. D'Esprey, with the powerful wireless plant at Caepel, Bela Kun, the Bolshevik dictator of Hungary, was enabled to foretell every move made by the Rumanians in their contemplated offensive or by the counter revolutionary government in Hungary.

Bela Kun has been enabled to read cipher messages by means of a code book which was stolen from the Allies.

www.americanradiohistory.com

Science In Slang

By Emerson Easterling

(Continued from page 669)

are they; and cousins, we might say. How about the life forms on the other planet? A different compositional environment would produce a different sort of beings, wouldn't it? You know that Man was manufactured out of the dust of the Earth. Well, Mars has a little differently compounded dust—not much, I guess, but somewhat different—sufficient to make a different being. Of course that is just my idea of it—but all of this Mars stuff is mostly *idea*.

"If we concede that Mars is on the lookout for some expression from us, or is waiting for some response to some of their signals that past over our heads; what do you think that they dream we are trying to tell them by the evidence given in the way of smoke and surface altering in our past battles—especially the last European shooting match? Don't you think that they could see us making the big smoke and everything? Of course, accepting that they can see."

"I don't suppose that they could hear us—thru all that thirty-five or forty million miles of ether," put in Bender.

"They may have their sense of hearing developed like a dog's smell," said Punk sardonically.

"Talking of the optical demonstrations that are proposed to attract Mars' attention, what do you suppose they think of our volcanos? I suppose they understand them, probably know more about such things than we do———"

"Prohibition and the sex question included," snapt in Punk, licking his lips and not even looking at the pretty young woman that past by our crowd and almost turned the subject.

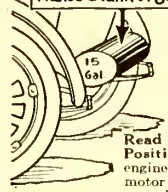
"I suppose that their time intervals are the same as ours—being that that goes in as one of the basic creative fundamentals—if you know what that means, I don't, hardly. In that respect we are homogenous—if there is any one at the other end of our proposition to make a *we*.

"The telegraph idea will probably make the gap better than the ash and darkness stuff. The etherial disturbances are more than likely better adapted to the Martians' receivability. Perhaps they have not developed along that line tho. Perhaps they have not the natural resources in the electrical line, due to different mineral composition or planetary relation. However, I don't think that that would make any difference, tho.

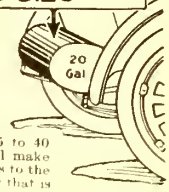
"Anyway we will sit tight and watch such guys as Marconi, Tesla, Wood and the like and see what turns up with Mars at the other end of the line. We are *doing* things today in that line. We, the world in general, will not be more surprised at finding that we have neighbors on Mars than were we at the discovery of the force of electricity, the air-ship, the telephone, wireless, or the shimmie.

"Our train is ready to get on its way to Pendleton," spoke up Punk, "Row-de-dow!"

"Here's to talking to Mars over the back yard fence," said Stokes, as we walked out thru the gate to our waiting train. "We may pick up a paper tomorrow and read that some one has just received a message from Mars."



"Yes," replied Bender, "and it might be a false alarm too."



3¢ Worth of Miracle Motor-Gas Equals a Gallon of Gasoline

A Wonderful Chemical Discovery that Increases the Power of Gasoline fully One-third

Big Money Saver for the Motorist. Eliminates Carbon, Makes Engine run Smoother, Saves Gas and greatly increases mileage

Miracle Motor Gas Makes a tank of gasoline this size **Equal in Service** to a tank of gasoline this size

YOU will be surprised at the way it multiplies the power of your gasoline. Hundreds of letters from customers who have made many tests show that MIRACLE MOTOR-GAS gives from 15 to 40 per cent more mileage from every gallon of gas. Many even claim greater results than that. But even at 20 per cent it is a good investment.

MIRACLE MOTOR-GAS Guaranteed Absolutely Harmless

Read This Positive Guarantee MIRACLE MOTOR-GAS is guaranteed to increase mileage from 15 to 40 percent, eliminate and prevent carbon, greatly reduce cost of fuel and make engine run smoother. Contains no Acid, Alkali, Ether or other chemicals in any way injurious to the motor or any other mechanism of a car. We will make good any injury or damage to any car that is caused by the use of Miracle Motor-Gas.

HERE'S WHAT USERS OF MIRACLE MOTOR-GAS SAY ABOUT IT

"I was very doubtful about the ability of your MIRACLE MOTOR-GAS to do what you said it would do. After using it I find the car works much smoother, the amount of gasoline is very much less and the CARBON deposits in the engine are a thing of the PAST, which fact alone more than pays the cost of your product. As you know, I was a hard customer to convince but I have been thoroughly convinced and satisfied."—Dr. D. W. McKenna.

"I am well pleased and satisfied with the results obtained by the use of your MIRACLE MOTOR-GAS. Where I used to get 18 miles to the gallon of gasoline, I now get 25 miles; an increase of over 40 per cent in mileage, besides the car runs smoother, picks up quicker, and positively removes all CARBON. Seven hundred additional miles at a cost of one dollar is certainly satisfactory."—I. T. A. Lewis.

AGENTS WANTED EVERYWHERE—300% PROFIT

One of the greatest Money Making opportunities ever dreamed of is offered you right now. Live, hustling sales agents are wanted to sell Miracle Motor-Gas in every town and county of the United States. Think of the millions of car owners and every one a good prospect. Practically every auto driver will buy when once you have explained what Miracle Motor-Gas will do. It is one of the biggest Money Makers you can find. Your field is unlimited. There are thousands of autos all around you and you can help to make every one of them run more efficiently with Miracle Motor-Gas.

EASY TO SELL! PROFITS COME FAST! RESULTS WILL SURPRISE YOU!

Once you get started selling Miracle Motor-Gas you will be surprised to find how easy it sells. Just show our Guarantee to some auto owner and ask what he would give for a product that would do what we guarantee it to do, Read again those letters from users, —they tell the story. We have hundreds more just like them. As soon as Auto owners find what Miracle Motor-Gas will do, they scramble to get a supply. You don't have to sell it. You only need to convince a few;—the others will follow. Sales come so fast that you can't help but make money. One agent felt like pinching his own arm to see if it was really himself who was making so much money. It isn't at all unusual for our men to make $10, $25 and $50 per day. Some even do better than that.

ONE MAN MADE $210.00 IN ONE DAY. READ THESE LETTERS.

These are extracts from actual letters received from sales agents. They tell the story better than we can. Here's what O. V. Darling wrote us:—

"Made a test of Miracle Motor-Gas today on a 103 mile trip. Had two Fords. The one with the Miracle-Gas used only 3¼ gallons of gasoline; the one without Miracle-Gas used 7 gallons." As a result of this test he sold Miracle Motor-Gas like hot cakes. In one day he sold enough to make a clean profit of $210. We have his letter to that effect.

Next comes this letter from Dave Isom: — "My whole heart and soul are in this work. The Commercial Club of 4,000 members is boosting for me. Everyone is well pleased. Have two more men working for me. Send me 800 more packages by express. I can't afford to be waiting for goods. Sold 90 packages yesterday." (That's over $50 profit.)

And then read this one just received from R. Vollbrecht:— "Miracle Motor-Gas a big success. My 6 dozen were gone in two hours. Ship 50 dozen by return express. Will have to order in carload lots soon. Miracle Motor-Gas is a wonderful proposition."

HUNDREDS MAKING BIG MONEY—WHAT ARE YOU GOING TO DO.

Are you going to "get in" on this opportunity,—are you going to be one of the big money makers. Why work for a bare living when you can make hundreds every week. Don't let this chance slip by. Sit right down now and write us. Show the kind of stuff you are made of,—show folks that you too can make big money. Anyone with ambition and a willingness to work can make good with Miracle Motor-Gas. Read all those letters again. They prove you take no chances. Or, wire our bank. They'll tell you how we stand.

GET BUSY! DON'T WAIT!

Don't make the mistake of being a doubter and losing the opportunity. Our guarantee protects you. Or, better still, if you order two packages at the 50c trial price, and after testing them you aren't satisfied, send back the unused goods and get your dollar back. Miracle Motor-Gas is a proven proposition. It has demonstrated what it will do and now we want hundreds more good live agents to sell it. So get busy—get your order to us at once and tell us what territory you want. But you'll have to act quickly. Better get the Coupon on the way to us by return mail. Wire if you want terms for exclusive rights in your State.

A $5.00 Electric Toaster-Stove for $2.50 Postpaid

A SPLENDID GIFT

TOASTS, FRIES, BOILS

Toasts bread as fast as you can Eat It. Attach to your lighting circuit and it is ready for use.

We furnish the parts. You do the assembling and save $2.50. Nothing complicated, anyone can assemble it in 15 minutes. No knowledge of electricity required.

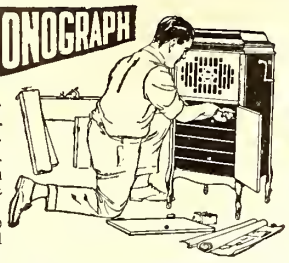
Frame made of Steel, Nickel plated and highly polished. Size 10" long, 6" wide and 3¾" high. Furnished with 6-foot cord and plug.

EMPIRE ELECTRIC SPECIALTIES CO., Not Inc., 2212 Sedgwick St., Chicago, Ill.

CORE WIRE

At Pre-war Prices, 20cts. lb.

We have been fortunate in securing thru auction several tons of guaranteed pure, double annealed **Norway Iron Core Wire** and are selling this wire to "Experimenter" readers at 20c lb. This wire is just the thing for spark coils, transformers, etc., and it is, of course, a very much more superior product than the usual iron wire. We have only one size left:



24 INCHES LONG. Thickness about No. 21 B and S

If this size should be too long we advise cutting the wire down yourself by means of shears. As long as the supply lasts we offer this wire as described above to our customers at the very low price of 20c a pound. Add postage or we will ship express collect. Order at once.

ELECTRO IMPORTING CO., 231 Fulton Street, New York City

MAKE A PHONOGRAPH

Save over half the regular cost. Enjoy your own handiwork. You can make a splendid talking machine that plays all records. Blueprints with full instructions. **Extra-Special introductory offer.** Double spring motor, 12" turntable, Universal tone arm reproduces all records and all other necessary metal parts, together with three 10" double-faced records, furnished complete for $11.85.

Write for catalogue. Send 25c for blueprints only. **$11.85**

PROTECTO EXPLOSION AUTOMOBILE WHISTLE

A pleasant, distinctive warning signal—more effective than a horn. THIS TYPE OF SIGNAL USED ON U. S. MAIL TRUCKS AND AUTOMOBILES. Self installed in two minutes on any machine or motorcycle; wrench only tool required. Cannot get out of order—NO WIRING. Money-back guarantee. $2.50 complete. **$2.50** Complete

Order NOW!

Marvel Curtain Windows

Bevel plate glass, nickel trimmed. High Quality. Insert them yourself in back or side curtains in 2 minutes. No mechanical skill or special tools required. Improves the appearance wonderfully. Various sizes and shapes shown in catalog. Priced according to size at **$1.00** and up

$3.00 complete set of 3 lights for 1917-18-19-20 Fords.

New Electrical Gyro Compass

(Continued from page 639)

Gyro Compass two wheels are used, so that both wheels combine their effect in fixing the meridian. When the ship rolls one of these rolls opposes the forces thereby set up, while the other holds and indicates the *true north.*

Figure 1 shows the binnacle stand with the glass dome cover taken off and the lower case dropt down, so as to show the two sensitive elements. Each wheel is mounted within a case which is suspended from a main frame and spider, as shown in figure 2. Following the standard practise of the U. S. Navy, the compass card is marked in degrees, instead of points of the compass, as formerly used by navigators on the old magnetic compasses.

The cross-section drawing, Fig. 2, shows the method of suspending the wheels from the framework, and also indicates the trolley, which is merely a very sensitive contact for detecting any movement of the wheels. It forms a pilot contact of a secondary system, whereby the compass card and other parts of the compass are operated by means of a motor, so as to relieve the wheels of all duty other than indicating the *true north.* As shown in the plan view, figure 3, the *azimuth motor* accomplishes the work of moving the card. It is a very small electric motor geared to a continuous rack under the compass card.

On the opposite side of the compass from the azimuth motor is a *transmitter.* This transmitter consists of three fingers which have electrical contacts, and are operated by means of a small cam shaft acting in under each contact. As the card is moved by the azimuth motor the same rack also operates the pinion that is connected to the cam shaft of the transmitter. Contact on the three fingers is made in such sequence as to connect in various pairs of poles in a step-by-step motor, mounted in the *repeater,* Fig. 5.

The main *Master* Gyro Compass is placed down below deck so as to protect it from weather and sea, as in Fig. 4. It has *repeaters,* however, that show its exact reading at any instant. A similar and familiar application of the repeater principle is that used in hotels and public buildings, where a master clock operates a number of repeater clocks. As stated above, a step-by-step motor is contained within the repeater, operated from a transmitter on the Master Gyro Compass. The step-by-step motor operates the card of the repeater mechanically, and its movements shadow those of the Master Compass. A number of repeaters are used on the ship, such as on the bridge, the Master's Cabin, on the stern deck, pilot house, and at all auxiliary steering stations.

The workmanship of a Gyro Compass must be of the very best. It will be seen how necessary this is when it is considered that each of the twin gyro wheels revolve at 12,000 revolutions per minute, or 200 r.p. second. Each wheel is driven by a small three-phase, induction motor.

A switchboard panel for controlling the ship's supply current, usually 120 volts, is also furnished. The ship's supply current is usually direct current and is converted by means of a motor-generator set to three-phase electricity for spinning the gyro wheels.

In case of failure of the ship's supply current the compass will still operate for a period of two hours, as a storage battery is connected in on the line and is automatically cut in when the emergency occurs.

The Electric Safety razor makes shaving a pleasure. Blade vibrating 7,200 times a minute cuts the beard smoothly and without slightest pull or irritation—feels like a gentle massage. Can be used with or without electric current.

All users of the Lek-Tro-Shav speak well of it

A barber says—"Have shaved for years and have never used any shaving device near its equal."
A home user says—"The most pleasing shave I've ever had in my life. Shaves my face closer than I used to shave, but there is no after irritation or ill effects as I usually get from another razor."
No. 1 Made for use from Light Socket.
No. 2 Made for use from Dry Battery.
Write for illustrated circular describing Lek-Tro-Shav Safety Razor fully.

Bulletin Building Philadelphia, Pa.

U.S. BABY TANK It goes with real Yankee Pep—by its own power
MADE OF METAL, IN CAMOUFLAGED COLORS OR GRAY

Most remarkable Toy ever invented. By drawing the Tank backward, either with the hand or over the floor or table and then placing it down, it will crawl along, overcoming all obstacles, in the same life-like manner as the larger Tank that proved so deadly in the great war. What makes it go is somewhat of a mystery, for there is no mechanism to wind up as is usually understood with mechanical toys, yet this tank will keep plodding along ten times longer than the ordinary run of toys. It will perform dozens of the most wonderful stunts: it will go backward or forward at will, and altogether will give you more fun and amusement than any other toy yet brought out. 2½ inches long. Each packed in colored box. **Price only 35 cents prepaid, three for One Dollar, or $3.00 by the dozen, postpaid** to any address in the world. Johnson Smith & Co., Dept. E13, 3224 N. Halsted St., Chicago, Ill.

PARCHEESI

Our Grandparents played Parcheesi. Our Parents played Parcheesi. Our Children want Parcheesi. Sold by Department Stores, Toy and Stationery Stores.

Manufactured by
SELCHOW & RIGHTER CO., N. Y.

www.americanradiohistory.com

In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries addrest to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

Automatic Release Air Valve.

(350) T. A. Ayes, Ilion, N. Y., writes:

Having applied for a patent on an "Automatic Release Air Valve," am writing you to get your opinion as to its merits, aad whether you think it advisable to try to commercialize it or not.

The idea of the valve is to release the remaining pressure from the air hose after the valve has been closed, and do it automatically, not leaving it to the trainman to do it or not, and by the use of such a valve you are reducing the chances of wrecks and accidents by doing away with the cause of such accidents.

There are hundreds of accidents (and wrecks) caused by air hoses bursting while the train is in motion, and in every case it can be traced to a weak air hose; and what caused the air hose to be weak? It was all O.K. when it was put on the train, because the railroads will not have anything but the best in air hose, knowing the responsibility resting on it. Then what made it burst? One thing, and only one thing, and that is the very thing my valve does away with, which is: pulling the hose apart when an uncoupling is made, while the pressure is still in the hose. With a pressure of 85 lbs. it takes quite a pull to part two hose, and the pull either bursts them at once or it strains them so that the jar and vibration of the running motion of the train causes them to burst, with a consequent wreck, with loss of life in lots of cases.

The valve used at the present time is the cause of it all, for the reason that it will not release the pressure from the hose when turned, and the trainmen will not run the risk of uncoupling the hose by hand, as they run the chance of getting hurt every time they do so. So in either case my valve is cutting down the chance of accidents either to the trainmen or train.

Another incident: A week or so ago, at Dunkirk, N. Y., a train ran into the rear of another train because the airbrakes refused to function, for the reason that a tramp stealing a ride on the train had (accidentally or otherwise) turned one of the air valves (or cocks), so that when the engineer applied the brakes they only worked on the engine and tender, because the line was cut at the valve turned by the tramp. Now, if that valve had been one of mine, the accident would never have occurred from that cause, for the simple reason that as soon as the valve had been turned by the tramp the brakes would have been set either on the train or on the engine, according to whichever value he turned.

I am only asking you as to what you think of the idea, as I have a working model and know it will do everything claimed for it, and will cost but very little more than the present valve.

A. If our correspondent's release air valve works in the way he claims, he certainly should have a valuable patent, and we are sure that the railroads would welcome such an improvement on their airbrake system, which improvement is badly needed. We would advise our correspondent to get in touch with a patent attorney.

Automatic Sign.

(351) Robert N. Rose, Queens, L. I., has this to say:

I would like to ask your advice concerning a new idea of mine and hope to see the answer in a near issue of your magazine.

Perhaps you have noticed on some of the subway stations electric signs which announce the destination of the trains as they come into the station. I have devised an automatic way of lighting these and it would cost but a small amount to make them.

About a foot above the rails from the beginning of the station to the end I would run several copper strips a few inches above each other. On the train would be a metal wedge fastened to a rod which runs up on the car, and say the lowest strip was to operate the sign reading "This train for Van Cortlandt Park." The conductor would then move the rod to where on the dial it said the above station (or to some other station) and when the train would come into the station the wedge would connect the circuit and the sign would light. There are also some other features, but this is the principle.

A. There is nothing fundamentally new in a device of this kind, and there have been ingenious patents issued along similar lines before, but somehow or other traction companies have never been kindly disposed toward such devices.

Cold Air Device.

(352) Irving Simpson, Brooklyn, N. Y., advises us:

I enclose a drawing of an idea which occurred to me while thinking of the methods of cooling the atmosphere in the home and elsewhere during the hot days of summer. The common electric fan does not cool but merely "stirs up" the air.

It is a well-known fact to scientists that when a current of electricity is passed thru a bar of Bismuth and a bar of Antimony and both bars touched to each other, the temperature at the points at which the bars touch is sufficiently low to freeze water. This "cold" generated is the principle of my idea.

A sheet of Bismuth and a sheet of Antimony (which are specially prepared so that they are perforated and that the space between the perforations are raised to points), are placed in a case so that the points of both plates touch. The current is turned on and a fan is placed in back. The current of air coming from the fan passes out thru the screen into the surrounding air.

A. The idea set forth by our correspondent is certainly worth trying, but we do not know offhand what success it will have. While the Peltier effect is well known and has been described at length in this magazine, very little is known as to what happens when a plurality of contacts are made between the two metals. The experiment is surely worth while trying. We think a patent can be obtained on this device should it work.

Electric Alarm Clock.

(353) George Daniels, Hamilton, Ontario, Canada, writes this Department, with sketch, proposing a novel and simple electric ringing attachment for alarm clocks, and asks our advice as to its patent aspects.

A. Your scheme is certainly very simple, and should work satisfactorily with any standard form of alarm clock on the market. The editor has experimented a great deal with electric alarm clock attachments, and has often considered the commercial possibilities of manufacturing such an attachment, but he has come to the conclusion that very few people will invest in one of these devices unless they can be purchased for a very small sum—certainly less than $1.50 or $2.00, the usual price for the simplest electric alarm clock attachments available.

U.S. PATENTS

Don't Lose Your Rights

Before disclosing your invention to anyone send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception" sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

Patent Advice

(Continued)

However, you might do very well in endeavoring to obtain a patent on your scheme, and to this end you should take the matter up with a patent attorney, a number of reliable ones advertising in these columns. As soon as you place the drawing and specifications of this device in the hands of your patent attorney, he will immediately make a search of the patent office records to ascertain whether or not there are any conflicting patents, and will notify you one way or the other.

In closing, we might suggest that to successfully commercialize this electric alarm attachment, it should be simplified and made as cheap as possible, utilizing a flashlight battery instead of a large size dry cell, and also using as cheap a bell as is available, or even designing a very simple and cheaply manufactured bell for the apparatus.

Electric Motor.

(354) J. P. Morgan, Pliny, W. Va., writes us, showing a sketch of a simple D. C. rotating field motor, as he calls it, and wants to know if it would be worth patenting. It employs oppositely disposed pairs of field poles, which are successively excited so as to drag around a pivoted iron armature.

A. The scheme you show with the motor field composed of a series of electro-magnets, which are excited in pairs successively by direct current in order to drag around a simple iron armature having no windings upon it, is quite old, indeed. You will find such motors of several different and very ingenious types described in many of the books on electric toy making. In fact, the earliest electric motors, dating back 35 to 40 years or more, were constructed on this simple, yet inefficient principle.

Unless you have something novel in mind in regard to the design of this small motor, which you do not disclose in your description of the device, we do not believe you can obtain a patent on it. However, the best thing to do is to take the matter up with a reliable patent attorney, and we can recommend any of those advertising in these columns. The patent attorney will make a search of the U. S. Patent Office Records and ascertain the nearest similar patents which cover ideas identical to or closely resembling your proposal.

Simplified Electric Motors.

(355) C. W. Halligan, Lewisburg, Pa., writes as follows:

"I should like your advice on this idea: It consists essentially in a radically different design of electric motor, and would, no doubt, find its principal application in toy motors.

"Referring to the drawing, Fig. 1 shows an end view of the essential parts. A single magnetic coil is provided with a hollow core. An iron shield surrounds one-half the interior of this space, as shown. The shaft is at the center of the solenoid, and is provided with a cam extending the whole length of the shaft and shaped as shown.

"In Fig. 2 the brush mechanism is shown. The cam, continued beyond the end of the solenoid, provides a means of making and breaking the circuit at the correct time.

"In operation, if the solenoid be energized, the cam will tend to assume the position indicated by the dotted lines in Fig. 1, following a well-known law in physics. At this time the current is broken and is again made after one-half revolution by the brush shown in Fig. 2. In this way rotation is effected.

"In Fig. 3 an alternative construction is indicated. In this case the shield is omitted and the axis of rotation is eccentric to the axis of the solenoid. The principle is the same: The iron will tend to assume a position such that the distribution of magnetic flux is symmetrical, the same as in the magnetic vane type of volt and ammeter. A suitable flywheel must be provided on the shaft to insure an even rotation.

"Please advise me as to the commercial value of the idea and its patentability as soon as convenient."

A. As you suggest, the theory of the operation of this motor is correct, and undoubtedly it will develop quite an appreciable amount of power if a very powerful electro-magnet coil is used. We presume you have done some experimenting already and determined just what proportions the various parts need to have, in order to work most efficiently for a given voltage and amperage.

We do not remember having seen anything just like this in the form of an electric motor for toy purposes, and believe that you can obtain a patent on it. Its simplicity should make it quite worth while for commercial development, so long as the design is confined to a small motor, as, of course, a large motor built on this principle would be very wasteful of energy. We would suggest that you put this in the hands of a patent attorney and have him make a search in the U. S. Patent Office for any conflicting patents. He will notify you directly whether or not there are any such patents which would interfere with the granting of a clear title patent for you on this invention.

PATENTS

If you have an invention and desire to secure a patent, send for our Free Guide Book, HOW TO GET YOUR PATENT. Tells our Terms, Methods, etc. Send model or sketch and description for our opinion of its patentable nature.

Sun Signals for Fighting Forest Fires

(Continued from page 628)

est Service to extend heliograph communication to the work of discovering and extinguishing fires.

It is pointed out by Arthur L. Dahl that in order to test the adaptability of the heliograph to the fire patrol conditions some experiments were tried in the California National Forest in the northern part of California. A competent instructor was secured and seven men were chosen from among the rangers to learn the art of signaling. None of these seven men had any previous knowledge of the instrument, but they quickly learned the technical part of their work and became proficient operators in a very short time. When the experiments were begun the only apparatus available was the standard heliograph instrument used by the Signal Corps of the Army.

There are a number of these instruments used by the forest men. The instrument consists of two four-inch square mirrors and adjustable frames, a mirror bar, a sighting rod, a shutter and two hardwood tripods, to the top of which the whole outfit is attached. The equipment is rather bulky and weighs approximately twenty pounds. The principle of the heliograph is the reflection of the sun's rays steadily in a given direction, provision being made for alternately exposing and obscuring the mirror so as to transmit a series of long and short flashes. This device is set up at a point from which can be seen the station to be signaled. By means of the sighting rod and the tangent screws the instrument is sighted on the receiving station. The mirror is then so adjusted that the reflected ray is projected directly toward the station. The circle of illumination created by the mirror has a diameter *which increases approximately fifty feet for every mile of distance from the mirror.* For example: If the receiving station is six miles distant, the space at that spot within which the flash can be seen would be 300 feet wide. As the shutter is placed directly in the path of the reflected rays, flashes are transmitted by opening and closing the shutter. The actual manipulation is very similar to that used in telegraphing. The best code for heliograph communication is the Myer code, used as a standard by the Signal Corps.

It is stated that in some cases the Morse code has been used for this purpose, but since it was created primarily for audible signaling rather than visible signaling, it is not adapted for heliograph work. The Morse alphabet is based on a combination of ones and twos. For instance, the letter A is represented by 22, the letter L by 221, and the letter P by 1211. The one in the Myer code is represented by a short flash. This means holding the shutter open for about one-half second. The two is represented by two shorter flashes in quick succession. Spaces between words are represented by a long flash of about two seconds. It is of the utmost importance that uniformity in the mechanical movement of the shutter be cultivated, as lack of rhythm in the signals of the sender entails unnecessary concentration on the part of the receiver.

It is maintained that it is easier to send than to receive messages, and one of the difficulties to be overcome by the forest rangers was to secure perfect team work between the men, as the men at first sent their messages too fast to enable the "receiver" to decipher them. When the men had been taught the code, and were able to send messages, a definite system was laid out for the forest. There were within the experimental area two prominent peaks al-

To cut down the cost per cut the blade

A Matter of Teeth

The efficiency of a hack saw blade depends almost entirely upon the rake, the "set," and the pitch or number of teeth to the inch.

There's no overhanging "hook" to the teeth on a Starrett blade. With proper adjustment of weight or pressure, they'll cut just as fast on the last cut as on the first. The teeth are uniform in shape, "set" and spacing. That's why every blade in a box of Starrett saws cuts alike.

Starrett Hack Saws are made in varying pitches or number of teeth to the inch, from 10 to 32, according to the work they are intended for.

Different kinds and shapes of metal need different blades for economical cutting. Get Starrett blades, use them according to the Starrett Hack Saw Chart and watch your cost per cut decrease. Write for Catalog No. 21 "L E" it's free.

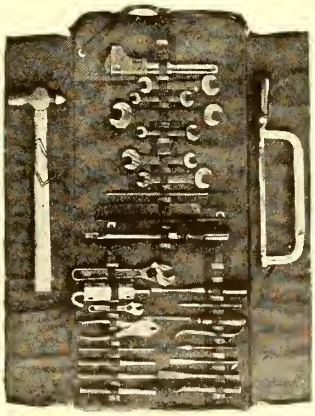
FOR AUTO AND TRACTOR EXPERTS



Learn at the School That Is Thorough

You and every man or boy who is interested in automobiles, trucks and tractors can positively learn to be a motor expert at The Milwaukee Motor School. Why? Because this school is so thorough—the instruction is so simple and clear that anyone who wants to can learn this profitable trade here. For over eight years this big school has been successfully teaching boys, men and young men to be motor experts and today our efficient instructors cannot be excelled for their ability to teach you anything you should know to earn big money as a motor-mechanic, chauffeur, garage owner, auto salesman, repair man or factory worker.

AN UNUSUAL SCHOOL

Men who have attended other schools come here to complete their training. Some of our graduates are employed by other schools as instructors. We make you an expert. We assure your success.

FREE TOOLS

SPECIAL OFFER

Everyone who enrolls now will receive a new kit of 29 tools without any charge whatever. These are not loaned but are actually yours to take home with you when you leave the school. There are no strings tied to this offer. This fine set of tools and kit bag are worth fully $17.50.

Low Tuition if You Write Today

Send for our new free book entitled "Making You Master of the Auto." Learn how we teach all the everyday problems concerning automobile and tractor engines—ignition, starting and lighting systems, magnetos, carburetors, etc.

THE BEST

Yes, the best and only the best is cheapest in the end. Then why not apply this rule when taking a course in wireless? Our correspondence course is simple, easy to master, up to date and consists of 15 lesson books prepared by our expert theory instructors. All practice and transmitting apparatus for mastering the code is furnished free.

We Operate the One Big

radio school of the world, and this correspondence course is an extension of our activities, a Post Graduate Course in our Washington School being given you free, if you desire. You see we are not *A RADIO SCHOOL*, but actually and absolutely *THE RADIO SCHOOL*—the top one, the biggest one—the one that *HAS BEEN* and *IS* turning out the *WINNERS* every week. You can't compare us with any other school, because we are head and shoulders above all—the very top. You get the idea? You can't get a better or higher course, we are the final—the finish. Act now. Get a grip on yourself—take the big important step. Settle your career today. Our new catalogue, just out of press, will tell you how. Send for it.

CARNOTITE

(Radium Mineral.) The American Pitchblende found in Colorado, from which *Radium* is extracted.

A generous piece, enough to conduct experiments, such as affecting photographic plates thru opaque material (similar to X-Ray pictures), first made by Sir W. Crookes and Mme. Curie, is furnished in neat, wooden box. **URANIUM ORE** (*Radio-Active*)

Containing about 35% of pure Uranium; also Radium and Vanadium. One of the most rare and interesting minerals. Twenty milligrams are furnished in glass vial protected by lead cover.

One box of *Carnotite* and one vial of *Uranium Ore* as described above 50c sent prepaid.

FORMULAS

Luminous Paint—Silver Plating Powder—Liquid Court Plaster—Soap Bubble Liquid—Straw Hat Bleach—Collapsible Tube Tooth Paste—Resilvering Mirror Liquid—Polish for Tan Shoes—Dressing for Tan Shoes—Paint to make Oil Cloth.

These Ten Recipes in sealed envelope for 50c. Sent prepaid.

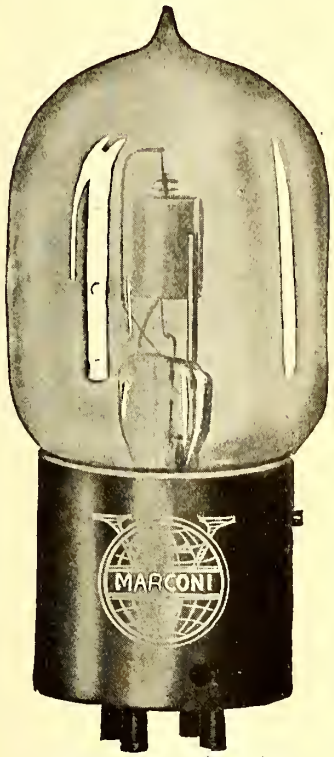
SIDNEY SPECIALTY CO., 233 Fulton Street New York City

ready equipt for fire lookout work.

It is noted by Mr. Dahl that both peaks were connected by telephone with the Forest Supervisor's office and with the nearby rangers' cabin. In addition to these two principal peaks, there were five smaller ones, also connected by telephone. The first two points were made the central stations, and two of the best men were stationed there. The other five points were designated as substations. These substations reported to the nearest central station, and since each forest officer was furnished with all locating instruments it was merely necessary for the substation to report the degree angle of the fire from its point and add a short statement of local description.

A typical heliograph message would read: "Smoke bears 26 about seven miles on Rattlesnake Creek, near Bloody Rock. Just started. Burning in bush." If the same fire was discovered by several operators each would send a report. and by plotting the angle lines given in these reports would give the location of the fire, which would be at the point of intersection of those angles. The average speed attained by the operators was four words a minute. It will be noted that as the average message need not exceed twenty words, that after discovering a fire a good heliograph man can notify headquarters within five minutes, whereas under the old conditions he would have to ride for an hour to reach the nearest telephone. The range over which heliograph signaling may be effected on favorable atmospheric conditions is almost unlimited. By actual test *it was found that perfectly visible messages could be flashed for a distance of 45 miles and read without the a'd of a field glass.*

It is held that the only serious drawback to the use of the instrument is that on a cloudy day it is useless. When it had been determined that the heliograph was valuable to the forest officers, the next step was to secure a more portable and less awkward outfit. After much experimenting the ideal instrument for the use of the forest men was designed. The instrument proper is made of aluminum alloy with certain parts of bronze. It fits into a small leather case approximately the size and shape of a 3A kodak case, which very conveniently fits into the saddle bags on the horn of a patrolman's saddle. Instead of two heavy tripods, as in the case of the Army instrument, the new Forest Service instrument fits entirely on the head of one small tripod about 20 inches long 2 inches in diameter.



The entire equipment, including tripod and instrument, weighs about one-fifth of the standard instrument, and in bulk it bears the same relation. It was also found that by reducing the size of the mirror from 4½ inches square to 3 inches square no appreciable difference was made in the brilliancy of the flash. This afforded the opportunity of reducing the size of the whole instrument accordingly. As fast as the rangers on the different California forests can be taught to use the heliograph, they will be furnished with the new instruments, and on their rides through the mountains, if a fire is discovered, they need only proceed to the highest available point and flash their signal to the proper points where the "fire fighters" are notified their services are required.

Chicago has more telephones than all France, and a single office building in New York contains more than there are in the whole of Greece.

Siam's telephone service is owned and operated by the government, and Bangkok, the capital, is the only city with an exchange.

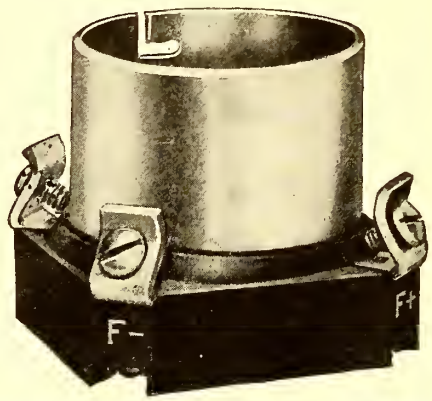
THE HEART OF THE WIRELESS

Fleming Pat. No. 803684
De Forest Pat. Nos. 841387-879532

An Amateur Station Without a Vacuum Tube is Years Behind the Times

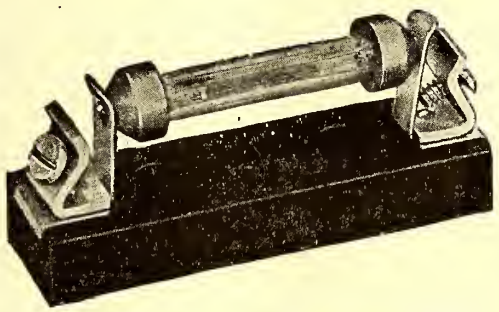
MARCONI V.T.

$7.00 each



Under agreements recently effected the Marconi V. T. is the only vacuum tube, or audion, which may be sold to amateurs, laboratories, schools of instruction and experimenters.

The approximate operating life of the MARCONI V. T. is 1,500 hours.



Class I.—Designed for use as a detector; operates with plate potential of 20 to 60 volts.

Class II.—Designed for use as an amplifier; plate potentials from 60 to 110 volts may be applied.

Tubes in either class may be used for detection or amplification, but those of Class I are best as detectors, and Class II tubes are superior as amplifiers.

Standardized Socket $1.50 additional

Standard Resistance, Complete $1.00

The Marconi Resistance, connected in the circuit between the grid and the filament of the Marconi V. T., is made in the following standard sizes:

½ megohm, 1 megohm, 2 megohms, 4 megohms, 6 megohms.

Resistances of any special fractional values up to 6 megohms can be supplied.

DE FOREST
Wireless Telephone

The Newest Development in the Radio Field

A Wireless Telephone that plugs into a lamp socket. A genuine DE FOREST UNDAMPED WAVE RADIOPHONE (and telegraph) OPERATING DIRECT FROM YOUR 60 CYCLE, 110 VOLT HOUSE CURRENT. NO MOTOR-GENERATOR REQUIRED. JUST PLUG IN AND TALK—SIMPLICITY ITSELF.

A greater invention than wireless telegraphy. Absolutely silent in operation. Trouble-proof, fool-proof and **only one adjustment required,** after which the instrument "stays right." Couldn't possibly be simpler to operate. Practically simultaneous transmission and reception by means of electrically operated relay transfer switch. Marvellous, snappy, clear speech. Voice quality superior to that over a wire. Absolutely stable in operation. Utmost selectivity. No decrement. The panel is divided into three divisions—rectifier, filter and oscillator. The rectifier employs two bulbs, thus taking advantage of both halves of the cycle. The filter of inductances and capacities smooths out the ripple, freeing the speech from distortion. The oscillator of four tubes comprises a new circuit of high efficiency both in power, output and modulation.

Tested Ranges { Telegraph 50 to 75 miles Depending upon aerial
Telephone 10 to 20 miles height and terrain.

Our actual experience with this set indicates that these ranges can be greatly exceeded.

Price Complete Including Bulbs $200.

You will eventually use this type of transmitter, now recognized as the most efficient of all low-power systems. Investigate this new De Forest production now. Order immediately to insure early delivery; either thru your regular dealer or direct from us.

Inventors and Manufacturers of Amateur and Commercial Radio Apparatus

1415 SEDGWICK AVENUE, NEW YORK CITY

EXPERIMENTERS! Get a SKINDERVIKEN Transmitter Button

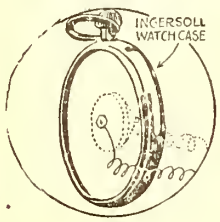

Fig. 1

Fig. 2

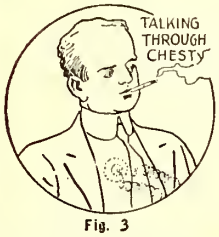

Fig. 3

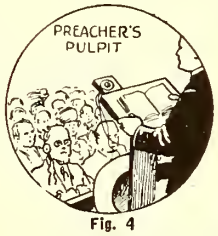

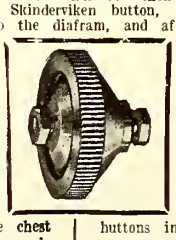

Fig. 4

THE SKINDERVIKEN TRANSMITTER BUTTON presents the latest advance in microphones and marks a revolution in transmitter construction. It works on an entirely new principle, takes up practically no room, and marks the end of all telephone transmitter troubles.

The SKINDERVIKEN TRANSMITTER BUTTON can be placed in any position and it will talk loudly and distinctly and is at the same time extraordinarily sensitive. It was primarily designed to replace the old damaged or burnt out transmitter. Simply unscrew and remove the telephone transmitter front, disconnect the two inside wires, unscrew and remove the bridge and the old electrode. There remains only the diafram. These wires are then connected with the Skinderviken button, the latter screwed to the diafram, and after screwing the old transmitter housing together again the telephone is ready for work.

ELETRICAL EXPERIMENTER readers will be particularly interested in all the different experiments that can be performed with the Skinderviken Button. Fig. 1 shows the Skinderviken button attached to the back of an Ingersol watch case. When speaking towards the inside of the case, it will be found that the voice is reproduced clearly and loudly. Fig. 2 shows another interesting stunt. By attaching the button to a tin diafram about the size of half a dollar, and by holding the diafram at the side of the throat, as shown, speech can be transmitted with surprising clarity. Fig. 3 illustrates the same arrangement placed on the chest as shown. In this position the transmitter will talk clearly and loudly. Fig. 4 shows an arrangement wherehy the Skinderviken button is attached on a thin wood board at the preacher's pulpit. His voice is clearly transmitted so that people hard of hearing can readily hear the sermon. Fig. 5 shows an interesting stunt, whereby a hole is drilled in the side of a thin glass water-tumbler; the sides of the glass thus acting as a diafram, the voice is clearly transmitted. Fig. 6 shows a simple match box Detectophone. The Skinderviken button is concealed inside of a box, only the small brass nut showing on the outside. This can be camouflaged as well. This device talks well. Fig. 7 shows how to transmit phonograph music at a distance merely by drilling a small hole in the phonograph arm and attaching the Skinderviken button; a very favorite experiment with all experimenters. Fig. 8. shows how a very sensitive Detectophone can be made by placing one of the buttons in the center of a lithographed cardboard picture, so that only the small brass nut shows. The large surface of the picture acts as a big diafram, and the voice is well reproduced.

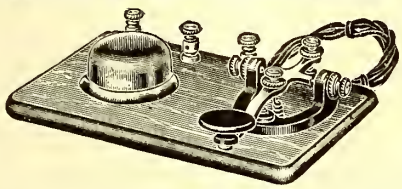
Mesco Radio Buzzer

With Shunt Resistance
U. S. Navy and U. S. Army Standard

THE Radio Officers of the NC Planes, after testing all other buzzers, decided to use the "Mesco" on their radio equipment. The R-34 was equipped with two Mesco Radio Buzzers.



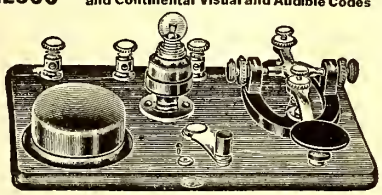
Why? Because of its reliability and constancy in operation; greater output efficiency; ease of adjustment; unaffected by extreme variations in weather conditions; exposed wires eliminated.

Sparking is almost entirely eliminated, so that the energy lost in light and heat in the operation of other buzzers is here conserved and radiated in the form of oscillating energy.

This buzzer maintains a constant note and is recommended as an exciter for checking wavemeters where pure note and ample energy are required.

List No. 55, Mesco Radio Buzzer
Price $2.05

MESCO WIRELESS PRACTICE SET



The Practice Set comprises a regular telegraph key without circuit breaker, a special high pitch buzzer, one cell Red Seal Dry Battery, and four feet of green silk covered flexible cord.

The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

List No. Price
342 Telegraph Practice Set, with Battery and cord.....$3.24
Weighs 4 lbs. packed.
Price does not include postage.

MESCO Combination Practice Set for Learning the Mo and Continental Visual and Audible Codes

This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord.....$4.05
Weighs 4 lbs. packed. Price does not include postage.

Radio Links Airplane and Submarine

(Continued from page 661)

Wire.—Seven strands of No. 14 B. & S. phosphor bronze wire, covered with 40 per cent Para rubber, to a total outside diameter of ½".

Supports.—Two substantial masts, triangular or oval in cross-section, 3 feet high with insulators at the top, erected at either end of the boat and braced to withstand considerable strain.

Stanchions.—Two stanchions insulated at the top placed high enough to support the wire at least 1 foot above the bridge.

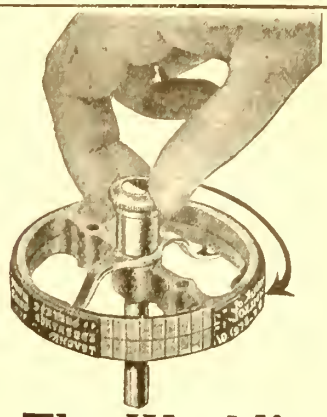
Radio Insulators.—An extra radio insulator similar to the one already installed, placed in the space now occupied by the antenna mast (or in any convenient place at least 3 feet away from the other insulator), and extended vertically thru the hull.

Water-tight Sleeves.—(To prevent the sea water from working up under the insulation on wire.) Brass stock 3" long bored to outside dimensions of insulated wire for 2¾" and drilled dimensions of bare wire for ¼". The wire is stript of insulation for a few inches and is slipt thru the sleeve, the insulated portion being smeared with white lead and the stript portion being soldered to the brass.

Grounded Connections.—Lugs on end of wire grounded to hull by bolts.

Lead-in Joints.—Junction of insulated wire and radio conductor is made watertight by marine glue poured in a cylindrical mold.

Wire-tightening Device. — (*a*) Turnbuckles may be placed at the end of each wire next to ground connections; or (*b*) in order to take up slack on both wires equally it is preferable if construction of boat permits to place one insulated turnbuckle between stanchions on bridge.



Receiving Apparatus.—Tuner capable of receiving wave lengths of 300 to 16,000 meters, and oscillation audion detector and three-stage resistance type amplifier of French design. (The Navy standard audion control box type SE 1,000 two-step amplifier cannot be used unless placed in a noise-proof and inductive-proof compartment.)

Transmission Apparatus. — Regular quenched spark set, preferably the 1 KW. size. Terminals of loop antenna are connected to the antenna and ground connections, respectively, with a .0005 microfarad condenser in series with the loop. The ground connection on the set being removed.

Nauen Radio Opened Again

(Continued from page 662)

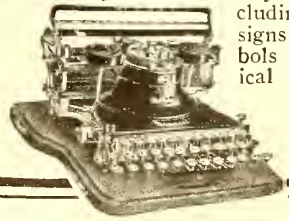
were captured during the war, of course, and we may presume from those captured, that the bulbs used in practically all the Teutonic radio stations were similar or nearly so, and that if the German experts had devised any wonderful new bulb, that they would have put these bulbs into their field sets, by the very nature of the wartime conditions, and particularly those used in the large base radio stations, several of which were captured during the latter months of the war. In a test with these bulbs as compared with the French vacuum bulbs and the American types, such as the De Forest and Western Electric amplifiers, the German bulbs showed up as good, but not better, under careful tests which were carried out in conformity with U. S. naval specifications for the device. A radio engineer of the U. S. Navy Department recently informed us to this effect, and we also heard the same opinion voiced by officers of the French and British Armies, who had the opportunity of carefully testing a

The World's most wonderful Typewriter—

Here's a polyglot machine that writes all languages from Eskimo Indian to Kata Kana Japanese and over 365 different type-sets. The type is instantly interchangeable—two different languages or type sets are always on the machine. You just turn the knob—to change language or type.

Hammond MULTIPLEX

"MANY TYPEWRITERS IN ONE"



Sounds like an Arabian Knights story but the machine itself is very practical, very real. It is the typewriter President Wilson uses personally — the typewriter he took with him when he visited King George. It's the typewriter King George's mother, Queen Alexandra, and many other Queens and Kings use.

The Multiplex has revolutionized typewriting—has changed it from monotonous commercial work to the beauty of fine printing and engraving.

No Other Typewriter Can Do This:

MULTIPLEX HAMMOND'S
Instantly changeable type
Many styles, many languages
Two types or languages always in the machine
Just Turn the Knob to change

Write for booklet showing the many languages and type sets of the Multiplex—there's a type for every profession, every business, every science, including technical signs and symbols and chemical keyboard.

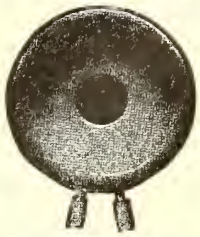
AMPLIFY YOUR RADIO SIGNALS

With the new DETECTAGRAPH-TRANSMITTER, the amateur can amplify radio signals to such an intensity that he can hear the signals about his station without the need of the telephone head set.

By the addition of a loud talking telephone he is able to hear the messages many feet away from the instrument.

The super-sensitive DETECTAGRAPH-TRANSMITTER herewith shown is two and three-eighths inches in diameter, five-eighths of an inch thick and weighs less than three ounces. It is the most sensitive sound detecting device ever brought before the public.



The manner in which the amplifying process is attained is by attaching with tape the DETECTAGRAPH-TRANSMITTER to the regular wireless receiver.

Not only is this instrument applicable for amplifying radio signals, but it can be used with equal satisfaction for magnifying other sounds. Phonograph music can be transmitted from one place to another by means of this instrument, and those who are afflicted with deafness will find enormous benefit by using this transmitter. It is the greatest device for building your own loud talking telephone, detectagraph and other devices. Can be used for any purpose where a sensitive detecting instrument is required.

SUPER-SENSITIVE Detectagraph MICROPHONE DEVICES

Type RORB, Price $45

Two-Stage Audio-Frequency Amplifier

This Amplifier is designed to eliminate howling due to resonant feed-backs, without impairing its amplifying efficiency. The cover is hinged, affording accessibility to all parts. The sockets accommodate the standard four-prong tube and perfect contact is secured through strong phosphor-bronze springs.

The wiring and mechanical construction are characteristic of Grebe workmanship. Better be sure *your* Amplifier is a Grebe.

Write for free bulletin describing Grebe Amplifiers; complete catalog sent upon receipt of 10c.

large number of bulbs of all makes, before and after the signing of the Armistice.

Two large antenna systems are provided—the larger being of T-shape, and the smaller in the form of an elevated horizontal triangle with the down leads from the apex, says the *Wireless World*. Simultaneous transmission on two different wavelengths is thus possible. The two main masts, of lattice construction, are 260 meters high, and are bedded on an insulating ball at the base. Additional insulation is provided at 150 meters from the ground. The supply alternator, single phase, can deliver 800 horse-power, and after multiplication of the frequency by static frequency raisers, furnishes 24,000 cycles current to the aerial. The wave-length is thus 12,500 meters. Transmission at 200 letters per minute can be carried on. The overall efficiency is claimed to be 65 per cent from alternator to aerial at 12,000 meters wavelength.

The following table gives an interesting comparison with the installation in use in 1908:

	1908	1918	
		Small Aerial	Large Aerial
Masts	1 of 100 m.	2 of 150 m.	2 of 260 m.
		1 of 135 m.	4 of 120 m.
Antenna area sq. metres	31,000	77,500	155,500 sq. m.
Primary ouptut K. W.	50	175	600
Aerial energy K. W.	12	100	400
System	slow spark	quenched spark	H. F. Alternator C. W.
Range Kms.	3,600	8,000	20,000

THREE LAND RADIO STATIONS FOR AIRPLANE MAIL.

The Post Office Department has contracted for the erection of three high-power radio stations, the first of a chain of wireless communicating centers in various cities to be used primarily for the direction of mail-carrying airplanes handicapped by fog, it was announced recently by Emil J. Simon, the well-known New York radio engineer.

Stations will be established at Bellefonte, Pa., and Cleveland, Ohio, with a third at some point on Long Island or Newark, N. J. Appropriations for them already are available. Others will be erected at Washington and Chicago as soon as Congress provides funds.

Each station will be equipt with steel towers 200 feet high and 300 feet apart and will have a range of approximately 400 miles to *mail airplanes* and approximately 700 miles between stations, the difference in range being due to the lesser sending ability of airplane wireless equipment.

The station at Bellefonte were completed about the middle of October, while the other two definitely decided upon were expected to be ready early in December.

Establishment of the radio stations will enable the Post Office Department to maintain communication between cities having air post delivery independent of telegraph and telephone services in the event of a disruption of service by storms or other causes.

Lieutenant Clark A. Edgerton, formerly of the army aviation service, in charge of the air mail experimental work at Washington, will direct the activities of the radio stations.

"Cold Fire"

By H. Gernsback

(*Continued from page 633*)

(standard 110,000 volt insulator for 60-cycle work, such as is used in electrical power transmission equipment) equipped with a "corona" or flux distributing shield. This flash-over is occuring at 234,000 volts and 51,000 cycles per second. Without the corona shield, corona will form on the metal cap of the insulator and flash-over will occur at voltages slightly less than 100,000 at a frequency of 51,000 cycles per second.

SEVEN ZEPPELINS WERE LURED TO DEATH BY RADIO.

This is the tale of the seven Zeppelins. Do you remember the last big raid over England after which most of the flock of ungainly birds came flopping down into the fields and forests of France, while one met its fate in the Mediterranean?

People in London told one another all manner of tales about frozen motors and gasoline icicles. As well to let it go at that in those days, but now that I know the Germans know all about it, here is what happened, says Gordon Stiles in a press report from Berlin.

A certain French radio officer had been very diligent during the war. When America came in some wireless experts from over there joined forces with him. Among other things they studied the German method of wireless control of aircraft.

The Allies had known for a long time the Zeppelins were guided by instructions sent from powerful wireless stations in Belgium and Germany. When its cargo of bombs had been disposed of the airship would flash back, "Where am I? And what course shall I take to reach home?"

This call would be received by several German stations, indicating the direction from which it came. Thus by using formula which involved mathematical calculation dealing with intersections and the like the position of the Zeppelin could be exactly determined. The rest was easy. The compass course to be taken went thru the ether to the Zeppelin.

By patient work the French radio officer had compiled a vocabulary which embraced more than 400 German code words. With the help of mechanicians he had built a wireless set which had all the characteristics of the German apparatus, even to "flaws."

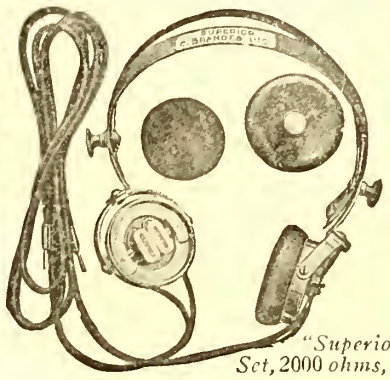
On the night of the raid in November 1917, this set was read for use. Fate was with the Allies, for when the Zeppelins were floundering at a dizzy height over London, the signaled replies from the German stations did not reach them. Static disturbances prevented the message carrying.

The French stations were very busy. "Come this way." "Take this course." "Steer so many degrees east by south." These were the messages flashed over the new sending apparatus.

From the Zeppelins, one after another came "O. K." And they came. They came so accurately that the French actually telephoned the various anti-aircraft stations the exact minute when they might expect a Zeppelin over their position. Allied night fliers were sent up in swarms to demolish those which the guns did not claim.

We know their success. The big gas bags came tumbling into France or sailed wildly about, damaged and limping, until the airplanes finished them.

Another dent in Fritz's wild war-dream.



"ASK ANYONE WHO HAS USED IT"

Said Denver, Col. to Valley Stream, L. I.:—

One of our most enthusiastic customers communicates by wireless from his home in Denver to a friend on Long Island. He uses a Brandes Headset—after exhaustive tests and comparisons. (Name on request.)

BRANDES WIRELESS HEADSET

CLEAR TONE
LIGHT WEIGHT
DEPENDABLE SERVICE

"Superior" Set, 2000 ohms, $7

Score 100% efficiency in actual use. Sharp, Unblurred, Readable Signals assured by

"BRANDES MATCHED TONE"—

Exactly matching the tone of both receivers in each set and thus eliminating all confusion due to unmatched harmonics.

TRIAL OFFER

Buy a Brandes Superior Headset and use it critically for ten days. Then, if it doesn't come up to our claims or your expectations, return it and your money will be cheerfully refunded. Test it—compare with others—for sensitiveness, clearness, distance. Prove for yourself the fine quality, the "matched tone." The two diaphrams, toned exactly alike, strengthen the signals and prevent blurring. Used by many U. S. Government experts, and experts abroad; by colleges and technical schools; and by professional and amateurs everywhere.

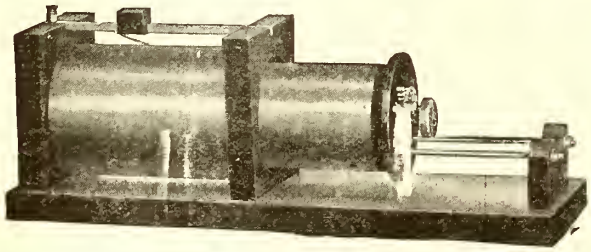
DUCK'S New Big 264-Page Wireless and Electrical Catalog Just Out—Now Ready

It is mailed for 12c in stamps or coin which may be deducted on first order of $1.00. Catalog not sent otherwise.

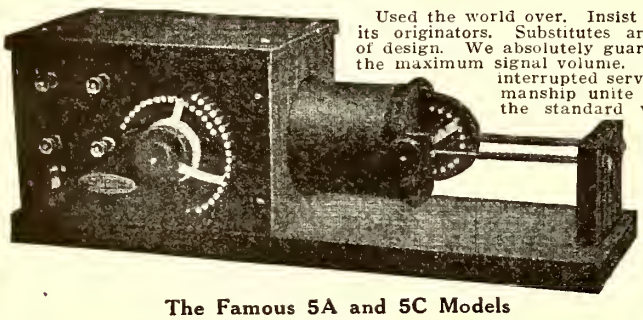


We regard this catalog as our greatest effort. It embraces everything in wireless worth while. 172 pages with no waste space devoted exclusively to wireless instruments. Your amateur friend will tell you that there never has been any wireless catalog to take the place of catalog of this company and above all that you can absolutely depend on our goods. There is no need for any other catalog when you have this big catalog.

NEW MODEL 5BB. NAVY TYPE RECEIVING TRANSFORMER

A big improvement over our former model. Primary divided into two sections, with three dead end switches, greatly improving selectivity.

Secondary divided into three sections, with two dead end switches, eliminating harmonics. By changing the construction of the end piece, there is also greater loose coupling. It is a wonderful improvement over our old model both in performance and appearance. Only $23.50.



OUR IMPROVED ARLINGTON RECEIVING TRANSFORMER

The secondary on our new type Arlington is divided into three sections with two dead end switches, eliminating dead end effect and harmonic and giving greater selectivity. The end support similar to that on our Navy type permitting of greater loose coupling. It is a beautifully finished instrument and will be sold by us at the same price as the old model. $9.00.

THE WILLIAM B. DUCK CO., 240-242 Superior St., Toledo, Ohio

TRACO QUALITY

RECEIVING TRANSFORMERS

Used the world over. Insist on the genuine, built by its originators. Substitutes are expensive, irrespective of design. We absolutely guarantee our tuners to give the maximum signal volume. Delicate refinement, uninterrupted service and high class workmanship unite to make TRACO tuners the standard whereby all others are judged. If you Dealer does not handle them, order direct from us.

LIBERTY DETECTOR VALVES, RADIO AMPLIFYING PHONES, type used by the **UNITED STATES, BRITISH and FRENCH GOVERNMENTS,** now in stock, for sale.

Send stamps for bulletins.

The Famous 5A and 5C Models

THE RADIO APPARATUS CO., Pottstown, Penna., U. S. A.

CHANGE OF PRICES

With Quantity Production and adoption of Automatically Wound Coils, we are glad to announce a Reduction in prices of our Amplifying Transformers as follows:

Type A-2 fully mounted with Aluminum Supports, Engraved Bakelite Dilecto Panel, and Nickel Plated Bind Posts.....$7.00

With Supports, but without Panel and Bind Posts $5.00

Assembled, but Unmounted.....$4.50

Although originally designed for use with VT-1 Tubes, these are now being used extensively and with excellent results with Marconi V. Ts.

ACME APPARATUS CO., 28 Windsor St., Cambridge, Mass.

DENMARK PLANS BIG RADIO STATION

Official announcement that Denmark is making plans to open wireless communication between Copenhagen and the United States was made recently by the Danish Legation. This statement was made public:

"Information to the effect that regular wireless connection has been established between Denmark and Great Britain has just been received by the Danish Legation here. Plans are now being worked out by the Danish Ministry of Traffic for erecting a great transatlantic radio station near Copenhagen which will put Denmark in direct wireless communication with the United States.

"Danish newspapers complain that their telegrams for some time have been greatly delayed because of the crowded cables. The Danish papers express the hope that the still important plan for a great transatlantic station will soon be realized. The Danish press is anxious to get into direct communication with America, so as to be able to obtain news from over here at first hand and at reasonable rates.

"The Danish wireless station at Lyngby is at times able to hear the American station at Arlington talk to Rome, but is not powerful enough to send messages over the Atlantic. The plan now under consideration by the Danish Government call for the erection of a transatlantic wireless station to cost 2,000,000 kroner."

JAPAN WANTS $16,000,000,000 PACIFIC CABLE.

The Marconi Company, it was said, had proposed a wireless system between America and the Far East, at a cost of about $6,000,000. But the members of the council declared that wireless would not be satisfactory owing to static conditions and other disadvantages which would make transmission impracticable for more than seven hours out of twenty-four.

RADIO-CONTROLLED 'PLANES WERE TO BOMB BERLIN, SAYS JACK BINNS.

At the very moment when the armistice was signed a squadron of super-Handley Page bombing airplanes were awaiting orders to bomb Berlin, says Jack R. Binns, the well-known radio expert, late instructor in the wireless school of the Royal Air Force. These giant machines were equipt with wireless in such a way that the German wireless station at Nauen would have unwittingly navigated them in a direct line to Berlin.

It has made inter-communication between airplane and airplane possible over a distance of 400 miles, with less power than is used by a ship at sea to communicate 200 miles.

It has made aerial navigation possible irrespective of weather conditions. It has made the transmission of human speech between the occupants of one plane to the person on another plane possible over a distance of 25 miles.

Of these its effect upon aerial navigation is the most recent and most phenomenal of the developments arising out of the welter of war.

On all the great Handley Page and super-Handley Page airplanes of the British Air Force the so-called Chanffer "direction "finder" has been equipt. This is one of the most closely guarded secret inventions of the war.

With its aid the navigator of one of these giant machines can pin down upon a chart the exact latitude and longitude of the airplane within five minutes of commencing the observation. Moreover, this navigational work can be done while the machine is in a dense fog.

The most remarkable thing about this invention is the fact that the large aerial

www.americanradiohistory.com

which makes a wireless station such a conspicuous landmark is entirely missing. In its place two moderate sized coils of wire are fitted into the nacelle of the machine.

I have located the exact position of a Handley Page while flying above dense clouds over the North Sea in less than ten minutes.

The manner in which these observations are taken is as follows: One of the two coils on the machine is movable thru a complete circle. This coil is moved until it receives signals from some well-known wireless station in Europe. The direction of this coil gives the true bearing of that particular station after allowances have been made for certain well known and charted errors, such as magnetic deviation of the compass and quadrantal error of the airplane.

The angle of the station to the bearing of the machine is then worked out on a chart, and the resulting line drawn clear across the chart. When this is completed the coil is turned around until some other well-known station is heard. The same process is completed, and the point where the two lines cross is the exact location of the airplane in latitude and longitude above the earth. The whole apparatus, with the exception of the coils, can be carried in one hand; and the coils, while bulky, have very little weight.

Another remarkable feature of this invention was its application to the big bomb-dropping airplanes that raided German cities. In this case there was a variation in its utilization. The coils were fixt rigidly in the machines, which then pointed themselves bodily at a wireless station situated at the point where they wished to go.

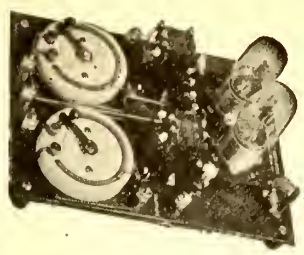
In other words, German wireless stations directed British bomb-dropping airplanes to their cities without knowing it, and over the shortest possible route. The wireless stations back of the British lines took care of their return.

Next to the direction finder the development of the wireless telephone on aircraft has been the greatest achievement of the radio experts during the war.

All the day and night bombing squadrons were fitted with it. Its utilization brought success to bombing raids by eliminating all confusion and enabling the squadrons to retain their formation under all conditions.

The squadron commander sitting in his machine would issue orders in an ordinary tone that was easily heard above the roar of the powerful engines, while the machines were rushing thru space at the rate of a mile every thirty seconds.

If, thru unforeseen circumstances, a machine got separated from the squadron, it could rejoin by means of instructions given thru the air by the human voice up to any distance within twenty-five miles.



This wonderful invention was also utilized in scout work. All the Bristol scouts were equipt with it.

They would sit above the clouds watchfully waiting. Immediately a German scout appeared the artillery co-operation machine would radio the fact to the aerodrome. The operator on duty at the 'drome would then talk into a telephone transmitter, and ten seconds later the Bristol would swoop down thru the clouds upon its unsuspecting prey.

One of the 1918 developments was the long distance wireless telegraph sets for aircraft. With these machines engaged in patrol work hundreds of miles back of the German lines could communicate instantly with headquarters any distance up to 400 miles. Not only this, but they could receive special instructions instantly from headquarters.

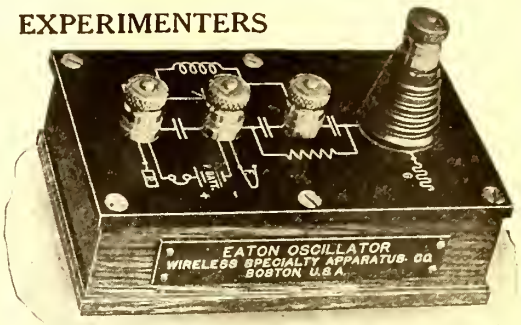
The moment the German command began to move troops in the back areas, the fact was known in all headquarters in the British army.

All this was done from a speck in the sky, from an airplane large enough to carry only two men.

TWO STEP AMPLIFIER

TYPE TRIODE E

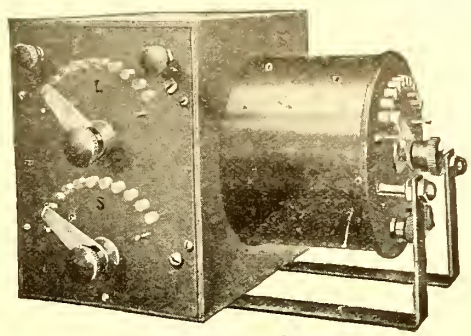
This unit was designed to facilitate experimenting by making all wiring and connections visible and accessible It is a compact unit of the resonance low frequency type, and provides a maximum of amplification. The design of this instrument is such that it will not "squeal," "howl," "fry" or "roar," as is the case with so many amplifiers now on the market. Particulars and price on application.



THE EATON OSCILLATOR

FOR EXPERIMENTERS

This instrument, in conjunction with a loose coupler, a single variable condenser and a vacuum tube, makes a complete system for receiving all undamped signals.



It will oscillate over a wavelength range of 200-25,000 meters, and requires no adjustments of any kind. It employs the Eaton Circuit, standard with all U. S. Navy receiving equipment.

The simplest and cheapest way of receiving undamped signals.

Become An Artist In Spare Time

Wonderful New Method

By our wonderful new method of teaching by mail, you can learn Illustrating, Cartooning and Commercial Art right in your own home—and in your spare time. Hundreds of successful students and graduates are now making splendid incomes. Get into this fascinating work yourself and make from $50 to $125 or more a week! Our method makes it easy for anyone to learn. The study is fascinating. Only a few minutes a day! Personal instruction given you by WILL H. CHANDLEE, one of America's foremost commercial artists. You can have your own studio—or secure high salaried position. Many students have earned more than the cost of the course while they were learning!

No Talent Necessary

Just as you have learned to read and write, we can teach you how to draw. Everybody has the ability. True, some have more than others, but that is because that ability has been developed. You start with straight lines—then curves. Then you learn to put them together. Now you begin making pictures. Shading, action, perspective, and all the rest follow in their right order, until you are making pictures that bring you from $50 to $500 or more! Many artists receive as high as $1000 for a single drawing!

Big Demand for Commercial Artists

There are thousands of big-paying artists' positions open **right this minute.** These positions are actually **going begging** for the lack of trained artists to fill them. Magazines, newspapers, advertising agencies, and business concerns are all looking for men and women to handle their illustrating. With the tremendous expansion of both foreign and domestic trade, commercial art is more in demand than ever—and that demand is increasing every day!

Write for Free Book

Mail coupon NOW for our valuable book, "How to Become an Artist." Contains full particulars of our Free Artist's Outfit, and special terms for a limited number of new students. Also contains many interesting drawings by our students, showing their amazing progress. Book just full of valuable information to you. Send for it NOW!

Will These Perpetual Motion Schemes Work?

By John D. Adams

(Continued from page 649)

be a very marked effect at this distance, but the main thing to note is that there will be no back pressure. From the point "d" the free North pole will then proceed to point "a," as every point along that leg of the triangle is nearer to the attracting South pole than to the repelling North pole of the horseshoe magnet. This completes the path, and, if the reader will now apply the same line of reasoning with the other two horseshoe magnets in place, it will be seen that the operating force is very greatly increased, as each of the three magnets may be considered separately with the same result. As the free North pole leaves the point "a" under the repulsion of the North pole of the left-hand magnet, it is also attracted by the South pole of the right-hand magnet.

The above merely describes the device in its simplest form. If such a machine were to be designed for power purposes, the power could be greatly increased, it would seem, by providing a great many bar magnets, and if they were arranged on a belt at the top and bottom, three similar horseshoe magnets, with polarity reversed, could be applied to the upper or South poles, thus *doubling* the power.

FRENCH TO HAVE 12,500 MILE RADIO STATION

The new wireless station to be erected at Croix-d'Hins, near Bordeaux, will have a sending radius of 12,500 miles. It will be one of the most powerful wireless stations in the world, with five times the strength of the Eiffel Tower station, three times that of Lyons and twice that of Nauen. The station will have a capacity of 72,000 words daily, and will reach all of the French colonies thruout the world.

"PLAN-T"

By John White

(Continued from page 648)

Stevenson's face showed his open disappointment and consternation as the radiogram proved, not a key to the message on hand, but a puzzle; quite as difficult, if not more so, than the "personal."

However, on pondering the matter, he wondered if it were not probable for this message to have a direct bearing upon the newspaper excerpt. It was decidedly possible, else why should Larnelle have postponed this message last evening when by an obvious mistake a duplicate of the "personal" had been transmitted, unless he feared that the uninitiated receiving the two with such proximity should discover the relation between them. This being the case, the solution must be of the utmost simplicity.

Crossing the room, he compared the message just received with the personal. The truth dawned upon him! The message and the personal were but the alternate words of a complete communication! *A code impossible to solve except for the slight, very slight, chance of one stumbling upon the two halves, each transmitted thru radically different mediums.*

Quickly and methodically Stevenson matched up the communication, one word from the "personal" and the next from the radio message, translating as he proceeded, until the deciphered code was before him in full.

www.americanradiohistory.com

It read, capitalized and punctuated:

"Larnelle:—Watkins and Short have delivery ready. Send all four on the fifth. Danger and directions taken up here. S. S. Unsuspecting. Bordinage."

It was evident that a "Larnelle" and "Bordinage" were the *recipient* and *sender* of the message, respectively. Stevenson plausibly assumed that "Send all four on the fifth" was a conveyance in which to transport the "delivery." The "danger and directions" gave the idea that the work was illegitimate. His interpretation of "S. S." varied. It might well be intended for steamship, but from the context he was of the opinion that it was more appropriately "Secret Service."

Stevenson, with his former experience as a government detective, considered that there were plans being formulated, if not already complete, which would culminate in illegitimate business. His ignorance of the kind of work and lack of sufficient evidence prevented his informing the proper authorities. He decided that it would be impossible for him to do other than await developments.

Stevenson unhooked the telephone book from his desk and ran his forefinger down the 's.....Warlick, Washburne," and then his search was rewarded with...."Watkins and Short, paper manufacturers, 36 East Cliff Street."

"Paper manufacturers," thought Stevenson, "that apparently is above board, unless—"

For the next month the air gave no sign of Larnelle, nor was his activity displayed in the personal columns.

Stevenson decided that the transaction, of which he had but the faintest conjecture, were being directed by one Bordinage in the very safe manner described. The complete message was doubtless written out in full, and, on two separate sheets divided into alternate words, a copy of one being sent to the publication while the other was transmitted by radio. By mistake or absentmindedness on the first evening, Bordinage had sent the wrong half.

Some five weeks after the first insertion, Stevenson again found reference to Larnelle in the personal columns. It ran:

"Larnelle: fast with s. wary on may shortly. Bordinage."

The same evening, Stevenson, intent upon his instruments, threw in two-thousand, five-hundred meters wave length.

Occasionally, a high-powered station would chime in, but he was far too high for the common gossip. As ten o'clock approached he feared that Bordinage and Larnelle had varied their wave, but shortly his anxiety was put to nought by the strident screech ...."Larnelle Larnelle Larnelle..."

"....work but caution s. direction removal follow Bordinage," it continued in the clear-cut notes of the experienced operator.

There was silence and Arlington ticked out ten o'clock. Stevenson, with receivers still elasped to his ears, compared the message with the "personal."

When pieced together the communication read:

"Larnelle:—Work fast but with caution. S. S. wary. Directions on removal may follow shortly. Bordinage."

Again, and with more certainty, he interpreted, "Secret Service wary." It was also apparent that Bordinage, Larnelle and Co. were contemplating a change of base of operations if the danger increased.

Removing the headset he walked to the desk 'phone and called Washington by Long Distance.

"Hello, Secret Service?.....Chief Langford, please.....Lang.....How's the boy? Stevenson speaking....Hope to be with you again soon. Say, is there any 'queer' in circulation now?"

"Yes, some. In fact, to you, Steve, I'll confess there's quite a bit."

1919 ATLAS WITH LATE WAR MAPS FREE

To the readers of *Electrical Experimenter* who take advantage of this offer made in connection with

Webster's New International

THE ONLY GRAND PRIZE

(Highest Award) given to dictionaries at the Panama-Pacific International Exposition was granted to Webster's New International and the Merriam Series for superiority of educational merit.

WORDS OF RECENT INTEREST

Anzac, ace, barrage, Bertha, blighty, Boche, Bolsheviki, camouflage, Lewis gun, Liberty, bond, Sammy, soviet, tank, war bride. These are but a few of the thousands of late words—all clearly defined in this great work.

"The Supreme Authority"

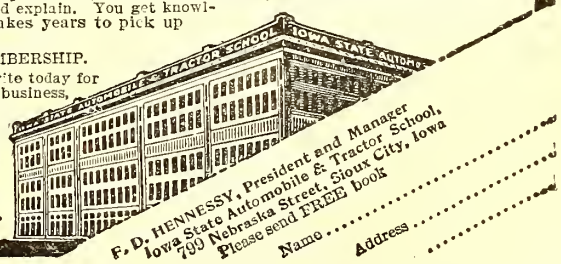
YOU Have Got To Know Motor Mechanics

—No matter what business you enter, motor power is fast replacing all other types of power. Auto, truck and tractor factories are working overtime—1,500,000 new cars and thousands of trucks and tractors will be put in service in cities and on the farm this year. Men are needed everywhere to repair and operate them. Big wages are paid competent men who know how. You returned soldiers and sailors who want jobs bigger than you left—you young men everywhere—your opportunity is right here. Don't sit and dream of success—make it.

Make $2,000 to $5,000 a year Prepare yourself for this big, growing, money-making business. Opportunities wait you every where. Every village has or needs its garage. Big city shops are calling for more trained men. "White collar" jobs no longer get the good pay. Auto mechanics always have good jobs and get big pay. Your opportunity as a trained auto or tractor man is bigger RIGHT NOW than ever before.



My Course Teaches You Thoroughly and Completely in 7 Short, Busy Weeks Come here, learn this business—then go out and make good as thousands of other IOWA STATE graduates are doing. Here you learn step by step, slowly—surely—simply, every phase of auto, truck and tractor repair and operation—starting, lighting, ignition systems—vulcanizing, welding, machine shop practice. Tools are placed in your hands, not books, with a competent instructor always at your side to help and explain. You get knowledge here in 7 weeks that takes years to pick up on the outside.

FREE Y. M. C. A. MEMBERSHIP.

Don't wait a day longer. Write today for my big FREE book on the business, showing actual pictures of equipment you work on, etc.

BOYS

How would you like to have this ghastly warning hanging in your room? It will make your station or den look big and command respect. It is the neatest sign made. Printed in bright red with big bold letters on stiff cardboard. 7¾" x 11½". Price 20c, 3 for 50c, postpaid anywhere. Don't miss this opportunity.

LEONARD BECK

102 Beach 65 St., Arverne, N. Y.

"Source New York?"

"I have an idea that it is. But it is being distributed rather widely by agents. But what's the idea. How'd you....?"

"Have you got Watkins and Short under suspicion?" broke in Stevenson.

"Yes, but how the devil'd you know. Is there a leak?"

"No, your department's O. K. But I think I'll have a bit of information for you shortly. Well, so long for the time, and remember me to the boys."

Then again followed weeks of silence between Bordinage and Larnelle. Stevenson experienced fears that they had intercommunicated thru other channeds and that, whoever they were, they had fled.

However, his fears were dispelled when a few days later, amid the agony columns, appeared the following code to Larnelle:

"Larnelle to ignorant to of Europe possible plan followed at with goods nine tomorrow arranged. Bordinage."

Stevenson decided that the "S" was the first part of a reference to the Secret Service, and with his knowledge that the law was closing in upon the probable counterfeiters, it was doubtless to enlighten Larnelle of the increasing danger. "Europe possible plan followed," if the foregoing were true, tended to show the contemplated method of escape. The completion of the message in the evening would, of course, verify his conjecture, but if the conspirators were then told to disembark by a previously arranged plan designated by a letter or numeral, it would be impossible to intercept them.

Again calling up Washington the ex-secret service man communicated with Chief Langford.

"Hello, Lang, old boy? How about that 'queer' you and I talked about. Contemplating arrests, aren't you?"

"Yes, but we can't find exactly where under the sun they're working from. It also seems that somehow or another they're on to us. I haven't the slightest idea where they get their information. But where'd you get yours? How the deuce!"

"How are your directions sent to your deputies in this city?" inquired Stevenson.

"Special delivery and wireless; but that's not it; it's all in code."

"Oh," murmured the radio man, comprehensibly. "Well, have a squad of men up here at nine P. M. to-morrow and I think you'll get them all with the possible exception of the leader. But you'll have to get me permission to use the Brooklyn Navy Station this evening. It is the only way you can get any of them. They'll be gone by to-morrow. Can't explain any more on the 'phone."

"What! Well, I'll take your word for it, but it is beyond me. No mistakes now, Steve. The permit'll be there before you. And, say, I'll be in the city myself."

Stevenson hung up, and with pencil and paper worked long and zealously at the "personal." When he raised his pencil an hour later, there was before him a supplement similar to that sent by Bordinage *via* the aid, but *one, which, when placed with the personal, would convey Stevenson's orders to Larnelle.*

The same evening his face glowed with appreciation as his fingers clasped the key at the Navy Yard's station, to which Langfords' permit had gained him quick admittance.

A half-hour before the usual time of the Bordinage messages, he called "Larnelle Larnelle Larnelle." His wave length was two-thousand, five-hundred meters—that previously employed by Larnelle—and the slightly subdued quenched tone of the navy's roar was so similar to that of Bordinage's that anyone but a professional operator would fail to detect the difference.

"Bordinage Bordinage," he signed, and shortly came the amateurish reply from Larnelle.

COLBY'S TELEGRAPH SCHOOL, AUBURN, N. Y.

"Shut down wave length to two-hundred meters and keep it there," ordered the apparent Bordinage. There was but one danger, namely, that the genuine Bordinage, listening in, should overhear the orders given to his confederate. But this was not the case.

With the wave as short as the present one, the danger of Bordinage's receiving the following message from Stevenson was nil, and it would be equally impossible for Larnelle to copy the *bona fide* communication from Bordinage in the old wave length.

Stevenson tapt out:

"S. on doings as method communication not now as be 840 w. 80 at P. M. all Bordinage." The "840 W. 80" being the residence of Stevenson.

When combined with the personal of that day, the full message read:

"Larnelle: S. S. onto doings. Ignorant as to method of communication. Europe not possible now. Plan as followed: Be at 840 W. 80 with all goods at nine P. M. All arranged. Bordinage."

As he threw in his switch for receiving, the "O. K. Larnelle" ticked in his ears, followed, as he returned to the former meterage, by a crashing, high-pitched call for the Brooklyn Navy Yard from a Canadian Station at Q——. In the midst of the communication the sender quit abruptly and apparently from t same station came the call, "Larnelle Larnelle, Bordinage."

Stevenson switched to a rotary gap, and, running it slowly, answered in the uncertain manner of Larnelle. The message from Bordinage followed:

"....s. on business as method communication only safety T be landing all at A. M. as Bordinage."

When Stevenson O.K.'d the message as Larnelle had done in previous times, the Canadian station returned and continued the message where it had left off. Its tone and wave length were identical with that of the Bordinage station.

At the completion of the communication, Stevenson handed the 'phones to the regular operator and compared the Bordinage message with the personal. Decoded it read:

"Larnelle: S. S. onto business. Ignorant as to method of communication. Europe only possible safety. Plan "T" followed: Be at landing with all goods at nine A. M. as arranged. Bordinage."

His conjecture was correct; they intended to flee.

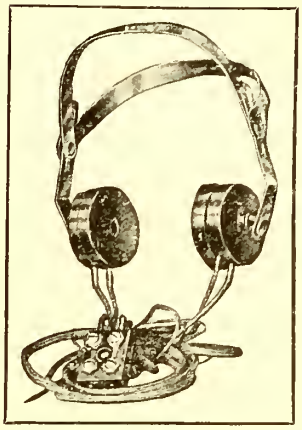
As Stevenson made his way homeward, a possible explanation for the interruption of the Canadian station occurred to him. Upon reaching his quarters he immediately got in touch with the New York Branch of the U. S. Secret Service.

"Hello...Langford arrive yet?...No?... Well, as soon as he gets in, send him over to Stevenson's.... yes, important."

Early that morning, Langford, tired from a sleepless journey on the Washington flier, arrived at Stevenson's dwelling.

The friends shook hands and Stevenson inquired:

"The men, will they get here this evening?"



"Sure, they'll all be here, but what's this something 'important' you want and then me for your bed."

"This is it: I think that we can get hold of the leader also. Here is my whole plan...." and he recounted to the amazed Langford how he had first caught on to the drift of things.

"But how under the sun could they have deciphered our codes?" demanded the secret service man.

"A person of sufficient ingenuity to formulate a cipher of the cleverness that Bordinage employed should have no trouble in decoding those of yours which he received thru the air.....But for the last part of the plan. Have extradition papers ready

HIGH SCHOOL COURSE IN TWO YEARS

YOU ARE BADLY HANDICAPPED if you lack High School training. You cannot attain business or social prominence. You are barred from a successful business career, from the leading professions, from well-paid civil service jobs, from teaching and college entrance. In fact, employers of practically all worth-while positions demand High School training. You can't hope to succeed in the face of this handicap. But you can remove it. Let the American School help you.

FIT YOURSELF FOR A BIG FUTURE This Course, which has been prepared by some of America's leading professors, will broaden your mind, and make you keen, alert and capable. It is complete, simplified and up-to-date. It covers all subjects given in a resident school and *meets all requirements* of a High School training. From the first lesson to the last you are carefully examined and coached.

USE SPARE TIME ONLY

Most people *idle* away *fifty* hours a week. Probably you do. Use only one-fifth of your wasted hours for study and you can remove your present handicap within *two years*. You will enjoy the lessons and the knowledge you will gain will well repay the time spent in study.

YOU RUN NO RISK So that you may see for yourself how thorough and complete our training is, we invite you to take *ten lessons* in the High School Course—or any course of specialized training in the coupon below—before deciding whether you wish to continue. If you are not then satisfied, we will refund your money in full. *We absolutely guarantee satisfaction.* On that basis you owe it to yourself to make the test.

Check and mail the coupon NOW for full particulars and Free Bulletin.

from Canada for one Bordinage, and also a squad of Canadian plain-clothes men watching the wireless operator at Q—— ready to arrest him the minute you telephone the word. Of course, I'm not sure he's the man; but if so, by to-night I'll get hold of sufficient evidence to demand his arrest."

"Why not, after the capture of the criminals, get the men themselves to tell the whereabouts of Bordinage? That seems the simplest way," argued Langford.

"Because," returned the radio man, "I doubt if they really know who or where he is. He has played one of the safest games in the annals of crime. And also I will require the use of the Brooklyn Navy Yard station for the whole day. You remain here to direct the capture of the men."

Before noon, Stevenson again journeyed to the Navy Yard, where Langford's influence gained him control of the key.

He had scarcely seated himself, when the operator at the Canadian station at Q—— signaled an outgoing ship. Stevenson threw on his sending apparatus and called "Bordinage, Bordinage, Bordinage, Larnelle." There was no danger of Larnelle hearing for the wave was in the upper hundreds and Larnelle, in obedience to the orders of apparently, Bordinage, had reduced to two-hundred.

There was no response to his call of "Bordinage."

A few minutes later the same Canadian operator transmitted the weather reports relayed from the astronomical station at St. Johns. Again Stevenson made a futile attempt to call Bordinage.

Thruout the afternoon and evening, except when the navy station was operated for government use, and *only when the Canadian operator was busy*, the hobbyist vainly endeavored to reach Bordinage.

Shortly after nine, Langford entered and announced that the active members of the gang, including Larnelle, coming to Stevenson's home, had been arrested with little difficulty. They had brought the "goods," *five boxes of tightly packed ten-dollar bills.* Stevenson had been correct. They profest ignorance as to the whereabouts of their leader.

The radio man motioned for quiet and again listened to the Canadian operator in communication with an Atlantic vessel.

"How about this Bordinage," broke in Langford.

"I'm going to get him now," responded Stevenson.

A moment after the man at Q—— had completed his orders to the ship, Stevenson prest the key with:

"Bordinage, Bordinage, Bordinage."

It was the first time he had flashed the call *when the Canadian operator had not been transmitting.* "Larnelle Larnelle" he signed.

Silence for the moment.

Then back crashed the acknowledgment in the high-pitched tone of the Q—— station. "Larnelle Larnelle, Bordinage."

A coincidence was impossible! By a process of elimination the operator at Q—— and Bordinage *were the same!*

The light from the powerful nitrogen bulbs flooded the trans-Atlantic station at Q——, and, reflected from the polished instruments, dimmed the pale glow of the Audions into almost obliteration.

One of the two men in the outer office noiselessly replaced the Long Distance 'phone upon the desk.

The radio man moved nervously in a swivel chair, as for the fifth time in half as many minutes, he had screeched out to the unresponsive Larnelle.

Feeling a hand on his shoulder, he whirled in his seat and faced—a representative of the Canadian Secret Service.

(The End.)

THE WILCOX LABORATORIES, Lansing, Mich.

NEW 24-CYLINDER LIBERTY MOTOR.

The War Department has developed a 24-cylinder Liberty motor which has just been successfully tested at McCook Field. Originally the Liberty motor was designed for eight cylinders, then enlarged to twelve cylinders. The engine used in the test at McCook Field was built of standard Liberty twelve ports. The changes were few, consisting chiefly of the use of two regular crank case upper halves, one of which was somewhat altered, and special design connecting rods.

The following table compares the Liberty 12 and experimental Liberty 24:

HORSE POWER (NORMAL).

Liberty....24 673 Liberty....12 400

POUNDS PER H. P. (DRY).

Liberty....24 1.97 Liberty....12 2.11

GAS CONSUMPTION (POUND) PER H. P. AN HOUR.

Liberty....24 .55 Liberty....12 .51

The experimental Liberty 24 compares favorably with successful tests of foreign motors of approximately the same power. An engine of this power, if run at the normal speed, would enable the use of a comparatively large slow-speed propeller without gear reduction, thus increasing propeller efficiency.

The following table compares the Liberty 24 and various high-powered foreign motors:

Motor and Country of Mfg.	H.P.
Dedion, France	800
Liberty 24, United States	*673-738
Fiat A-14, Italy	600
Rolls-Royce "Candor," England	600
Anzani 20, France	600
Renault 12-M, France	550
Salmson 18-Z, France	500
Napier "Lion," England	450

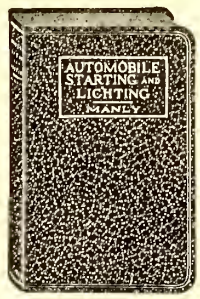
*Experimental, not rated.

The Electrical Machinist

By H. Winfield Secor.

(Continued from page 658.)

down operation is not carefully watched, the tool is liable to "hog-in," and before you know what has happened, there is one grand bang, and there are commutator segments in sixty-four different parts of the machine shop. Practical experience has proven that the best tool for all ordinary commutator work up to 6 to 8 inches in diameter, is a ¼-inch to $\frac{5}{16}$-inch piece of self-hardening steel, ground carefully to a diamond point with a good clearance. This tool should measure about 1½ to 2 inches long, being supported in an Armstrong or other patent tool holder of the clamping type. A left-hand tool holder should be used in turning a commutator. If the commutator is to be machined, then the armature is invariably placed in the lathe with the commutator facing the tail-stock center. This means that the tool will be fed from right to left across the commutator, taking a fine cut, the depth of which can best be judged by actual experience in turning a few commutators of different sizes. As will be readily appreciated, great care must be exercised to quickly release the tool carriage *feed*, as the tool approaches the rear end of the commutator where the connecting lugs are, or it will "hog in" with disastrous results so far as the mechanical job is concerned. On small commutators it is the best practice unless you are a skilled Electrical Machinist, and used to turning commutators, not to use the automatic feed on the lathe carriage and screw, but to traverse the carriage and tool along



FIT YOURSELF FOR THE BIG JOB

Don't hesitate any longer. There is a greater demand for trained men now than ever before—greater opportunities—bigger pay—more rapid advancement. It's training that counts now—accurate knowledge—a complete grasp of your trade.

Says the Master Mechanic. The Greb Automatic Grip Puller is a One-Man Puller—Quick-acting, strong and simple in the extreme. May be locked in any desired position. A combination of two or three arms. Heavy Duty Size capacity 1" to 18"—Junior size capacity 1" to 7". Two sets of jaws furnished with each size.

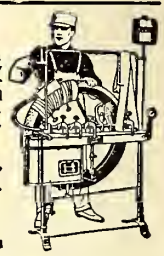
Ten Days' Trial If your dealer or jobber does not have them we will send you one. Try it ten days. If not satisfactory, return to us and we will refund your money. We also make the GREB RIM PULLER.

THE GREB CO., 239 Slate Street, BOSTON

the commutator by hand. The commutator should revolve at medium speed, it usually proving the best practice to shift the belt on the lathe to the center cone on the stept pulley. Be sure to oil the tail-stock center, or both centers, if the armature or shaft supporting the commutator is supported at two centers instead of gripping the rear end of the shaft in the live chuck; also watch the tail-center closely, making sure that it is kept tight, and does not slowly loosen, or the armature may fly out of the lathe and be badly damaged. There are two ways of supporting the armature or shaft in the lathe;—in the *first* method a *dog* is secured to the rear end of the shaft which engages with one of the slots in the face plate mounted on the lathe spindle. In the *second* method, the commutator end of the shaft, as shown at Fig. 2, is supported on the tail center, while the rear or pulley end of the shaft is gript in the lathe chuck. Care must be taken to accurately center the shaft in the chuck if it is an independent 3 or 4-inch jaw chuck, and of course, if it is an automatic self-centering chuck, then the shaft will be centered without trouble, at once. Do not under any consideration, allow the chuck jaws to close down on the shaft directly; a piece of thin brass or copper is placed around the shaft and the jaws of the chuck are allowed to press on this, so as not to damage the shaft.

Finishing the commutator: After the commutator has been turned down, until all of the burnt spots or *low areas* have been cleared up and a new even surface is seen all around the commutator, it is ready to be finished or polished. It is good practice to start finishing the commutator (the tool of course being backed away from the commutator, or in fact removed from the tool post), by gently applying a fine cut file. This means a single cut file and not a double cut one, and also one having a fine pitch. After the rough surface has been pretty well drest down by a light application of the file applied over the rotating commutator as evenly as possible, it can then be finished with fine sand paper. Some machinists use first a medium coarse sand paper, and then finish with a fine sand paper. *Emery cloth must never be used on any commutator, under any condition whatsoever.* Particles of emery lodge in the mica between the commutator bars, and tend to conduct the current, thus short-circuting the bars. Sometimes bad spots will develop in the mica; thoroly clean out this spot until the white mica is seen, and all charred portions removed; this hole is then filled with a few drops of water glass (sodium and potassium silicate) and this is allowed to harden. This is a very good insulator, and has saved many commutators from breaking down electrically.

Such holes or grooves can be easily cleaned out by means of the small steel tool shown at Fig 3 D. These tools are carried by all electrical and motor men, and they are usually constructed from the ends of broken hack-saw blades, taped up along the handle portion.



At Fig. 3, several interesting wrinkles in commutator machine work are shown. At A, the position of the diamond point tool is illustrated from above. This tool should be placed at an angular position as shown, and so ground that when it comes up in line with the lugs on the commutator bars, the side of the tool will not touch before the point does. Sometimes it is necessary to take a cut or two over the radial face of the commutator segment lugs, and even the edges of these lugs are frequently turned down. The usual surfaces finished on a commutator are shown at 3-F, and marked F. All narrow edges

AN EASY WAY TO MAKE MONEY

Don't be content to plod along on a small salary. Be independent. Go in the tire repairing business. One man says "I made $60.00 the first day." Others average $200 to $500 a month. Very little capital needed. Jobs plentiful. Every motorist a possible customer. No experience needed. We teach you.

SHALER Tire Repair Outfit

Improved Wrapped Tread Method Used by Tire Manufacturers

Does as good work as the big high priced vulcanizing outfits. A boy can use it. It's the only vulcanizer that has Automatic Heat Control, and can't undercure or overcure a tire. Requires no watching or regulating.

or surfaces are invariably machined off with the hand-feed of the tool rest and carriage. At Fig. 3-B, there is shown the proper position of the diamond point tool turning the commutator, and the point of the tool is best placed a *slight distance* above the center line of the shaft. A handy sand paper block, several sizes of which can be made where much commutator work is done, is shown at Fig 3-C. The curvature of the wooden block over which the sand paper is stretched, should approximate that of the perifery of the commutator. These blocks are extensively used in cleaning the commutator on motors and generators in actual operation in factories, etc. The sand paper is secured in two slots or by screw clamps on the rear of the block.

At Fig. 4 the operation of boring out a commutator to fit a shaft is shown, as well as the detail of the boring out tool. Tools for this purpose are available in the Armstrong or other style of patent clamping tool, in which a short nib of self-hardening steel properly sharpened may be placed, but it is common practice to forge a tool for this purpose of the pattern shown. The cutting edge of the tool may be ground to a diamond point on the emery wheel, as shown. In some cases it may expedite the work to use a drill somewhat smaller than the size of the shaft, for which the commutator is to be bored out to fit, placing the drill in a chuck held in the tail-stock sleeve. It is best to have the point of the boring-out tool slightly above center as before mentioned in the use of the turning tool. The automatic carriage feed, which traverses the tool either way along the lathe, may be used and time gained by increasing the *cut* a thousandth of an inch or two on the cross-feed handle. When the tool has progrest thru the commutator one way; thus a new cut will be taken by the boring-out tool when the carriage is being traversed back toward the tail-stock. It is presumed in this case that the commutator has been accurately centered as regards the outside perifery in the lathe chuck; also the commutator should not be gript by the chuck jaws directly, but a piece of $\frac{1}{16}$-inch brass or copper for small commutators, should be placed around the segments in the manner shown, and the jaws clamped down.

Inside and outside calipers are necessary to correctly carry out this machine operation, the outside calipers being first used to accurately determine the diameter of the shaft, and the inside calipers are then set from the other calipers. From time to time the inside calipers are then tried in the opening being bored out at the center of the commutator, and very light cuts taken toward the last, until the bore is of the right size to permit the commutator fitting on to the shaft. In some cases the commutator has to be bored out so that it will just fit on the shaft with a little urging, and it is then held in place by a key on the shaft. Very small commutators are usually made to have a driving fit. In other words, the hole bored out in the commutator in this case must be a few thousandths of an inch smaller than the diameter of the shaft. It is frequently necessary to apply ice to the shaft, and heat to the commutator, in order to *contract* the former and *expand* the latter, so as to allow the commutator to fit over the shaft. It may even then require a little urging with a mallet and a piece of pipe in order to drive it into place, depending upon how accurately the commutator has been bored out. In a short time the shaft will expand and the commutator will contract, thus providing a very firm juncture, and holding the commutator rigidly in position on the shaft.

(Next installment will appear in the December issue.)

Mechanical Engineering

Learn at Home!

Employers everywhere are looking for men with mechanical ability. Splendid salaries and rapid advancement are offered.

There is an easy, delightful way in which you can learn right at home in spare time. For 28 years the International Correspondence Schools have been giving men and women just the training they need for success in mechanical engineering and more than 200 other subjects. Hundreds of thousands have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least and it will bring you information that will start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon *now*.

Sir Charles Parsons on War Inventions.

(Continued from page 640)

Another device, used first by the Germans and afterward by the Allies, consisted of an insulated cable laid on the bottom of the sea, mark a passage thru a mine field or other intricate channel. One end of it was earthed and an alternating current was past along it. Delicate devices were then installed on the vessel, and these enabled it to follow the cable accurately. Sir Charles said that by this means ships were guided for a distance of fifty miles and followed the cable with as much precision as a railless electric street car follows a trolley wire.

BORING INTO THE EARTH FOR POWER.

Sir Charles also discust what England could do when its coal supplies began to give out, saying:

"One cannot but realize that, failing new and unexpected discoveries in science, such as harnessing molecular and atomic energy in matter, the great position of England cannot be maintained for an indefinite period. At some time more or less remote, long before the exhaustion of our coal, population will gradually migrate to those countries where natural sources of energy are most abundant."

He suggested that a new form of energy might be discovered by sinking a shaft twelve miles deep, * that is, about ten times as deep as any in existence. It would cost $25,000,000 and take about eighty-five years, but not only would much useful knowledge concerning the internal constitution of the earth in relation to minerals of high specific gravity be gained from it, but it might also solve the problem of obtaining power.

"In Italy, at Lardarello," Sir Charles said, "boreholes have been sunk which discharge large volumes of high pressure of steam which is being utilized to generate about 10,000 horse power by turbines. At Sol Fatara, near Naples, a similar project is on foot to supply power to the great works in the district. It seems, indeed, probable that in volcanic regions a very large amount of power may be in future obtained directly or indirectly by boring into the earth."

Sir Charles also spoke of the intense pressure produced by moderate forces closing up cavities in water. A committee appointed by the Admiralty investigated during the war the rapid corrosion of propeller blades of some ships performing arduous duties. It was "found that the corrosion was due to the intense blows struck upon the blades of the propellers by the nuclei of vacuous cavities closing up against them. Tho the pressure bringing the water together was only that of one atmosphere, yet it was proved that a nucleus of 20,000 atmosphere might be produced." Sir Charles said this great pressure might be generated under some conditions in rivers and waterfalls when the velocity in river current exceeded fifty feet per second, and was probably as great a source of corrosion as the washing down of boulders and pebbles.

*This scheme was fully described in Mr. Gernsback's editorial, "Tapping the Earth's Heat," in the March, 1919, issue of the "Electrical Experimenter."

Popular Astronomy Questions and Answers

By Isabel M. Lewis

(Continued from page 638)

of the sun and that cepheids of longest period have ten thousand times the luminosity of the sun and are rarely surpassed in size by other stars.

Knowing the light-giving power of these stars at a standard distance from the periods of their fluctuations, it is easily possible to find the distance of the clusters in which they appear by the simple relationship connecting apparent with absolute brightness for the apparent brightness of stars of a given magnitude varies inversely as the square of their distance from us.

This simple method founded on the peculiarities of the cepheid variables has yielded wonderful results and made it possible to find the distances of objects so far away that *their light takes two hundred thousand years to reach us*, as easily as the distance of a star ten or fifteen light years away can be found by direct trigonometric measurements of the parallax.

There are many theories to explain the puzzling cause of the fluctuations of light of the cepheids. It is doubtful if two stars are concerned as in the case of eclipsing variables, and it is generally believed that the light variations arise from some change within the masses of isolated stars, such as periodic pulsations or internal oscillations whose course is unknown.

FINDS ANOTHER NEW COMET.

Discovery of a second new comet in three days by the Rev. Joel H. Metcalf was announced August 20 by the Harvard College Observatory. After picking up in the eastern sky on August 20 the first of the year's new stray stars, Mr. Metcalf reported that on the night of the 22d at 11 o'clock he found in Bootes constellation in the western sky another uncharted body, more conspicuous than the first. The discoverer said it could be seen with a small telescope.

Verification of Mr. Metcalf's latest find came in an announcement from Paris of the independent discovery of the same body by M. Morielly of Marseilles the night after Mr. Metcalf found it. The Harvard Observatory also verified it by visual and photographic observation.

The two discoveries of Mr. Metcalf, which are the latest of many he has made, occurred at South Hero, Vermont.

AURORA BOREALIS TIES UP PHONE SERVICE.

Aurora Borealis or "Northern Lights" tied up the telephone and telegraph lines of Canada and the United States as far south as Kansas City and clear across the continent at intervals during the middle of August. The longest interruption was from noon until 12:30 the following day, when the peak load of both telephone and telegraph companies is always felt.

Measuring instruments showed that the "foreign" current had broken all known previous records when it touched 120 volts at times. Previously, when the effect has been felt, five volts was enough to cause trouble, but the record voltage this time exceeded all scientific records. The worst previous disturbance from this cause was in 1914.

According to officials of the Western Union Telegraph Company the disturbance paralyzed the New York City service at intervals.

ELECTRICITY AS A PROFESSION

is laden with success—possibilities for you! Now, while this promising profession is comparatively new and uncrowded, is the time to TRAIN.

The improved and advanced teaching methods of the School of Engineering of Milwaukee,—their original text books, lectures, laboratory experiments and workshop practice—will quickly train you to *develop yourself*, in addition giving you the thorough theoretical knowledge and Practical Ability that insure success.

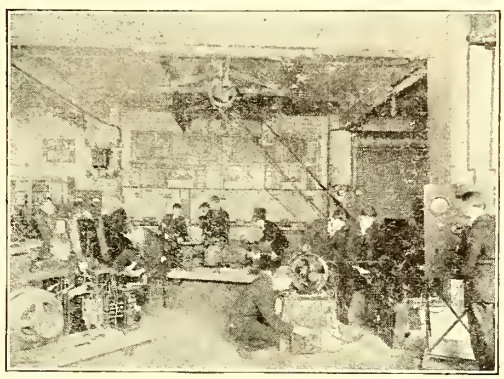
Five Specialized Departments

have been organized, each complete in itself, covering all branches of electrical instruction. Among them is a place for you, no matter what your previous education or future aims.

College of Electrical Engineering

The B.S. Degree in 3 years, from the College of Electrical Engineering will fit you to immediately assume positions of importance in the electrical profession. Large expert faculty of instructors.

Institute of Electrotechnics



A Junior and a Senior Course organized to train young men having either an 8th grade or part high school education for a promising new profession. Prepares also for entering College of Electrical Engineering.

School of Practical Electricity

Will train you in one year to become a master electrician. The modern methods, fully equipped laboratories and latest electrical installations are the result of 15 years of continuous specialization in Electricity.

School of Electrical and Mechanical Drafting

A one year course, requiring no special educational preparation for entrance. Opens a vast field of opportunity to the man who will train.

Extension Department

Offers four special courses in Electricity, Mathematics, Drafting, and English. A practical method of mail instruction. "Earn While You Learn" is a most popular and practical plan at this school. A half day of school and a half day employment satisfactorily combines theory and practice.

Now Is The Time To Get The Facts

New Terms Open Jan. 2.

To be fully informed now may save you time and money later. For complete details and information concerning the course that interests you—Clip the Coupon **Now.**

Ask about the Students Fraternity House with Board and Room at cost. Athletics, Glee Club, R.O.T.C. (optional) and Lakeside advantages.

What 15c Will Bring You from the Nation's Capital

Washington, the home of the Pathfinder, has become the World's Capital and reading the Pathfinder will be like sitting in the inner council with those who will mold the world's destiny for the next generation

The little matter of **15c** in stamps or coin will bring you the Pathfinder **13** weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its **27th** year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send **15c** to show that you might like such a paper and we will send the Pathfinder **13** weeks. The 15c does not repay us; we are glad to invest in new friends. **Pathfinder, Box 76 ,Washington, D. C.**

Health In A Glass Tube

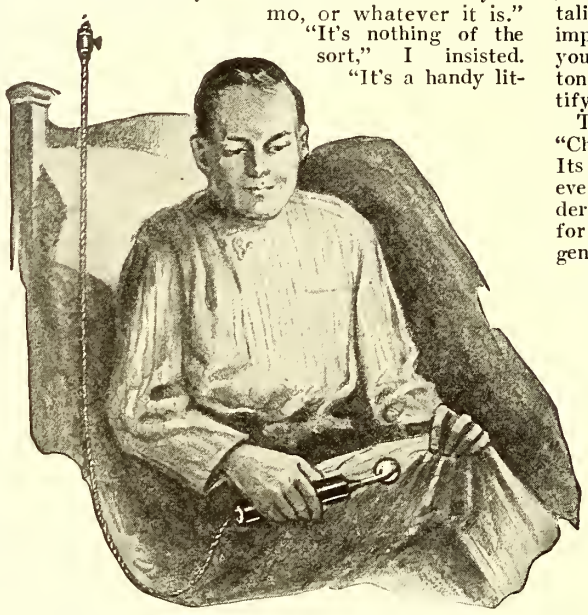
The interesting story of a man "too busy to bother" who appreciated perfect health, energy and vitality only after he lost it—and how he won it back in a startling way

By FRANK HARTLE

YOU probably know dozens of people like my friend John Brainard. Strong, robust, a human dynamo for work, a real bull-dog for stamina, and a very likeable fellow in spite of his entire lack of sympathy for sickness and sick people. He regarded sickness as a mild sort of a crime and had such faith in his own excellent health that he had about as much sympathy for sick people as, according to Mark Twain, David had for Goliath. If you happened to mention that you didn't feel extra well, Brainard would say, as courteously as was absloutely necessary, "T'bad, very sorry"—and you could almost *see* the entire matter sail out of his other ear. Sickness and suffering were foreign to John Brainard and he couldn't understand it in other people, that was all.

But as Josh Billings once said, "Health is like munny. We never have a true idee uv its value until we lose it." And quite suddenly John Brainard realized what ill-health is. Too much overwork, inconsiderate hours, immoderate meals, and general inattention to his health finally "told on him." One day I went to his apartments and found him in bed with a severe attack of sciatica, but fuming with rage in spite of the intense pain. "Why should I have this?—I've been as healthy as a horse all my life. Why should *I* be sick?—hang, it, I won't be sick," and he jerked himself to a sitting posture only to fall back in pain upon the pillow.

For a week John Brainard lay in bed in intense agony. Those of you who have suffered from acute sciatica or rheumatism know what it is. The doctor came and went, but Tuesday and Friday when I called, John only said, with a weak attempt at his former cheerfulness, "Nothing doing, Frank. They haven't pushed the right health button yet. Who was that fellow, anyway, who said something about 'a man too busy to take care of his health is like a mechanic too busy to take care of his tools."



Next day while at lunch with George Conrad, our mutual friend, I mentioned about John's still being so very ill. "Listen, Frank, old boy," he said, "I don't want to be presumptuous or anything like that and I certainly believe that the Doc will fix John up fine, but there's a treatment which entirely cured my wife of chronic neuralgia, and now it's bringing total cure to my cousin, another sciatic sufferer. I think if John would give it a trial it might help him some." Ten minutes further conversation with Conrad convinced me and I went right over to John's home to "spring it."

"John," I said quietly, as I tip-toed into his bedroom, "I've got the very thing. Conrad has given me some real facts about what electric violet rays are doing for people and I think—"

"Oh," he interrupted, "I don't know, I don't imagine it can help me."

"Of course you don't know. And you never *will* until you try. Now don't talk foolish, Johnny, old scout. Won't you even believe your friends? This violet ray treatment has *proved* what it is."

And then I went on to tell him all I had learned about violet ray treatment—how it had been invented by the great Tesla in 1890, how it was being used with wonderful success by eminent physicians all over the world, how he could use it on himself and it wouldn't shock him like electricity in other forms, how it would surely at least *help* his own sciatica when it had *cured* other folks' sciatica, neuralgia, hay fever, asthma, neuritis and dozens of other diseases, and finally I told him how it would bring back to him his old "pep," vigor, and "knock-'em-dead" vitality. Then John rolled over and said, "Alright, if it brings me out of this blamed bed a well man I'll swear by it for life. Cart in the dynamo, or whatever it is."

"When I ran that glass tube over my hide'," said John, "it felt just like a local anasthetic on a wild tooth."

"It's nothing of the sort," I insisted. "It's a handy little tube-shaped thing that attaches to that electric socket right over your head. And you can apply it yourself right to your 'hide' without feeling a bit of a shock."

Three days late I had gotten a violet ray instrument from Chicago and John used it on his legs and thighs. "Say," he cried, after the first treatment, "I thought electricity always shocked a fellow. "Why, when I ran that glass tube over me and the violet rays flshed around, it just felt like a local anaesthetic on a wild tooth. If this keeps up—oh, boy!"

John Brainard got up for good three days ago for the first time in over two weeks. Five days' treatment with the violet rays put him on his feet.

"Where is your 'rheumatiz,' John," I remarked yesterday.

"Dunno, Frank, I can't find it anywhere. It just 'violet-rayed' itself away, I guess," he said, pointing to the instrument in the bathroom.

"I see you keep it attached."

"Yes, you see my wife discovered that the best beauty specialists in town used it, and she—well, my wife's a woman you know."

* * * *

Violet rays have brought *good results* in almost every disease and Violetta, being the most advanced instrument produced and selling many thousands ahead of all others, is certain to bring you the health-giving results you have always wished. But we do not want you to take our word for it. Judge for yourself—try it for ten days in your home before you decide one way or the other.

Now, through the Violetta, you can have in your own home, the wonderful violet-ray treatments exactly as given by eminent physicians and beauty specialists throughout the country. Now you can rid yourself of Chilblains, Colds, Corns, Constipation, Dandruff, Deafness, Eczema, Eye Diseases, Hay Fever, Headache, Goitre, Insomnia, Lumbago, Nervousness, Neuritis, Obesity, Paralysis, Piles, Pimples, Pyorrhea, Rheumatism, Skin Diseases, Sore Throat, and many other ailments.

Multiply your bodily health—vitalize your nerves—double or treble your energy and vitality. Sleep better, increase your strength, improve your appetite and digestion. Soothe your nerves, reduce or increase your flesh, tone and strengthen the entire system, beautify your complexion. All with the Violetta.

Trixie Friganza, the famous actress, says, "Cheerfully will I add my praise for Violetta. Its the best 'pain chaser and 'soother' I've ever had the good fortune to find. It's wonderful. It cured my brother of neuritis. As for myself, I use it for facial treatment and general massage. I cannot say too much for it." Frank Borzone, of Seattle, Washington, says: "I purchased the Violetta for my wife who was suffering from an acute attack of sciatica. From the very first treatment it induced peaceful rest and she is entirely well now." Scores of letters like these are received each day.

The Violetta is not a vibrator. It is not a machine that contracts the muscles—it does not shock—it does not pound the muscles—it is absolutely painless.

Eminent physicians from all over the country apply the Violetta with wonderful results. Dr. Bert H. Rice, of Vinton, Iowa, says: "I have good results with the Violetta. Almost instant relief in Facial Neuralgia." Dr. Daniels, Lisbon, North Dakota, says: "Have used the Violetta in such cases as Goitre, Bronchitis, Pleurisy, Neuritis, Neuralgia and Lumbago, and find it very beneficial. In fact, I would not be without it in my office." Dr. G. B. Duncan, Kewanee, Ill., says: "The Violetta is the finest thing I ever used to relieve congestion in any part of the body; and to relieve pain. Treatments are so pleasant that all of my patients like it."

Write today for a very interesting little booklet explaining fully about the Violetta and how you can try it for ten days before you decide. Read some of the amazing results produced in almost every disease. Read how the Violetta can be attached to any electric socket and also used where there is no electric light. Read how this little instrument, shaped somewhat like a thermos bottle with a glass tube and bulb at the end, pours electric energy and vigor into every muscle, fibre, cell, and pore of your body. Read how you do not have to obligate yourself in any way until the Violetta has proven its value in your particular case.

Write for this interesting booklet now. Fill out the coupon printed below for your further convenience, *and mail at once.* Address Bleadon-Dun Company, Dept. 2-J, 326 W. Madison St., Chicago, Ill.

BLEADON-DUN CO., Dept. 2-J, 326 W. Madison St., Chicago—Please send me your free booklet about the Violetta and ten days' trial offer.

"The Baby" Double Action Hammerless Revolver

A HANDSOME AND MOST EFFECTIVE WEAPON

$6.50

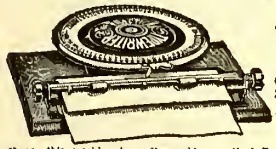
Measures but 4¼ inches long

Takes regular .22 calibre cartridges

The new Baby Double Action Hammerless Revolver has been produced to meet the ever increasing demand for a revolver that would combine small size and light weight with the essential features of Efficiency and Practicability. It is small in size, yet is just as effective and serviceable as the most expensive weapon you can buy. Every lady should have a revolver and should know how to use it, and there is no safer or better one made than this. A great feature is the safety action that guards against accidental discharge, making it quite safe for young men and ladies. The illustration gives an idea of its appearance, but it must be seen and used to be thoroughly appreciated. The ammunition used is the standard .22 calibre (short) cartridge obtainable anywhere, or you may obtain the cartridges from us (cartridges can be shipped only by express). The revolver fires six shots in one loading. The operation of the charging mechanism is extremely rapid and absolutely reliable, six well aimed shots can be fired in as many seconds. The revolver is very well constructed, with finest nickel plated fluted barrel of cylinder, and it weighs about 14 ounces. The Price of the Baby Revolver is only $6.50, sent by mail postpaid to any address.

SHARPEN-M-ALL SAFETY RAZOR STROPPER

SHARPENS EVERY KIND OF SAFETY RAZOR BLADE



Sharpens the Gillette and Durham Duplex both edges at one time

ALSO SHARPENS THE GEM JUNIOR, EVER READY, KEEN-KUTTER, MARX CROSS, CLARK, AUTOSTROP, STAR CRUSTEEL, AND ALL OTHERS.

By using the SHARPEN-M-ALL STROPPER, you will not only get BETTER SHAVES, but you will SAVE MONEY on blades, as you will be able to get from 150 to 200 shaves from one blade, and the last shave will be as good as the first. The construction is simple and will last a lifetime. There are no parts that can possibly get out of order. Any novice can use it just as well as the most expert barber. It is operated by simply turning the crank or handle as shown in the illustration. It has two spiral rollers that travel from heel to point as they are revolved, giving the CORRECT DIAGONAL STROKE. There are no screws, adjustments or any kind of tinkering necessary to operate the machine. The rollers are made of a special material that STROP AND HONE the blade at the same time. The rollers turn only one way, so there is no fear of damaging the blade or the stropper. The SHARPEN-M-ALL is packed in a handsome case, 4x12x1¼ in., and has three holders and full instructions. The weight of the complete machine is but eight ounces. Price, only $1.20, postpaid.

Price, $1.50 postpaid. SIMPLEX TYPEWRITER ONLY $2.50

Cheap But Good. So Simple a Child Can Use It. We Guarantee the Writing.

Though so marvelously cheap, this machine is a thoroughly practical Typewriter. We positively guarantee it to produce writing equal in every respect to that of any $100 machine. It does not seem possible at the price, but if we could send you a specimen of its work and you will be convinced. With reasonable care it will last a lifetime. It is so simple that a child just able to read can write with it. You can learn all there is to know about it in five minutes, and an hour's practice will make you an expert operator. Every business man must have a typewriter. A legible pen writing is unbusinesslike and creates the impression that the firm is a slow-going and slow-going concern. We assure you that the Practical Typewriter fully deserves its name as it is fit to do the correspondence of any business or profession, and to do it well. You should not miss this chance of securing a bargain. The letters of the alphabet, the numerals 1 to 10, and punctuation marks are so grouped that the letters most used are before the operator most of the time, enabling him to write rapidly. The rollers hold the paper in position while writing and at the end of each line a slight turn of the roller moves the ratchet which makes a click and forces the paper forward, giving the proper line spacing, so that the lines are all an equal distance from each other, no desirable in letter writing. Each typewriter packed in a strong box, with full printed instructions for use. Price complete, $2.50 sent by mail postpaid.

Boys, you can have Movies at your own home with this latest model MOVING PICTURE MACHINE

Uses Standard Films same as the larger machines. Very easily managed. Simply turn the handle. Good Variety of Films always obtainable

PRICE Complete ONLY $3.00 Postage 15c, extra including Film.

Extra Films, 15c each postpaid

THIS IS A GENUINE MOVING PICTURE MACHINE and the motion pictures are clear, sharp and distinct. The Moving Picture Machine is finely constructed, and carefully put together by skilled workmen. It is made of Russian Metal, has a beautiful finish, and is operated by a finely constructed mechanism. The projecting lenses are carefully ground and adjusted, triple polished, standard double extra reflector, throwing a ray of light many feet, and enlarging the picture on the screen up to three or four feet in area. The light is produced by a safety carbide generator, such as is used on the largest automobiles. This throws a dazzling white light on the screen.

It is a solidly constructed and durable Moving Picture Machine. The mechanism is exceedingly simple and is readily operated by the most inexperienced. The pictures shown by this marvelous Moving Picture Machine are not the common, crude and lifeless Magic Lantern variety, but are life-like photographic reproductions of actual scenes, places, and people which never tire its audiences. This Moving Picture Machine has caused a rousing enthusiasm wherever it was used.

ANARCHIST BOMBS

Consists of a little glass vial, containing in liquid form a chemical which will produce a most horrible odor. One dropped in a room full of people will cause more consternation than a limburger cheese. The smell will entirely disappear in a short time. 3 Boxes for 25c, shipped by express only with a Dollar's worth of other merchandise.

ITCHING POWDER

This is another good practical joke; the intense discomfiture of your victims to everyone but themselves is thoroughly enjoyable. All that is necessary to start the ball rolling is to deposit a little of the powder on a person's hand and the powder can be relied upon to do the rest. The result is a vigorous scratch, then some more scratch, and still some more. 3 Boxes for 25c. Sent only by express. (Must order at least One Dollar's worth of other merchandise.)

INVISIBLE INK

The most confidential messages can be written with this ink, for the writing MAKES NO MARK. Cannot be seen unless you know the secret. Invisible for many reasons. Keep your pockets and other private memorandums away from prying eyes. Great fun for playing practical jokes. Only 15c Bottle.

LOVE LETTER INK

Writing written with this remarkable ink vanishes entirely in a few weeks (sooner if desired), leaving the paper QUITE BLANK. 15c p. pd.

LUMINOUS INK Writing can be READ ONLY IN A DARK ROOM; writing shines like fire. Quite invisible at daytime. Very remarkable. 15c bottle; 3 for 40c postpaid.

Oh Boy! Have You Seen LITTLE EGYPT

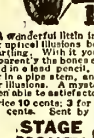
THE ORIGINAL ORIENTAL DANCER

AND THE WONDERFUL

SHADOW DANCER

If not, do not fail to send for these, it will be money well spent. In fact, we would go as far as to guarantee you more fun in showing these two novelties to your friends than you have had in a long time.

They Will Dance For A Life-Time

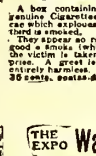


Price 30 cents each or both for 50c Postpaid

SQUIRT RING

You may have a lot of fun with this up-to-date Gem Squirt Ring. It consists of a handsome gold plated ring, attached to a rubber bill, as arranged that the latter is quite out of view when the ring is in the proper position. Such an attractive looking ring as this cannot fail to be the center of attraction. While the victim is absorbed in getting the paper forward, you just squeeze the rubber bell and the observer experiences a very great surprise. PRICE 25c each, 2 for 40c or 6 for 80c sent, postpaid. J. S. A. CO

Wonderful X-Ray Tube

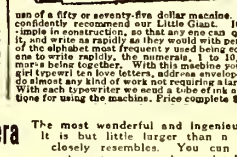


10c

A wonderful little instrument producing optical illusions both surprising and startling. With it you can see what is apparently the bones of your fingers, the lead in a lead pencil, the interior spaces in a pipe stem, and many other similar illusions. A mystery that no one has been able to satisfactorily explain.

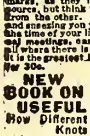
Price 10 cents; 3 for 25 cents; 1 dozen 75 cents. Sent by mail, postpaid.

LOADED CIGARETTES



Just Like Ordinary Cigarettes, But Quite Real Ejectors.

A box containing ten apparently genuine Cigarettes. They contain a tube which explodes when about one-third is smoked. They appear so real, and afford as good a smoke, (while they last) that the victim is sure to be surprised. A great laugh producer and entirely harmless. Price, box of ten, 30 cents, postage 4c.



THE "LITTLE GIANT" TYPEWRITER

A First Class Writing Machine For $1.25

A perfect little typewriter for $1.25. There are thousands of persons who would like to own a typewriter but whose needs and business do not warrant the expense at sched to the purchase and use which explosive when about one-third is smoked. To such persons we confidently recommend our Little Giant. It is strongly made, but simple in construction, so that any one can quickly learn to operate it, and write as rapidly as they would with pen and ink. The letters of the alphabet most frequently used being so grouped as to enable one to write rapidly, the numerals, 1 to 10, and the punctuation marks being together. With this machine you can send your best girl (or wife) love letters, address envelopes, make out bills, and do almost any kind of work not requiring a large expensive machine. With each typewriter we send a tube of ink and full printed instructions for using the machine. Price complete $1.25 by mail postpaid.

Sneezing Powder

Place a very small amount of this powder on the back of your hand and blow it into the air, and everyone in the room or even a mile away will begin to sneeze without knowing the reason why. It is most amusing to hear their remarks, as they never suspect the real source, but think they have caught it one from the other. Between laughing and sneezing you yourself will be having the time of your life. Excellent for parties, social meetings, car rides, or any place at all where there is a gathering of people. It is the greatest fake out. Price 10c, 2 for 30c.

By Express Only

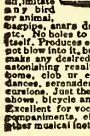
STAGE MONEY

With a bunch of these bills, it is easy for each person of limited means to appear prosperous. By flashing a roll of these bills at the proper time and peeling off a genuine bill or two (which is outside of the roll), the effect created will be found to be all that can be desired. Prices, postpaid: 15 bills, 10c; 50 Bills 25c, 125 for 50c, or $3.50 thousand.

NEW BOOK ON ROPE SPLICING

USEFUL KNOTS, HITCHES, SPLICES, ETC.

How Different Knots Are Made and What They Are Used For. Knots to Use and Knots to Avoid.



A most practical handbook giving complete and simple direction for making all the most useful knots, hitches, rigging, splices, etc. Over 100 illustrations. All about wire rope attachments, lashing, blocks, tackles, etc. 37 Heraldic Knots illustrated. Of great value to mechanics, riggers, campers, boatsmen. Price 20c p. pd.

LUMINOUS PAINT

Make Your Watches, Clocks, Etc., Visible by Night

The very latest discovery in the scientific world. Hitherto, practically unobtainable except at an exorbitant price, we have at last succeeded in producing this remarkable LUMINOUS PAINT, which, when applied to the surface of any article, emits rays of white light, rendering it perfectly visible in the DARKEST PLACE. THE MORE BRILLIANT THE SURROUNDINGS, THE MORE BRILLIANT THE LIGHT. This wonderful paint is simple to use. Anyone—yes can do it. A little applied to the dial of your watch or clock will enable you to tell the time by night. You can coat the push buttons or switch plates of your electric lights, match boxes, and innumerable other articles; make your own Luminous Crucifixes, Luminous Rosaries, etc. Enough in one bottle containing sufficient to coat several small articles. Price 25c. Larger sizes 50c and $1 postpaid.

MUSICAL KAZOO

With the Musical Kazoo you can, without previous practice whatsoever, play any tune right off, imitate any bird or animal, bagpipe, snare drum, Punch and Judy, etc. No holes to finger. It is simplicity itself. Produces excellent music. You do not blow into it, but sing, speak, laugh or make any desired imitation. Used with astonishing results at society meetings, clubs or church entertainments, dances, serenades, picnics, outings, excursions. Just the thing for choruses as above, bicycle and marching clubs, etc. Excellent for vocal or instrumental accompaniments, either with or without other musical instruments. Price 15c, postpaid.

MAGIC FLUTE

Wonderfully Sweet Toned and Musical

A marvelous musical instrument. No other instrument can produce sweeter music, whether it be the joyous notes of a quick-step or the solemn strains of a church hymn—in fact, any class of music can be played upon the Humanotone without practice, as it is almost a self-playing instrument. When played with a piano accompaniment, or any other musical instrument, the effect is charming. Full printed instructions for playing sent with each instrument.

THE EXPO Watch Camera

The most wonderful and ingenious Camera made. It is but little larger than a watch, which it closely resembles. You can carry the Expo about in your pocket and take pictures without any one being the wiser.

One Cent a Picture

The Expo loads in daylight with 25 Exposure Films, costing 25c, thus the picture taking part of a whole day's outing may be had for the nominal sum of 25c—one cent a picture. 10 Exposure Films also obtainable. It is simplicity itself to operate. Takes pictures through the stem, where the Rapid Fire Lens is located. The photos (⅝"x⅞") may be enlarged to any size.

Quick as a Flash

Time and instantaneous shutters; weighs but 3 ounces; nickel plated. Endorsed by amateurs and professionals the world over. Thoroughly practical—printing and developing of films just the same as ordinary cameras—in daily use by the police, newspaper reporters, detectives, and the general public. Important beats have been secured with the Watch Camera by enterprising reporters. Produces clear, sharp negatives indoors or outdoors, equal to any camera on the market, size or price notwithstanding.

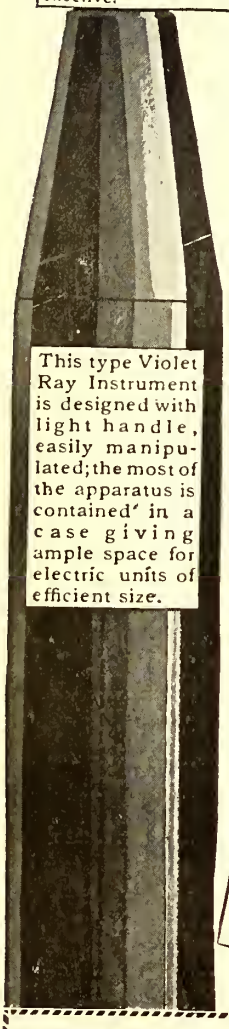
The CONJURER'S CASKET

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM

50c



It is great fun mystifying your friends. Get this Conjurer'n Cabinet, and you will be the cleverest fellow in your district. It contains the apparatus for seven first-rate tricks, including The Disappearing Rose, that, when placed on the lapel of your coat, vanishes from sight as well; the Magic Vase and Ball Trick in Wooden Ball so placed inside, and upon replacing the lid has disappeared and is found in someone else's pocket!; The Magic Nail with which you can apparently eat your finger almost in two; the Wonderful Card Trick (a card is placed in an envelope, and when opened an entirely different card, together with cheese wall, clothing, etc.); The Glass Goblet and Vanishing Coin Trick (a coin is placed in a little wooden barrel, and when opened again, is found to have vanished entirely, or can be made to change into a coin of another denomination); The Famous Mesmerised Penny, that defies the law of gravitation (suspends from the palm of the hand, cheese wall, clothing, etc.); The Glass Goblet and Vanishing Coin Trick (a coin is placed in a little wooden barrel, and when opened again, is found to have vanished entirely, or can be made to change into a coin of another denomination); The Famous Mesmerised Penny

Regain Your Health Thru Renulife VIOLET RAY Treatments at Home

Unequaled for neuritis and rheumatism

More Than 25,000 Volts
No pain, shock or muscular contraction. Entirely harmless — powerfully effective.

This type Violet Ray Instrument is designed with light handle, easily manipulated; the most of the apparatus is contained in a case giving ample space for electric units of efficient size.

There is no "quackery" or uncertainty about *Renulife Violet Ray.* It is not claimed to be a "Cure All," but it has proved in thousands of cases a practical health-producing, revitalizing agent—powerful in restoring normal physical conditions—yet gentle, soothing and perfectly safe. *You* can treat yourself. Get full information regarding uses shown on coupon below.

Users Get Wonderful Results

(Voluntary Testimonials)

"The Renulife Violet Ray High Frequency Generator is superior in efficiency because of its perfect character and control of current, compactness and perfect insulation. The smallness and lightness of Electrode holder is also a great advantage." "The doctor told me that the trouble was hardening of the arteries. I wish I had got it a year ago. I would not be without it for all the money in the world." "I cannot recommend it too highly." "I have been using mine now for a week for Sciatica and I am highly pleased with results." "I think it is one of the best little machines that was ever invented." "I have used it with excellent results for the restoration of hair and stiff and sore rheumatic finger joints." "Am well pleased with the Generator, and the kind treatment received from your Company." "My Generator has stopped my neuritis." "Every house should have a Renulife Violet Ray High Frequency Generator, for the treatment of Neuralgia, Neuritis, Sore Throat, Kernels in Neck, Cramps, Headache, Stiff Neck, Muscular Soreness, Rheumatism, Paralysis—in short, pains of all kinds."—M. D. "I have been much relieved by the use of your Violet Ray Generator." "It is fine for Insomnia." "I find it such a help in nervousness." "I would not part with it for five times the price. It is sure a little wonder." "I am more than pleased with the Generator; the whole family are using it." "A neighbor lady was suffering from lumbago and could not move, and my wife brought over the Generator and in less than ten minutes the lady was greatly relieved." "Your Generator is just the thing for me. That tired feeling has left me, and I feel like myself again." "It has relieved me of the nervousness and also it has helped me a great deal in using it for the treatment of rheumatism."

How Renulife Benefits

Science has demonstrated a strange relation between electricity and life cells. This instrument harnesses a tremendous current of electricity and applies in the form of Violet Rays so that the body welcomes and responds to it in a marvelous manner—no pain—shock or the slightest harmful effects. A few seconds of Renulife Violet Ray gives more benefit than hours of the old time battery methods—because a thousand times as much voltage is made use of.

The irresistible, revitalizing powers of *Renulife Violet Ray* reach every nerve cell, fibre and part of body. Blood is enriched and purified by a flood of oxygen, giving added vitality and strength. Assimilation and digestion improved—functions retored to normal—extra supply of fresh blood quickly brought to area treated, removing congestion and supplying nourishment. While relieving pains and aches, the manifest results of disorders, it removes the deep seated cause, combines the benefits of electricity, vibration, exercise, stimulation and oxidation.

Get Book "Health via Violet Ray"

Learn the whole marvelous story of the Violet Ray—this method that works with nature to restore and build up. Learn how you, at home, can now use these great curative forces of Violet Ray—heretofore only available at big expense from physicians or beauty doctors. The price goes up

Your last chance to procure a complete electrical education at as low a price as $16, payable $2 per month.

Several hundred people have written us that we were not fair to them by not announcing the forthcoming increase in price. We have decided to extend the date.

The price of the CROFT LIBRARY OF PRACTICAL ELECTRICITY must go up. We have fought against this increase as long as we could. You have, however, one more chance to purchase at the old price.

In fairness and justness to the readers of this paper, we desire to give everyone notice of the change in price before it goes into effect.

Know electricity as experts know it

No other library or course on the practical side of electricity adheres so closely to actual electrical work as the Croft Library of Practical Electricity. No other set of books or course is more modern, complete, or more easily understood. This Library, with its mine of working details, enables you to master electricity quickly, and to know it as experts do.

The standard in America

Terrell Croft has had twenty years' experience in electrical practice. He started as wireman's helper. Later he became trouble shooter, then draftsman, then electrical engineer for the Westinghouse Co. His twenty years' experience is boiled down to eight flexibly-bound pocket books which are now accepted as the standard in America.

Nothing better at any price

No matter how much you may pay for electrical literature, nor how much you spend on educating yourself in the finer points of practice, you cannot get more reliable, more authoritative, more detailed information than is contained in the Croft Library. It is an innovation in the world of electricity, as a ten-minute examination will prove.

Ten days' free trial
NOT ONE CENT IN ADVANCE

In order to receive advantage of the old price on these books, just fill out the coupon and return to us. Keep the books ten days and examine them thoroughly, putting their usefulness to every imaginable test. Then if they are not satisfactory, return at our expense.

Should they come fully up to your expectations, send us $2 per month for eight months.

McGraw-Hill Book Co., Inc.
239 West 39th Street New York

Meet Terrell Croft

Be guided in your study of electricity by an experienced electrical engineer of high professional standing, a man who gained his knowledge with his sleeves rolled up, and has met your problems in advance. He tells in plain, understandable language how to proceed by the best and most practical methods to the higher position.

FREE EXAMINATION COUPON

After February 28, price of the set $20

McGraw-Hill Book Co., Inc.
239 W. 39th St., New York.

Gentlemen:—Please send me the Library of Practical Electricity (shipping charges prepaid), for 10 days' free examination. If satisfactory I will send $2 in ten days and $2 per month until $16 has been paid. If not wanted, I will write you for return shipping instructions.

EDITORIAL

Ether and Space

FOR thousands of years it was an establisht fact that the earth stood still, with the sun, moon and stars revolving around it. All known evidence, visual and otherwise, supported the "fact." But humanity with its deceptive senses had been fooled for generations, until the "establisht fact" was disproved by one Galileo, who brought very convincing proofs that it was the sun that stood still.

Since Euclid, down to a very few years ago, scientists thought that light was always propagated along absolutely straight lines. Einstein, however, showed an astonished world that a ray of light may be curved considerably. Indeed, we appear to have proofs to support him.

Again, for over one hundred years we have accepted unhesitatingly Faraday's teachings that the whole universe is permeated with a very tenuous and exceedingly fine substance, the ether. Faraday and Maxwell, in order to explain the wave theory of light and other electromagnetic waves, invented the ether, as they reasoned that you cannot have waves without a suitable medium in which to vibrate these waves. The ether, accordingly, is a substance so fine, so minute, that it permeates and fills not only the entire universe but all other substances. It fills the space between atoms in metals and all other solids or fluids; in short, it is everywhere. It was reasoned that the ether must have elastic, jelly-like material properties in order to explain many mystifying phenomena, but nothing of the actual structure of the ether is known.

But now Einstein and his followers come along and flatly deny all existence of the ether. In their support it must be said that there are no experimental proofs of the existence of the ether. The ether, in short, is only a theory, which was never proved—but so far also never entirely disproved. If a light ray is material, the ether is no longer required to explain its propagation. Indeed, all recent researches along this line tend to show that light *is* material. We know for instance that the sunlight exerts a pressure of many thousand tons upon the surface of the earth upon which it falls. This is termed the pressure of light. But can you exert pressure upon a body unless the light which exerts it has "body"; in other words, is material? Then, too, if a light ray is deflected in a gravitational field, it certainly must be material.

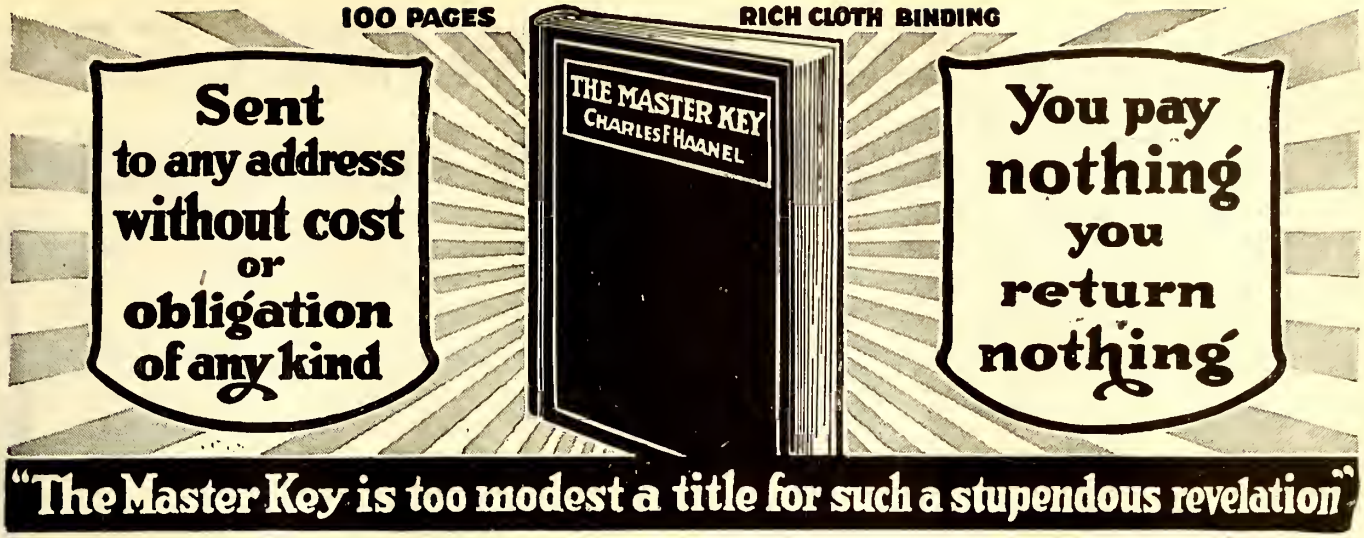
Once arrived on these premises let us see how space looks to our mental eye, robbed of its hypothetical ether. We will now have a vast vacuum, nothing but a vacuum at a temperature of—273° Fahrenheit. But how can a light ray, or a radio ray (wave) cross this bottomless void? An analogy may perhaps help here. Imagine a man stationed out in space shooting a stream of a non-freezing liquid earthward from a fire-hose. Suppose he vibrates (shakes) the nozzle back and forwards slightly. This would impart to the liquid stream a wave motion the same as we know a light ray has. There being no friction, the wave motion of the liquid stream would persist till the stream reaches the earth's atmosphere, where it would break up into drops.

Now we have seen that given a material stream we need no medium such as the ether to hurl it earthward. If, then, light and other electromagnetic waves are material, we no longer require the ether to explain the wave motion. We can even explain how it comes that the intensity of light diminishes inversely as the square of its distance. If a light ray is material—let us say composed of electrons—we can conceive how, thru its terrific speed of 186,000 miles per second, a certain quantity of electrons are lost continuously in space during its course. These electrons would probably be flipped off from the crests of the wave.

The next decade will no doubt shed further "light" on the question.

H. GERNSBACK.

The **ELECTRICAL EXPERIMENTER** is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions. Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. **A green wrapper indicates expiration. No copies sent after expiration.**



All communications and contributions to this journal should be addrest to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. **ALL** accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

ELECTRICAL EXPERIMENTER. Monthly. Entered as second-class matter at the New York Post Office under Act of Congress of March 3, 1879. Title registered U. S. Patent Office. Copyright, 1919, by E. P. Co., Inc., New York. **The Contents of this magazine are copyrighted and must not be reproduced without giving full credit to the publication.**

The ELECTRICAL EXPERIMENTER is for sale at all newsstands in the United States and Canada; also at Brentano's, 37 Avenue de l'Opera, Paris. Sole British agents—Geoffrey Parker & Gregg, 62 and 8A The Mall, Ealing, London.

Member of the Audit Bureau of Circulation.

SOME men seem to attract success, power, wealth, health and attainment with very little conscious effort, others conquer with great difficulty, still others fail altogether to realize their ambitions, desires and ideals. Why is this so?

The Master Key will tell you why! It will tell you that these things are controlled by Natural Laws, precisely the same as the falling of an apple.

The Master Key is a key with which many are converting loss into gain, fear into courage, despair into joy, hope into fruition. No one will emerge from its magic pages but with a firmer grasp of the future, a surer understanding of what he can do.

This may seem to be too good to be true, but remember that within a few years, by the touch of a button or the turn of a lever, science has placed almost infinite resources at the disposal of man, is it not possible that there are other laws containing still greater possibilities.

An understanding of this law will enable you to control every other power which exists. It is without doubt the greatest discovery of the Twentieth Century. In it may be found the remedy for every ill, the solution to every difficulty, the gratification for every desire; in fact, it would appear to be the Creator's magnificent provision for human emancipation.

A copy of this magnificent, richly bound hundred-page book will be sent to any address, without cost or obligation of any kind.

Charles F. Haanel, 203 Howard Bldg., St. Louis, Mo.

You should send for a Master Key.

LEARN WIRELESS By Mail—In Ten Weeks

Calls Coming in Steadily for National Radio Institute Graduates From All Parts of the Country. Four Concerns Guarantee to Take All Operators We Can Furnish.

Commercial Radio has arrived and many attractive positions are now open in the commercial land radio service, merchant marine, railroads, radio supply factories, lake and ocean steamship lines, telegraph companies and aerial mail service. We are now receiving requests for more National Radio Institute graduates than we can furnish.

Salaries Up to $250 a Month

with exceptional opportunity for promotion to Radio Mechanics, Electricians, Engineers, and Government Inspectors. No previous experience or training is necessary. You can learn wireless the National Radio Institute way in ten weeks by mail right in your own home. With our help you can quickly qualify for First Grade Government License and a good position at big pay. Many of our students secure positions before completing the course because it is based on actual practice and teaches what is needed to make a big success of wireless work.

Get Your Instructions From the Nation's Capital

(Our Course is Endorsed by the United States Government Officials)

The National Radio Institute, established in 1914, was the first in America to successfully teach wireless by mail. It is headed by authorities who have been closely allied with government training of students. The work is under the direction of J. E. Smith, E. E., formerly director of the Radio Department, Howard University, and E. R. Haas, formerly of the Radio Division of Yale University, assisted by a competent corps of trained instructors and lecturers.

We now have hundreds of students throughout the world. Our location in the Nation's Capital, together with the standing of our officers and their wide acquaintance among government officials connected with Wireless activities, places us in position to give our students the best instructions obtainable and to be of the utmost help in assisting them to secure good paying positions.

Travel If You Want To

If you want to travel and see the world, go to foreign countries and increase your knowledge of world affairs, wireless offers you the chance of a life time. However, you are not obliged to travel, but may secure a permanent position at one of the many land radio offices, railroads, telegraph or steamship companies, if preferred.

Pay As You Learn

Our plans of payment places a wireless education within the reach of anyone who desires to learn.

A small payment down on our convenient payment plan and small following payments enables you to earn the cost of your tuition while actually learning to be a wireless operator.

Free Instruments to Every Student

In addition to six text books—35 special lessons and 18 personal examinations—we send you, while taking our course, a standard Automatic Transmitting and Receiving Set for sending and receiving messages. These fine instruments are free only to National Radio Institute students.

Free Membership in N. R. I. Relay League

Upon enrollment every student in the National Radio Institute is presented with a handsome blue and gold pin, signifying his official membership in the N. R. I. Relay League, with a rapidly growing membership throughout the world.

FREE

In addition to our complete course in radio telegraphy, every student is given our complete course in modern radio telephony. This course comprises ten special lessons and ten personal examinations. These combined courses enable our students to fill positions requiring thorough knowledge of both radio telegraphy and modern radio telephony.

Send the following coupon today for our FREE book containing all particulars and special offer to students enrolling now.

Mail This Coupon Today

Five Days to Prove I Can Raise Your Pay

I've done it for thousands of others. I can doubtless do it for you. If I can't, then it won't cost you a cent.

I MEAN just what I say. There's no trick or catch about it. Give me five days and I'll prove that I can get your pay raised for you. I'll do it on a "show you" basis. You get the proof before you pay me a cent.

You've probably heard of me. My name is Pelton. Lots of people call me "The Man Who Makes Men Rich." I don't deny it. I've done it for thousands of people—lifted them up from poverty to riches. There's no sound reason why I cannot do it for you. So let's try.

Now, follow me carefully. I'm going to tell you exactly how to do it. I'm the possessor of a "secret" for which men have been searching since Time began.

A FEW EXAMPLES

Personal Experiences

Among over 350,000 users of "Power of Will" are such men as Judge Ben B. Lindsay; Supreme Court Justice Parker; Wu Ting Fang, Ex-U. S. Chinese Ambassador; Assistant Postmaster General Britt; Lieut. Gov. McKelvie of Nebraska; General Manager Christeson of Wells-Fargo Express Co.; E. St. Elmo Lewis, of Detroit; Gov. Ferris of Michigan, and many others of equal prominence.

$300 Profit from One Day's Reading

"The result from one day's study netted me $300 cash. I think it a great book and would not be without it for ten times the cost."—A. W. Wilkie, Faulkton, So. Dakota.

Worth $15,000 and More

"The book has been worth more than $15,000 to me."—Oscar B. Sheppard, 1117 E. Locust St., Decatur, Ill.

Would be Worth $100,000

"If I had only had it when I was 20 years old, I would be worth $100,000 to-day. It is worth a hundred times the price."—S. W. Taylor, The Santa Fe Ry., Milano, Tex.

From $100 to $3,000 a Month

"One of our boys who read Power of Will before he came over here jumped from $100 a month to $3,000 the first month, and won a $250 prize for the best salesmanship in the State."—Private Leslie A. Still, A. E. F., France.

There's no need to discuss the whys and the wherefores of this "secret." Suffice it to say that *It Works*. That's all we care about—*It Works*. Over 350,000 men and women the world over have proved it for themselves.

Among them are such men as Judge Ben B. Lindsay; Supreme Court Justice Parker; Lieut. Governor McKelvie, of Nebraska; Wu Ting Fang, ex-U. S. Chinese Ambassador; Governor Ferris, of Michigan; and thousands of others of equal prominence.

Some of the things this "secret" has done for people are astounding. I would hardly believe them if I hadn't seen them with my own eyes. Adding ten, twenty, thirty or forty dollars a week to a man's income is a mere nothing. That's merely playing at it. Listen to this:

A young man in the East had an article for which there was a nation-wide demand. For twelve years he "puttered around" with it—barely eking out a living. To-day this young man is worth $200,000. He is building a $25,000 home—and paying cash for it. He has three automobiles. His children go to private schools. He goes hunting, fishing, traveling, whenever the mood strikes him. His income is over a thousand dollars a week.

In a little town in New York lives a man who two years ago was pitied by all who knew him. From the time he was 14 he had worked and slaved—and at sixty he was looked upon as a failure. Without work, in debt to his charitable friends, with an invalid son to support, the outlook was pitchy black. Then he learned the "secret." In two weeks he was in business for himself. In three months his plant was working night and day to fill orders. During 1916 the profits were $20,000. During 1917 the profits ran close to $40,000. And this genial 64-year-young man is enjoying pleasures and comforts he little dreamed would ever be his.

I could tell you thousands of similar instances. But there's no need to do this as I'm willing to tell you the "secret" itself. Then you can put it to work and see what it will do for you. I don't claim I can make you rich over night. Maybe I can—maybe I can't. Sometimes I have failures—everyone has. But I do claim that I can help 90 out of every 100 people if they will let me.

The point of it all, my friend, is that you are using only about one-tenth of that wonderful brain of yours. That's why you haven't won greater success. Throw the unused nine-tenths of your brain into action and you'll be amazed at the almost instantaneous results.

The Will is the motive power of the brain. Without a highly trained, inflexible will, a man has about as much chance of attaining success in life as a railway engine has of crossing the continent without steam. The biggest ideas have no value without will-power to "put them over." Yet the will, altho heretofore entirely neglected, can be trained into wonderful power like the brain or memory and by the very same method—intelligent exercise and use.

If you held your arm in a sling for two years, it would become powerless to lift a feather, from lack of use. The same is true of the Will—it becomes useless from lack of practice. Because we don't use our Wills—because we continually bow to circumstance—we become unable to assert ourselves. What our wills need is practice.

Develop your will-power and money will flow in on you. Rich opportunities will open up for you. Driving energy you never dreamed you had will manifest itself. You will thrill with a new power—a power that nothing can resist. You'll have an influence over people that you never thought possible. Success—in whatever form you want it—will come as easy as failure came before. And those are only a few of the things the "secret" will do for you. The "secret" is fully explained in the wonderful book "Power of Will."

How You Can Prove This at My Expense

I know you'll think that I've claimed a lot. Perhaps you think there must be a catch somewhere. But here is my offer. You can easily make thousands—you can't lose a penny. Send no money—no, not a cent. Merely clip the coupon and mail it to me. By return mail you'll receive, not a pamphlet, but the whole "secret" told in this wonderful book, "POWER OF WILL."

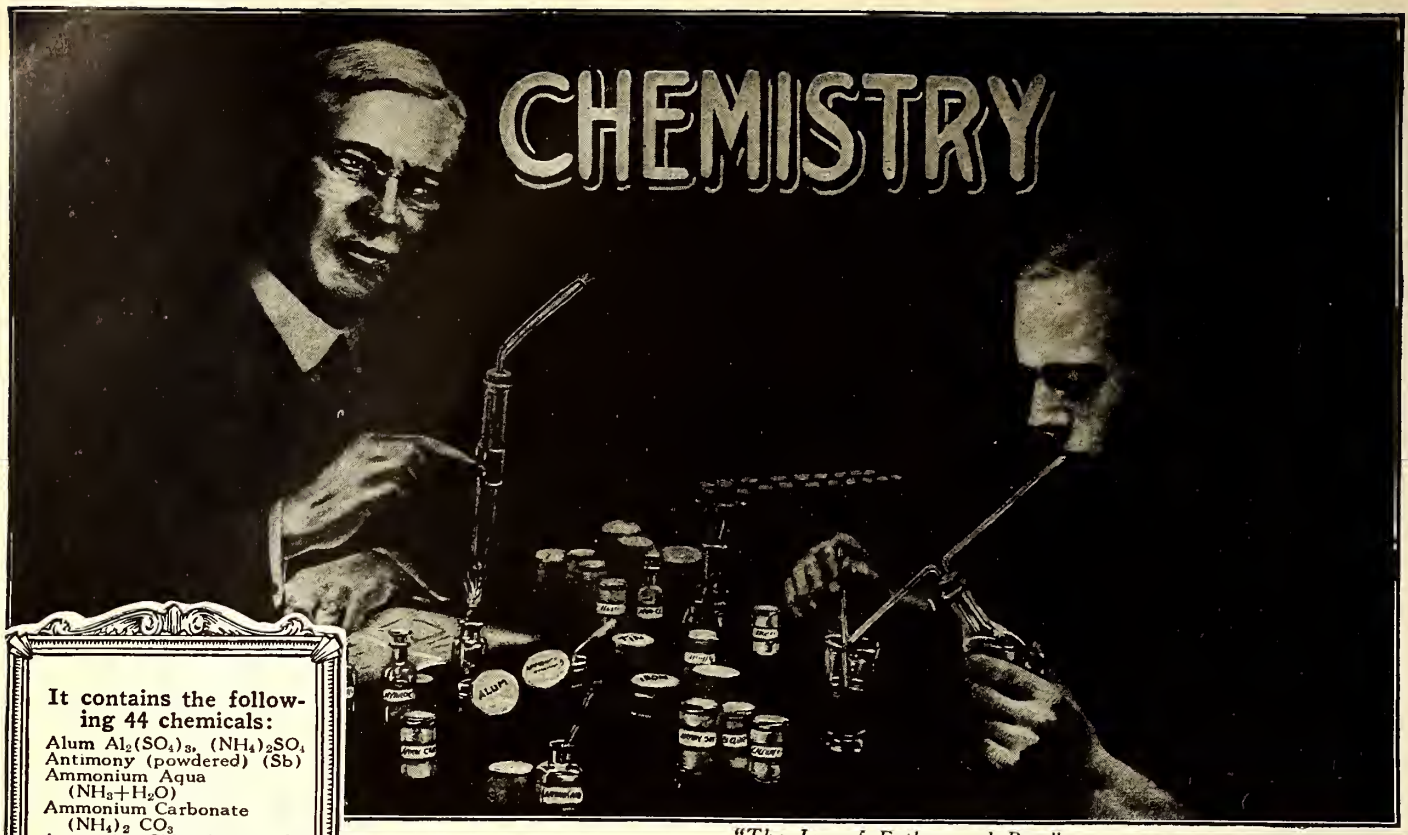
Keep it five days. Look it over in your home. Apply some of its simple teachings. If it doesn't show you how you can increase your income many times over—just as it has for thousands of others—mail the book back. You will be out nothing.

But if you do feel that "POWER OF WILL" will do for you what it has done for over a quarter of a million others—if you feel as they do that it's the next greatest book to the Bible—send me only $3.50 and you and I'll be square.

If you pass this offer by, I'll be out only the small profit on a three and a half-dollar sale. But you—you may easily be out the difference between what you're making now and an income several times as great. So you see you've a lot—a whole lot—more to lose than I.

Mail the coupon or write a letter now—you may never read this offer again.

PELTON PUBLISHING COMPANY
30-W Wilcox Block Meriden, Conn.



PELTON PUBLISHING COMPANY,
30-W Wilcox Block, Meriden, Conn.

You may send me "Power of Will" at your risk. I agree to remit $3.50 or remail the book to you in five days.

"The Joy of Father and Boy."

Chemical Laboratory

We present herewith to our friends our new **E. I. Co. Chemical Laboratory** which contains **real** chemicals and apparata to perform **real** chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a **Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.**

DESCRIPTION OF THE OUTFIT:

The outfit consists of forty-four (44) Chemicals all C. P. (chemical pure) put up in appropriate wooden boxes, glass bottles, and hermetically closed jars. The acids are put up in glass bottles, with ground-in glass stoppers and there is a sufficient quantity of chemicals supplied (mostly one to two ounces) enough to make dozens of experiments with each. See list of Chemicals herewith.

The apparata furnished are all of the best obtainable make and of standard laboratory size and shape. A list of the 17 pieces of apparata furnished with this outfit is printed also herewith.

The Instruction book is a real **Chemistry Course for the Beginner.** Some of the Contents are: **Division of Matter:** This is a Treatise on Elementary Chemistry and deals with the theory of the Elements, Molecules and Atoms, etc. **Chemical Nomenclature:** This explains in simple language the derivation of the chemical names of the Elements and their compounds. There is a chapter on **Laboratory Operations; Glass Working; First Aid; Fire Extinguishers; Experimenters' Aphorisms,** etc.

A good part of the book is devoted to Weights and Measures. The Metric System, the English system and the U. S. System are fully explained.

The following tables are furnished: Symbols and Atomic weights of the Elements; Measures of Weights, Volume, Capacity and Length; Per Cent solutions; Conversion of Measure expressed in parts; Poisons and their antidotes; Technical and common name of chemical substances; Formulas for Cleaning various substances, etc., etc.

Among the **100 Experiments** are:

How to make chemical tricks; How to make invisible and magic inks; How to test flour; How to test soil; How to Make Chlorine Gas and smoke (German War Gas); How to bleach cloth and flowers. How to produce Oxygen and Hydrogen; How to make chemical colors; How to test Acids and Alkalies and hundreds of interesting hints and formulas.

It contains the following 44 chemicals:

Alum $Al_2(SO_4)_3$, $(NH_4)_2SO_4$
Antimony (powdered) (Sb)
Ammonium Aqua (NH_3+H_2O)
Ammonium Carbonate $(NH_4)_2CO_3$
Ammonium Chloride (NH_4Cl)
Ammonium Sulphate $(NH_4)_2SO_4$
Barium Chloride ($BaCl_2$)
Boric Acid (H_3BO_3)
Brimstone (Sulphur) (S)
Calcium Chloride ($CaCl_2$)
Calcium Oxide (CaO)
Calcium Sulphate ($CaSO_42H_2O$)
Charcoal (Carbon) (C)
Chloride of Zinc ($ZnCl_2$)
Copper Sulphate ($CuSO_4$)
Ferrous Sulphate ($FeSO_4$)
Ferrous Sulphide (FeS)
Glycerol (Glycerine) $C_3H_5(OH)_3$
Hydrochloric Acid (HCl)
Iodine (I)
Iron Chloride ($FeCl_2$)
Iron Oxide (Fe_2O_3)
Lead Acetate Pb $(C_2H_3O_2)_2$
Litmus Paper
Magnesium Carbonate ($MgCO_3$)
Manganese Dioxide (MnO_2)
Mercury (Quicksilver) (Hg)
Nickel Chloride ($NiCl_2$)
Oxalic Acid ($H_2C_2O_4$)
Sodium Bicarbonate ($NaHCO_3$)
Sodium Borate ($NaBO_2$)
Sodium Carbonate (Na_2CO_3)
Sodium Chloride (NaCl)
Sodium Nitrate ($NaNO_3$)
Sodium Phosphate (Na_2HPO_4)
Sodium Sulphate (Na_2SO_4)
Sodium Sulphite (Na_2SO_3)
Stannous Chloride ($SnCl_2$)
Sulphate of Nickel ($NiSO_4$)
Sulphate of Zinc ($ZnSO_4$)
Sulphuric Acid (H_2SO_4)
Tin (Granulated) (Sn)
Zinc (Metal) (Zn)
Zinc Carbonate ($ZnCO_3$)

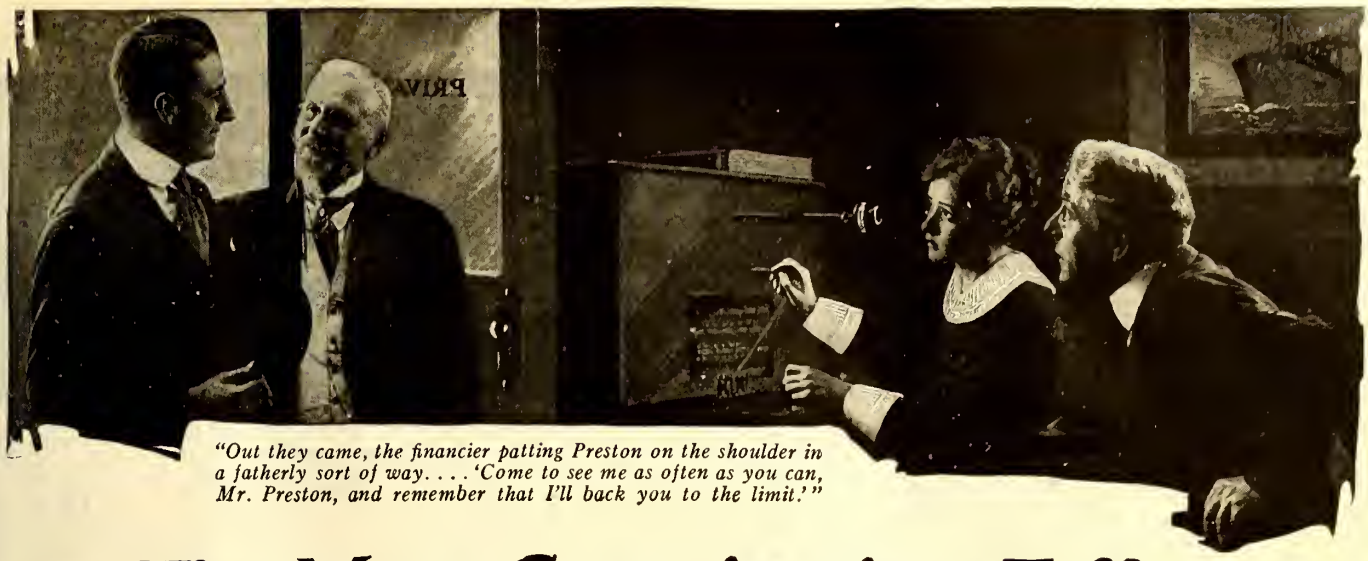
The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube
Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure
Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

The price is still $5.00. **Shipping Weight 10 lbs.** **(Can be shipped by Express only.)**

TRADE MARK **THE ELECTRO IMPORTING CO., Mfrs.** TRADE MARK
231 FULTON STREET NEW YORK CITY

"THE LIVIEST CATALOG IN AMERICA"



Our big, new electrical cyclopedia No. 21 is waiting for you. Positively the most complete Wireless and electrical catalog in print today. 176 Big Pages, 400 illustrations. 300 instruments and apparatus, etc. Big **"Treatise on Wireless Telegraphy."** 21 FREE coupons for our 160-page FREE Wireless Course in 20 lessons. FREE Cyclopedia No. 21 measures 7x5¼". Weight ½ lb. Beautiful stiff covers.

ELECTRO IMPORTING COMPANY
231 Fulton St., New York City

I enclose herewith 6 cents in stamps or coin, to cover postage, for which please send me your latest Cyclopedia Catalog No. 21 as described.

"Out they came, the financier patting Preston on the shoulder in a fatherly sort of way. . . . 'Come to see me as often as you can, Mr. Preston, and remember that I'll back you to the limit.'"

The Most Convincing Talker I Ever Met

Everywhere this man goes, people shower him with favors and seek his friendship. Things which other people ask for and are refused, he gets instantly. How he does it is told in this amazing story.

LET me ask you this: There is a big business deal to be put through. It involves millions of dollars. Putting it through depends wholly on one thing—getting the backing of a great financier.

But this man is bitterly opposed to your idea and to your associates. Seven of the most able men and women in all America have tried to win over this financier. They failed dismally and completely.

Now, could you, a total stranger to this man, walk in on him unannounced, talk for less than an hour, and then have him take your arm as a token of friendship, and give you a signed letter agreeing to back you to the limit?

Could you?

ASTOUNDING? Yes! But it *W A S* done. And I'll tell you how. Here is the way it all came about. For a long time the directors of our company had felt the handicap of limited capital. We had business in sight running into a million dollars a month. But we couldn't finance this volume of sales. We simply had to get big backing, and that was all there was to it.

Because of trade affiliations, one man—a great financier in New York—controlled the situation. Win him over and the rest was easy. But how to win him?—that was the question. No less than five men and two women—all people of influence and reputation—had tried. They were all repulsed—turned down cold and flat.

You know how a thing of this sort grows on you and how bitter utter defeat is. Well, we were talking it over at a board meeting, when one of our directors announced that he knew of only one man who could possibly put through the deal—a man by the name of Preston.

So it was agreed that Preston was to be sounded out at luncheon the following day. He proved to be a fine type of American. At 34 years of age he had become president and majority stockholder of a thriving manufacturing business rated at three-quarters of a million dollars.

Preston was deeply interested, as anyone would be over the prospect of closing such a big deal. The director in question said casually, "Why don't you run down to New York and take a shot at it, Preston?" Preston looked out of the window for a moment, and then quietly answered, "You're on."

I WENT along with Preston simply as a matter of form to represent our interests. Aboard the 10:25 train out of Chicago we headed for the smoker and got to talking with the crowd there.

Then I noticed something. Preston had dominated them all. Everyone was eagerly hanging on his words, and looking at him with open admiration. No sooner would he stop talking than one of the men would start him up again. And as the men dropped off at stations along the way they gave Preston their cards, with pressing invitations to look them up. No doubt about it, Preston was *T H E* man aboard that car.

The colored porter, too, came under his sway. For that night, when the berths were being made up, the porter came unasked to Preston, told him that his berth was right over the car trucks, and insisted upon changing it to a more comfortable one.

And so it went all the way to New York. Everyone who met Preston took a great liking to him the instant he spoke. They seemed to be eager for his companionship — wanted to be with him every minute, openly admired him, and loaded him with favors.

Even the usual haughty room clerk at the hotel showed a great interest in Preston's welfare. He showered us with attention while a long line of people waited to register.

The next morning we called on the great financier—the man who was so bitterly against us and had flatly turned down seven of our shrewd influential representatives.

I waited in the reception room—nervous, restless, with pins and needles running up and down my spine. Surely Preston would meet the same humiliating fate?

But no! In less than an hour out they came, arm in arm, the financier patting Preston on the shoulder in a fatherly sort of way. And then I heard the surprising words, "Come to see me as often as you can, Mr. Preston, *and remember that I'll back you to the limit!*"

AT the hotel that night sleep wouldn't come. I couldn't get the amazing Preston out of my thoughts. What an irresistible power over men's minds he had. Didn't even have to ask for what he wanted! People actually competed for his attention, anticipated his wishes and eagerly met them. What a man! What power! . . . Then the tremendous possibilities of it all—think what could be done with such power.

What was the secret? For secret there must be. So the first thing next morning I hurried to Preston's room, told him my thoughts, and asked him the secret of his power.

Preston laughed good-naturedly. "Nothing to it—I—well—that—is—" he stalled. "I don't like to talk about myself, but I've simply mastered the knack of talking convincingly, that's all."

"But how did you get the knack?" I persisted.

Preston smiled, and said, "Well, there's an organization in New York that tells you exactly how to do it. *It's amazing!* There's really nothing to study. It's mostly a knack which they tell you. You can learn this knack in a few hours. And in less than a week it will produce definite results in your daily work.

"Write to this organization—the Independent Corporation—and get their method. They send it on free trial. I'll wager that in a few weeks from now you'll have a power over men which you never thought possible . . . . but write and see for yourself." And that was all I could get out of the amazing Preston.

WHEN I returned home I sent for the method Preston told me about. It opened my eyes and astounded me. Just how he had won over the financier was now as clear as day to me. I began to apply the method to my daily work, and soon I was able to wield the same remarkable power over men and women that Preston had. I don't like to talk about my personal achievements any more than Preston does, but I'll say this:

When you have acquired the knack of talking convincingly, it's easy to get people to do anything you want them to do. That's how Preston impressed those people on the train—how he won over the financier—simply by talking convincingly.

This knack of talking convincingly will do wonders for any man or woman. Most people are afraid to express their thoughts; they know the humiliation of talking to people and of being ignored with a casual nod or a "yes" or "no." But when you can talk convincingly, it's different. *When you talk people listen and listen eagerly.* You can get people to do almost anything you want them to do. And the beauty of it all is that they think they are doing it of their own free will.

In committee meetings, or in a crowd of any sort you can rivet the attention of all when you talk. You can force them to accept your ideas. It helps wonderfully in writing business letters—enables you to write sales letters that amaze everyone by the big orders they pull in.

Then again it helps in social life. Interesting and convincing talk is the basis of social success. At social affairs you'll always find that the convincing talker is the centre of attraction, and that people go out of their way to "make up" to him.

Talk convincingly and no man—no matter who he is—will ever treat you with cold, unresponsive indifference. Instead, you'll instantly get under his skin, make his heart glow and set fire to his enthusiasms. Talk convincingly and any man—even a stranger—will treat you like an old pal and will literally take the shirt off his back to please you.

You can get anything you want if you know how to talk convincingly. You've noticed that in business, ability alone won't get you much. Many a man of real ability, who cannot express himself well, is often outdistanced hy a man of mediocre ability who knows how to talk convincingly. There's no getting away from it, to get ahead—merely to hold your own—to get what your ability entitles you to, *you've got to know how to talk convincingly!*

THE method Preston told me about is Dr. Law's "Mastery of Speech," published by the Independent Corporation. Such confidence have the publishers in the ability of Dr. Law's method to make you a convincing talker that they will gladly send it to you wholly on approval.

You needn't send any money—not a cent. Merely mail the coupon, or write a letter, and the complete Course "Mastery of Speech," will be sent you by return mail, all charges prepaid. If you are not entirely satisfied with it, send it back any time within five days after you receive it and you will owe nothing.

But if it pleases you, as it has pleased thousands of others, then send only five dollars in full payment. You take no risk. You have everything to gain and nothing to lose. So mail the coupon now before this remarkable offer is withdrawn.

Independent Corporation

Publishers of the Independent Weekly

Dept. L11012. 119 W. 40th St. New York

Please send me Dr. Frederick Houk Law's "Mastery of Speech," a Course in Business Talking and Public Speaking in eight lessons. I will either remail the Course to you within five days after its receipt, or send you $5 in full payment of the Course.

MAGAZINE Prices Slashed

Millions of magazine subscriptions expire this month! With the tremendous advance of paper prices and labor it is certain that nearly all magazines will advance their subscription prices at least from 25% to 50%.

BY ORDERING NOW YOU WILL SAVE BIG MONEY.

In announcing these wonderful prices it is with the absolute knowledge that our readers are offered the lowest prices for standard Magazines that it is possible to obtain anywhere. Only by special arrangement with the publishers are these prices possible, but to take advantage of them, you must act quickly. **Don't delay, do it now.** This offer is so good that of necessity it must be limited in time. Just think of buying standard Magazines at reduced prices in time for Xmas Presents, and they certainly make ideal gifts being a constant reminder for a whole year of a considerate friend. Just glance over our wonderful prices, and see how we enable one dollar to bring you two dollars' worth, and then make up your list. When sending your order, don't forget to state where magazines are to be sent. But be sure you do it now. To-morrow means you may forget and lose this wonderful opportunity. All prices quoted are for subscribers in U. S. A. only, Canadian and Foreign subscriptions require additional postage.

The Publishers Will Mail the Magazine Direct From Their Own Office to You.

The Couple That Spent Every Cent

WHERE did it all go? Forbes earned a good salary. Neither he nor Mrs. Forbes could be accused of extravagance. But somehow they could never keep more than a few dollars ahead of expenses. Then something happened that gave them a scare—and out of it they found an easy way to get on EASY STREET.

ABOUT six months ago I got the scare of my life. Edith was worried, too. But in the end it was one of the best things that ever happened to us.

I guess I had a pretty close call. The doctor said afterwards that he never expected me to pull through.

But it wasn't my own sickness that gave me my fright—at least, I wasn't alarmed about myself. It was the sick condition of the family finances, and thinking of Edith and the boy that put me in a panic.

There I was, flat on my back in bed; a big doctor's bill running up; a trained nurse to pay every week; and no reserve to fall back on—not a dollar laid by for emergency.

Luckily the firm was good enough to continue my salary without a break, or I don't know what we would have done.

The things that went through my mind during that slow process of getting well made me feel like a criminal. Suppose the worst had happened? No provision for Edith and the boy except a little insurance—the total amount not enough to last more than a year at the rate we had been living.

It hurt like a stab. It seems incredible that two people in their right minds could drift along the way we had been doing, constantly living up to the last cent, constantly on the edge of a slippery precipice. Yet according to statistics, something like 50% of all the men in America over sixty years of age are dependent on relatives or charity for support—including men who had earned princely incomes when in their prime. Think of it! And all because they had failed to look ahead—had never learned how to save. It hit me right between the eyes. For I was nearly thirty-two years old—certainly old enough to know better; yet I wasn't a dollar nearer independence than when I was twenty.

One day, while still in bed, I ran across something in one of the magazines that opened my eyes to our whole trouble.

It said that most people make hard work of saving simply because they don't go at it in the right way. Their money doesn't last long because they have no check on it—no definite system for adjusting their outgo to their income. It said the only practical way is the budget system—split your salary up into proportionate parts; allow so much each week for this, so much for that, and then stick to it.

Then the article told of an almost automatic way for doing this—a new system for managing personal affairs; it was called the Ferrin Money Making Account System.

It struck me that this was just what Edith and I needed if we ever expected to get our feet on solid ground. When I showed my discovery to Edith, she agreed with me, and immediately sent for the complete system.

That little step has proved to be our salvation. It has helped us put nearly $500 in the bank in less than six months—out of the same salary that was formerly never enough. At the same time it helped us to pay a big doctor's bill without ever missing the money.

The Ferrin Money Making Account System has shown us how to cut out all that old haphazard, hit-or-miss kind of spending, how to save money that we formerly frittered away—how to stop the little leaks that were keeping us poor.

The Magic Budget Plan

The Ferrin Money Making Account System is simplifying money matters for thousands upon thousands of people all over the country — helping square up bills and debts—putting money in the bank for people who never before saved a cent. It will help you in the same way. This system, which is simplicity itself, comprises:

The Ferrin Money Making Account Book.
The Ferrin Kitchen Calendar (for the household).
The Ferrin Pocket Account Book.
The Ferrin Investment and Insurance Register.
The Ferrin Household Inventory and Fire Insurance Record.

Compact information is given on Making a Budget, Keeping Expense Accounts, Making Safe Investments, Making an Inventory of Household Goods.

The Pocket Account Book (price when sold separately, 50 cents) contains printed slips so that you have only to jot down the amounts of your daily expenditures. The Kitchen Calendar (price 50 cents) keeps track of household expenses. At the end of each week or month these amounts are transferred to the Money Making Account Book, which contains 112 pages, size 8¼ x 10½ inches, and is bound in half blue Silk Cloth Back—Cadet Blue Cover, Paper Sides—Turned Edges, semi-flexible, stamped in gold on Front Cover. This book has been prepared by an expert to fit any salary from the smallest to the largest. Incorporated in it is a recapitulation for every month of the year, which shows at a glance the Budget and the amounts paid out during the month for the various classified items of expense. It is the only book to our knowledge which has a Budget column for every month. Special columns are provided for items on which an income tax does not have to be paid, so that these amounts may be deducted at the end of the year.

"The things that went through my mind during that slow process of getting well made me feel like a criminal."

One Money Saving Feature

A war tax is now levied on almost every kind of article you buy. Few people know that the amounts so paid on daily purchases may properly be deducted from their income tax report. The following items, for example, are deductable: Interest on personal indebtedness; taxes on land, buildings and household property, war taxes on club dues, theatre tickets, transportation, telephone messages, telegrams, tobacco, etc.; contributions to churches, charitable, scientific or educational institutions which are not conducted for profit. By keeping track of these war taxes on the pages for daily expenditures, and transferring the weekly or monthly totals to the Money Making Account Book, you will effect a saving on your income tax that will surprise you and that will pay the small price of the System many times over.

The Ferrin Investment Insurance Register is designed to keep an accurate record of your investments, insurance policies, etc. Contains 32 pages, size 5 x 8 inches, price separately, 50 cents. The Ferrin Inventory and Fire Insurance Record will enable you to make and keep a complete inventory of every room in the house; also provides for record of your fire insurance policy. It is an absolute necessity in case of fire. It may save you many thousand times the cost, which is 50 cents when sold separately.

Two Minutes a Day

The Ferrin Money Making Account System takes only two minutes a day. Any grammar school boy or girl can keep the accounts. This method is not a hard task.

Now you need not worry about the money you spend for clothes, food, rent, or the theatre. You will spend it freely because you know how much you can afford to spend.

The Ferrin Money Making Account System is a most practical gift to any newly married couple. Many people use them for Christmas gifts.

Send No Money

See how the Ferrin Money Making Account System works magically, no matter how much or how little your income. We know what you will think of it when you see it. So we are willing to send you the complete System without your sending us any money in advance. Just mail the coupon, and back will come the System by return mail. If you feel that you can afford not to have it, simply send it back, and you will owe nothing.

But when you have seen what big returns the Ferrin System will pay you, you will surely want to keep this wonderful aid to money-making, especially as we are now making a special short-time offer of only $3 for the complete System.

You will appreciate what a remarkable offer this is when you consider that other expense account books are sold for $3 and cover a period of only two years. The Ferrin Money Making Book covers four years, and therefore has twice the value, $6. And in addition you get the Ferrin Kitchen Calendar, the Ferrin Pocket Account Book, the Ferrin Investment and Insurance Register, the Ferrin Household Inventory and Fire Insurance Record, each worth 50 cents, or $2. You have the opportunity, therefore, of securing $8 value for only $3.

But we can make this special combination offer only for a limited time. You are, therefore, urged to mail the coupon now—to do so costs nothing, and does not obligate you in any way, and it may be a revelation to you of how much more you can get out of your income.

READ:

Letter from Head of Financial Department of Largest Corporation of its kind in the United States:

"I consider your account book a remarkable contribution to the people of this country at this time.

In our company we have 5,000 employes and it was a revelation to me, in giving them advice in regard to the making out of their income tax returns to find how few had any intelligent idea of their income and their living expenses.

The simplicity of your plan, which, by comparison with previous methods of account keeping, would seem to be well-nigh automatic, appeals to me strongly.

They say you can't teach an old dog new tricks, but I will say to you that I am going to use the Ferrin Book for my own family expenses, and consider it will make money for me right from the start."

(Signed) D. S. BURTON.

Letter from A. B. Dick, Jr., of the A. B. Dick Company, of Chicago, Manufacturers of the Edison-Dick Mimeograph Machine:

"I can candidly say that all the record books which you have issued are practically invaluable to the man who wishes to handle his personal and household accounts in the proper manner. I have seen several systems to take care of these matters, but yours covers the ground in a more thorough manner than any of them.

"To further show my appreciation, I would like to have three copies of your Investment and Insurance Register, and also one copy of the 'Money Making Account Book,' if these are off the press and available. It would be particularly gratifying to have them in sufficient time for the opening of the new year. If you will forward your bill, I will be very glad to remit."

(Signed) A. B. DICK, JR.

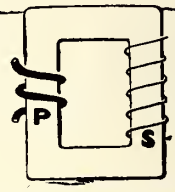
Electricity
taught by a practical man

You Can Learn



By This Practical Method of

Home Study

Every Burgess student receives perfect satisfaction. My course is clear and simple. No limit is placed upon my efforts to help each student during the time he is studying and afterwards because of the uniform success of my method of instruction, I agree to refund the tuition to any graduate who believes that he has not obtained full value when he has completed the course.

HUNDREDS of Burgess-trained men and boys have advanced to better positions by means of the practical electrical knowledge learned at home by this method. *If you are willing to utilize a little of your spare time you can do the same.*

Advancement

is made possible to any ambitious man or boy—whether a beginner or experienced in electrical work — who will faithfully devote part of his spare time to this course of home study.

For Beginners and Experienced Men

This home study course is based upon the years of practical electrical experience of Yorke Burgess who gives personal attention to each student. There is no limit to what you can accomplish with its aid. *It is up to you.*

READ What these Burgess-trained men say.

"You remember perhaps, when I started your course, I was working on a farm and that I had never had any electrical experience whatever. * * * The practical advice offered convinced me that a master, and a man who knew men, was my instructor. As you continued to more than make good on your statements, my confidence in you grew, and I knew then as I know now that I made a wise selection in taking your course in preference to any of the others I looked into. * * * I have been earning nearly as much weekly as I used to earn monthly.

If you have any fellows who write you about your course and who are not sure it will fit them, send them my name and address, and I shall certainly give you a boost, as I am always glad to do."

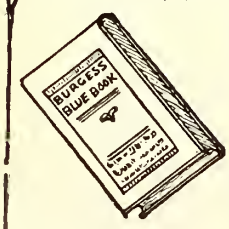
Yours very sincerely,
C. D. BAKER.
(Address given on request)

"I took some of my lessons down to the plant and studied them. The superintendent saw them and asked me what they were. The next day he informed me that I would draw $150.00 instead of $110.00.

Your pupil,
G. D. WATERS.
Fairview, W. Va.

RESULTS OF THIS SERVICE

Practical electrical men recommend this course to others.
Students are invariably promoted and get better salaries.
Over 80 per cent of the students are engaged in the electrical business.
Over 15 per cent of present enrollment came through satisfied students.
Beginners get employment in electrical work after taking the course a short while.



FIFTY-FIFTY

This method of learning PRACTICAL ELECTRICITY is supplied on EASY PAYMENTS, including apparatus, instruments, material, etc. Start any time—stop any time—your payments cease if you are not satisfied. Send for the BURGESS BOOK today. It gives full information without cost or obligation.

YORKE BURGESS, Superintendent

BURGESS ELECTRICAL SCHOOL

745 East 42nd Street **Chicago, Illinois**

BURGESS BLUE BOOK

ELECTRICAL MEN AND STUDENTS

PRICE $1.00

A pocket hand-book for ELECTRICAL MEN and STUDENTS. Contains over 200 CALCULATION FORMULAS and worked-out problems showing their use. Also DRAWINGS of ELECTRICAL APPARATUS and DEVICES of which the **inside connections are clearly shown.** ALTERNATING CURRENT CALCULATIONS and hundreds of everyday problems are covered. Recommended by electrical men all over the country. Used in technical schools. Purchased by electrical concerns for employees and customers. There is no other book like it. A $1.00 bill, money order or check brings the book. We refund your money if you are not fully satisfied.

BURGESS ENGINEERING CO.

Yorke Burgess, President
Consulting, Electrical Engineering
750 East Forty-second Street **Chicago, Illinois**

We give information on electrical subjects, design and perfect electrical devices and apparatus. Power plants, electric railway and operation and railway signals a specialty. Write us your needs and let us furnish data and advise you. Our service is prompt, reliable and satisfactory.

Read What These Purchasers Say of Burgess Blue Book

"I have bought a good many books in my days, but the Blue Book is the best one on electrical matters."
J. F. Downer, Medford Hillside, Mass.

"It is surprising how much information, drawings, etc., can be concentrated into such a small pocket size book."
Joseph C. Hanhauser, Philadelphia, Pa.

"Your Burgess Blue Book, which I have received recently, has caused quite a stir among my fellow electricians, for many of them asked me to get one for them as soon as they read mine. They think it is a great help to them in their work."
Frank Stalzer, Toledo, Ohio.

"This Blue Book is the best book for the practical electrician that I have ever seen."
John F. Downes, Medford Hillside, Mass.

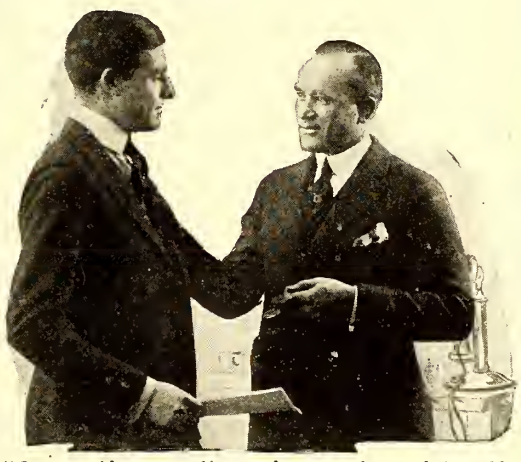
A Startling Memory Feat That You Can Do

How I learned the secret in one evening. It has helped me every day

WHEN my old friend Faulkner invited me to a dinner party at his house, I little thought it would be the direct means of getting me a one-hundred-and-fifty per cent. increase in salary. Yet it was, and and here is the way it all came about.

Toward the close of the evening things began to drag a bit, as they often do at parties. Finally some one suggested the old idea of having everyone do a "stunt." Some sang, others forced weird sounds out of the piano, recited, told stories, and so on.

Then it came to Macdonald's turn. He was a quiet sort of chap, with an air about him that reminded one of the old saying that "still waters run deep." He said he had a simple "stunt" which he hoped we would like. He selected me to assist him. First he asked to be blindfolded securely to prove there was no trickery in it. Those present were to call out twenty-five numbers of three figures each, such as 161, 249, and so on. He asked me to write down the numbers as they were called.



This was done. Macdonald then astounded everyone hy repeating the entire list of twenty-five numbers backwards and forwards. Then he asked people to request numbers by positions, such as the eighth number called, the fourth number, and so on. Instantly he repeated back the exact number in the position called. He did this with the entire list—over and over again, without making a single mistake.

Then Macdonald asked that a deck of cards be shuffled and called out to him in their order. This was done. Still blindfolded, he instantly named the cards in their order backwards and forwards. And then to further amaze us, he gave us the number of any card counting from the top, or the card for any number.

You may well imagine our amazement at Macdonald's remarkable feat. You naturally expect to see a thing of this sort on the stage, even then you look upon it as a trick. But to see it done by an everyday business man, in plain view of everyone, blindfolded and under conditions which make trickery impossible, is astonishing, to say the least.

* * * * * *

ON the way home that night I asked Macdonald how it was done. He said there was really nothing to it—simply a memory feat, the key to which anyone could easily learn in one evening. Then he told me that the reason most people have bad memories is because they leave memory development to chance. Anyone could do what he had done, and develop a good memory, he said, by following a few simple rules. And then he told me exactly how to do it. At the time I little thought that evening would prove to be one of the most eventful in my life, but such it proved to be.

"Our president complimented me on always being able to tell him instantly facts he wanted to know."

What Macdonald told me I took to heart. In one evening I made remarkable strides toward improving my memory and it was but a question of days before I learned to do exactly what he had done. At first I amused myself with my new-found ability by amazing people at parties. My "memory feat," as my friends called it, surely made a hit. Every one was talking about it, and I was showered with invitations for all sorts of affairs. If anyone were to ask me how quickly to develop social popularity, I would tell him to learn my memory "feat"—but that is apart from what I want to tell you.

The most gratifying thing about the improvement of my memory was the remarkable way it helped me in business. Much to my surprise I discovered that my memory training had literally put a razor edge on my brain. My brain had become clearer, quicker, keener. I felt that I was fast acquiring that mental grasp and alertness I had so often admired in men who were spoken of as "wonders" and "geniuses."

The next thing I noticed was a marked improvement in my conversational powers. Formerly my talk was halting and disconnected. I never could think of things to say until the conversation was over. And then, when it was too late, I would always think of apt and striking things I "might have said." But now I can think like a flash. When I am talking I never have to hesitate for the right word, the right expression or the right thing to say. It seems that all I have to do is to start to talk, instantly I find myself saying the very thing I want to say to make the greatest impression on people.

It wasn't long before my new-found ability to remember things and to say the right thing at the right time attracted the attention of our president. He got in the habit of calling me in whenever he wanted facts about the business. As he expressed himself to me, "You can always tell me instantly what I want to know, while the other fellows annoy me by dodging out of the office and saying 'I'll look it up.'"

* * * * *

I FOUND that my ability to remember helped me wonderfully in dealing with other people, particularly in committee meetings. When a discussion opens up the man who can back up his statements quickly with a string of definite facts and figures usually dominates the others. Time and time again I have won people to my way of thinking simply because I could instantly recall facts and figures. While I'm proud of my triumphs in this respect, I often feel sorry for the ill-at-ease look of the other men who cannot hold up their end in the argument because they cannot recall facts instantly. It seems as though I never forget anything. Every fact I now put in my mind is as clear and as easy to recall instantly as though it were written before me in plain black and white.

We all hear a lot about the importance of sound judgment. People who ought to know say that a man cannot begin to exercise sound judgment until he is forty to fifty years of age. But I have disproved all that. I have found that sound judgment is nothing more than the ability to weigh and judge facts in their relation to each other. Memory is the hasis of sound judgment. I am only thirty-two, but many times I have been complimented on having the judgment of a man of forty-five. I take no personal credit for this—it is all due to the way I trained my memory.

THESE are only a few of the hundreds of ways I have profited by my trained memory. No longer do I suffer the humiliation of meeting men I know and not being able to recall their names. The moment I see a man his name flashes to my mind, together with a string of facts about him. I always liked to read but usually forgot most of it. Now I find it easy to recall what I have read. Another surprising thing is that I can now master a subject in considerably less time than before. Price lists, market quotations, data of all kinds, I can recall in detail almost at will. I rarely make a mistake.

My vocabulary, too, has increased wonderfully. Whenever I see a striking word or expression, I memorize it and use it in my dictation or conversation. This has put a remarkable sparkle and pulling power into my conversation and business letters. And the remarkable part of it all is that I can now do my day's work quicker and with much less effort, simply because my mind works like a flash and I do not have to keep stopping to look things up.

All this is extremely satisfying to me, of course. But the best part of it all is that since my memory power first attracted the attention of our president, my salary has steadily been increased. Today it is many times greater than it was the day Macdonald got me interested in improving my memory.

* * * * * * *

WHAT Macdonald told me that eventful evening was this: "Get the Roth Memory Course." I did. That is how I learned to do all the remarkable things I have told you about. The publishers of the Roth Memory Course—the Independent Corporation—are so confident that it will also show you how to develop a remarkable memory that they will gladly send the Course to you on approval.

You need not pay a single penny until you have examined the Course and found that it fully lives up to all the claims made for it. Send no money. Merely mail the coupon or write a letter, and the complete Course will be sent to you instantly, all charges prepaid. If after examination you decide that you do not want to keep the Course, then return it and you will owe nothing. On the other hand, if you find, as thousands of others have found, that the Roth Memory Course will do wonders for you, then merely send five dollars in full payment.

You have always wanted a good memory. Now you can have it. Remember, you pay no money until you have proved that the Course will benefit you. You have everything to gain and nothing to lose by taking immediate action. So mail the coupon NOW before this liberal offer is withdrawn.

What "Radio Amateur News" Is:

With its sixth issue RADIO AMATEUR NEWS holds the field undisputedly as the greatest radio magazine in print to-day. In point of circulation, number of articles, illustrations, RADIO AMATEUR NEWS now leads all other wireless magazines. Take for instance the December issue with its sixty-four pages; there were fifty-one separate purely radio articles and 112 illustrations. *Over thirty-three thousand copies were printed and circulated.*

Each issue of the RADIO AMATEUR NEWS now contains 64 pages (or more) and an artistic cover in two colors. The illustrations average 125 every month and there are from 40 to 50 up-to-date articles, some by our biggest radio scientists, in every issue.

RADIO AMATEUR NEWS is the greatest and biggest radio magazine in print today.

RADIO AMATEUR NEWS is the only INDEPENDENT monthly wireless magazine in existence. It caters to no commercial interests—it has no boss save its readers. It is "different"—it has the latest radio news. It is a scientific magazine but it caters largely to the RADIO AMATEUR—it is by and for the Amateur. It is published by the publishers of the ELECTRICAL EXPERIMENTER, but there is no duplication of articles in the two magazines. Both are entirely different—but both together will give you ALL the radio news of all the world. Whether you are a professor or an Amateur, get a sample copy or order it from your Newsdealer today.

JUNIOR RADIO COURSE

A distinctly new feature began with the September issue in our new Junior Radio Course. In the December issue Lesson No. 4 appears complete. This course is intended for the beginner and everything presented will be in plain English—even the merest tyro in radio will find no trouble in understanding and assimilating the knowledge. The series is a very important one and nothing like it has ever appeared in print before. Everyone owes it to himself in this new age to know something about wireless and this course will enlighten all laymen. Profusely illustrated with pictures that anyone can understand.

15c The Copy

SPECIAL OFFER

Gentlemen:

Please enter my subscription for RADIO AMATEUR NEWS for the term of one year for which I enclose herewith $1.50. For this you will send to me immediately your great Wireless Course, containing 160 pages, 350 illustrations, size 6¾ x 10" with fine flexible cloth cover. I have added 5c extra for postage. (I have written my name and address in margin below.)

Shake Hands With Yourself!

Do You Really Know Yourself? Are You in the Line of Work for Which You Are Naturally Best Fitted? Read This Interesting Story of a Man Who First Shook Hands With Himself—and Then With Success.

A CLERK since 1911! Eight long years I had been at the same desk, the same work, and almost the same pay. And, from all signs ahead, 1930 would still find me in the same old grind.

Perhaps you may know just how I felt. At 9:00 every morning I would hang up my hat, settle in my chair and get set to "put in another day." Never a single rush of joy for my work. For some men I knew, each week meant a succession of big deals crowned with big rewards. For me, Monday dragged into Tuesday, which crawled wearily into Wednesday, which finally overlapped into Thursday, and so on—until the welcome oasis of Saturday afternoon and Sunday at home. And then came another week, etc., etc., ad infinitum.

One day, in February of this year, came an incident which was later to mean a great deal to me. While getting together some data for our salesmanager (who had only been there a short time) I overheard part of his conversation with one of his salesmen.

"Willis," I heard him say to the salesman, "I'm *mighty* sorry that you have fallen down on your job. But I really knew when I came here that you would never make a good salesman. I knew it by your face, your carriage, and your manner of speech. Salesmanship isn't written on any part of you. I have given you your chance and you admit that you are misfit in your present position. But I feel sure that you could make an A-1 success in other work. Because a man fails in one line is no reason that he will not make good in another. I believe that you have the capabilities of an excellent office manager and if you wish I will see——"

The door slammed shut but my mind seemed to have been torn loose from its rut. Was *I* a misfit? Was *I* really in the position I was naturally fitted for? I had just drifted into this "clerk's job" eight years ago without studying myself for my biggest capacities. I merely wanted a job—and I got it. I *knew* I had the capacity for big things *in the right line*. But what *was* my right line?

For more than a week I tried to think it out and decide what was best to do. Finally I determined to ask the advice of the salesmanager himself. He had helped Willis and perhaps he would help me. It would do no harm to talk with him and he might be able to help me make a decision.

So I put the whole matter up to him, and asked him to give me the benefit of his opinion.

I felt his keen gaze bore through me as I spoke. Instinctively I knew that his ears were listening to my story but that his eyes were making a sharp estimate of their own.

Finally he spoke. And to my amazement, he solved the whole problem for me. "Henning," he said, "you have been swimming against the current, I do not believe that your *real* work is at a clerk's desk. It might seem that I am hasty but my judgment is usually right. You could, I firmly believe, make a real success as a salesman. I'm willing to give you the chance. If you *don't* succeed, then it will be one of the very few mistakes I have ever made in sizing a man up by his face."

Well, I *did* succeed. I knew it—because money talks and my salary tells me so. I am known as one of the best salesmen in the firm. And now, instead of looking on my work as drudgery, I enjoy it as a great game. Thru my salesmanager's courtesy, I have learned to read character at a glance from the little course he studied and which the publishers sent me for free examination. I find it of immense help to me. Most of us know a few things about character readings. We know that a high forehead indicates the intellectual type—that a receding chin denotes weakness while a pronounced chin means determination. But often these signs are counterbalanced by others which are just as apparent but which the average person doesn't recognize. Consequently we often jump to conclusions about people which later prove incorrect. It's like trying to read a sentence by looking at the first one or two words.

It's all as clear as a book when you know the simple alphabet of signs that spell out a man's character and mental "slants"—an alphabet that is surprisingly easy to learn and of remarkable value to apply. People with whom I had never been able to get along I now number among my best friends. I am popular with my co-workers and receive their hearty co-operation and good-will. In my business dealings, when I approach a prospect I know immediately whether to use tact or sweep him away by enthusiasm—whether to get right down to business or open up in a roundabout way—what angle of talk will make the best appeal to each man and what arguments will clinch him.

I know immediately just how to deal with everyone I meet. I know how to interest them, how to appeal to them most effectively, how to touch their "responsive chord." I can gauge at once their tastes, mental traits, temperament, and personality. Immediately upon meeting a man I know how to make him my friend. At least 40 per cent. of the credit for my success I attribute to my easily-acquired ability to read at sight the character of everyone I meet.

Just as Nature intended that the normal condition of our bodies is perfect health, so the normal condition of everyone is perfect success. We are all meant to be a success at *something*. We all have the capacity within us to achieve big things *in the right line*. If we are not a big success, it is merely because we are in the wrong occupation. Napoleon was a failure at authorship. Florence Nightingale failed as a social favorite. Grant was a failure at everything until he became a soldier. These were their *wrong* occupations. We all have the germ of success within us—the capacity to do big work in some one line. The thing to do is find out what *your* line of work is.

Dr. K. M. H. Blackford has helped thousands of men find out the work for which they were best fitted to achieve big success. This famous character analyst has been retained at record fees by such corporations as the Westinghouse Electric and Manufacturing Company, Scott Paper Company, The Laurentide Co., Ltd., and many other big concerns, to pick and place rightly the men they employ. And 98 per cent. of Dr. Blackford's selections—regardless of their previous experience—made good at the jobs in which they were placed.

Dr. Blackford has helped thousands of others and is now ready to help you. A good many of us are just plugging day in and day out at work we are not naturally fitted to do, work we do not like, work we can never fully succeed at. We swim against the tide, trying to fit our given set of talents to the wrong job. But thru Dr. Blackford, we can now all judge in just what line our biggest success lies. And we can learn the worthwhile secret of knowing, in one quick survey of their features, physique, gestures, and habit of conversation, unerringly the character of every person we meet—of looking *into* people and *through* them, instead of *at* them.

Thru the little course of lessons in "Reading Character at Sight" now being distributed by Dr. Blackford, we can know, the minute we lay eyes on people, how to make them our friends, in either a business or social way—how to talk to them, how to influence them to the best advantage. Thru the secrets given by Dr. Blackford, we can get a better line on the folks we meet than the friends who have known them for years.

Thousands have already benefited thru the course. Some have decided thru it just what their life-work really is. Others have saved themselves from business disaster and unscrupulous partners. Many others have avoided hiring men whom they knew at a glance to be dishonest and unreliable. Many salesmen use the knowledge they have gained to judge and approach their prospects. Executives use it to deal with and judge their employes. Doctors use it in dealing with their patients. Lawyers find it of great help in their court work and in their actions towards clients. Public speakers employ it in judging their audience, and in debate.

And besides its great practical value this course in "Reading Character at Sight" is as fascinating as a game to use in your social life. Written on every man, woman, and child are signs, as clear and distinct as tho they were written in letters a foot high, telling their character. Mouth, nose, chin, eyes, voice, gestures, carriage—each tell a story, which averaged up, give a complete outline of a person's character. And a fascinating pastime it is to be able to tell a person's innermost nature by glancing at him.

Entire Course on Free Examination

This ability to analyze character immediately and without error can easily be yours. It is not a gift. There is no trick or second sight about it. It is not a supernatural mysterious power. It is merely the immutable rules of science, practically applied. You can do it as infallibly as Dr. Blackford. This new course in "Reading Character at Sight" in seven simple and fascinating lessons will be sent to you without cost, for examination. You can judge for yourself just what the course will mean to you before you decide whether or not you want it, return it and forget the matter. Otherwise mail its reasonable cost of $5. The coupon printed below will bring you the entire course for free examination without obligation. Use it.

LEARN WIRING

Earn $30.00 to $60.00 a Week

POCKET SIZE
LEATHER COVER

This Latest Edition of "STANDARD WIRING"

Will Make You An Expert Wireman

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or for A. C. single, two or three-phase.

OUTSIDE WIRING—Pole line construction, line wires, service wires, roof structures, poles and their dimensions and weights, and how to erect and protect them and wires they carry. Insulators, guard arms, guy anchors. Tree wiring, splicing, service and entrance wiring. How to install Lightning arresters. Transformers with diagrams and instructions.

INSIDE WIRING—when and where to use rubber covered, slow burning and weatherproof wire. How to find the proper size of wire to use for lamps, motors or heating devices for any current, voltage and drop, either by formula or by the many tables that are given in this section of the book. How to wire for two-wire or three-wire systems. Direct current, two-phase and three-phase with formulae and tables, with examples worked out for each system and in a simple manner that anyone can understand and use. How to run wires on walls, ceilings, floors, through partitions and walls and in concealed places, damp places and where dangerous surroundings exist. When and where to install Switches, Cut-outs and Circuit Breakers and just how to do it. How to wire for high and low voltage systems and the precautions to be taken. The proper way to install Knife and Snap Switches, Cabinets and Cut-out Boxes, Outlet, Junction and Switch Boxes, Panel Boards, Wooden and Metal Raceways. How to install complete interior conduit jobs either for rigid metal, flexible metal or flexible non-metallic conduit. Concealed knob and tube work or armored cable. How and where to install and wire electric and combination lighting fixtures. How and where to use flexible cord and where not to use it. How to install arc lamps and gas filled lamps and the fixtures and rules required.

LIGHT AND ILLUMINATION—What is meant by proper and efficient illumination, the latest data on Mazda and gas filled lamps of every candle power and wattage. Direct, indirect and semi-indirect illumination and where each should be used. Illumination required for various classes of service from show window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors.

Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.

The most complete and accurate Book on Wiring and Construction published

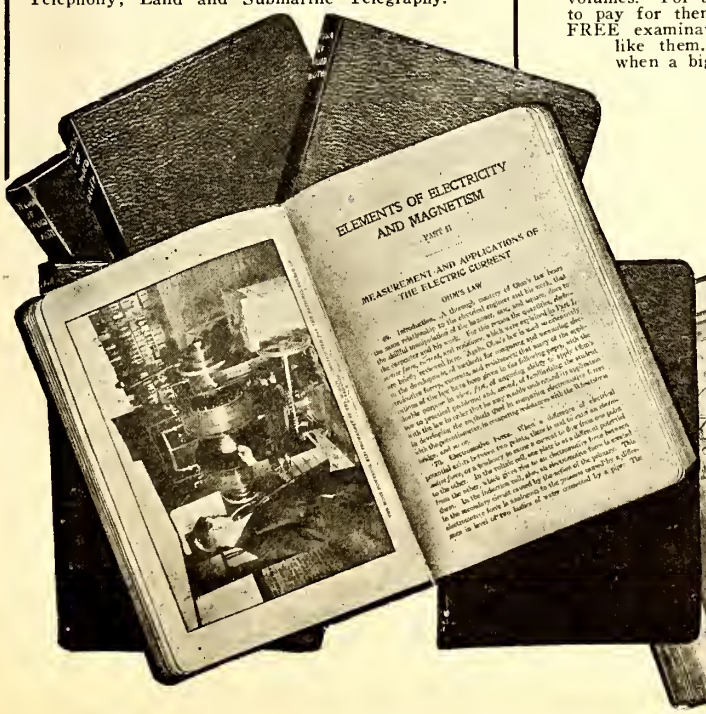
Dr. Charles P. Steinmetz,
Chief Consulting Engineer of the General Electric Company, has said that, "The world needs men who know something of electricity, of the operations and control of electrical power. It needs men more every year, its very existence depends on the electrician."—*Electrical Experimenter, June, 1919.*

What a Knowledge of Electricity Would Mean to YOU



A real job with a man's size salary—that's what it would mean. It's easy to get it if you know electricity. Electricity is the biggest force in the world today. It's one of the best paying fields a man can get into. Just see what the great Steinmetz says about electricity—"the very existence of the world depends on the electrician." That's the kind of business to be in for real money making. Get into it as quick as you can—train yourself at home—in your spare time.

8 Great, Big VOLUMES

3800 Pages—2600 Pictures

Clearly Covering

Elements of Electricity; Electrical Measurements; Electric Wiring and Lighting; Underwriter's Electrical Requirements; Theory, Calculation, Designs and Construction of Direct Current Generators and Motors; Types of Generators and Motors; Management of Electrical Machinery; Electric Lighting; Alternating Current Machinery; Power Transmission; Electric Railways; Power Stations; Switchboards and Switching; Storage Batteries; Applied Electro-Chemistry; Electric Elevators; Electric Welding and Heating; Wireless Telegraphy and Telephony; Land and Submarine Telegraphy.

The Cyclopedia of Applied Electricity

The world's greatest electrical books will fit you to hold the biggest kind of a job. They were written by the engineers and experts that helped to make electricity what it is today. These men know what you need. They give you 50 year's of electrical experience at your finger tips. Plain, everyday language and thousands of pictures make everything as simple as A B C. Glance over the partial list of what the books contain and see our offer that gives them to you a whole week free. Mail the coupon today.

Reduced Price—Year to Pay

The regular price of this great library is $5.00 a volume—$40.00 for the set of 8 volumes. For a limited time though you can have the whole set for $24.80 and take a year to pay for them. This is less than one cent a day for each volume. Entire set sent for FREE examination—no money in advance—return the books at our expense if you don't like them. **Mail the Coupon Now.** Don't be satisfied with an ordinary job when a big one is open to you.

AMERICAN TECHNICAL SOCIETY
Dept. E-259 **CHICAGO, ILL., U. S. A.**

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,500 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Special Automobile Ignition Course

We have just installed a special automobile ignition course for auto mechanics, garage men and owners. The course covers completely ignition, starting, lighting and other electrical equipment in connection with automobiles, motor boats, etc.

Let us explain our complete courses to you in person. If you can't call, send now for 64-page book—it's FREE to you.

New York Electrical School
29 W. 17th St., New York, N. Y.

Please send FREE and without obligation to me your 64-page book.

DEC 27 1919
U.S. PATENT OFFICE

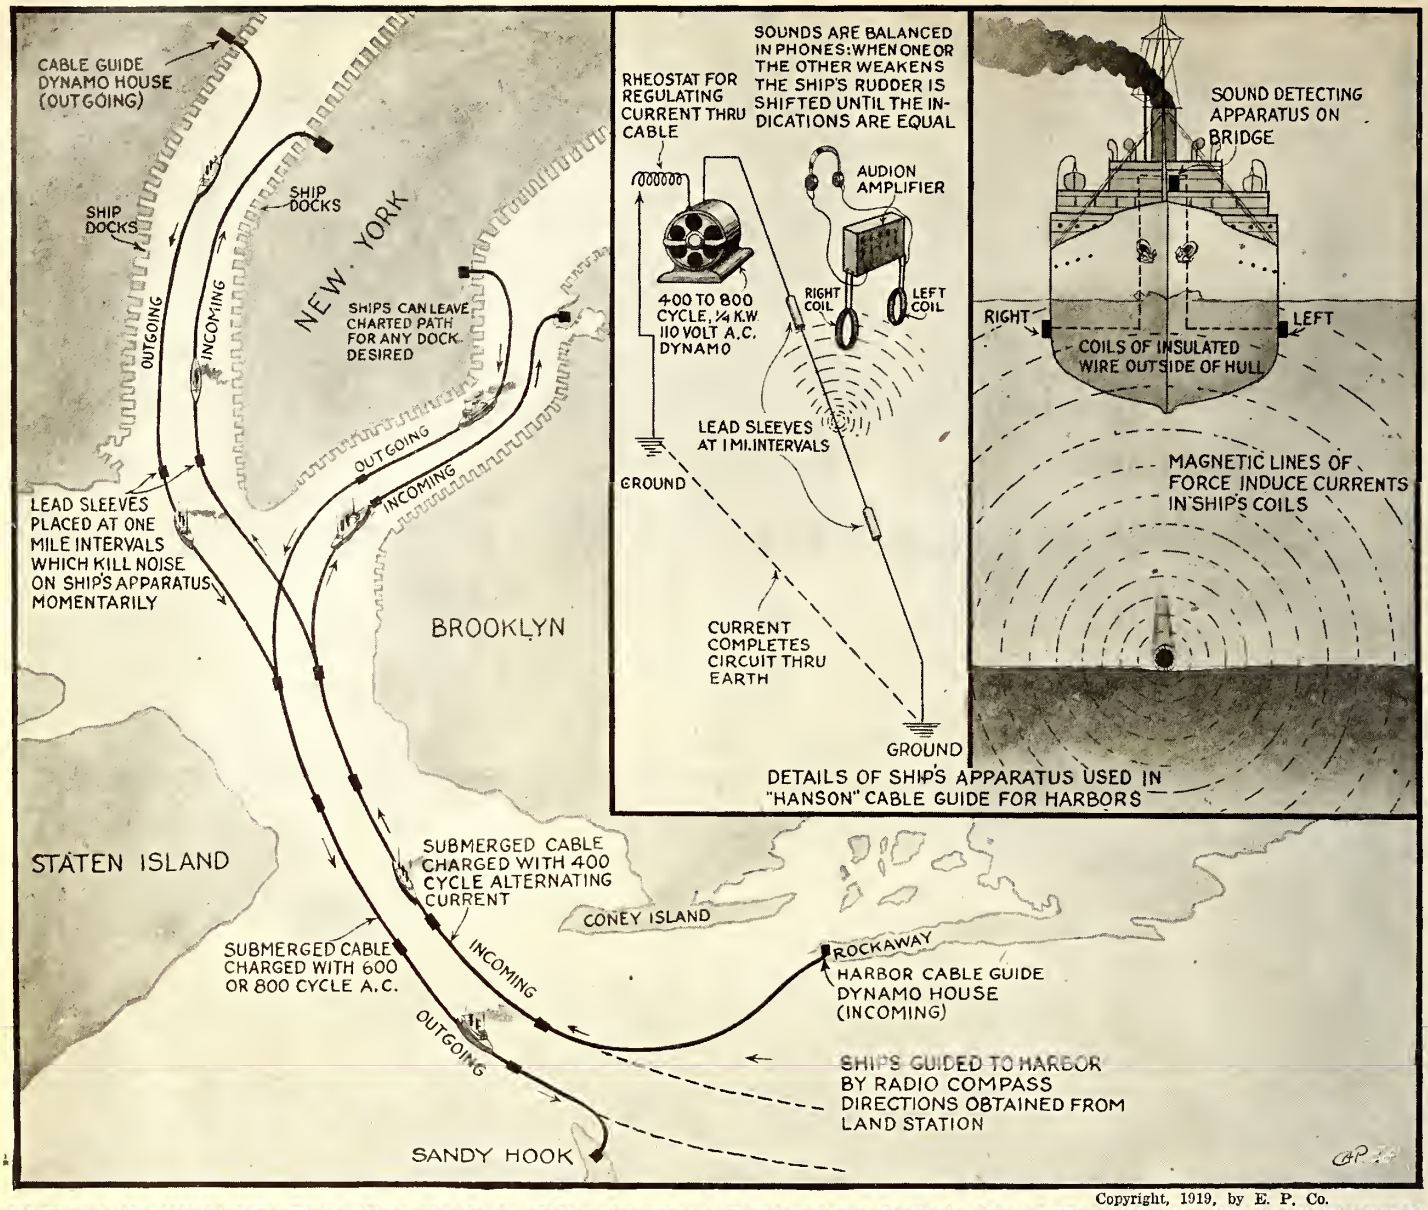
Submarines to Salvage Sunken Ships

THE submarine proved to be one of the most effective and formidable sea devices ever conceived during the course of the World War, and now a Yankee genius, Mr. George Wall, comes forward with a peace-time suggestion for utilizing the principle of the submarine to raise some of the thousands of ships sunk during the war.

The accompanying illustration shows Mr. Wall's suggestion in practise. One of the basic principles underlying this new *submerging-pontoon* salvaging craft, is that of the great buoyancy produced when such a large air-tight chamber as a submarine is filled with air while submerged. The lifting power or buoyancy of such a pontoon of the size of a submarine, is tremendous, especially when it may have a length, let us say, of from 500 to 600 feet. These pontoons could be submerged to any depth while seeking the wreck, in the same manner as submarines submerge, i. e., by admitting water into the submerging tanks. When it is desired to rise to the surface, this water is blown out of the ballast tanks by comprest air.

Copyright, 1919, by E. P. Co.

A New Scheme for Salvaging Sunken Vessels Proposed by a Yankee Genius, and Comprising Salvaging Craft Constructed in the Form of Gigantic Submarines, Which Can be Sunk When Desired and Their Immense Buoyancy Utilized in Lifting the Wreck.



TWO SUBMERSIBLE PONTOONS USED

The submarine-pontoon of which two or more may be used in raising an ordinary size vessel, are not tied together mechanically, but may be anchored to each other when desired, by means of steel girders. A number of powerful, motor-operated derricks are placed along the decks of the salvaging pontoons, and from these a series of steel cables depend downward. At the start of the salvaging operation on the wreck, divers are employed to pass cables around under the hull of the boat. The free ends of these cables are caught and brought up to the surface where they are fastened to the lifting derricks of the second pontoon.

Such a salvaging outfit possesses many advantages over the surface type of craft, which cannot submerge, and under many salvaging conditions it is often impracticable to lower a diver down to the scene of the wreck, owing to the long lengths of air-hose, hoisting cables, etc., which have to be used. With the present invention, it is possible whenever necessary, to submerge the pontoons and keep them submerged the same as any ordinary submarine, for several hours. These pontoons may be fitted with powerful electric

Copyright, 1919, by E. P. Co.

All During the World War There Were Hundreds of New Inventions Developed and Applied. One of These Was the "Hanson" Electrified A.C. Cable, Buried in the Mined Regions Where Our Ships Had to Travel. By a Suitable Listening Device Aboard the Ship the Navigator is Enabled Instantly to Ascertain Whether or Not He is Out of the Proper Course. A Great Stunt for Foggy Weather.

Ships Guided by Electrified Cable

THE marvelous "fog tamer" invented by Earl S. Hanson, a young Los Angeles scientist, is to be thoroly tested by the Navy Department, it is said. The Hanson invention marks an important step to make practical what has been called the greatest development in marine travel since the discovery of the steam turbine.

Mr. Hanson's device makes it possible for steamships to navigate any channel with perfect safety, no matter how winding or treacherous, thru the heaviest ocean fogs or under the most adverse weather conditions. It will prevent the tying up of shipping outside of harbors while vessels wait for the weather to clear so that they can navigate the channel. Steamship service between New York, Liverpool, Brest, Southampton, Cherbourg and other channel ports will be as regular as railroad passenger trains arriving in the giant terminals of New York.

Tests will be made at once at the naval base at New London and later a greater test with some of the biggest liners of the world, such as the *Leviathan*, will be made in Ambrose Channel, New York harbor. Material has been shipt to New London for the first test and men have already been detailed for this work. As soon as the official tests prove satisfactory all the great ports of the United States will be equipt by the navy with the device to defy fog, hail, rain, snow and sleet.

By the use of the new invention in connection with the radio compass which the navy has now perfected, all danger or delay in ocean travel due to weather is absolutely eliminated.

The radio compass brings all shipping in sight of land and the new device, like a friendly hand, reaches out and takes the biggest of ships thru the most tortuous channels safely and quickly to its pier.

The new device is simplicity itself. A cable is laid in the center of the ship channel. Thru it is sent an electric current of low frequency which thru the listening devices on board ship gives off a sound of certain pitch that cannot be mistaken for any other sound. The ship hugs the cable from harbor line to the dock. On the bridge and in the captain's cabin listening devices like telephone receivers are placed and attached by wires to the hull of the ship. The ship follows the course of the cable. Any variation away from the cable is indicated by visible indicators (sensitive galvanometers connected in the receiving coil circuits), which show in feet the distance away from the cable, and the ship is then put back over the cable by the steering rudder in the usual way. By the ear receivers the indicator may be confirmed at all times.

Vessels going into port will use one cable; those coming out another. *The sound on each is different* and there can be no confusion and therefore no collision.

Along the cable, at mile intervals, a section is sheathed with lead. Thru this no sound can come and therefore the man on listening duty can tell instantly how far the ship has progrest, and by the cable chart in front of him, can tell where the cable turns and where the ship must be steered to follow the curve of the cable and the center of the channel. The new device, according

Did the Romans Have "Wireless"?

"WIRELESS telegraphy is new; wireless communication is as old as Biblical times." With this trite statement the National Geographic Society quotes from a communication by John A. Kingman, who sets forth the interesting theory that the island of Capri was an imperial wireless station of ancient Rome.

"We know that the ancients signaled in various ways and over long distances," he says. "They signaled by beacon fires, by beacon smoke, by pigeons, by flags, and by shouting from one sentinel to another.

"Lighthouses are as old as the earliest chapters of the Bible. Beacon fires and beacon smoke were commonly used by the early Greeks, and there was no reason why the more practical Roman should not have employed inproved methods, such as *heliographing*.

HOW ROMANS USED GREAT MIRRORS.

"We do know that at the siege of Syracuse by Marcellus mirrors were employed by Archimedes; and tho we may doubt the burning of vessels from shore by mirrors, as stated on that occasion, we can appreciate the blinding effect of many mirrors on the eyes of the navigators of the attacking vessels. That is what probably happened during that conflict. At any rate, it shows that the great Archimedes, at least, had found some use for mirrors other than the usual one.

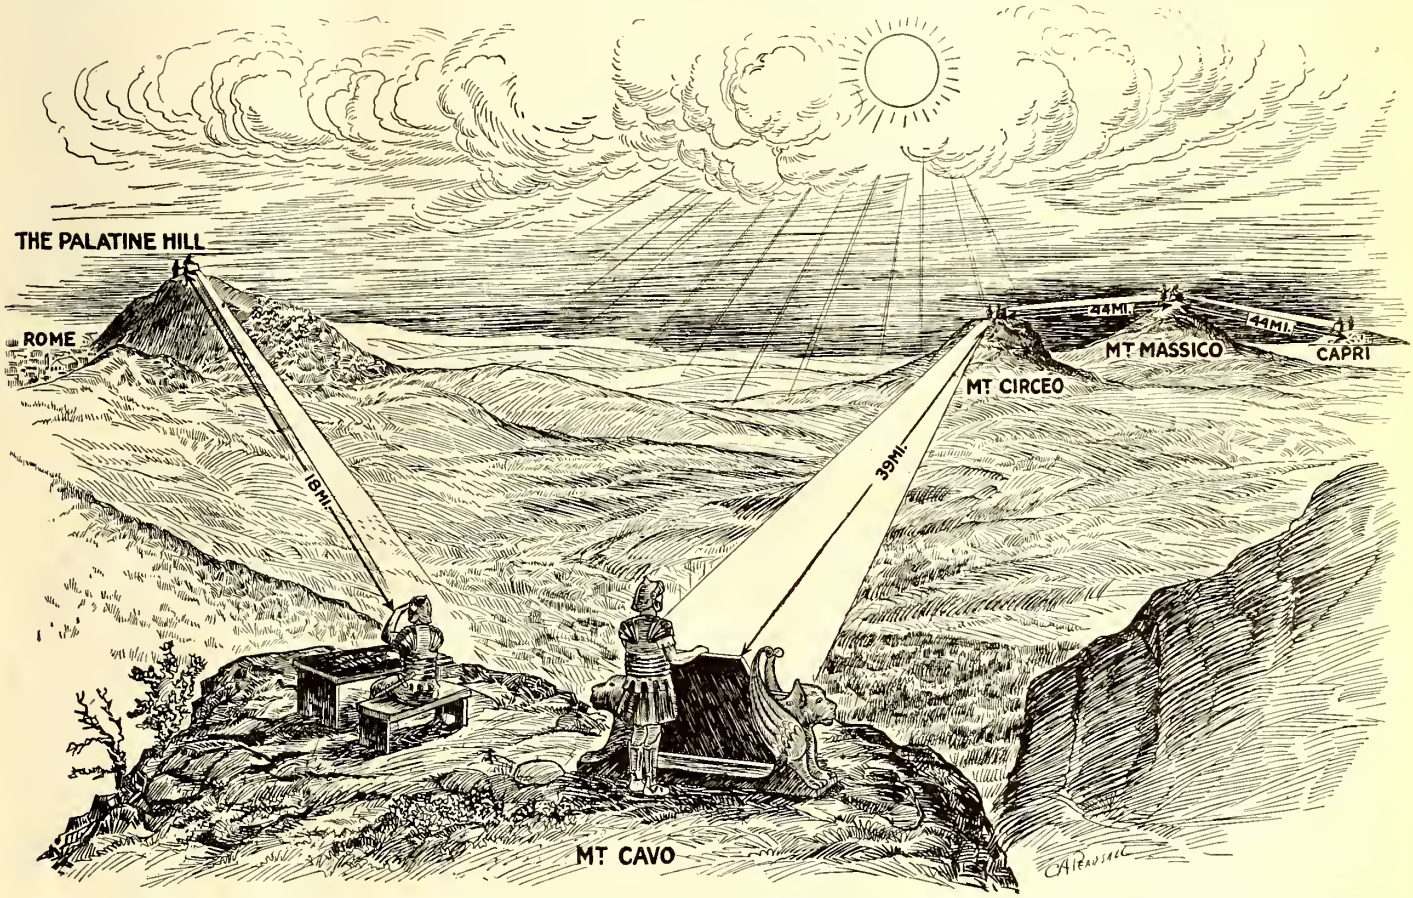
"In Imperial times the Romans had mirrors large enough to reflect the entire person; they even had mirrors of glass backed with tin instead of quicksilver.

"Signaling was certainly a common military practise among the ancients, and ancient writers, such as Virgil, Aeschylus, and Herodotus, frequently alluded to it.

"An interesting case of long-distance signaling by relaying is mentioned by Herodotus, in which it appears that certain tidings were sent to Xerxes in Asia by means of a line of beacon fires arranged thru the Greek islands.

"The ancients went further than simply announcing some prearranged message; they had codes and sent long messages. The Greeks signaled on one occasion 100 miles at one jump. This was from Mt. Chigri, 1,698 feet, to Mt. Athos, 6,500 feet.

"Gallup's Hand Book of Military Signaling states that 'under favorable conditions the distance to which messages may be sent and received is only limited by the curvature of the earth'; also, that 'square mirrors are better than round ones only because they contain about one-quarter more reflecting surface for the same packing space.' Round mirrors are used now. Mirror signals have been seen with the unassisted eye at distances of 160 miles. While this is, perhaps, a record, and tho there is no statement as to the size of the mirror, it probably did not exceed twelve inches square.



"The reasonableness of the Capri 'wireless' station theory tempts one to speculate as to how much signaling was done and how it was done. It will be remembered that Tiberius, the unpopular successor of Augustus, spent eleven years of his reign on Capri, and without coming to Rome directed most successfully the affairs of the vast empire. He even foiled the conspiracy of his trusted minister, Sejanus who was supposed to have general charge of affairs after Tiberius retired to the island.

"Tho Tiberius went to Capri, an old man, he was the actual ruler—emperor, in fact—and his heavy hand was felt all over the empire until the very end. With regular news bulletins and reports, received daily if need be, containing confidential information, he would be able to issue instructions and manage affairs as thoroly as if he were in Rome.

"Possibly the *Publica acta* (Senate Journal) and the *Diurna acta* (authorized news) were sent to Capri by signal instead of by messenger. We can conceive that such a system, organized most likely under Augustus, must have operated very smoothly after some years of experience and practise. I hazard the theory of mirrors because of its simplicity and convincing character. Signaling by beacon seems too primitive for the wonderful civilization of the empire. Of course, at night-time beacon fires would have to be employed; mirror signaling was a fair-weather method.

"The distance in an air line between Rome and Capri is 130 miles—too long for direct signaling; but if we look along the coast of the Tyrrhenian Sea we find numerous mountains affording points where the signals could be relayed. The frequency of the relaying would depend on the conditions. The highest point on Capri is Monte

(*Continued on page* 832)

There Is Nothing New Under the Sun, Not Even "Wireless." It Now Appears That the Ancient Romans Already Had a System of Sending Messages Over Several Hundred Miles Merely By the Use of Mirrors,—a Sort of Heliograph. This Illustration Shows How It Was Possible to Telegraph from Rome (The Palatine Hill) to Capri, a Total Distance of 145 Miles. Our Illustration Shows How the Flashing of Signals Was Accomplisht During the Day Time. At Night, Fires in Front of the Mirrors No Doubt Were Used.

Thomas A. Edison Speaks to You

By H. Gernsback

MR. EDISON having kindly consented to speak to the readers of the ELECTRICAL EXPERIMENTER, an interview with the illustrious inventor had been arranged for during the latter part of October of this year.

This interview, by the way, has some history attached to it. During the early part of 1917 a similar appointment had been made to interview Mr. Edison on the same subject. But just then the great war broke out and Mr. Edison, who, as is well known, was immediately appointed the head of the Naval Consulting Board, broke off all engagements, devoting himself day and night to the welfare of his country. For this reason the interview only took place a few weeks ago.

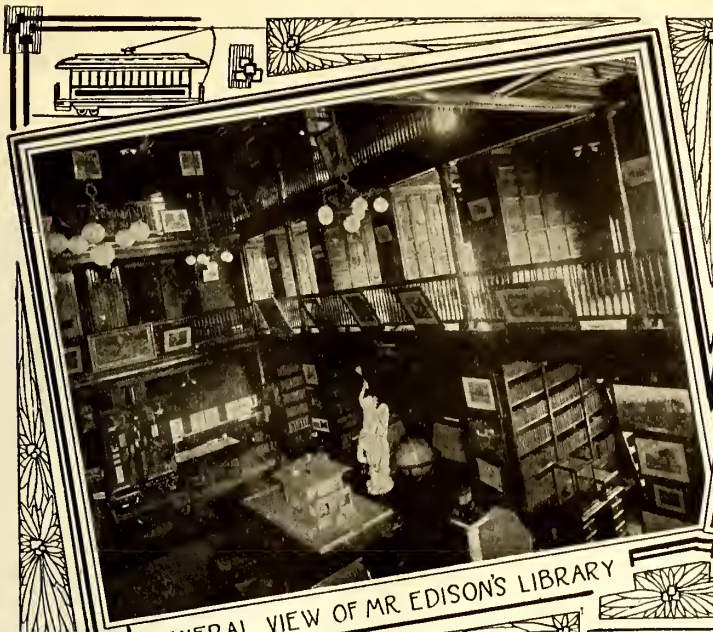
THIS is the first interview which Mr. Edison has given out for some years past.

Mr. Edison, who, as is well known, was elected Chairman of the Navy Consulting Board at the outbreak of the world war, was taken up with important duties, refusing to see all visitors. Even several years before this, no general interviews were given out. In this story are covered many points of interest not only to all experimenters and the man interested in science, but to the world at large. Much that is new has been presented here, and it will be noted with satisfaction by all that at the age of seventy-three, Mr. Edison's mind is as keen and clear as ever. We are certain our readers will appreciate this important article. Nearly all of the photographs and illustrations appearing in this story have never been publisht.

I ARRIVE AT MR. EDISON'S LABORATORY.

I arrived at West Orange on a crisp October morning and was soon in the little gate house which protects Mr. Edison from a curious public. Plain and modest as it is, the little red house has past thru its gates hundreds and thousands of the world's most famous men and dignitaries. Few such modest little houses, if any, have held under their roofs such an array of famous people who have come to pay homage to one of the greatest inventors the world has ever known.

In this little gate house is located the famous time clock on which Mr. Edison rings in his time and rings out every day of the year, many holidays included. An inspection of his week's time card revealed that Mr. Edison had invariably been at the laboratory before 8 o'clock in the morning and had worked as many as eighteen hours for three days at a stretch. Only once did he have a twelve-hour day. Right then and there I wondered how Mr. Edison felt about the now so popular eight or six-hour day, and I meant to ask him about it, but we became so engrossed in other more important questions which are moving the world, that altho we touched upon this subject, the eight-hour day question was never broached by me.



After passing thru the gate house, I made my way to Mr. Edison's library, where I was welcomed by Mr. W. H. Meadowcroft, his trusted and capable friend and secretary. While waiting for Mr. Edison, who was just then engaged with some chemical experiments, Mr. Meadowcroft pointed out all the interesting objects of Mr. Edison's library. This library is a huge affair and, besides containing electrical, chemical and physical reference works printed in almost any imaginable language with English, French and German predominating, many other curiosities are to be found here. There are many dozens of autographed photographs of famous men hanging about the walls, as are famous historic photographs portraying this or that view of an important phase of Mr. Edison's great discoveries, such as the electrical traction, the electric light, the phonograph,

The Only Authentic Photograph of Mr. Edison's Hands Ever Taken Publisht Here for the First Time. The Spots on the Hands Are Chemical Stains Which Could Not Be Washt off at the Time the Picture Was Taken. IF THE WORLD WERE CALLED UPON TO MAKE AN INVENTORY OF WHAT MR. EDISON'S HANDS ACTUALLY WROUGHT IN ENRICHING THIS PLANET, THERE WOULD NOT BE GOLD ENOUGH TO PAY HIM.

MR. EDISON WITH ASSISTANTS LISTENING TO PHONOGRAPH RECORD

www.americanradiohistory.com

The Illustration at the Left Shows a Photographic Reproduction From One of Mr. Edison's Note Books. It Is Nothing Less Than the Now Historic Proof of the Invention of the Phonograph. It Shows the Conception of the Idea Plainly. On July 18, 1871, Mr. Edison Was Making Some Experiments Which Had Nothing To Do with the Phonograph. As a Matter of Fact It Seemed To Be More or Less Nebulous In His Own Mind, for at the Top of the Page He Wrote "Speaking Telegraph." The Part of Interest to History Is Found in the Foot Note of the Page, Which Reads as Follows:

"Just Tried Experiment with a Diaphragm Having an Embossing Point and Held Against Paraffine Paper Moving Rapidly. The Speaking Vibrations Are Indented Nicely and There Is No Doubt I Shall Be Able to Start Up and Reproduce Automatically at Any Future Time the Human Voice Perfectly."

Note Also the Two Witnesses' Names Under the Date, at Top of Page. The Other Page Shows a More Recent Sample of Mr. Edison's Handwriting. It Is From One of His Memorandum Books and Is Dated December 6, 1907. Note How Much Attention Mr. Edison Pays to Record Even Trivial Experiments, Also His Characteristic "N. G." In Two Places. The Changed Handwriting After an Elapsed Time of Thirty-Six Years Is of Great Interest.

the moving picture and many others. A huge white marble statue immediately catches the eye. Mr. Edison brought this from Paris at the time of the World's Exhibition in 1889, it having caught his fancy. The marble figure represents a boy seated upon a broken gas lantern, holding aloft triumphantly an electric light. Another object of recent dating is a solid cubic foot of copper weighing several hundred pounds mounted upon a mahogany pedestal. This solid piece of copper, made by Tiffany and suitably engraved, was presented to Mr. Edison by the copper interests of this country as a tribute to the great inventor. This symbolic gift can be better understood when it is realized that fully 50 percent of most of this copper is used for lighting purposes, which art was founded by Mr. Edison.

In this library I also inspected the famous "bed" upon which Mr. Edison catches a little sleep when he is engaged in day and night work at the laboratory. This cot is a very prosaic affair, and is located in the corner of the library amidst books and other curios. It is a bed in name only, for it is comprised of nothing but a mattress, pillow and a blanket.

On one of the walls, we also find a complete history of Mr. Edison's Alkaline Storage Battery, exhibited on a large wall board. This is graphically shown by displaying every part, chemicals included, that go into the making of this famous non-lead battery. The thing that most interested me in Mr. Edison's library, however, were his notes, and right here we find one of the pregnant reasons for Mr. Edison's great success.

MR. EDISON'S LABORATORY NOTES.

As is well known, few inventors have made their inventions pay. They are usually "inventors"—and that is all. Mr. Edison, on the other hand, aside from being an inventor, is also an excellent business man. Mr. Edison is systematic and knows the value of notes. He won many a patent suit on account of his notes written dozens of years ago. Early in his career it was brought home to him that when you have an idea, a record should be made *at once!* This was so engrained into his system that it is almost an impossibility for him to make even the most trivial experiment without making a careful record of it. Mr. Edison writes his notes in pencil, and at the end of the day the notes are carefully put away. Each month these notes are bound into a book, where they are kept for further reference. The office staff card-indexes his experiments and cross-indexes them, so at any time Mr. Edison can readily find any one experiment he made during the month, or, for that matter, any experiment that he made 25 years ago, if necessary. The notes are invariably made on yellow paper on ordinary scratch pads, the pages measuring about four by six inches. Being systematic, Mr. Edison always uses the same size pad year after year, and it is therefore refreshing to see the same sized sheets, and the same kind of paper made into bound volumes. While I was still inspecting some of these note books, many of which contain priceless data, Mr. Meadowcroft was informed by telephone that Mr. Edison was ready to receive me.

We walked across an open space separating the library from the chemical laboratory, and Mr. Meadowcroft explained that the building in which Mr. Edison was working that day was known as the chemical laboratory. Mr. Edison, however, does not work in the same laboratory all of the time, but for the past

"Slow Movies" Analyze Motion

THIS camera is known as *Novagraph*, and is an ultra-speed camera According to its inventor, Mr. Charles Watson, it is the result of years of hard study and costly research work, together with intense concentration and experiment. The camera is "cranked" the same as any ordinary motion picture camera, i.e., by hand, and exposes the film to the subject at the rate of 160 *exposures per second*, as compared with the usual *sixteen exposures* of the ordinary motion picture camera taken in the same interval of time. In projecting the film at the normal speed, sixteen pictures per second, the audience views the screened picture *slowed down to one-tenth the usual rate*, thus affording a perfect eye analysis of every motion of the subject. One hundred and sixty exposures per second does not mean that this is the maximum speed at which this camera can be operated. At any time the exposures, if need be, may be speeded up to 200 per second, or even 300, if necessary. In this case, however, the projection would be unduly slow, and quite unnecessary for making the essential analysis of ordinary motion. Needless to say, this camera is of enormous value, and its value lies particularly, perhaps, in its efficiency in scientific work. By means of the Novagraph, wonderful photographs of surgical operations have been taken, and the dexterous manipulation of instruments is made so clear that even an amateur is prompted to attempt the skilled operator's work. The Novagraph recently played an important part in taking photographs of heart actions and medical subjects, at which time Dr Samuel W Lambert, late Dean of the College of Physicians and Surgeons, Columbia University, exprest his highest approval of the wonderful work of this machine and immediately recognized the opportunity of the "slow" motion picture camera in medicine and surgery. At the Convention of Physicians and Surgeons in June at Atlantic City, members from all over the world were tremendously impressed with the above-mentioned motion picture. So much so, that Dr. M. C. McBride stated that never before had the members of the audience broken out into such spontaneous and tremendous applause.

Photographs were taken of the heart and lungs, in which case the movement of the oricles and ventricles of the heart were brought out so clearly that it seemed as tho the heart were being moulded into its various forms. Every little spasmodic contraction was instantly noticeable, and the analysis of its motion rendered complete to the finest detail. Twenty-pound bulldogs were used in conducting these experiments, and as daylight was not powerful enough to enable the camera to attain its best results, 7,200,000 candle-power Sunlight arcs of the new Sperry design were used.

The Advent of the "Slow Movie", as It is Called, Has Clarified for Us Many Hitherto Foggy Scientific Facts. Did You Know That It Is Possible for a Running Horse to Get All Four Feet Off the Ground Simultaneously? How Does the Heart Look While Beating? Is a Man or a Woman the Most Graceful Swimmer? All the Views at Right Were Taken by the "Novagraph" Camera Between Two Successive Exposures of the Ordinary Movie Film Shown at Left. The Slow Movie Camera Catches Details Which the Regular Movie Never Shows.

Five hundred feet of film are run thru this camera in forty-nine seconds! Ordinary film traveling thru the camera at this rate would instantly burn up. Hence specially treated film must be used.

In the taking of slow motion pictures it is the general rule of the director to have two cameras placed side by side, the Novagraph and ordinary commercial camera, both cameras trained upon the same subject; the film is then "shot" at the same time. The positives of these films are then cemented end on end. Immediately on projection of the film taken by the ordinary camera, a small sub-title telling of the appearance of the same picture, but taken at the ultra-rapid speed, introduces the Novagraph *detailed analysis* picture on the screen.

In one case a famous billiard artist had photos taken of some very fancy and difficult shots—one in particular being a billiard ball leaping from the table into a wicker basket. When this photograph was taken with the ordinary camera the ball appeared in one frame only. With the Novagraph, however, which was taking pictures of the play at the same time, there were twelve such exposures, depicting the actual flight of the billiard ball into the wicker basket, proving that the Novagraph recorded twelve extremely rapid exposures to one of the ordinary camera. Very interesting pictures were made of the extent of deterioration of steel, and on photographing pictures when a test was being made of its tensile strength one could clearly see the breaking and rending of these steel rods Photographs of high explosives being used to blast rock were so distinct, and the analysis of the cringing movement and the shredding apart of these rocks were so clear as to make the ordinary layman express the greatest surprise that a blasted rock would cause such an intensely interesting scene.

A very peculiar phenomena happened recently in New Jersey. The high-speed camera experts were to take some interior photographs. When it came to the developing of these films it was found that the ordinary camera, which we said before always accompanies the Novagraph camera in the taking of such pictures, produced a most perfect film. In the high-speed camera, however, such was not the case. Every third film was absolute blank. *On inquiring into the cause, it was found that alternating current had been used for the illumination, and this camera had actually photographed the alternations of the current.*

We do not ordinarily perceive any alternations or pulsation in such a current which would be at once indicated by a distinct flicker

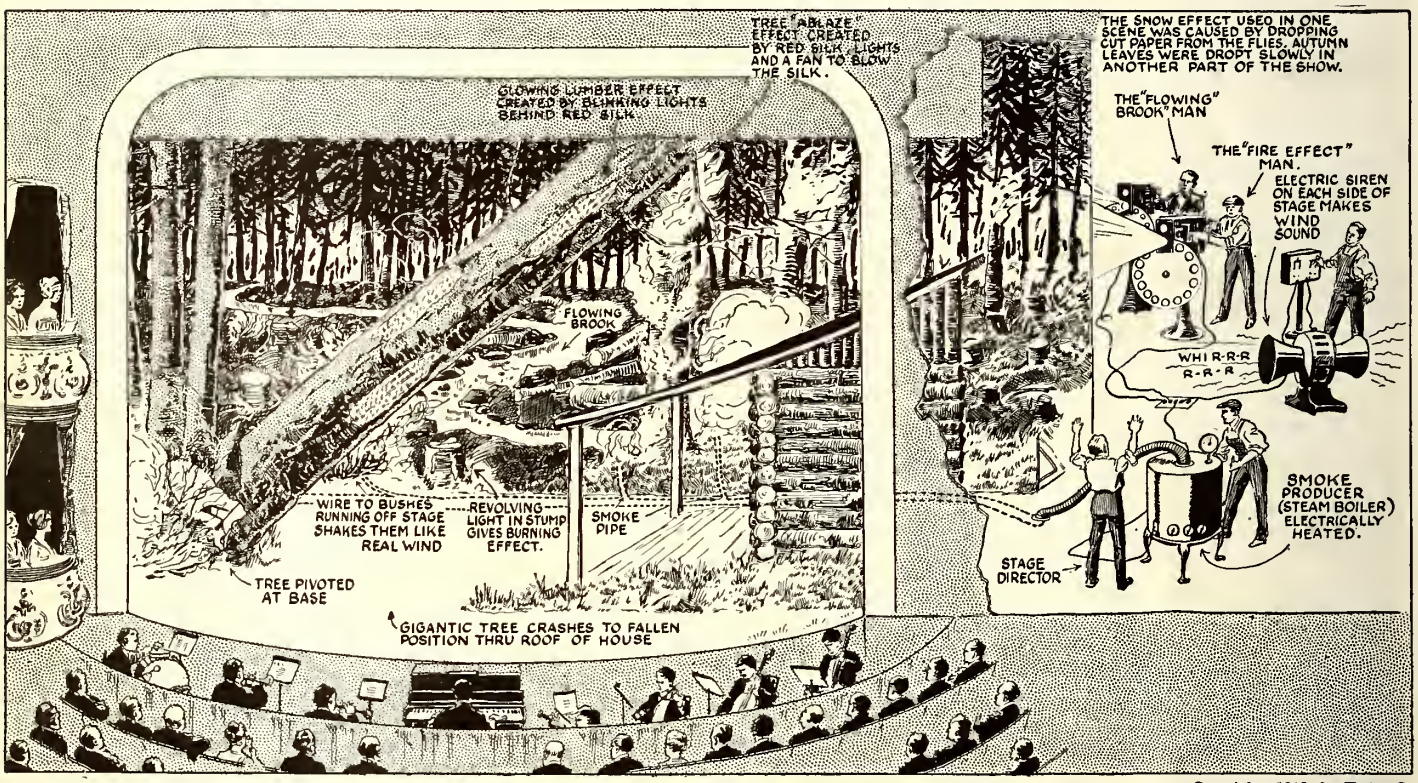
Mysteries of Stage-craft

How Electricity Makes Possible Modern Stage Wonders

By H. Winfield Secor

IT is a far cry from the present-day theater, with its thousands of electric lamps which can be flashed on and off in the twinkling of an eye, back to the gas-lighted theater of our grandfather's time. The stage electrician of the present generation is king of all he surveys, and a king he truly is, for he can mar or make any theater production. Some of the interesting things which are actually being done on the stage today are described in the following article—electrical and mechanical and stagecraft tricks which the audience never sees.

REVOLVING AND ELEVATING STAGE FLOORS.



In order to expedite the change of scenes in the more elaborate theatrical productions, especially those having several different scenes to each act, many novel ideas have been developed and installed in several New York theaters, including revolving, as well as rising and falling stage floors. Three different forms of these movable stage floors, which enable several different scenes to be set up at one time, are illustrated at figures one, two, and three. Each of these three ideas, for providing multiple stage floors, have been actually tried out and proven successful.

Figure 1 illustrates a rising and falling stage in use at one theater. Two platforms, each large enough to carry the stage setting as shown, are built in the form of a gigantic elevator; the top platform being separated about 20 feet above the lower platform, with steel girders at the ends and at the rear, where they will not show in the setting. Under the lower platform, which normally is level with the basement floor, there is placed a battery of *hydraulic elevators*, which operate by water under pressure. For the second scene shift, scene No. 1 may be set on either the upper or lower platform, and the second scene brought to the stage level in a few seconds by the hydraulic elevators. That is, considering that a two-act show is being put on. With a three-act show or a production having several acts with many changes of scenes, then at the start, scene No. 1 would be set on the lower platform, while scene No. 2 would be set on the upper platform. When the curtain goes up, scene one appears before the audience, the setting of scene two being 20 feet above the stage. The lights are then winked off for a few seconds, or the front curtain is dropt for a moment and raised again, when, Lo! and behold! the scene has changed! How is it done? Simply by operating the hydraulic elevator cylinders and plungers to lower the platform structure, so that scene No. 2 which was above the stage is now level with it, and the lower platform containing scene No. 1 is level with the basement floor, where the scene shifters immediately get busy and remove the scenery of set No. 1, and dress it with the scenery for scene No. 3.

The revolving stage which is in use in one of the largest New York play-houses, which is necessary as this circular floor is of quite a large diameter, is illustrated in use at figure 2. Two, three, or even four scenes can be set up at one time on this revolving stage. Where an elaborate musical comedy or extravaganza is to be produced with anywhere from 10 to 15 changes of scenery, the convenience and speed with which the different scenes may be changed and the show run off, will be appreciated. The revolving stage is rotated when desired by a throw of a switch, controlling an electric motor which rotates the platform thru a powerful worm gear underneath the floor. The platform rotates on roller bearings.

At figure 3, there is shown the checker-board scheme of quickly changing the scenes in a show. In one scheme now in actual use, the scenes for the three acts are set up on the right, left and rear scene platforms, as shown. These platforms are mounted on substantial rubber-tired wheels, so as to make a minimum amount of noise when the scenes are changed. When act No. 1 has been placed, the curtain is dropt and the platform carrying scenery for this act is rolled to the right, and the platform carrying the scenery for act No. 2, is pulled into place. One of these sets, including the platform, is quite heavy, and while it can be shifted by a number of men, recourse is had to a series of ropes fastened to the platforms and also to a powerful electric motor winch in the basement, whereby any

Scene from "The Storm" by Langdon McCormick, a Most Realistic New York Theatrical Production. In the First Act, There Is a Very Good Snow Storm Effect; the Bushes and Trees Swaying in the Wind as it Moans. At the End of the Third Act, the Audience Is Treated to One of the Greatest Masterpieces Ever Produced in Stage Settings,—a Sure-enough "Forest Fire" with Crashing Trees and Howling Wind,—and Not One Speck of Real Fire on the Whole Stage. In This Sensational Scene, the Fire May Be Seen to Creep Slowly Thru the Trees in the Distance. As It Gains Headway the Flames Leap Higher and Higher Until the Whole Stage Is Enveloped in Flames. Trees Fall, the Bushes and Underbrush Sway In the High Wind, and the Largest on the Stage, as Shown Above, Crashes Thru the Cabin Occupied by Burr Winton and David Stewart. The Incandescent or Burning Wood Effect on the Trunk of the Trees, Is Created by Electric Lights, Suitably Camouflaged Behind Colored Silk, Etc. Those Lights, Blinking on and Off, Enhance the Effect. Powerful Electric Sirens Produce the Wind Noise and the Creeping Fire Thru the Trees in the Distance Is Projected From Back Stage on to the Back Drop by Special Lanterns Provided With Moving Colored Discs.

An Aerial Passenger Rocket

OUR pleasure resorts and summer amusement parks have for many years tried to satisfy the whims of the proverbial "tired business man" and his family, not to mention the millions of others who flock to the great amusement parks at Coney Island and other national play-grounds scattered thruout the country. There are many hair-raising surprises to be found at all of the large amusement parks—such as scenic railways with dizzying inclines down which the passenger-laden cars rush at speeds greatly surpassing those of our fastest express trains, while the passengers proceed to yell and scream their delight as they dash at two-mile-a-minute speed into a pitch dark subterranean cavern made out of papier-maché with the aid of a glue pot, and then decorated by some clever artist to resemble a smaller member of the Rocky Mountain family. But aside from the steel-nerved lady and gent who have in the past few years delighted thousands at the big three-ring circus by looping-the-loop in mid-air in a real automobile or on a bicycle, there haven't been any real hair-raising and startingly new novelties produced in the Amusement World. The illustration here presented, shows a newly proposed amusement-park feature, which smacks decidedly of the essence of war, and while old man Mars and his spiked club, so familiar to our war-time cartoonists, has disappeared from favor in our national family life today, we hope, in fact we know, there is still a small fraction of the war-time spirit burning in the heart of everyone. So those who still think now and then of the war and some of the great deeds performed and the gigantic death-dealing machines developed during that period, will be interested in this new "Aerial Passenger Rocket" amusement device proposed by H. W. Secor and H. Gernsback of New York City.

You board this aerial passenger shell or rocket, on the ground, after which you are "loaded" by a powerful hydraulic plunger into the base of a gigantic comprest-air or electro-magnetic gun, which hurls you skyward with bewildering speed. The next moment you find yourself flying thru space with all the sensations of being imprisoned in one of the ex-Kaiser's dainty ltitle 42 C.M. shells, hurtling thru the upper air strata on its 70-mile journey toward Paris. The greatest pleasure of a trip in the new aerial passenger rocket is yet to come however. The next phase of the journey, all of which occupies the space of but a few seconds, so far, is when the passenger-carrying missile strikes the great mound of water at the top of the race-way or track, shown in the illustration. The water acts as a cushion, and prevents the shell from striking with a disagreeable jolt. All the while you, as a passenger, have been enjoying one of the most novel sensations of your life, thanks to the double-pivoted chair mounted on gimbal rings, and provided with a weight which stabilizes the chair constantly in a vertical position, and now you find yourself dashing earthward with express-train speed down a hollow steel raceway, along which the water discharged from the fountain at the top travels in its journey to the lagoon below. Directly you strike the water in your downward rush, there is a mighty splash as you strike the water and dash thru it, guided by the curved steel rails, until you return around the loop on your journey toward the starting point. As the shore of the lagoon is reached, the pasesnger-laden missile, acting under its own momentum, or else aided by a belt or link conveyor, such as used on scenic railways, is loaded onto electric cars of the type shown, which carry it along the track to the debarking station. Here the aerial rocket is unloaded and new passengers get aboard. The doors are closed and the human skyrocket starts on its journey toward the mouth of the "gun" once more. By proper design of the whole affair, it is possible for several rockets to be employed, the gun firing them at carefully timed intervals, a fraction of a minute apart. Of course, if one of the shells happens to get stuck on the water chute, and shell No. 2 comes sailing thru space directly behind it, then of course there will be a collision,—but that is nothing, for did you not start out to have a real sensation?—and you will have one sure enough, just the same as those you read of during the war, when one of the Hun's mighty shells and a French shell met in mid-air. Yes, this looks a little bit like a real accident, something on the order of the physicist's classic—"When an irresistable force meets an immovable body . . . . . etc."!!!??

Putting aside the smaller details, such as what kind of grease to lubricate the gun and what color to paint the projectiles, altho the inventors would like to see red, white and blue stripes painted along the tips of the shells, pointing rearward, we now come to some more serious problems. One of these is: What kind of a gun or projecting device can be used to hurl the shell skyward with possibly eight to twelve passengers with not too great a velocity, such as 12 K.M. per second, which would hurl the projectile away from Mother Earth so fast that little Johnnie and his sister would never come back to earth again to see Ma and Pa? Further, it should have enough speed to make the shell follow a carefully calculated trajectory, taking into consideration the ballistics of the air, and of course, the wind pressure, etc., all of which our able artillery officers are wont to tell us they have boiled down to such an exact science, that they can hit the head of a pin with a twelve-inch shell ten miles away.

As we were saying, this is one of the big problems, and four methods are proposed, at least one of which should certainly prove practicable, providing a rich Croesus from New York or some other well-known monetary mart, gets up enough nerve to back this invention, and if he cannot be found, it may be suggested that at least one of the inventors has signified his willingness to make the first trip, when the aerial passenger rocket shall have been built. Four ways in which the rocket can be projected heavenward with sufficient speed, are as follows:

First: An electromagnetic gun or steel tube around which are wound a number of magnet coils, each of which is successfully and progressively connected with a source of electric current, so that the steel body of the projectile will be sucked forward at ever-increasing speed in a well known manner, which has been described a number of times in the ELECTRICAL EXPERIMENTER.

Comprest air forms the basis of a second method for forcing the projectile thru the tube at high velocity, and a comprest air plant and tank are shown in the present illustration, which in any event would prove a worth-while auxiliary source of power for operating the device.

Gun powder used as a source of power to project the rocket upward thru the tube, would provide a fine spectacular effect at night, and in the day-time, the noise of the successive explosions, as the shells popt skyward one after another, would prove an excellent drawing card, but perhaps no passengers.

A fourth scheme may utilize the well-known belt with spurs on it, similar to that used in scenic railways at the present time, or some other form of modified rapidly moving belt can be devised which would rapidly carry the projectile skyward. This scheme may seem impractical and something that cannot be realized in a commercial way, but if it is possible for a person in an automobile to loop-the-loop in mid-air as has been done, then with the proper design of the apparatus here proposed and with the necessary precautions taken to arrange proper protective nets and other paraphernalia so that the "Aerial Passenger Rocket" cannot land so as to injure the passengers, it would seem quite possible with modern engineering technique, that the device would be practicable. It would not be surprising to us, if such a scheme as this should greet our eyes even within the course of another year or two at one of our great national playgrounds.

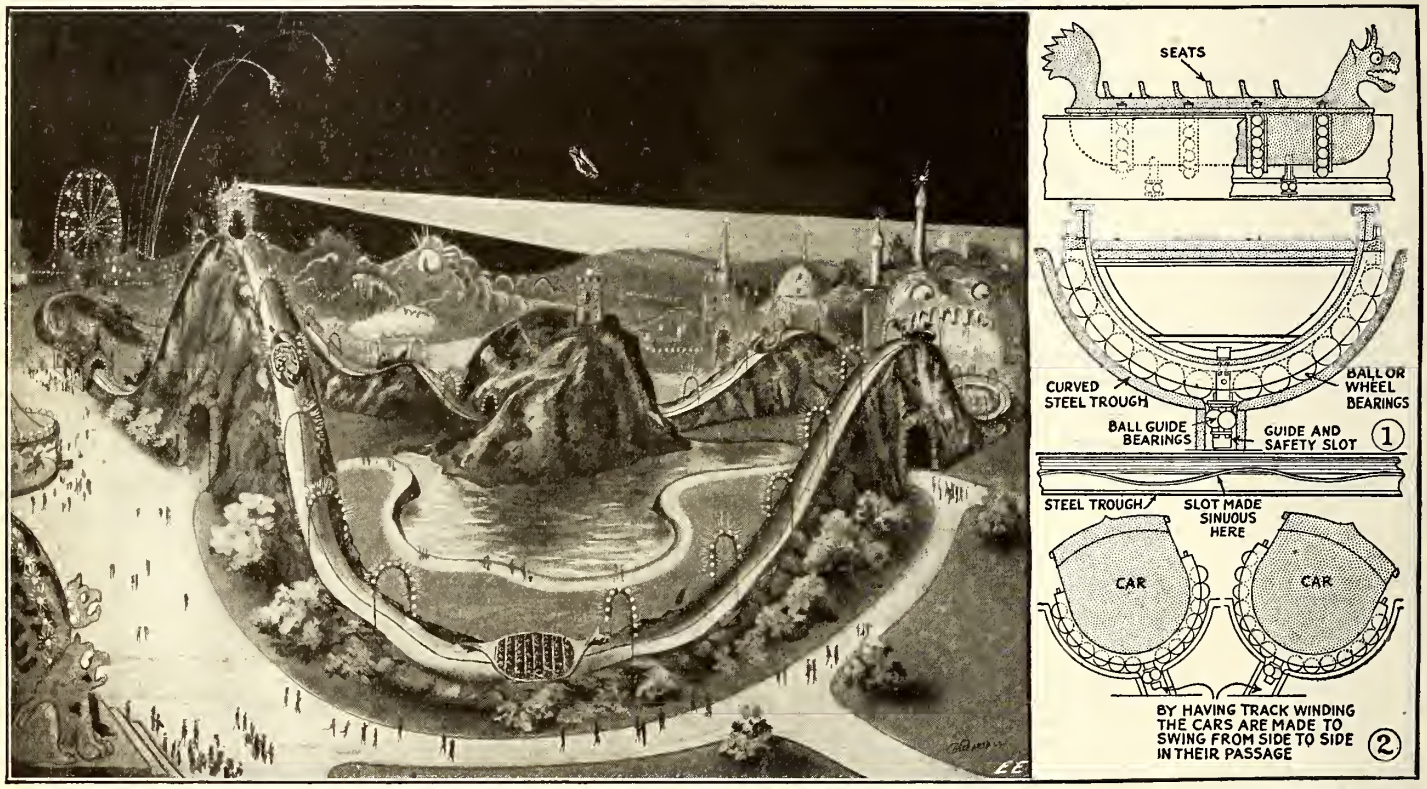
The Illustration Herewith Shows a Novel Pleasure Resort Attraction Devised by Two New York Inventors. Altho, at a First Glance, It May Seem Impracticable to Construct Such a Daring Amusement Contrivance as This, a Little Reflection Will Show That It Is Not so Impossible at All. In the Circus We Are Used to Seeing a Person "Loop-the-Loop" or Turn a Somersault in Mid-Air While in an Automobile, the Vehicle and Its Passengers Landing Right Side Up on a Properly Inclined Platform, Down Which It Glides to Earth. Our Artillery Experts Can Compute with Extreme Accuracy the Trajectory of Various Projectiles, Both Large and Small, and Thus It Should Be Quite Possible, with the Aid of Modern Mechanical Engineering Technique, to Build One of These Aerial Passenger Rocket Amusements Successfully. The Gun Out of Which the Shell or Rocket, with Its Human Cargo Is Shot, May Be Operated by Compressed Air, by Powder, or It May Be an Electro-Magnetic Gun. After the Shell Has Sped Thru the Air, Over the Course Indicated by the Dotted Lines, It Lands on a Large Cushion of Water Emerging from the Stand Pipe Shown. It Proceeds to Glide Down to the Lagoon on a Cushion of Water Also, and Upon Striking the Lagoon, It Is Guided Back to the Starting Point by a Link-Belt as Here Illustrated. Electric Cars of Special Type, Seen at the Left of the Picture, Carry the "Rockets" Back to the Station, Thence Around to the Gun Breech, Where a Hydraulic Plunger Loads the Carrier Into the Gun.

www.americanradiohistory.com



An Oscillating Scenic Railway

BY means of a sinuous undulating track on this new scenic raliway, the cars are caused to oscillate. Scenic railways are not new, by any means, but a radical departure in the design for an improved *Pleasure Railway,* as its inventor, Peter F. Meyer of Brooklyn, N. Y., calls it, is incorporated in the one here illustrated. Several novel and important features, both with regard to the amount of pleasure to be derived by the passengers on Mr. Meyer's pleasure railway, as well as with respect to their safety, have been worked out by the ingenious inventor.

One of the principal objects of Mr. Meyer's new design of scenic railway is the safety feature, and it is applied in a very simple manner. At the bottom of each passenger-carrying car there are two rigid vertical shafts, securely fastened to the base of the car, and suitable wheels are placed on these shafts in such a manner that they minimize any friction as the car rolls along, while at the same time preventing the car from jumping out of the rail slot, as becomes evident, as in order to do this the lower wheels on the vertical shafts would have to be wrenched off.

The inventor has provided an ingenious anti-friction scheme for supporting the cars in the hollow steel or wooden trough, along which the cars ride, and to this end he provides a series of round iron balls. These balls are held in grooves in such a manner that they cannot drop out, but they are held sufficiently loose so as to be easily rotated. The cars thus roll along on this series of balls in the same manner as a roller skate moves along with a minimum of friction on its ball bearings. Of course, where desired, and if the builders do not care to go to the expense of utilizing the ball bearings on the cars, wheels can be substituted, but these would have to be pivoted in two directions, preferably so as to obviate any undue noise or friction as the car sped along and suddenly changed to a tilting position, due to the grooves encountered in the guide rail or slot.

To begin with, the passenger-laden cars may be hauled to the top of the first highest incline by means of a link belt hoist or conveyor in the well-known manner. As the inventor mentions, the track over which the cars speed is best made continuous or endless; the cars to eventually finish a run in front of the station at which they started from. The track is made preferably of thin steel in a trough-like or semicircular form, and, as will be evident to the reader, the inventor has certainly shown original design, and also a very practical and feasible idea in bringing forward this new proposal for building scenic railways. If the people want something exciting and novel in this line, why not give them something that is really novel. For probably a generation now people have become accustomed to the old-fashioned, undulating, humpback scenic railway, but Mr. Meyer has, we think, given us something just as pleasing as its prototypes, and one which will bring in a new era for scenic railways. As you dash down one of the great inclines at mile-a-minute speed, you think you are safe and sound when you reach the bottom and have nothing to do until to-morrow, as the proverb goes, when suddenly—zowie!! the car careens sidewise, or slowly but surely takes an angular tilting position, the same as a small boat on the ocean. Of course you should not have a headache when you start on your journey over Mr. Meyer's oscillating scenic railways, but if you like good sport and feel right for the trip, you will wonder how it ever happened that the older type pleasure railways have existed so many years without a single change in their design or construction, excepting for the innovations now and then, with which we are more or less familiar perhaps, such as long dark tunnels (the longer the better some of us wish, what!!?? . . .), with a few "A Street in New York" hurdy-gurdy scenes, as well as Uncle Tom's "Little Eva" ascending to heaven, etc., ad lib. Possibly by next year they will degenerate to showing us scenes of the Bolsheviki regimé in darkest Russia, where you go down to the public "Spouse Market" and pick out your wife for the next six months.

Copyright, 1919, by E. P. Co.

The Cars on This New Scenic Railway Sway Back and Forth Sidewise, Like a Boat on the Ocean, as They Shoot Along the Troughlike Tracks. The Cars Roll on Ball Bearings, as the Detail Drawings Show. This Pleasure Railway Provides a "Real Thriller" for the Amusement-Seeking Public.

Turf Fuel for Power

Electrification of Moscow factories on a basis of turf fuel is in progress under the direction of the engineering staff of the Soviet Government, according to Arthur Ransome to whom the scheme was explained by the President of the Supreme Council of Public Economy. ("Russia in 1919," Huebsch.)

"He said that there was no water power near Moscow but big turf deposits which would be used as fuel. In order not to interfere with the actual lighting of the town from the power-station already in existence, they are taking the electric plant from the Provodnik works, which will supply enough electricity for the lighting of the town. As soon as that is set up and working, they will use it for the immediate needs of Moscow, and set about transferring the existing power-station to the new situation near the turf beds. In this way they hope to carry out the change from coal to turf without interfering with the ordinary life of the town. Eventually when things settle down they will get a larger plant. . . .

"I asked how they were going to get the machines. He said that of course they would prefer to buy them abroad, but that, though this was impossible, the work would not be delayed on that account, since they could make a start with the machines they had."

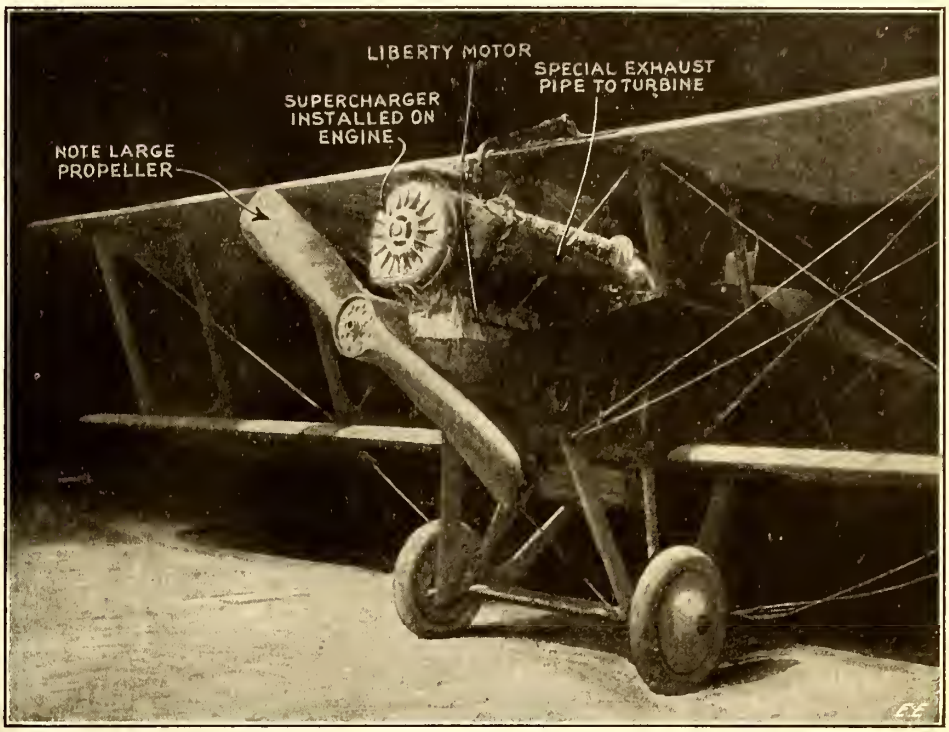
Airplane Supercharger for High Flying

By CHARLES M. RIPLEY

IN 1783 Benjamin Franklin witncst a balloon ascension and after seeing it he wrote as follows: "A few months since, the idea of witches riding thru the air upon a broom-stick, and that of philosophers upon a bag of smoke, would have appeared equally impossible and ridiculous—these machines must always be subject to be driven by the wind. Perhaps mechanic art may find easy means to give them progressive motion in a calm, and to slant them a little in the wind."

Today our aviators laugh at a 60-mile gale—it is negligible compared with their own speed of 150 miles per hour. And 200 miles per hour and even more, is seen upon the horizon for regular commercial airplane service; for the new *Supercharger* or oxygen booster assures us that the long distance air transportation of the future will be conducted at from three to five miles up in the sky, where the air resistance is less than half that at sea level.



At Wilbur Wright Field, August 2nd, a U. S. Army aviator broke the world's speed record at high altitudes. Major R. W. Schroeder of the U. S. Air Service, while at an altitude of 18,400 feet, attained an official speed of 137 miles per hour.

The official report states that "he used a two-seated La Père biplane, built by the Packard Motor Car Co., and designed by Capt. La Père of the French Army, while in the employ of the U. S. Government. It had a 12-cylinder Liberty motor, equipt with a *supercharger* developed by Dr. S. A. Moss, a turbine research engineer of Lynn, Mass., working in cooperation with the engineers of the U. S. Air Service. So far as is known this is the highest speed ever attained at this altitude with a two-seated plane; and the best speed known for a single-seater at this altitude was only 128 miles per hour."

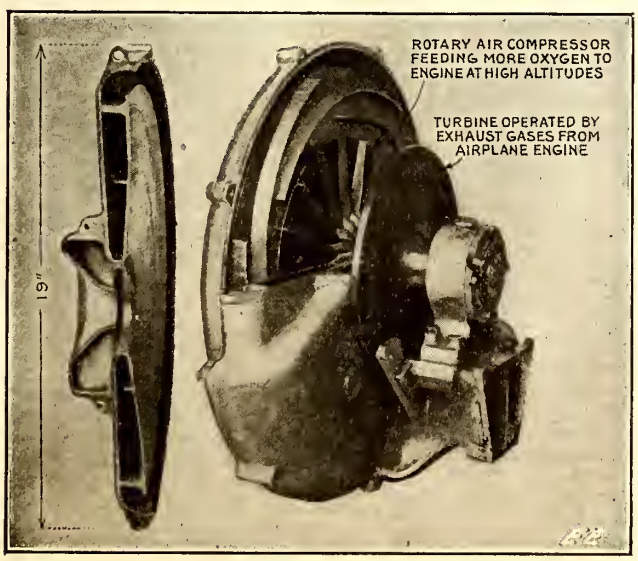
It is not generally known among "landlubbers" that heretofore every airplane engine lost 50% of its power when up 20,000 feet; and that at 25,000 feet its loss of power is between two-thirds and three-quarters—that is, instead of having 400 horsepower, as at sea level, it only has 100 to 150 horsepower.

So far as is known now, the *scarcity of oxygen* at the high elevations is the only factor which has made 30,000 feet "the Ceiling of the World." So the engine suffers from lack of oxygen, just as do the birdmen.

The thin "skin" of air which surrounds the earth is no thicker than the skin of an apple—relatively speaking. Thus it is that the daring birdmen who approach the ceiling of the world must prepare to take oxygen from a tank as they near 15,000 to 18,000 feet elevation. Otherwise they would suffocate.

La Pere Airplane That Broke World's Speed Record at 18,000 Feet Altitude. Liberty Motor Equipt With "Super-Charger" or Oxygen Booster, Which Is Shown at Front of Engine and Just Above the Propeller Shaft. This Small Attachment Practically Doubled the Horse-Power of the Engine at an Altitude of 18,400 Feet, Where the Air Is Extremely Rarefied and Deficient in Oxygen. In Future Flights It Is Expected That Previous Speed and Altitude Records Will All be Eclipsed.

The *supercharger* used recently by Major Schroeder and his observer, Lieut. G. W. Elsey, is one of the most remarkable inventions which have been developed as a result of America's participation in the World War. The observations (officially checked) show that altho the plane was 18,400 feet above the ground, the air supplied to the carburetor had the same density as that at 2,900 feet elevation. Thus the supercharger gave the engine an amount of power equivalent to what it would have had, if it had been 16,500 feet nearer to the ground. So this attachment is as useful and necessary to the engine as is the tank which supplies oxygen to the sky-pilot.



The supercharger or oxygen booster is a little device only 19" in diameter, and complete with piping, adds only 100 pounds additional net weight to the plane; yet it practically doubled the power of the Liberty motor! Such vast quantities of oxygen are needed by the motor that it is impossible to carry a supply in tanks as is done for aviators, so the supercharger TAKES IT FROM THE AIR! Literally the wonderful little device compresses the rarefied air until it equals that near sea-level, and then this "good, thick sea-level air" is fed to the carburetor. It takes a considerable amount of energy to suck in air which is already at 50 per cent vacuum or more and compress it—or "buck the vacuum." But there is where the engineer has played a brilliant trick—for he has found some energy there, miles up in the sky, which he can use.

Where do you suppose the power comes from which doubles the power of the Liberty motor as it approaches the "ceiling of the world"? Why, from the red-hot exhaust gases of the Liberty motor! It is so simple: heat is energy; heat is thrown away in the exhaust gases; therefore the Yankee engineers set about to collect this power.

Now the gases exhaust into manifold or flat-shaped pipes (one on each side) which convey it to a gas turbine. The turbine is thus driven at 20,000 to 25,000 revolutions per minute—40 revolutions per second! Thus the wasted energy is now reclaimed into a useful by-product power; and this power drives the air compressor. The combination of the turbine and the centrifugal compressor is called a *supercharger*, and the weight is only 100 pounds!

Engineers—whether airmen or not—have shown intense interest in and admiration for this outfit. A "gas turbine" itself is a

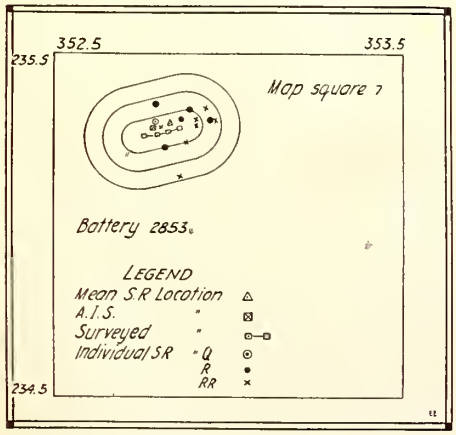
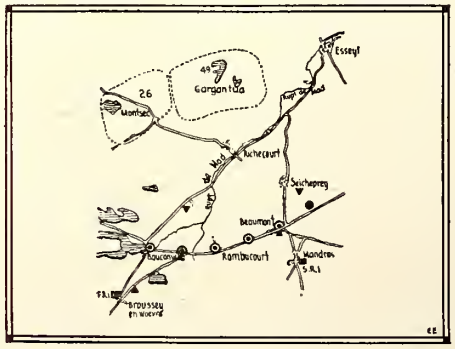
Sound and Flash Ranging in the A.E.F.

By Prof. Augustus Trowbridge



DEPARTMENT OF PHYSICS, PRINCETON UNIVERSITY. LATE LIEUTENANT-COLONEL, CORPS OF ENGINEERS, U. S. ARMY, IN TECHNICAL CHARGE OF THE SOUND AND FLASH RANGING SERVICE OF THE AMERICAN EXPEDITIONARY FORCE.

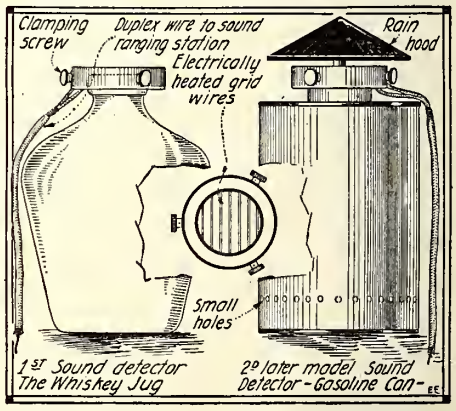


The Above Chart or Map Shows a Typical Layout of "Sound Ranging" Stations at the American battlefront in France, as Actually Used for Locating German Artillery. The Photographic Record of Enemy Gun Bursts Was Recorded at the Sound Ranging Headquarters Station, From Which Wires Radiated to the Various Listening Stations, Placed Along the Arc of a Circle at 1, 2, 3, 4, and So Forth. Every Enemy Gun Was Accurately Located, Numbered and Charted in This Way.

AFTER the first battle of the Marne in the early autumn of 1914 the war on the western front soon took on the character of a gigantic siege operation in which each belligerent played the parts both of besieged and besieger on different portions of the battle front. The long period of trench warfare set in during which each side increased the number, the caliber and the range of its artillery—the heavier calibers were most carefully concealed both through the choice of naturally favorable positions and through the use of the new practice of camouflage, so that the location of the enemy batteries by existing methods became increasingly difficult and often impossible.

The new problem, which the French were first to solve, was first, the location by some other means than sight of invisible enemy batteries and the directing of the fire of their own batteries on these and other enemy targets, and, second, the location of, and the *ranging* on, the enemy batteries which tho not completely hidden, were so distant that the ordinary triangulation methods from a short base-line hitherto practiced by the artillery were not sufficiently accurate to accomplish. To attain these two objects the French inaugurated two new services of artillery information which have been called respectively Sound Ranging and Flash Ranging.

This Map of Which Thousands Were Made Daily by the "A. E. F." Engineers on the Battlefront in France, Shows the Accuracy With Which Enemy Guns Were Located by Sound Ranging, S.R. by Artillery Information Service, A. I. S., Etc. Dots in Squares Show Actual Location of Guns.

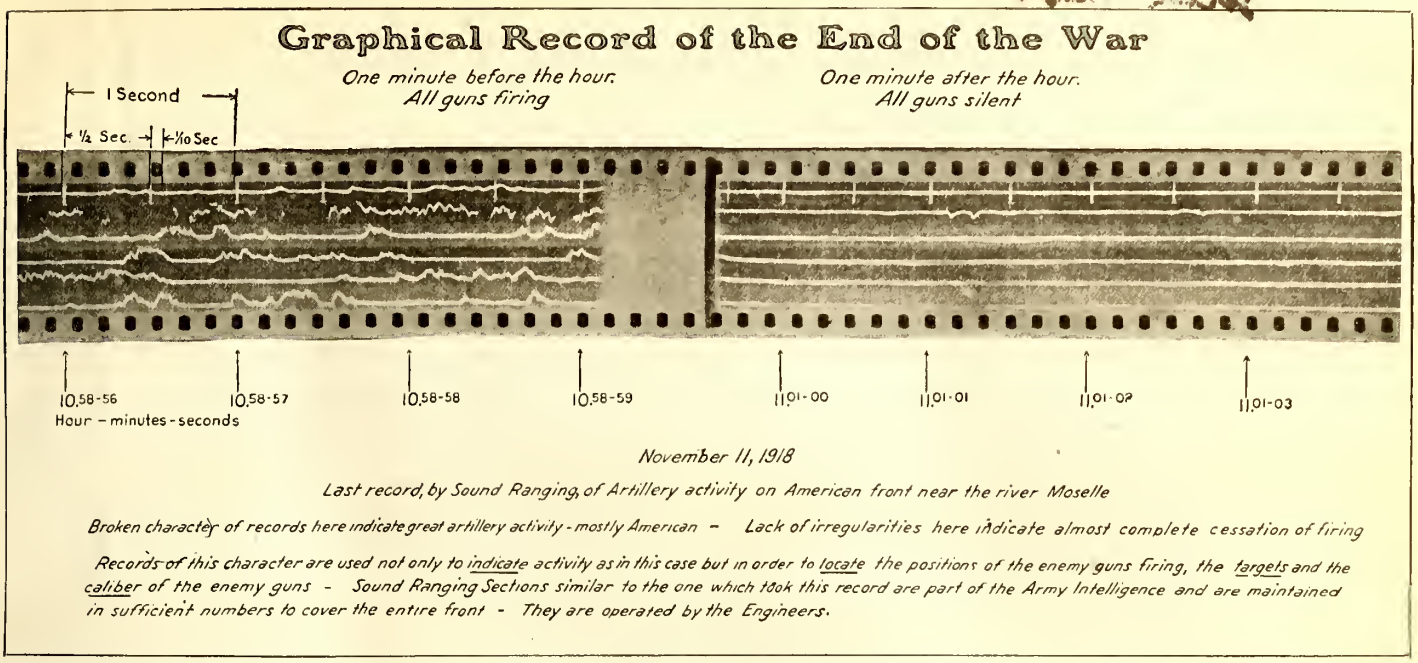


An Actual Map of Sound Ranging Stations in the Vicinity of Seicheprey, France. Sound Ranging Central Station at S.R. 1. Observing Instruments Indicated by Black Dots in Circles. Flash Ranging Stations F.R. 1. Enemy Artillery Located in Areas Enclosed by Dotted Lines.

These services were copied by the British with but slight modification as regards organization and later by the United States, which organized both services under one head.

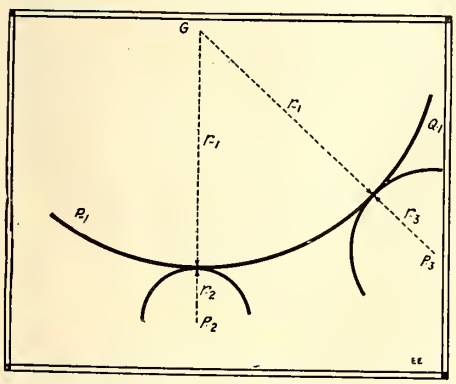
The flash ranging services in all of the allied armies were very similar both as regards instruments and methods of observation and report; such differences as there were were due chiefly to the methods of training and to the character of the personnel. The Germans also had an extremely efficient flash ranging service, many of the good features of which were copied by the Allies as they became known through prisoners and captured documents.

A flash ranging section consisted of about 100 men under the command of a lieutenant, who was assisted by three other officers. The installation consisted of a central calculating station—marked F. R. 1.—and from four to six advance observation posts—marked as erect triangles on the accompanying map, which gives approximately the positions occupied by one flash and one sound ranging section on a ten kilometer front in the spring of 1918.



At each observation post two men were on duty at all times, day and night, and each post was in telephonic communication with the calculating station and with each of the other posts of the section. Each post was provided with suitable day and night telescopes mounted on graduated circles for measuring the bearing of a sight away from the north-south line. The method of operation was as follows: If an observer at one of the posts noted the flash of an enemy gun, or even only the smoke puff he called back to "central" the approximate bearing and distance; the

No Microphones of the Usual Carbon Grain Type or Anything Like Them Were Used In Picking Up the Sound of the Enemy Guns in the "A. E. F." Sound Ranging Work. What Was Used, However, Was a Fine Grid of Electrically Heated Wires Placed Over the Mouth of a Whiskey Jug, at First and Later Over the Mouth of a Discarded Gasoline Can, Which Latter Acted as Sound Resonating Chambers. When a Sound Wave From an Enemy Gun Several Miles Distant, Perhaps, Which of Course Was an Air-Wave, Impinged Against the Heated Wire Grid, It Caused a Variation in Temperature of the Grid, and in Turn a Variation of Its Electrical Resistance.



calculating officer at central was provided with a large plotting board, on which the surveyed positions of all of the observation posts were accurately marked and which was provided with weighted strings and angular scales for each of the posts. When a report came from an observation post the calculator at the plotting board set the corresponding string in the direction reported and brought all the other strings to cross the first at about the estimated distance and called to all the other

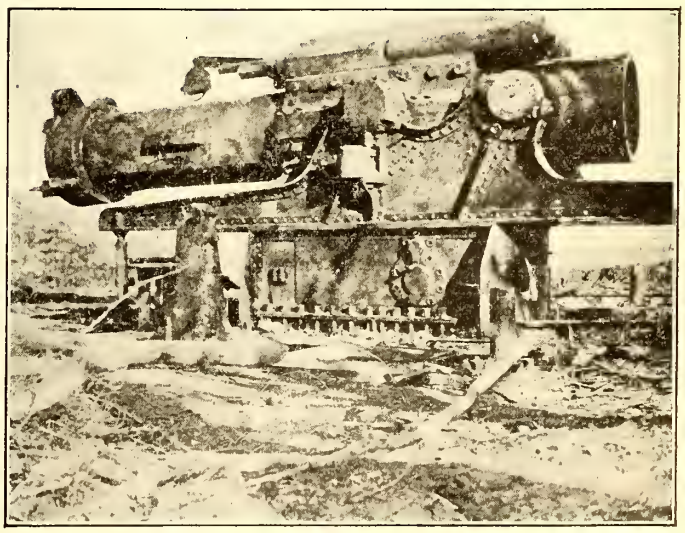
One of the Most Remarkable Graphical Records Extant Delineating the End of the Great "World War." This Is a Reproduction of a Sound Ranging Record Taken at the American Front at 11 O'Clock on the Morning of November 11, 1918. Note That the Gun-fire Was Very Active up Until the Last Minute Before 11 O'Clock; While at One Minute Past 11, the Firing Practically Ceased. Two Gun-bursts Appear on the right of the Chart at 11.01-01 and 11.01-025, Which Show Where a Boche Had Let Go a Few Seconds After the 11 O'clock Period When the Armistice Called for Firing to Cease.

posts to set their instruments in the proper direction as given on the board. After one or two more rounds by the enemy gun, several or all of the posts might be in a position to give an accurate report of the direction as seen from these posts, and the calculating officer be enabled to obtain an ccurate intersection of the strings on the board and thus be able to report to the artillery the location of the gun which had been firing. In case of great enemy artillery activity when there was danger that all the posts might not be sighting on the same enemy gun, an electrical synchronizing device was employed which enabled the calculating officer to assure himself

The Chart Above Shows How the Sound of a Gun Fired at "G", Requires Different Lengths of Time to Travel to Various Locations and How the exact Position of the Gun may Be Surveyed by Sound When Several Listening Stations Located at Say P1, P2, P3, etc., are Employed in Determining the Exact Arrival Time of the Sound From the Gun at Each of These Points.

that all the observations were made at the same instant. This rendered it unlikely that different observers should report on different guns firing at about the same time.



In directing the fire of the friendly artillery the procedure was similar with this difference that it was the *burst* of our own shells on the ground in the case of ranging on a visible target that was observed and plotted or the burst in the air in the case of an invisible target. In this latter case known corrections could be worked out to permit of a burst at or near the invisible target.

A sound ranging section was similar in organization to the flash section except that there were fewer men (60-70), due to the fact that instruments took the place of living observers to a great extent. The "central" instrument recorded photographically the time of arrival of the sound of the enemy guns at a series of instruments at surveyed positions near the front line and covering a length of about five miles; this instrument delivered automatically, developed and fixed photographic records in less than a minute after the sound of the enemy gun reached the front line and this record could be interpreted by the use of quick graphical methods so that the position of the gun could be telephoned to the friendly artillery in about a minute more. The probable accuracy of the location could be estimated and also the caliber and target of the gun which had just fired; this and the fact that neither rain, fog or darkness interfered with sound ranging were unique and valuable features of the service. Calculations were rendered difficult by great artillery activity tho they were not impossible except under actual barrage conditions.

On the accompanying map the sound ranging central is marked S. R. 1, and the observing instruments are shown as circles lying equi-spaced along a circular arc, whose center lies near the groups of enemy artillery shown enclosed in the two irregular areas, one of which was supposed to contain 26 and the other 49 active enemy batteries. The front line trenches ran about midway between these areas and the sound ranging instruments. In or near the trenches were two forward observation posts marked on the map as inverted triangles; at these posts observers were stationed, whose duty it was to start and stop by means of electrical relays the photographic mechanism at the central station whenever they heard the report of enemy guns whose positions it was desired to locate.

(*Continued on page 832*)

Stranger Than Any Fiction, Would Be the Tale That the "Sound Ranging" Experts of the "A.E.F." Could Tell You If They Wanted to, Regarding the Wonderful Hits They Made By Artillery. The Accompanying View Shows a Typical Hit on a Large German Howitzer Several Miles Behind the Lines, From an American Gun. This Shot Having Been Fired From Information Gained by the Sound Ranging Corps. The Enemy Gun Was Put Out of Commission, the Recoil Cylinders Having Been Blown Off and Totally Disabling It. In One Case, a Railroad Train Was Fired at Several Miles Behind the Lines the Train Being Completely Wrecked on the Bridge It Was Crossing at the Time. Due to Shell-fire. Not Only This, But the Location of Friendly Shell-bursts Could be Checked Up and Measured by the Sound Ranging Experts and the Gunners Told in a Fraction of a Minute, to Alter Their Range to the Right or to the Left, Until the Shell Landed Squarely on the Target.

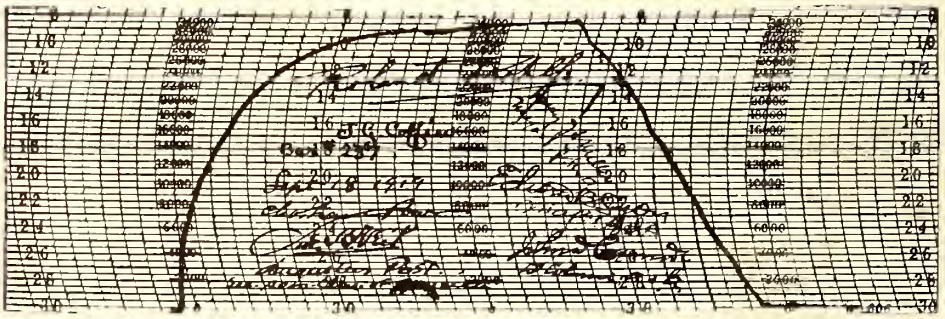
Rohlfs Flies 34,610 Ft.—New World's Record

FLYING his Curtiss "Wasp" type triplane, with a 12-cylinder, 400-horsepower Curtiss motor, Roland Rohlfs, test pilot for the Curtiss Company, broke the world's altitude record, when, at Roosevelt Field September 18th, he reached the height of 34,610 feet, or more than six and one-half miles above sea level. On Saturday the 13th he had come within nearly 400 feet of this mark, but the flight was not official.

The previous unofficial record was 33,137 feet, made last May at Villa Coublay, France, by Adjutant Casale of the French Army.



Every precaution was taken therefore to make sure that all official requirements for a record were observed. A committee representing the Aero Club of America, composed of Augustus Post, Secretary of the club; Sydney B. Veit, and Professor C. L. Poore, Professor of Celestial Mechanics at Columbia University, were present. The army was unofficially represented by Colonel John D. Carmody, in command at Roosevelt Field; Major E. B. Lyons, in charge of flying at Mitchel Field, and Major Henry F. Miller.

Rohlfs left the ground at 12:06 o'clock and landed within twenty feet of his takeoff at 1:59.

© International Film Service

Roland Rohlfs, Who Broke the World's Altitude Record. He Is the Test Pilot for the Curtiss Engineering Corporation, and Is Shown Seated in His Curtiss "Wasp" Machine Before the Start of the Flight Over Roosevelt Field, Mineola. He Ascended to a Height of 34,610 Feet, Establishing a New World's Record. The Inset Photograph Shows Rohlfs Rising From the Ground for His Record-Breaking Flight. The Chart Below Is a Copy of the Official Barograph Record of Rohlfs's Altitude-Breaking Flight.

As he landed he stept out and handed the sealed barograph to Mr. Post. When the latter called out that the instrument showed a new world's record the onlookers cheered. The barograph was then resealed by the Aero Club committee. It was shipt to Washington where it will be calibrated by the Bureau of Standards and subjected to the most detailed and exhaustive analysis and testing. Until the result of this examination is given out, the reading will not be recorded by the Aero Club as absolutely official.

Rohlfs wore a suit of fur-lined clothing, and heavy felt mittens made by himself from material half an inch thick. Of the flight, he said:

"At 20,000 feet, trouble began. I had to call on my oxygen bottle. This feeds air to my lungs thru a device something like a football nose guard. At first I tried drawing it in thru the nose and mouth, but this dried my throat and I had to shut my mouth and breathe thru the nose alone. If anything had happened to this oxygen apparatus I would have been a 'goner.'

"At 31,000 feet the plane began to wobble in a way that, frankly, frightened me. It careened this way and that, and while doing so dropt 600 feet. I threw on more power and up it went again." (The barograph markings showed the fall plainly.)

"When I reached the 'peak' the thermometer showed forty-three degrees *below* zero. It took seventy-eight minutes to get this high and I spent another twenty minutes trying to make the plane rise still higher. I used every trick I knew, but could not coax another foot of altitude out of it. I believe I attained the absolute top possible in this machine.

"I noticed several peculiar things up there. Near the top I felt nervous twitchings in parts of my body. These were at several scars left by an automobile accident several years ago. After my two other high flights my teeth ached severely and also my stomach. I guess I can count on the aches lasting about ten days more. They lasted that long when I went above 30,000 feet before."

Rohlfs reached 10,000 feet in eight minutes after leaving the ground. He flew as far as Riverhead, L. I., where a head wind made him turn about. When at the highest altitude he was above Lake Ronkonkoma, which is twenty-five miles from Roosevelt Field.

Rohlfs made his flight after most careful study of his problem, paying particular attention to how much weight he could spare from his machine with safety. Rohlfs contemplated removing the tires but changed his mind and left them on. By a judicious casting off of nuts, bolts, wires, and fire-fighting apparatus and lessening his gasoline supply to eleven gallons he reduced the weight of the machine by 100 pounds.

New World's Record for Pilot and Passenger.

A new official world's altitude record for pilot and one passenger was made at Dayton, Ohio, on September 6, when Major Rudolph W. Schroeder climbed to 28,500 feet in a Lepere biplane equipt with a 400 horse power Liberty motor, according to announcement made recently by the Contest Committee of the American Flying Club, which had charge of the recent New York-Toronto contest. The announcement followed the homologation of data and barograph charts sent by Colonel Thurman H. Bane, Chief of the Army Airplane Engineering Division at McCook Field, Dayton.

This new mark of 28,500 feet greatly surpasses the former two-man altitude record held by Captain Lang of the Royal Air Force, who ascended to 27,300 feet on January 2, 1919, in a 375 horse power English biplane. No official figures have been received in this country yet in regard to the reported altitude climb of Adjutant Casale, who, with one passenger, according to unofficial reports, broke previous records last June. Until official proof of this flight is received by the Contest Committee of the American Flying Club, Major Schroeder's record will stand as the world's record for pilot and passenger.

Major Schroeder's new record is of international interest because it was made possible by the new airplane engine *supercharger* originated during the war but

New York Electrical Show

THE annual Electrical Exposition held in New York was more resplendent than ever before, this year. It was discontinued during the war and, judging by the size of the crowds that visited the exposition this year, the public was pleased indeed to see once more on exhibit the latest advances in electrical wizardry. The exposition at New York was staged in the Grand Central Palace, a very handsome building and one that provided a commodious space for the beautiful display of the various apparata, instruments and devices, which included everything imaginable from a specially sensitive micro-ampere meter, the needle of which indicated in millionths of an ampere, the current produced by applying your dampened finger to an iron nail and a one-cent piece—up to a ponderous electrical storage battery truck, or a complete electrical dairy, where the electrically operated vacuum milker was demonstrated several times each day.

At the New York Electrical Show, Which the Editors Visited, There Were Several Ingenious and More or Less Practical Electric Apparata Exhibited and Demonstrated. A Few of the More Interesting and Useful Things That We Noted There, Are Illustrated and Described Herewith, for the Benefit of Readers Who May Not Have Had the Opportunity of Witnessing This Wonderful and Educational Electrical Display.

The accompanying illustration shows just a few samples of the hundreds of electrical devices exhibited and which appealed to every member of the family, from little Tommy Edison, Jr., up to old Grandad puffing contentedly on his old and tried "Meerschaum." What, between electrical washing machines that wabbled around, or back and forth, including some that oscillated up and down, with electric lights shining thru their soapy depths, electrical sirens and powerful X-ray machines, together with wireless sparks and a few dozen other choice crashes and flashes thrown in for good measure, the electrically interested populace was thoroly entertained. Excellent band music was furnished afternoons and evenings during the week of the exposition.

WHAT WE SAW AT THE SHOW

A very clever vase light was demonstrated and what "got our goat" was why—out of 100,000,000 people in America—some one had not thought of it before. It instantly converts any vase, no matter how big or small, into a beautiful electric lamp with a silk shade costing as much as you have money to buy yards of silk for. See Figure 1. As we walked down the aisle, our attention was arrested by one of the most efficient looking electric dish washers that we have seen for some time. The hot soapy water was forced up thru and around the dishes in great fashion, and if any microbes or bacteria could lift one of their hind legs after passing thru this scalding ordeal, well, they have got to show us, that's all! We told mother and the girls about it as soon as we arrived home, and as soon as the mail order houses start selling these electric dish washers on the installment plan, I and Mike McStinchy, the chief clerk at the office, have promised ourselves one apiece. Take a shot at Figure 2.

As we hove to, around the corner on one of the floors, we were almost "flabbergasted" trying to count the total number of electric vacuum cleaners exhibited. There must 'a been a million of 'em! One particularly large and interesting machine was being pushed slowly over a large Persian rug by a dusky demonstrator. "Some vacuum cleaner," quoth we. Egad, we had the wrong family this time! This machine (see Fig. 3) was an *electric rug and carpet washer*. When we got close up to it we saw that it had a rapidly oscillating scrub-

"Speaking Crystals"

By A. McL. NICOLSON*

MANY new and surprising things have come to light during the war. While the guns thundered in Europe, American scientists quietly went about their work, hatching out many new marvels.

One of the most unique inventions—at least from the Experimenter's standpoint—is the wonderful Piezo-electric effect of Rochelle crystals. In these, a veritable new gold mine has been opened to all experimenters. What these crystals will all do fairly staggers one's imagination. Think of a simple salt crystal that will actually talk, that can be a telephone receiver, and a transmitter combined, that will give as much as 100 volts when squeezed with two fingers, that will "sing" when current is supplied to it! And the best part is every one of us can make his own crystals and perform these experiments without having to buy this 20th century electrical wonder—for as yet it can't be bought, anyway!

We consider ourselves fortunate to present our readers with a very comprehensive article on the new invention by its inventor, Mr. A. McL. Nicolson. Many new uses will be found for the invention and we invite our readers to send us their experience for the benefit of all.—The Editors.

ELECTRICITY is liberated in many apparently different ways. There are at least a dozen so-called "sources" of electricity which are mentioned in text books. It probably could be shown that in every case in which electricity is produced, the fundamental cause of the manifestation is the same. We have merely different ways of operating on matter with the dissipation of some form of energy; and the electric charge or current is generated. This signifies the transformation of one form of energy into another, and, generally, the mechanism is reversible. For example, in the case of static electricity the influence machine may be used reversibly as a "converter" of electricity or of mechanical energy,—that is to say as a generator or as a motor. When we hear of a "new" source of electricity we are curious to find out all about the mechanism of the source—as to its reversibility, efficiency of energy conversion, applicability to the mechanical arts, etc.

"Piezo-Electricity", discovered by J. and P. Curie, is the name given, in 1881, to a crystal source of electricity. In this case electric charges of different signs are liberated on different surfaces of a crystal when mechanical stresses or vibrations are impressed on certain of its parts. The word *piezo*, pronounced p ī é z o, is derived from the Greek *piezein*, signifying "to press"; hence "pressure" electricity.

Crystals Which Evolve Electricity.

Not every crystal is *piezo-electrically* active. Nature grows crystals, whether mineral or organic, in thirty-two differing classes of structure—of these, just twenty classes offer the necessary condition for piezo-electric activity. And this condition is *asymmetry* of structure or of molecular arrangement. While a very large number of crystals have the electric property, only comparatively few exhibit the phenomenon to a sufficiently interesting degree to warrant mention of it at this time.

Amongst mineral crystals quartz and tourmaline are the best known having the asymmetric structure — the molecules consisting of regular "bricks", are staggered into a *skew symmetry* or *spiral structure*. In the case of the organic crystals, the molecules themselves are asymmetric, that is to say, they do not comprise "regular bricks". They have, in fact, little skew symmetries of their own. Both the mineral and the organic crystal exhibit their respective asymmetries as right- or left-handed skew structures. This is revealed in their power to rotate the plane of polarization of polarized light in corresponding right or left directions.

We are, just now, more interested in the *organic* crystal since this type, comprising, as it does, the asymmetric carbon molecule, has proved to be more susceptible of large piezo-electric effect. Examples of active organic crystals are sugar, camphor, tartaric acid, etc.

Rochelle Salt Crystal Very Active Electrically.

A crystal which is very active piezo-electrically is *"dextro rotary" sodium potassium tartarate or Rochelle salt.*

Recently, the Research Laboratory of the American Telephone and Telegraph and the Western Electric Companies investigated the possibility of developing piezo-electric crystals. It was soon found that crystals of *Rochelle salt* would give good results *if prepared in a special manner.*

Briefly, increased efficiency is brought about by the following conditions:

1. Selection of particular habit of growth.
2. Desiccation. (Preserving by exhausting the moisture.)
3. Development of the crystal into a composite polar structure.
4. Application of static compression.
5. Use of electric poles normal to each other.
6. Application of torque.

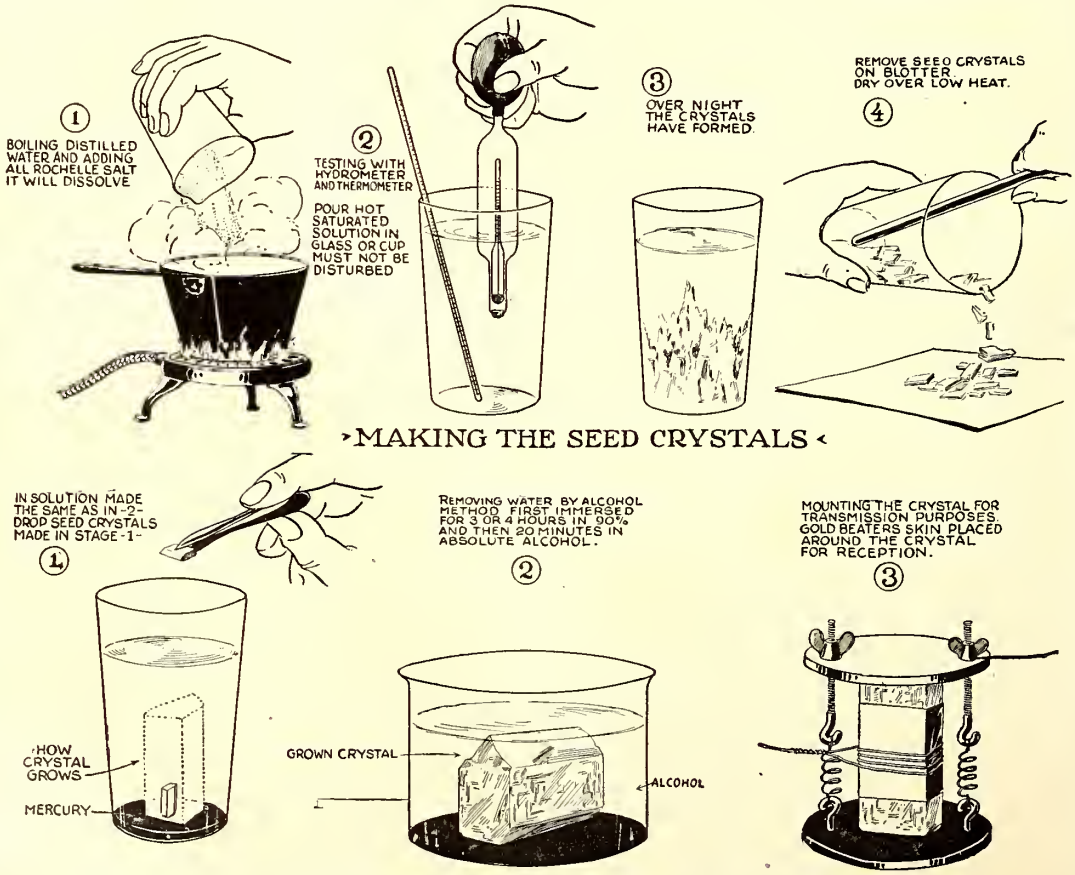
How the Crystals are "Grown".

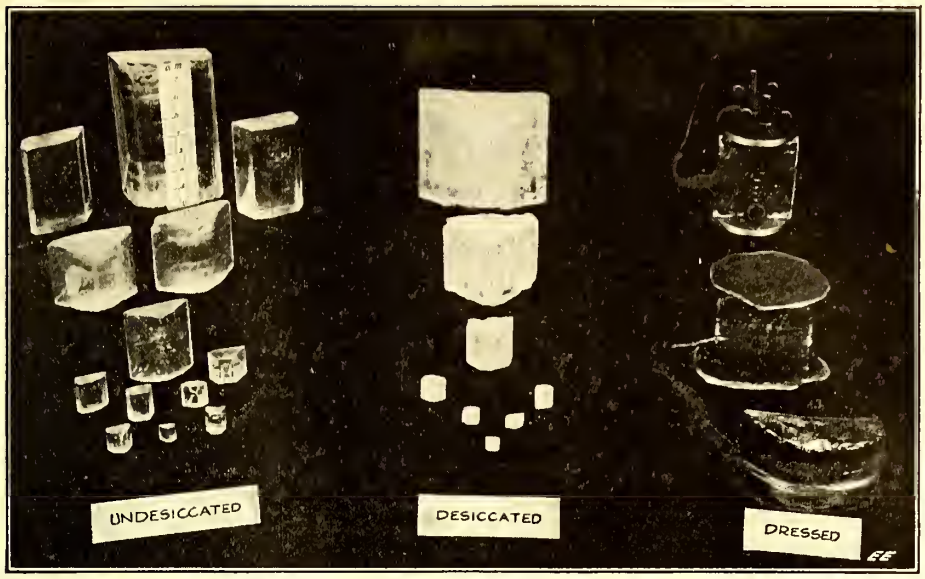
Rochelle salt crystals are grown from nuclei or "seeds" of definite form. These are obtained by selection from crystal croppings spontaneously grown in a *supersaturated solution* of the salt (the formula is $Na\ K\ C_4\ H_4\ O_6 . 4H_2\ O$). The solution should be made up of 8 parts Rochelle salts to 5.33 parts of water. The density of the solution at 50°C. is 1.33 and the nuclei from which large crystals are grown, are "planted" in the mother liquor when the temperature has dropped to 38°C. *The crystal grows rapidly as the temperature of the liquor falls to that of its surroundings.* The seeds are selected so that they are practically square shaped—the seed, for this purpose, must lie with its principal or optic axis in a horizontal plane.

When a crystal is grown very rapidly—as by the temperature gradient method described—it develops a *composite* structure termed by mineralogists the "hour-glass". Fig. 1 illustrates the entire process graphically.

How the Crystals are Mounted

Important use is made of this structure and its development is fully encouraged. It is found that if the crystal, when grown to the desired size, from 30 to 200 grams, and when thoroly desiccated, or dried, develops new and stronger electric poles on its surface. The vertical walls, surrounding the principal axis, *form one pole* while the *two horizontal*, or basal planes





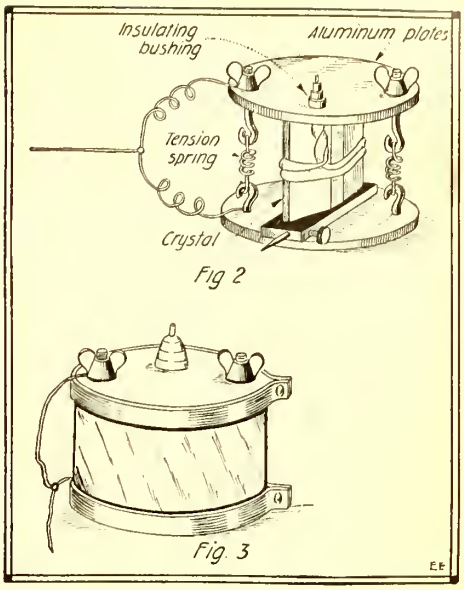


Fig. 1.

*Research Laboratories of the American Telephone and Telegraph Company and the Western Electric Company, Inc.

Above:—Crystal as a Phonograph Transmitter. Below:—As a Transmitter or Receiver.

together *form the other pole.* Beeswaxed tinfoils serve as electrodes when applied to the crystal. Since compression greatly improves the piezo-electric effect in these crystals an appliance shown in Fig. 3 called the "spring compressor" may be used. The appliance comprises a pair of aluminium plates connected together with powerful springs. Thumb-screws are provided so as to apply 20 to 40 pounds pressure to the crystal. The compressor forms one pole, preferably the "grounded" pole of the crystal. The other is called the "girdle" pole, because fine wires may be stranded and wrapped around the crystal at its equator, making proper connection with the tinfoil coating there.

The mechanically sensitive regions of the crystal are at the four corners of the "square"—on the ends of the two basal planes. Care should therefore be taken to have the crystal *bear on these corners* in the spring compressors. This is readily accomplished by filing the crystal on its basal planes so as to render it slightly concave on both crystallographic poles.

An ordinary half round file is used, and the top and bottom faces filed in such a manner that the corners are elevated slightly; making them higher than the rest of the face.

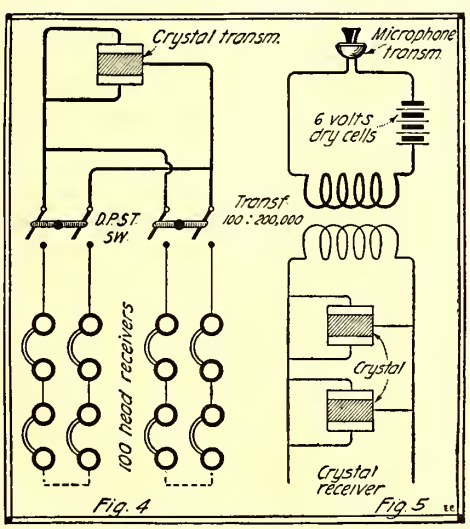
When *compression* is applied to the crystal an electric charge is imparted to its poles—so that the *girdle* electrode becomes plus and the basal planes, together (or the spring compressors) become minus. This electrification will leak away and when the compression is relaxed, the *crystal poles will reverse* the signs of the liberated charges. Great sensitiveness is also obtained if the crystal is subjected to torsion. *A charge of several micro-coulombs and potentials exceeding* 100 *volts may be obtained by twisting the crystal with the fingers.*

The Crystals "Talk".

If, now, we reverse the process and apply electric potentials to the crystal poles, *sounds will be emitted by the crystal due to its relative displacement.* It will be found, if a small mirror be applied with wax to different parts of a crystal and its motions examined by projecting a beam of light reflected by the mirror to a screen, that the principal component of motion is one of *twisting.* The crystal thus "wriggles" under electric stress and *will emit tones in consonance with the potentials applied.*

Several interesting experiments have been performed utilizing one or other or both of the electrical and mechanical effects produced by the piezo-electric crystal. We may first use the crystal as a transmitter or detector of mechanical vibrations or sound. A very convenient application is to the phonograph. A needle may be inserted in a plate attached to one end of the crystal, fig. 2, so that, if held properly over a moving record the needle will transfer torsional movements to the crystal, and corresponding electrical currents will be generated. The alternating potential generated by the crystal under these circumstances may be as large as 10 volts and the resulting current will be several microamperes. In the simplest form of this experiment, electromagnetic receivers of high impedance may be used to detect speech and music from the phonograph. Since the impedance of the crystal at acoustic frequency is about 300,000 ohms, the impedance of the receivers used should be very high—*at least a few thousand ohms.* The crystal itself can operate *several hundred receivers* in series and parallel. See Fig. 4.

Instead of using the phonograph to agitate the crystal transmitter, we can, by adding a diaphragm to the crystal, talk or sing against the diaphragm and thus excite the crystal to about the same degree that obtains with the phonograph record. Thus by singing against the diaphragm near a resonant frequency of the crystal housing, say at a frequency corresponding to "middle C" in music, or 256 cycles per second, *we can generate an alternating current* in the crystal of 20 microamperes and an open-circuit potential of 15 volts. The former may be



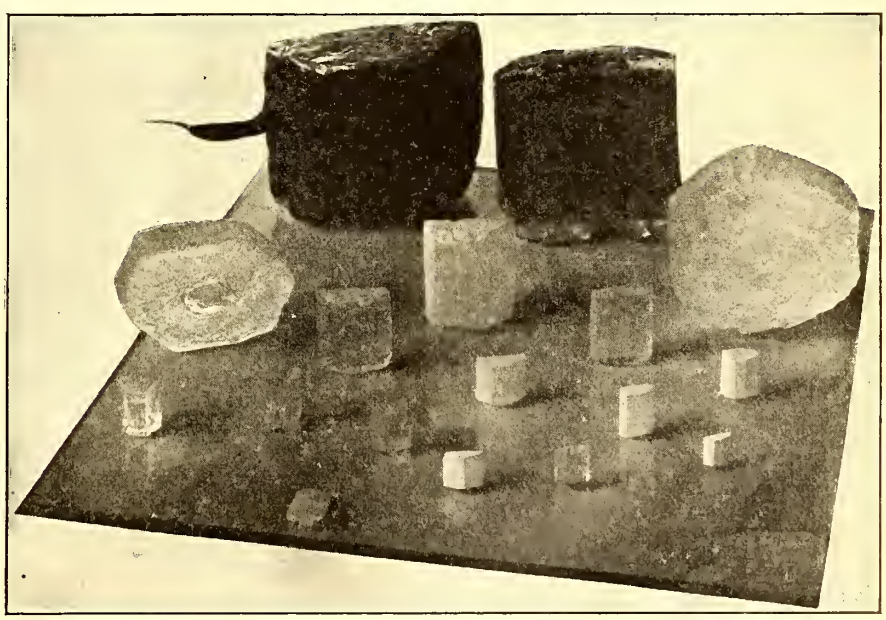


Fig. 4.—Circuit for Connecting Up 100 Telephone Receivers to Rochelle Salt Crystal Transmitter. Fig. 5.—Circuit for Crystal Telephonic Loud-Speaker. Photo at Right Shows Several Varieties of Rochelle Crystals.

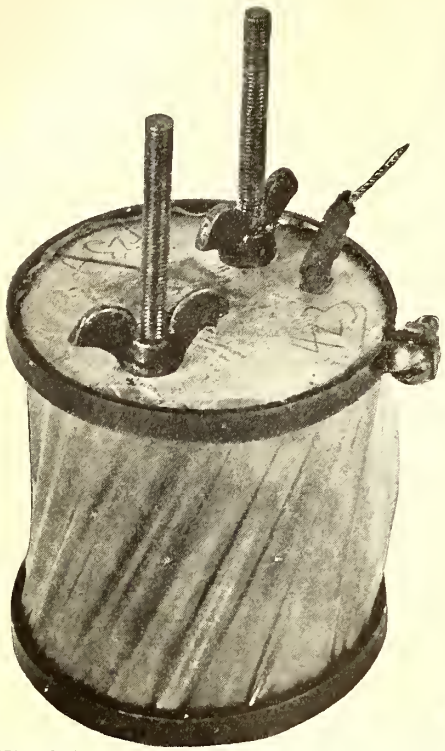
www.americanradiohistory.com



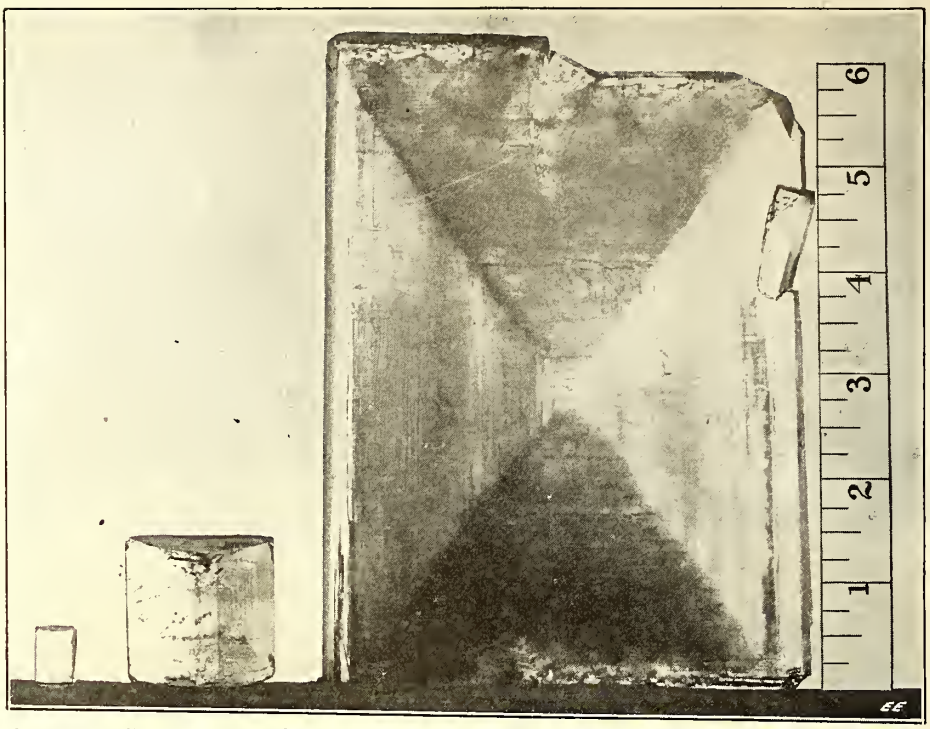


Fig. 3-A. How the Dressed and Mounted Rochelle Crystal Appears. The Diaphragm Is of Paper or Goldbeater's Skin Stretched Around the Outside as Shown.

Some Excellent Rochelle Salt Crystals "Grown" by the Author from "Seed Crystals." Some of These Crystals Have Been "Grown" as Large as Two feet and More. The Editors Have "Grown" Some Crystals Several Inches in Length Very Successfully, Following the Author's Instructions.

measured with a transformer, thermocouple and D. C. microampere meter, the latter with an electrostatic voltmeter.

The diaphragm used is rather novel. A strip of gold-beater's skin or even of paper (stiff bond) is wrapped around the spring compressors, holding the crystal, as in the first experiment, and metal bands tighten the strip on each of the two spring compressors. We now have a cylindrical diaphragm surrounding but not touching the crystal—yet conveying stresses to the crystal thru the spring compressors. The diaphragm, in order to be effective, must be corrugated as shown in Figs. 3 and 3A. This is done very readily by twisting the bands holding the diaphragm in opposing senses prior to its stretching and tightening. Usually a separate and removable appliance is used to perform these operations on the diaphragm.

Vibrations, due to sound waves, proceed from the cylindrical diaphragm thru the spring compressors, to the enclosed crystal. The crystal, when it is disturbed by the vibrations, converts these mechanical effects into corresponding electrical charges or currents, which may readily be detected in the receivers placed in the circuit.

Crystal Transforms Electricity into Speech.

But, as shown above, another interesting function of the crystal is that of a *receiver of electrical oscillations.* If we impress an alternating potential on the crystal poles and use the transmitter construction just described, then the crystal, itself vibrating under the electric stresses applied, will impart axial and torsional vibrations to the cylindrical diaphragm. Thus, corresponding acoustic effects will be produced which *may be heard considerable distances away from the crystal receiver.*

This experiment, using the crystal as a receiver, may be performed in different ways. Most simply, a carbon microphone may be applied as transmitter. This is shown in Fig. 5 with a local battery and high ratio transformer, which matches fairly well the low impedance of the local microphone circuit with that of the high impedance crystal. In this arrangement *the crystal operates as a "loud speaking" telephone* and may be heard several hundred feet away.

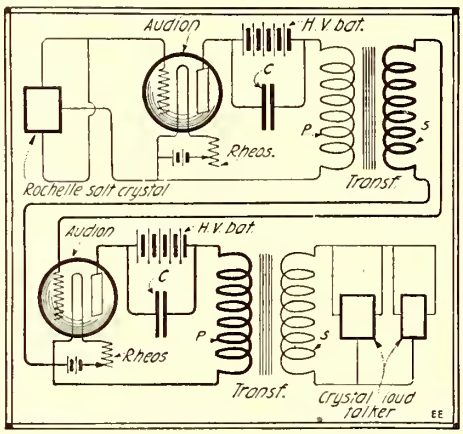

Fig. 6. Circuits for Connecting Speaking Crystal, Vacuum Tube Amplifier and a Second Crystal as a "Loud-Talker."

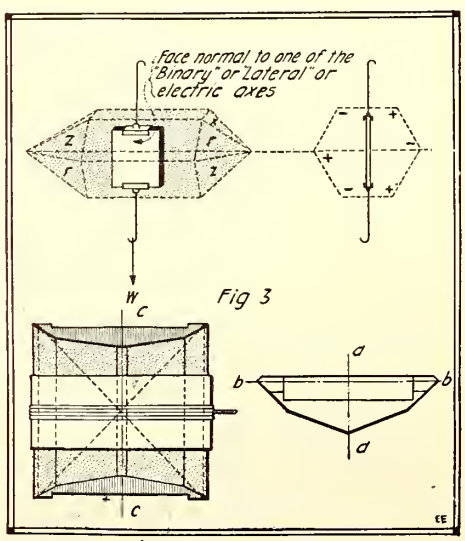

Fig. 7. Above:—Stress Applied to Quartz Crystal at "W" Produces Electric Current of Polarity Indicated. Rochelle Salt Crystals Act Similarly. Below:—Dressing of Crystals for the Girdle Orientation.

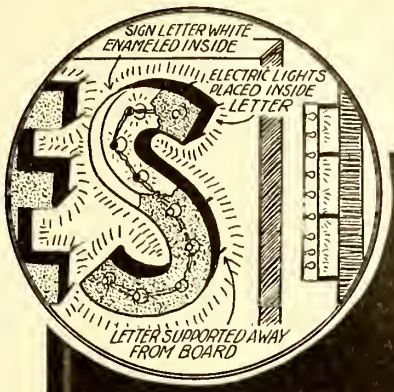
Another experiment is the use of crystals at both ends of a line. In order to increase the detecting and emitting effects of the piezo-electric crystal, the vacuum tube amplifier may be used. Fig. 6 shows a crystal transmitter, a crystal receiver, and an intervening two-stage vacuum tube repeater or relay. Speech and phonograph effects applied to the transmitter may be heard proceeding from the crystal receiver, with sufficient volume to fill a large auditorium. Under these conditions, if the crystal receiver is placed nearer than a few yards from the crystal transmitter, the receiver will *sing* to the transmitter. This well-known phenomenon in ordinary telephony is known as "howling" and is due, of course, to the presence of local free energy, of battery or amplifier, which will maintain circulatory oscillations of the acoustic and electrical effects.

At present the efficiency of these crystals, as defined by the ratio of the *output* to the *input*, is not high. This is principally because of the difficulty of associating a perfect *housing* with the crystal. The housing, is, of course, necessary in order to translate vibrations to or from the crystal. The efficiency becomes greater only when the frequency of the applied vibrations is close to that of the natural frequency of the combined crystal and its housing. Hence the comparatively large values of the alternating currents and potentials generated by the crystal when it is operated near any of its resonant frequencies—for, it may have several modes of vibration.



Some day it may be possible to pick up a pebble from the beach, place it to the ear and listen to voices spoken to another pebble found on some other shore.

[*As transmitters and loud-talkers, these crystals produce remarkable results and the amateur will be well repaid by his results, provided he follows the instructions given in this paper. As detectors for wireless telegraphy, however, they are practically valueless, if used in the regular way. Perhaps some amateur may some day hit upon a scheme which will produce the much-looked-for perfect crystal.*—EDITOR.]

Electric Sign With Indirect Lighting

The accompanying illustration of an electric sign, and which is mounted on the north side of 73rd Street and Broadway, New York City, involves a new departure of electrical advertising displays of this type. Instead of outlining the forms of the letters on the sign with electric light bulbs or illuminating the entire sign by indirect or flood lighting, reflected on to it from long reflectors placed at the sides and at the top, as is quite common practice, the letters themselves in this new sign form

One of the Newest Wrinkles in Electric Sign Design Is That Here Shown. The Letters Stand Out in Black Relief Owing to the Arrangement of the Lamps, Which Are Placed in Back of the Hollow Letters, as Illustrated in the Sectional View.

the reflecting troughs, in which the lamp bulbs are mounted. The inside surfaces of the hollow letters are painted white so as to serve as reflectors. The lights are supported at a short distance from the sign itself by means of iron rods as shown in the detail illustration herewith. In this way the letters seem to stand out in relief on the face of the signboard, and give a very pleasing and mysterious appearance indeed. The effect is much the same as that obtained when looking at an ordinary photograph, and then viewing a stereoscopic photograph of the same view or object with the aid of a stereoscope, when, of course, the images on the photograph appear to stand out in bold relief.

Aviators Instructed on Electric Chart

Many ingenious devices as well as mov- g pictures and electrical chart boards, and pecially illuminated maps, were devised id employed in training American aviators

ring the World War. Some of these ndered such excellent service and gave so ich promise that they have been retained d improved upon for utilization in the regular aviation training schools of the Army and Navy Departments. One of the most difficult things which the military or naval aviator has to learn is to shoot accurately while flying in the air. To the layman this may sound quite simple, but it is far from being such, and the experts who train aviators for this duty know it.

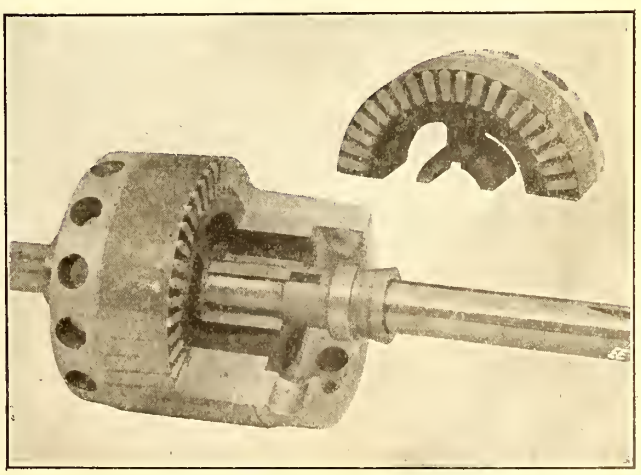
One of the methods used for instructing the soldier aviators in which electricity played its part is here presented. The bright spots indicate the positions of small incandescent lamps behind the screen on which the airplanes appear in various flying attitudes. These were all flashed on for the picture, but ordinarily are not visible. Aiming and firing practice is accomplished

Clever Electric Chart Board for Instructing Aviators in Firing at Enemy Planes. After the Dummy Machine Gun Has Been Sighted, the Lights Are Flashed On and the Gun Is Checked With Them.

by sighting a dummy machine gun at the position ahead of the plane, so that the time of travel of the bullet will be the same as that of the plane, and therefore it will reach a vital spot. After the sighting is completed, the lights are flashed on and the gun setting is checked by them. The three spots indicate the correct setting of the gun for various plane speeds of 75, 100 and 125 miles per hour.

"Casting" Motor Windings

A new type of rotor with cast winding, ich has been recently designed by one the leading electrical concerns, presents w features and improvements worthy of tice.



The bars and short-circuiting rings com- sing the windings employ the same mate- l and are cast in a single operation. With windings thus made a solid unit, rigidity, rability and better balance is produced. e cast winding from an electrical point view also insures uniform cross section d union between the bars and the end igs. This has become a factor in elimi- ting operating difficulties due to open- cuiting of joints between bars and end ngs.

Holes bored radially thru the cast end ings give effective ventilation for rotation n either direction.

The new cast winding rotor is said to e especially effective on induction motors of the *Squirrel Cage type*. The illustration shows a sectional view of the cast rotor.

The American Electrical Manufacturer Is Always Intent Upon Producing Machinery in Large Quantities and One of the Latest Departures in This Direction Is in the Form of a "Cast" Motor Winding. This Particular Cast Motor Winding Is a Squirrel-Cage Rotor for an Alternating Current Induction Motor. Not Only Is This Idea Mechanically Advantageous, but It Is Also Said to be Very Superior in the Electric Efficiency Achieved.

Each year sees more and more the mechanical manufacture of such parts of machinery as this.

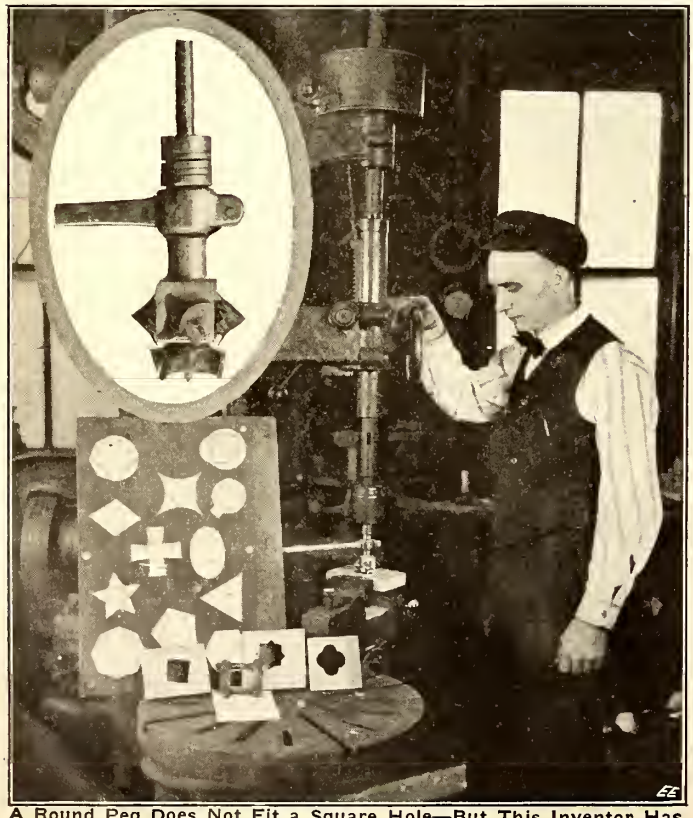
Beauty by the Kilowatt



London, England, Has Started on a New Road to Fame—Making Women Beautiful by Electric Tattooing! A Permanent "Peaches and Cream" Complexion Is Yours, Gwendolyn, for Six Bits.

We have always been under the impression that the English women were blest with one of the finest complexions in the world, but here comes a cable from London telling of the popularity accorded to a new fad in the English city—that of electrically tattooing a permanent complexion or blush on the face. The report goes on to say that the pallid and sallow faces of London women are being permanently brightened and given a rosy tint by expert tattooists, whose electric needle applications can be graduated to suit any physiognomy, and further, that the tattooists report they have never done such a thriving and profitable business among women as now.

Howsomever, and be that as it may, our artist has depicted in the accompanying illustration one of London's fair damsels receiving the electric tattooing treatment for a permanent rosy complexion. Such an outfit comprises an electric tattooing needle operated from a battery and supplied with current thru a flexible wire, while a small rubber tube leads thru the needle proper to whichever complexion is selected by the customer. In some of these tattooing needles the coloring pigment is contained in a small hollow chamber on the base of the needle itself. We presume this fad will cross the ocean and become a new art on Broadway—the lane of many brilliant accomplishments, the least of which is Beauty.

Drill Bores Square Hole

Did you ever have a dream of a drill that would bore a square hole? All of us have at one time or another, perhaps. An auger *to bore square holes* has at last been invented by Carl H. Schmidgall of Peoria, Ill. The simple tool works its way by rotary motion thru wood, iron or stone. It is really five augers in one—four little conical rotary cutters milling out the corners of the square after the main shaft has bored a round hole. Drilling a square hole thru a one-inch piece of marble by present methods takes four hours or more of careful work by a skilled man. The new invention does it in five minutes. There are only a dozen parts in the machine, and, according to experts, it can be manufactured at a comparatively low price. A simple variation in the shape of the cutters makes possible the boring of holes of many different shapes.

A Round Peg Does Not Fit a Square Hole—But This Inventor Has a Circular Drill That Bores a Square Hole.

Mr. Schmidgall has been working on his invention since he was twelve years old. He is now twenty-nine, and operates the biggest hand-made tool shop in Illinois, outside of Chicago. Master mechanics from all parts of the United States have recently visited his shop to look at the square hole auger.

HANDLESS, HE USES TELEPHONE.

In the latest bulletin as issued by the American Red Cross we come upon the remarkable story of a man whose arms were amputated midway between the elbows and wrists. The best way to tell his story perhaps would be to quote directly what this man has done and is doing:

"At the time of the accident the oscalcis was removed from my left heel with tendon of Achilles. A brace made of steel, leather, and felt is a substitute for the tendon of Achilles, and with it I can walk several miles every day with ease. I frequently walk five miles just for the joy of walking.

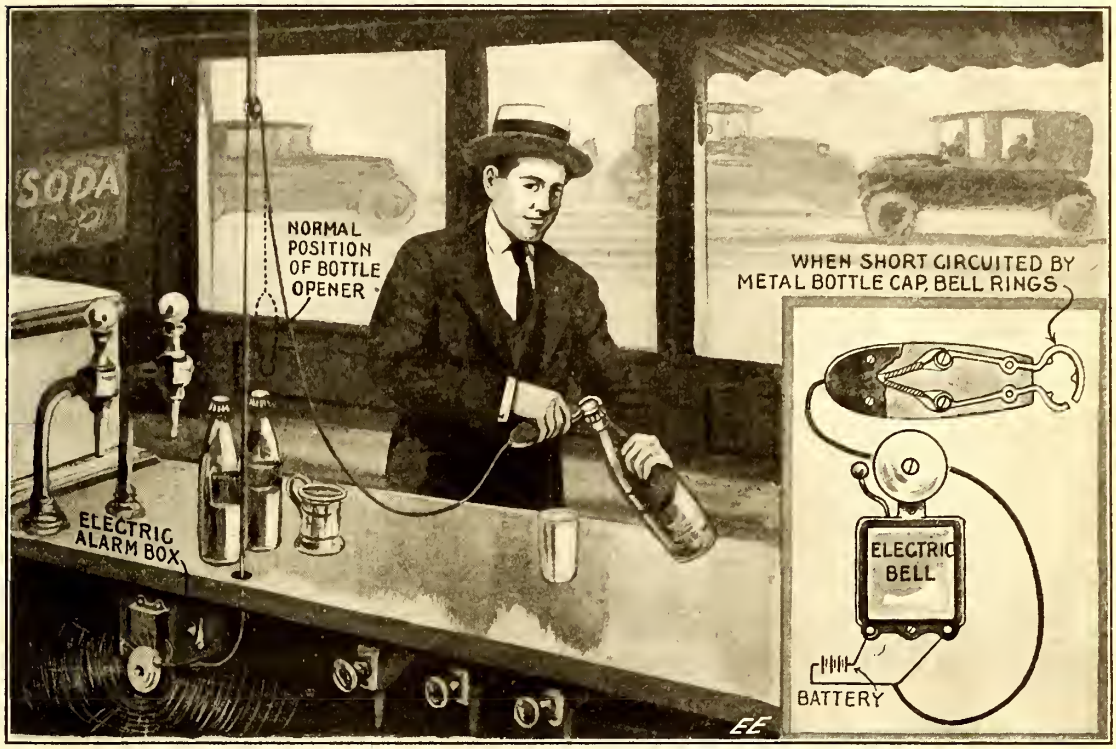
"I have the following implements, each of which has a fitting that is an exact duplicate of the butt ends of the hooks. These hooks and the implements fasten into the wrist plates of the artificial arms with a spring catch, so that I can release either or both hooks and insert the other implements at will:—Knife, fork, and spoon for eating; hair brushes; tooth brush; whisk broom and hat brush; blacking brush for shoes; Gillette razor and lather brush; tooth-pick; fountain pen; match-holder; telephone-holder.

Without Hands—He Uses Telephone. A Striking Example of the "Reconstruction" Work on Crippled Soldiers Being Performed by the Red Cross Hospital Experts. Soldiers Without Arms or Minus Perhaps One or Both Legs, Are Being Trained to Do Most Everything Any Normal Man Can Do. They Are Taught Clerical Work, Drafting, Painting, and Many Other Arts and Trades.

"On the dressing table in my bedroom, I keep a pair of extra long hooks with which I put on and take off collar and necktie. The remainder of dressing and undressing is not with the standard hooks which are not long enough to reach collar button at throat. I button the collar at back of neck before I put the shirt on. I dress in about twenty minutes and undress in about half that time. Shaving takes from twenty-five to thirty minutes, depending on condition of razor. I do this entirely alone, washing and drying face afterward, taking the razor apart and drying it and changing razor blades when they are dull. Brushing hair and clothes, attending to teeth, and shining shoes are simple matters.

"I meet with little difficulty in telephoning, or the ordinary routine of desk work. Have been receiving good living wages for more than twelve years.

"About four years after my accident, I married one of the several nurses that helped care for me in the hospital. We have four children."



Thus the great work goes on—every day sees new and more remarkable developments in helping the lame to walk and the sick to get well.

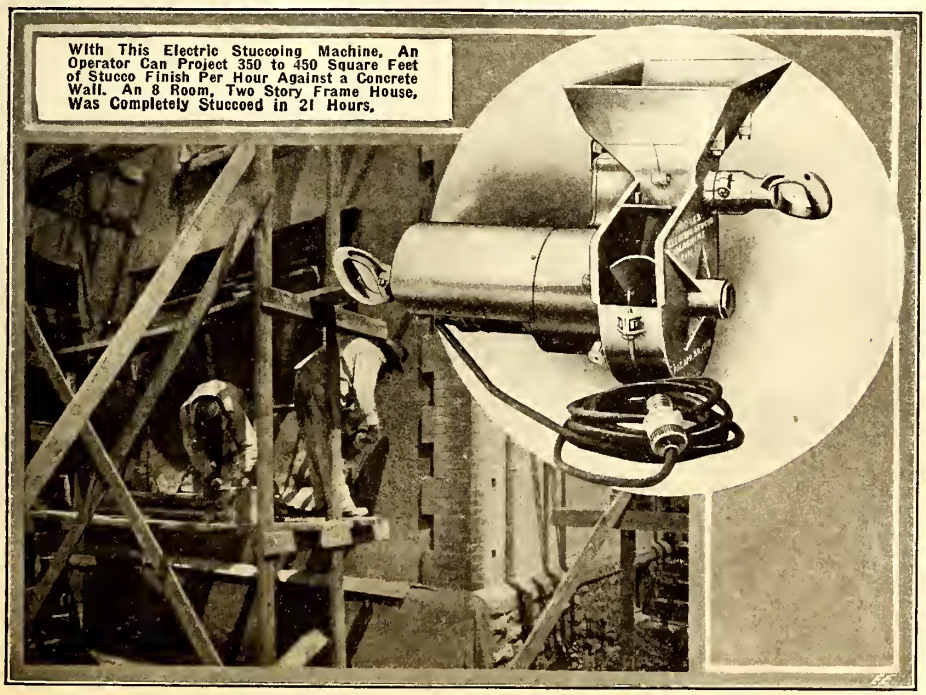
Soda Water Bottle Alarm

The thousands of owners of small soda water stands all over the country annually lose hundreds of dollars due to people helping themselves to the various drinks when the proprietor is conveniently absent. To mitigate this loss to the owners of soda water stands the inventor, Mr. Charles F. Scarborough, has brought out a clever, electric alarm which is combined with a bottle-cap opener in the manner here shown.



The alarm apparatus comprises a dry cell battery and bell mounted in small box, which can be placed out of sight so far as the customers are concerned. A flexible duplex wire or cable leads from the alarm box to the bottle-cap removing device. This cap remover comprises two distinct and thoroly insulated metallic rings which are connected to the bell circuit. If the circuit is closed as would be caused by a piece of metal coming in contact with the two metal fingers of the cap remover, then it will sound the alarm. Such soda bottles are usually opened up by a regular cap-remover and to make sure that the person desirous of stealing a drink, will use the electrified bottle opener, this is placed in as conspicuous a position as possible as the illustration shows. He grabs the cap remover, and the minute that it is placed in contact with the metal cap of the bottle, the circuit is closed—the bell rings, thus notifying the proprietor that he has "customers".

An Electric Soda Water Bottle Alarm, Which Has Recently Been Patented. It Comprises Two Electric Contacts Fitted in an Insulating Handle, Which, When Short-Circuited by the Metal Cap on the Soda Bottle, Will Cause the Bell to Ring.

Stuccoing Houses by Electricity

A recent house-finishing development is a motor-driven stucco machine by which the material is applied by projecting it from the machine by centrifugal force set up by revolving spider blades. The manufacturers of this device state that by applying the stucco in this manner, a skin, or enamel, is formed, making an outside coating which is impervious to moisture. As an instance of the speed at which the machine works it is said that an operator with a helper to supply the material can project 350 square feet an hour against hollow tile, brickwork or concrete blocks, and a trifle less against such material as metal or wood lath. The equipment is light in weight, aluminum castings being used for the frame and tool steel for the revolving spider blades and automatic feed. The weight of the motor, therefore, represents the greater part of the total weight of the machine. An auxiliary hopper is provided by which pebbles, crushed granite and similar materials can be effectively thrown into the stucco base.

With This Electric Stuccoing Machine, An Operator Can Project 350 to 450 Square Feet of Stucco Finish Per Hour Against a Concrete Wall. An 8 Room, Two Story Frame House, Was Completely Stuccoed in 21 Hours.

All of the work on an eight-room, two-story frame residence, including piazza posts, was accomplished with one machine, and the actual running time of the machine in completing the entire contract was just 21 hours. The lapsiding was not removed, but is covered with a saturated felt paper, against which was nailed the metal lath and the stucco then applied. The metal lath was completely imbedded within a projected depth of 5/8", and after being roughly floated, the white stucco finish effect was projected with the machine.

The following will be found a conservative average estimate of stucco projected by this clever machine.

Against a poured concrete base, a coat of stucco from 1/4" to 3/8", an operator should project 350 to 400 square feet per hour; against unpainted brick, hollow tile, concrete blocks, and like materials or construction from 300 to 350 square feet per hour; against Bishopric Board and like wood, lath backing, in filling up the keys and projecting as above, 300 to 350 square feet per hour; against Gypsum Plaster Board and other like materials from 400 to 450 square feet per hour.

Against Metal Lath furred out 1/4" with a backing of building or tar paper applied to a sheeted surface or studding, 350 to 450 square feet per hour.

Popular Astronomy

By ISABEL M. LEWIS, M.A.
Of the United States Naval Observatory

IS THE MOON A DEAD WORLD?

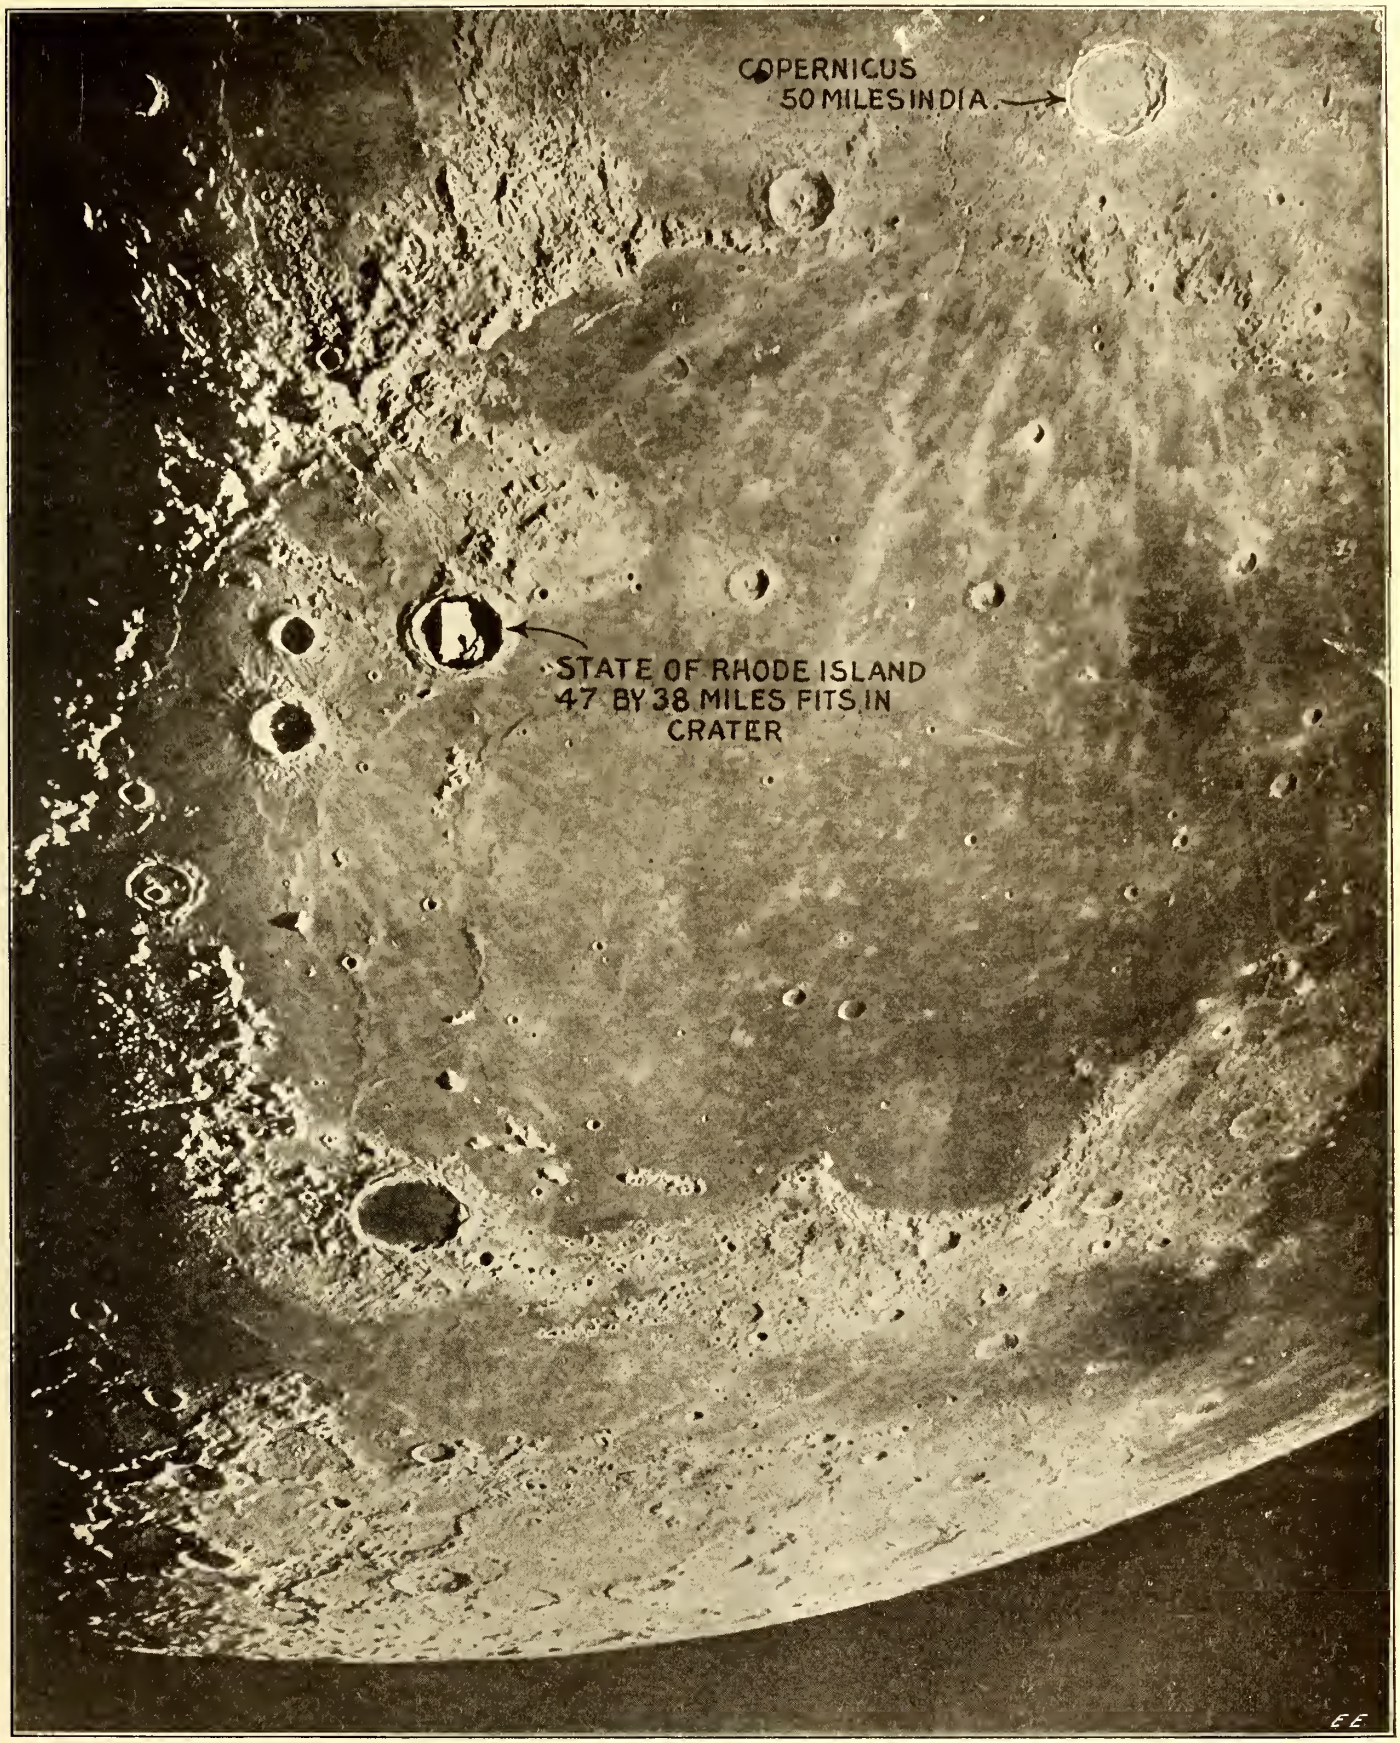
Photograph of the Moon Taken with the 60-Inch Reflecting Telescope of the Mt. Wilson Observatory Showing Regions of Albategnius and Hipparchus. This Photograph of the Moon Shows All the Varieties of Walled-Plains, Ring-Plains and Craters as Well as a Number of Conspicuous Clefts and Rills. Almost Exactly at the Center Is the Walled-Plain Albategnius, 65 Miles Wide, and Adjoining It on the North Is the Walled-Plain Hipparchus Nearly 100 Miles Wide. This Is One of Many Walled-Plains That Clearly Show Signs of Wreck and Ruin. Note the Superimposed Craters of a Later Origin. Just to the Northeast of Albategnius Is the Great Walled-Plain Ptolemaeus, 115 Miles Wide. In Its Interior to the Northwest Is a Very Conspicuous Little Crater 4 Miles in Diameter. Almost Due North of Ptolemaeus Is the Typical Ring-Plain Herschel, with a Rampart Rising Nearly 10,000 Feet Above a Dusky Floor From Which Rises a Central Mountain Peak. The Rampart Is Symmetrically Terraced Both Within and Without. To the Northwest of This Ring-Plain Is a Deep Lunar Valley About 80 Miles Long and in Places 10 Miles Wide. South From Ptolemaeus Extends a Long Chain of Great Walled-Plains Reaching to the Southern Border of the Photograph. Near the Western Border Which Marks the Terminator Appear Ring-Plains and Craters in the Greatest Profusion and the Harsh, Black Lunar Shadows Are Very Conspicuous. The Distinction Between Walled-Plains, Ring-Plains and Craters Becomes Clear From a Careful Study of This Photograph.

SUSPICIONS that changes are continually taking place in certain surface markings of the moon have been held for many years and as the face of our nearest neighbor and satellite is scanned more carefully from year to year with telescopes of high power these suspicions are being confirmed, rather than disproved, by many diligent and careful observers.

It has been estimated that at an elevation of about one mile above the surface of the moon the density of its atmosphere is only one ten-thousandth that of our own atmosphere at an equal elevation. It is, therefore, impossible for water to exist in the liquid form on the moon at moderate elevations, tho it may exist in the form of water vapor, hoarfrost or snow.

Comparatively recent researches of Very indicate that the highest temperature to which the surface of the moon is heated in the middle of the long lunar day, equal to fourteen of our own days in length, is probably about 200° F. During the long lunar night the heat rapidly escapes owing to the extreme rarity of the lunar atmosphere and within a few hours the temperature probably drops far below zero and at the lunar midnight may approach closely to the absolute zero of interplanetary space or —473° F.

If there were no other causes to produce changes in the lunar surface markings, it might be expected that these great extremes of heat and cold alternating periodically would register their effect upon the face of our satellite.



The evidence of change in the appearance of lunar features, aside from the expected and periodic changes due to variations in the lunar phase and altitude of the sun, which are of course not changes in the markings themselves, is to be found chiefly in connection with the more minute markings such as the crater-cones and

(*Continued on page* 820)

An Enlarged View of the Moon Taken by Ritchey With the 40-Inch Yerkes Refractor Showing Ray System of the Ring Plan Tycho (to the South), and of Copernicus, One of the Most Conspicuous and Magnificent of all Lunar Features (to the Northeast, Near the Lower Rim of the Photo). The Dazzling Whiteness of the Southwest Quadrant of the Moon Contrasts Sharply With the Dark and Comparatively Smooth Maria or Seas to the North and East. The Nearly Enclosed Sea, Mare Humorum, is Shown Near the Center of the Eastern Rim of the Photo. Its Area Is Approximately 50,000 Square Miles. The Walled Plain Gassendi, on its Borders, 55 Miles in Diameter, is One of the Most Beautiful Telescopic Objects on the Lunar Surface. A Lunar Mountain Range, the Riphaean Mountains, Is Shown a Little to the Northwest of the Mare Humorum. The Highest Peak is About 3,000 Feet Above the Surrounding Region, Which is a Very Moderate Lunar Elevation. This Is One of the Least Important Lunar Mountain Ranges. Close to This Mountain Range Is the Little Crater Euclides, 7 Miles in Diameter, One of the Most Brilliant Objects on the Lunar Surface; the Region Surrounding the Crater Is Equally Brilliant. The Ray Systems of Tycho and Copernicus are the Most Consnicuous of These Peculiar Markings Which are Found Associated With a Number of Other Lunar Craters. According to Prof. W. H. Pickering, Who Has Very Carefully Observed Them Under Excellent Observing Conditions, the Rays of Tycho do not Come From the Center of the Crater, But Orioinate in a Number of Minute Craters That Lie on the Outer Rim; While the Rays of Copernicus Originate in Craterlets Lying on the Inner Slopes of the Ramparts, Ascend to the Summit and then Spread Out Over the Surrounding Mare in Feathery Streaks.

Wide World Photos

The World's Great Satellite at Closer Range Than Ever Before Seen by the Eyes of Man Was Made by the New Hooker Telescope of Mount Wilson Observatory of the Carnegie Institution of Washington, Just Installed, and Was the First Taken After the Telescope Went Into Commission. The Picture in Detail and Definition Is Superior to Any Hitherto Made. The Mirror of the Telescope, the Largest Yet Constructed, Is 100 Inches in Diameter. The Scale of the Illustration Is About One Hundred Miles to the Inch, or a Little Less Than Eight Feet to the Moon's Diameter. The Mountains Above and to the Left Are the Lunar Apennines; Those on the Left Below the Centre Are the Alps. Both Ranges Include Many Peaks From 15,000 to 20,000 Feet in Height. The Ring-like Formations Are the So-Called Craters, Most of Them Far Larger Than Anything Similar on the Earth. In the Upper Right Corner Is Copernicus, About Fifty Miles in Diameter. The Largest of the Conspicuous Group of Three Just Below the Apennines Is Archimedes, and at the Lower End of the Alps Is Plato. Attention Is Called to the Long Sunset Shadows Cast by the Isolated Peaks on the Left, and the Shadows Cast Within the Craters by the Crater Shells Can be Plainly Seen. The Central Portion of the Picture Is a Vast Plain, the Mare Imbrium.

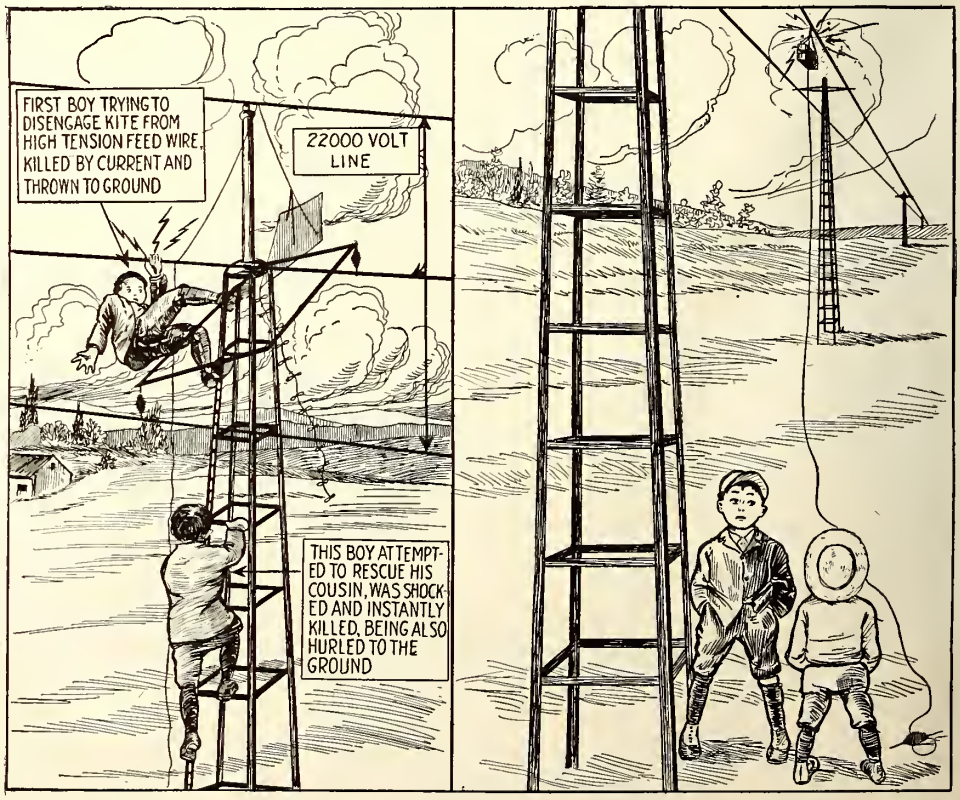
Training Women Sub-Station Operators

Sister and Auntie Go to the Electric School—It Happened in Boston—and Learn All About Dynamos and Motors, and How to "Parallel" Alternators; What a Synchronous Motor Is; What to Do When a Circuit-Breaker "Opens"; Yes, They Learned Easily, Says Their Instructor.

The accompanying illustration shows women substation operators being trained at one of the power stations of the Edison Electric Illuminating Company of Boston. We do not usually associate electrical diagrams, circuit breakers, dynamos and storage batteries with women operators, possibly because we are not used to them, and being used to anything is mostly nothing more nor less than a habit. As we become used to these newer adventures of the fair sex in the electrical and mechanical branches of applied science, we shall, after a while, think nothing of it. Women substation operators have served faithfully and well in many power stations in England during the war, and undoubtedly will continue to serve in these capacities. It is a common practice both in this country and abroad for all women operators running power houses and substations to wear modified overall suits, so as to eliminate the danger of loose clothing being caught in any moving machinery. We know that women's minds are very subtle and quick to respond, and moreover they are eager and quick to learn, in any trade or art which they may set their minds on. We therefore presume that the serious-faced students of electric power house matters shown in the accompanying photo have graduated into full-fledged switchboard and dynamo operating experts.



Ye scribe, having spent several long and patient years in power houses, pauses to philosophize on the mental equilibrium of the lady switchboard operators and dynamo tenders at the psychological moment when about steen thousand amperes charge over the line on a "dead short," and "blows" the breakers and perhaps the dynamos, too, with a roar like a young Niagara and flashes of fire like Pain's fireworks on the Fourth of July at Brighton Beach. And that is not all, for when a large steam main goes blooey and starts spitting out several hundred cubic feet of super-heated steam per second into the power room, they will think the end of the world has surely come; as the station fills up with steam accompanied by a deafening, seething roar as the steam escapes. But probably they will get used to these things the same as the male operators, and after one good initiation or so, never mind such little things as a 500 per cent overload short-circuit on the main generator bus-bars. We said "probably." But who can tell?

Two Kite Fliers Killed by Live Wire

Two boys came to their death recently at Winsted, Conn., as a result of contact with a high tension electric wire carrying 22,000 volts. Edward Isaacson, Jr., 13 years old, and his cousin, Walter Lindblad, also 13, were flying a kite on the elder Isaacson's farm when the kite caught in the electric wires atop a 50-foot steel tower.

The boys tried to disengage the kite and failing climbed the tower. Young Isaacson touched one of the wires carrying the heavy voltage and was thrown across the feed wire, dying instantly. Lindblad tried to assist his cousin but the current coursed thro his body and hurled him to the ground, where he was picked up dead.

The accompanying illustration shows how the current past thru the victim's body to earth. On such high tension lines all you have to do to get electrocuted is to touch one "live" wire; there is always a cross current or leak current somewhere which will complete the circuit as soon as this act has taken place. It is not safe to touch one rubber covered wire of a 2,500-volt feed circuit, let alone a 22,000-volt line. The electric chair requires only 1,800 to 2,200 volts to electrocute a man, and if you bear in mind that people have been electrocuted by touching a circuit carrying as low as 110 volts, then you will be extremely careful about touching any wires. If you are not the electrician who is *familiar* (understand that word) with the wire or pole in question, **leave it alone!** It may spell death. Electricians included.

How Many Volts Kill? Sometimes 110 Volts Will Kill; 500 Volts (Trolley Lines) Liable to "Jar" You to a Fall; 1,000 Volts—DANGEROUS! 1,500-2,000 Volts—FATAL. (1,800-2,200 Volts Used in the "Electric Chair".

Don't Fly Kites Over High Tension or Other Electric Wires. If the String Drops on the Wires, Even if Dry, You May Be Severely Shocked or Killed. Don't Touch the String—Leave It Alone.

The Amateur Magician

By JOSEPH H. KRAUS, Jr.

THE MAGIC BELL.

PROFESSOR HARGRAVE was known to all magicians as the originator of many ingenious tricks and sleight-of-hand passes and consequently aroused a feeling of considerable jealousy among others in the same field of work which he himself was engaged in. When, however, he made arrangements to publish broadcast those of his more spectacular tricks, the Magicians' Council, an order of the "Black Art," as that science is known, attempted to stop him, but their efforts were fruitless.

By special courtesy this publication has secured his consent for placing some of his works before the public in such a way that the lay readers who are the least handy with tools can construct apparatus to duplicate his marvelous feats. With this end in view not only the "gift of gab," or magicians' "patter," as it is sometimes called, is given, but also the constructional data are given. Let us attend one of Prof. Hargrave's performances.

"Good-morning, ladies and gentlemen," ventured Professor Hargrave, as he stept onto the stage in a recent performance at one of our largest theatres, "Evening, did you say?" he continued, "Oh, yes, to be sure it is, how absentminded I am. Well, what shall be your pleasure? This?" as he pointed to a beautiful bell hanging on a highly polished stand. "Very well."

Suiting his action to the words he reached for a pack of cards on one of the small tables and proceeded off the stage. Having had the audience select three cards,

View of the Glass Bell, Which Can be Made From an Ordinary Chandelier Shade.

he stept back to the stage again. Carrying the bell forward in full view of the audience and placing the stand right down front, he exclaimed:

The "Mystery Bell"—The Magician Shows That the Bell as Well as the Hook Upon Which It Normally Hangs, Including the Stand Separating the Bell, Are All Separate and Independent Pieces, Having No Strings or Electric Wires Attached to Them; Yet When the Bell Is Replaced on the Stand and Combined With the Stand Support, It Taps Out the Answers to Various Questions Asked by the Audience. It's Easy When You Know How!!

"Now, friends, I don't want to deceive you." He removed the hook from the rest of the stand; passing the hook to the public on one side of the stage and the bell down the other.

"Now examine those two articles carefully and note that there are no strings to deceive you; that hook is genuine silver. I bought it myself at Woolworth's jewelry counter, an emblem of the first thing I got when I appeared upon the stage some years ago from the enthusiastic manager." (To wit—the hook!)

By this time the bell had come back and Professor Hargrave continued: "The bell answers by ringing twice for *yes* and once for *no*." Then placing the hook into its position in the remainder of the stand, and resting the bell on its hook, he added: "Don't you, bell?" to the beautiful object of glass and metal.

The bell pealed forth two melodious sounds.

"Well, bell, suppose you tell me the number of spots which were on the first card I gave out? Seven? Very well. Did the lady choose hearts?"

The hammer rose and descended twice in succession.

"Seven of hearts. Was that correct, speak out please?"

The victim answered in the affirmative.

"Thank you."

"Now, bell, will you please tell me the name of the next card? (You know I have to talk kindly to the Little Miss). How many spots were on that card?"

One ring was the answer.

"Only one? Well, was it a spade?" The response was *yes* again.

"Ace of spades, was that right, sir? Don't shake your head, because I'm too far away to hear it rattle."

"Now for the next card. Tell me the number of spots on that." Hargrave awaited an answer but no response from the bell. "What— don't you know?" The bell answered in the affirmative by ringing twice. "Well, tell me then." Again no response, whereupon the performer became excited, exclaiming: "I hope you will all excuse the bell, but I don't think she knows, so we will have to go on with the rest of the performance.

Ding-Ding, Ding-Ding, Ding-Ding.

Oh, you *do* know. Well? How many spots on it, please?"

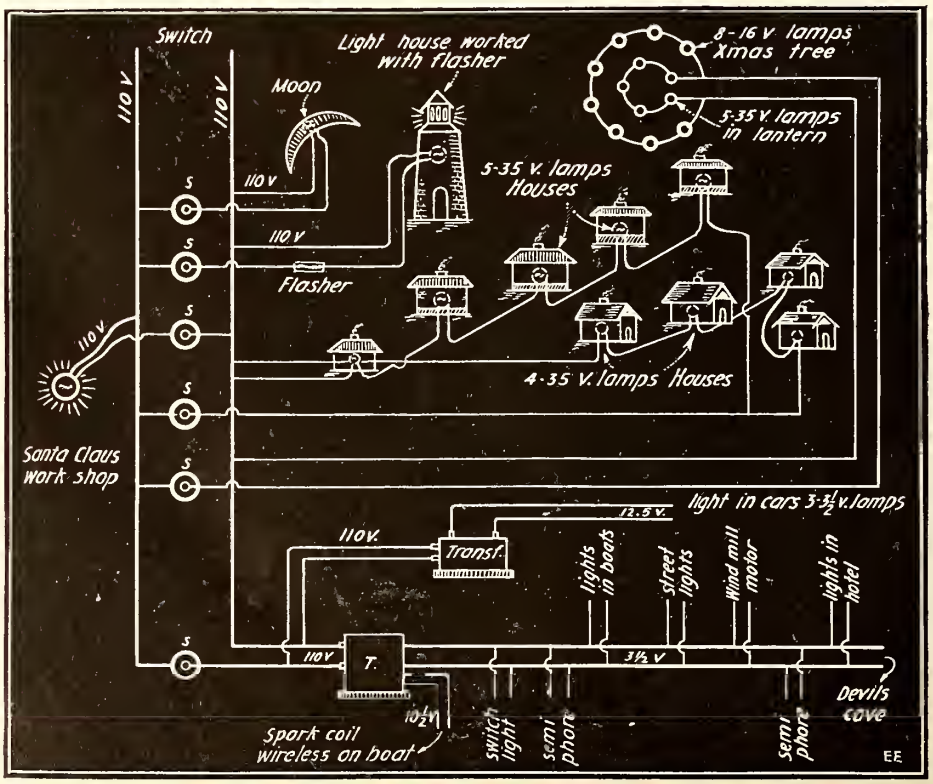
THE CONSTRUCTOR

A Model Electric Village



By FRED F. PHILLIPS

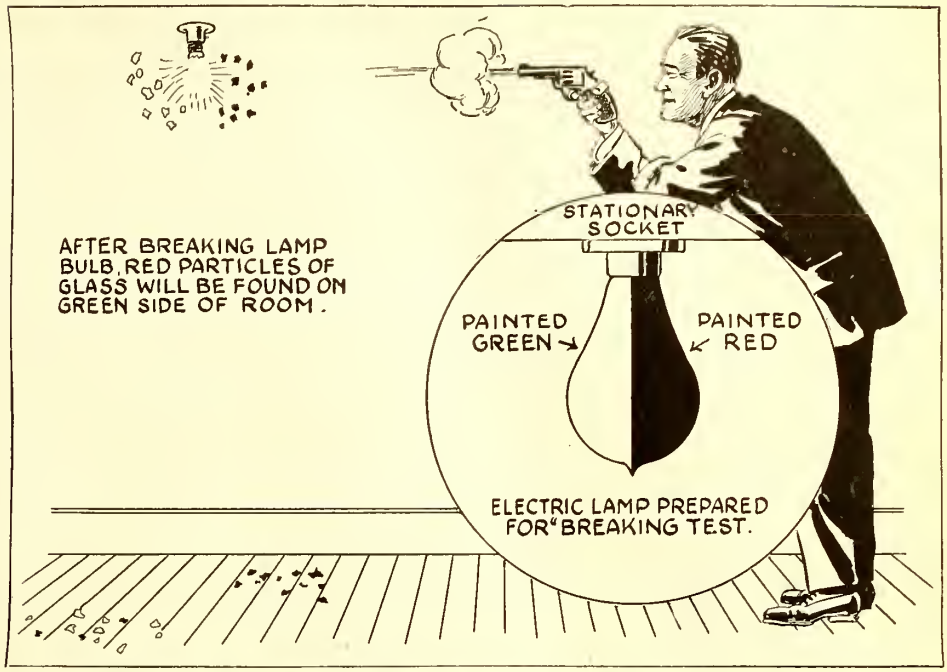
THE accompanying photos illustrate an electrical Christmas display that I got up for my boys, and as most of the ideas were taken from your magazine, I thought perhaps they might be of interest to your readers.

Three years ago I built a few simple electrical devices in connection with the boys' Christmas Tree, from ideas that I took from the EXPERIMENTER and the display made a "hit," not only with my own sons, but with a great many others and also the grown-ups in the vicinity. This has been followed by adding something new each year and the display here illustrated is the result of last year's work and I trust that thru new ideas gained in 1919, to build something more elaborate this Christmas.

Herewith is a diagram of wiring plan; this plan does not show telephone wires from rear of house to display in front room. I had a phonograph in the rear of the residence and transmitted music of bells and other Christmas pieces to the little church in the display. The mountains were built of wire netting over boxes and newspaper was used to cover them, the same being wet with flour paste and shaped over the wire, about 8 or 10 thicknesses were used. After it was dry, the same was painted with water color paints; white paint was used for snow and fireproof snow, such as is sold in the stores for the holidays, was used to make it sparkle. The boats are in a tank 4 feet square and 2½ inches deep; connections for lights in them and wireless on them, were run thru rubber tubing. The tank is made of tin. The light-house is made of tin and connected up with a flasher, made according to a diagram given in the EXPERIMENTER.

Wiring Diagram for Electric Christmas Tree and Village.

The back-ground is a piece of cheap canvas painted with water colors; inside the left-hand mountains, viewed thru a peek hole, was Santa Claus' work-shop, built on the idea of the old style candy Easter eggs. In the right-hand mountains was the "Devil's cave," where the bad boys go. This does not show up in the photo very well, as the red photographs black; it was built of red paper with lights under the same, to appear as hot coals.



The miniature houses were built of cardboard and painted to represent different buildings. The display base was 3 feet from the floor, the display itself was 9 feet long, 4 feet wide and 6 feet high from the base.

Do Lamps Burst Inward or Outward?

When an electric lamp is broken by force the glass walls are driven inward and do not fly outward as generally supposed. To prove this take a burnt-out lamp bulb and paint one half of it red and the other green. Then screw it in a socket suspended in the center of a room so that it cannot revolve. Note the direction each color is facing. Then break the bulb with a shot from a revolver or air rifle. Upon examination of the bits of glass that are scattered on the floor red particles will predominate on the opposite side of room which this color faced before the lamp was shattered, and green particles will predominate on the opposite side from which it faced also. This proves that the pressure of the air crushed the glass walls inward instead of exploding outward.

Contributed by J. A. WEAVER.

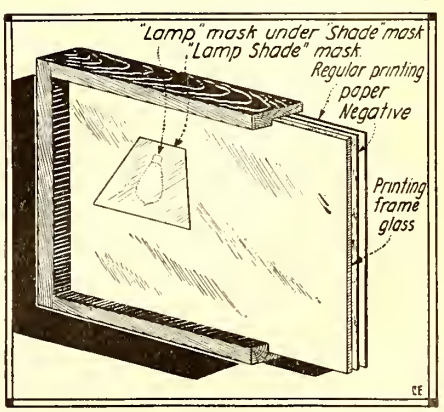
Which Way Do You Think Incandescent Lamps Break—Inward or Outward? Paint One-Half the Bulb Red, the Other Half Green and Break It with a Pistol or Air Rifle Shot. it Bursts Inward As This Experiment Shows, the Colored Fragments Falling on Opposite Sides of the Room.

Photographic Experiments

By MARION B. REYNOLDS

"DODGING" photographs to bring out the artistic values in an apparently unartistic negative is one of the tricks of the trade which offers a great many possibilities, even for the amateur photographer. If one has either acquired or was fortunate enough to be endowed with a little patience and perseverance, plus a little ingenuity and imagination, there is no end to the variety of "stunts" one can perform with ordinary negatives.

An Ordinary Photograph by the Author—Note the Table Lamp. It Has No Glow About It.



It Is Almost Impossible to Photograph a Scene Like This. By the Clever Use of a Simple Printing Mask, Such an Effect Is Readily Obtained from Any Negative.

One of these "stunts" is the introduction of artificial light in photographs snapped during the daytime, giving the effect of a picture taken in the evening. The accompanying photographs illustrate this point vividly. Obviously it is practically an impossibility to take a direct photograph giving the effect as shown in the photograph. With the average amateur's hand camera, the exposure would necessarily have to be rather long, as the only lighting used would come from a shaded lamp. A lengthy exposure would impose a trying job on the part of the sitter, as holding a position for any length of time is a difficult task and I will admit that he would have to possess a much quieter nature than I am blessed with. Then, too, halation would destroy to a great extent, the effect originally intended. This photograph was made on a bright day with a 3-A Folding Pocket Kodak, Rapid Rectilinear Lens, using Stop 16 and an exposure of four seconds. Incidentally I might say that it was taken by myself, using a black thread to release the shutter.

Printing the picture, producing the effect of a lighted lamp, was not a difficult procedure. The materials and equipment used were as few in variety as it is possible to work with and consisted entirely of amateur equipment. My printing frame glass happened to be thicker than is ordinarily used and very conveniently softened the lines of the masks used to obtain the result. The masks used need not be accurately cut as they are not used in contact with the negative but are placed on the *outside* of the printing frame glass. In making the masks, a piece of manila paper was cut to a shape resembling an electric light bulb, and another was cut to the exact size and shape of the lamp shade. In order that these masks might be placed in the correct position on the printing frame glass, the negative was placed in the printing frame and temporarily secured by means of gummed strips of paper. A piece of white unsensitized paper was then inserted in the frame so that the objects in the negative might be clearly defined. The first mask, cut to the shape of the bulb, was then placed in position with a little mucilage and the second placed immediately over it in the same manner, directly over the lamp shade in the negative, taking care to place mucilage only on the edges, making it possible to remove it without disturbing the first mask. After removing the white paper and replacing it with a sheet of sensitized paper, an exposure was made of about three seconds, using a very strong but soft light and dodging the lower portion of the negative with a triangular piece of cardboard. A second exposure was made of the same duration, but with the second mask removed, and a final exposure was made with both masks removed and without the use of the triangular cardboard. Upon developing the result, the effect was found to be just what was wanted.

Numerous other effects may be produced in this manner, such as a family circle around an open fireplace, or the rays of a light-house may be introduced in a daytime picture, turning it into a night scene. If one is willing to put a little thought and study into his experiments many other subjects and effects will suggest themselves, which if carried out will produce very pleasing results.

Showing How the Two Paper Shades or Masks Are Arranged in Front of the Printing Frame to Give the Effect of an Illuminated Table Lamp, As Shown at the Left.

www.americanradiohistory.com

The "Finer Workings" of Static Electricity

By FREDERICK VON LICHTENOW

THERE is hardly a branch of experimental electricity which requires a closer observation of its functional details than *Electrostatics*. The field itself, seemingly unlimited, not only offers a great variety of experiments, finished and complete in

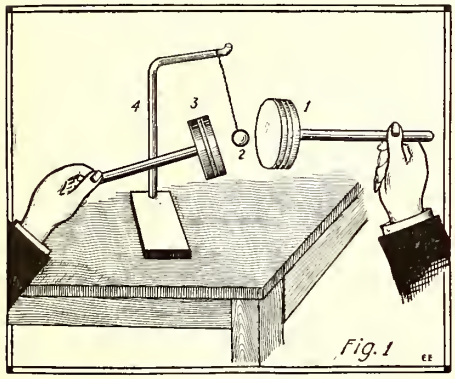


Fig. 1. Repulsive Action of Induced Charges. 1—Electrophorus Cover No. 1 (Charged). 2—Light Body (Pith). 3—Electrophorus Cover No. 2. 4—Insulating Stand

themselves and clearly demonstrating the basic principles of this element, but an additional multitude of variations from these—due to more or less marked changes in their conduction—which *in some instances* exemplify the "Finer Workings" of this earth-endowed mysterious power to a remarkable degree.

Many things about Static Electricity have doubtless remained unknown, just as well as even the action of the Wimshurst Static Machine, so long and widely used, is as yet not understood to the fullest extent.

Electrical experiments in general teach much; static experiments, however, are *in principle* and *in part* true replica of the great atmospherical movements and disturbances which occur above and around us, in consequence of which a favorable amount of conclusions regarding the latter may be drawn from these experiments. So much for static experiments in general.

Additional "clues" however, leading to the fuller understanding of this particular branch of the electrical science, may be gathered from experiments, which in a more or less pronounced way, expose the "Finer Workings" of static electricity.

Only the simplest apparatus is needed for their reproduction, in fact, weak charges-sources are a necessity to that end, since the

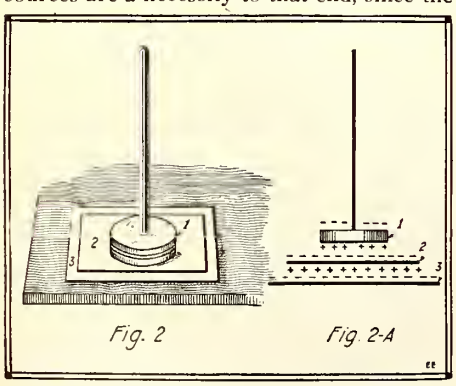

Fig. 2. Electrophorus Cover Charged Thru Glass. 1—Electrophorus Cover. 2—Sheet of Glass (1/16") 3—Hard Rubber Plate (Charged)

more powerful generators (static machines) liberate entirely too much unwanted energy (influence) into the surrounding air, as well as deliver too strong a charge into the instruments in operation, as to ever allow these very tender static actions to evidence themselves.

EXPERIMENT NO. 1.

Some light object (such as a pith ball), after suspending it by a silk thread from an insulating stand, is gradually approached by a charged electrophorus cover (a tin box fastened to a stick of sealing wax or hard rubber rod will do) until it moves toward the latter and is held under the influence of the charge in a position near the cover. "Near" means in this case the distance between the cover and the ball, when the latter, altho attracted, still hangs under *medium tension* and *will not move further on its own accord.* This has to be carefully worked out!

If now the cover of another electrophorus, *not* charged but in a so-called neutral condition, is brought near the light object from the opposite side and moved slowly toward it, the (supposedly neutral) cover will during this motion "force" the suspended pith ball ahead of itself and "push" it thru the intervening space up to the charged cover. (Fig. No. 1.)

The phenomenon finds its explanation in that the positively charged cover in attracting the light object induces a negative charge upon it as well as upon the so far neutral electrophorus-cover, repelling at the same time all positive electricity.

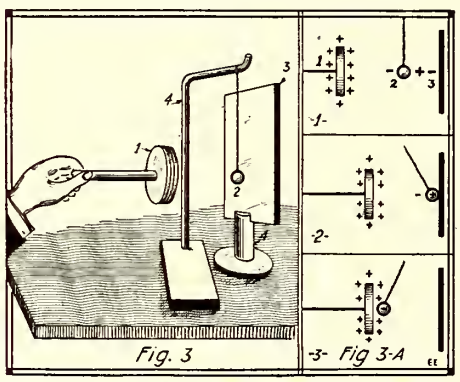

Fig. 3. Inductive Action Upon Neutral Body. 1—Electrophorus Cover (Charged). 2—Light Body (Pith). 3—Sheet of Glass. 4—Insulating Stands

(The small amount of positive electricity repelled on the light body (pith ball) is neutralized thru the air (at a distance) by the induced (—) charge on the face of the second El-cover). Both cover No. 3, and pith ball, carrying a like charge, repel one another and since this cover, which has besides the larger amount of induced charge (reflex-energy, so to speak) of the two residing upon it, is moved steadily in the direction of cover No. 1, the light object can not help but make contact with the latter.

It goes without saying, that, if the experiment is interrupted before the ball reaches the charged cover and the latter is removed altogether, the field of influence vanishes automatically, and both ball and the other cover are once more restored to a neutral condition.

The insulating stand to be used *in this experiment* should contain no metal parts and the pith ball should hang well off the table surface, as in all static experiments of a similar character.

Another way of gaining similar results—the effect, however, will be not quite so pronounced—is by employing a charged hard rubber plate instead of the charged electrophorus cover, using otherwise the same instruments and tactics. In this case, as is quite natural, the polarity of the respective parts will be found *reversed.*

If in either of the above cases the neutral El-cover is replaced by a *grounded conductor,* such as the operator's hand, for instance,

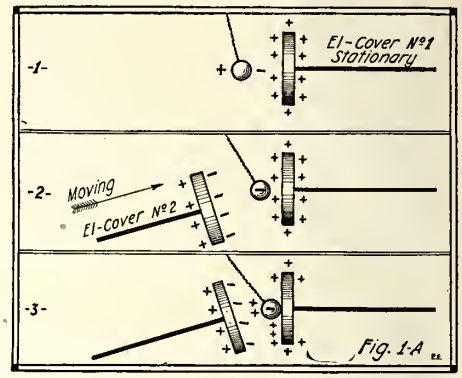

Fig. 1-A—Diagram Showing the Three Principal Stages of the Static Experiment Illustrated at Fig. 1.

which changes the fundamental principle of the experiment, then the pith ball will be first attracted to the hand (providing the latter is brought close enough to it) where the ball "unloads" its complement of positive electrons and an instant after, fully negatively charged, fly over to the + charged El-cover and make contact with it, which it, again, would not accomplish "under its own power."

Concerning the first two instances, I may further add, that, whenever the induced charge is too weak to neutralize the positive element repelled on the pith ball at a distance, the ball will (quite naturally) be momentarily attracted to the second El-cover, which in turn is a sign only, that cover No. 1 is not properly charged.

EXPERIMENT NO. 2.

(Electrophorus Cover Charged Thru Glass)

That an electrophorus cover will receive a charge, altho separated from its "cake" (charged hard rubber plate) by an insulating body, is proven by the following simple experiment:

The cover of an electrophorus (metal box used in experiment No. 1) is charged in the usual way, discharged and charged again until the sparks are raised to their

(*Continued on page* 837)

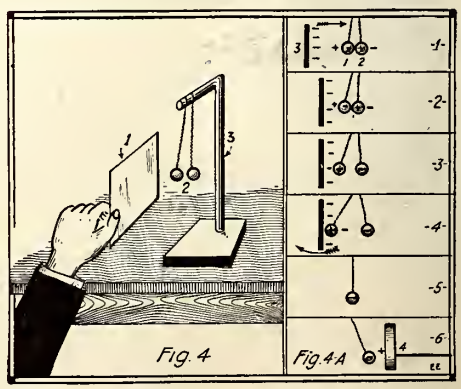

Fig. 4. Imprisoning Charge Upon Neutral Body by Induction. 1—Hard Rubber Plate (Charged). 2—Pith Balls. 3—Insulating Stand. Ball Hanging Nearest to the Plate Should Be Suspended by a Thread with a Wide Loop. Explanation for This Is Given in the Text

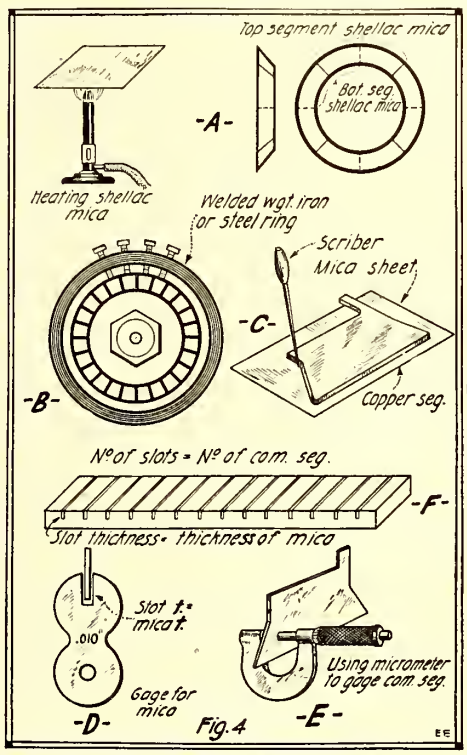
The Electrical Machinist

By H. WINFIELD SECOR

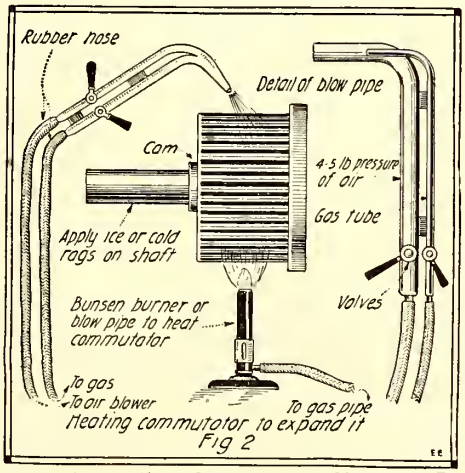
No. 2—Commutator Work (Continued)



Simple Clamp Compressor for Removing a Commutator From an Armature Shaft.

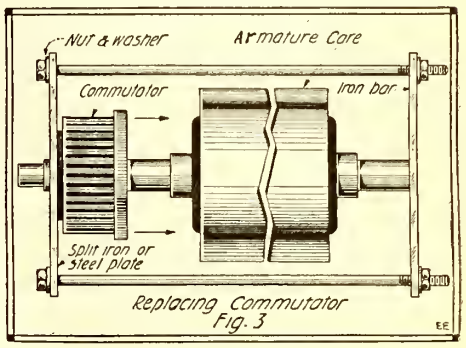
IN the opening installment of this new series of articles describing the work of the Electrical Machinist, the subject of *commutators* was discust. Commutator work is of such great importance to all electrical workers, that it has been thought advisable to have this second paper continue with some interesting and practical wrinkles concerning this class of work. For the benefit of those who happened to miss the first paper, it may be said that this treated on the best methods of turning commutators in the lathe, how to repair burnt mica between commutator bars, and so forth.

Figure 1, shown herewith, illustrates a simple form of clamp for pulling commutators off the armature shaft. Of course the size of the clamp and the parts composing it, will depend upon the size of the commutator to be removed. A very satisfactory and efficient form of commutator clamp is that illustrated, wherein the plate which is placed behind the commutator is made in two parts, these parts being held together by small iron links which can be held in place by machine screws or rivets. The lower link has a slot in one side, so that when the clamp member is to be removed from the shaft, this link can be moved out of register with the pin on the one side of the clamp, thus enabling the user to swing the two clamp plates apart and thus remove it from the shaft. At the center of this spliced plate, the hole is made large enough to fit around the average size armature shaft. Two long bolts, threaded at least for half of their length if possible, are used to create the compression force to pull the commutator from the shaft. The iron plate over the end of the shaft must of course be stout enough to withstand any bending stresses.



In emergency, all that is required to perform this work is two substantial blocks of wood instead of the iron bars. By means of suitable iron washers and nuts, similar results to those obtained with the iron clamp can be obtained. Where ordinary bolts are available in an emergency, it may have threads extending only for a few inches at the ends; they can be used very effectually by using washers or pipe nipples behind the nuts. When the commutator is removed as far as this action will permit, then the nuts can be backed up towards the ends of the bolts and by means of washers or short lengths of iron piping (nipples) placed under the nuts and washers, a new compression force can be utilized. Many a stubborn commutator has been removed in this fashion in actual practice.

Sometimes, a commutator will set fast on the shaft, aided by corrosion, so that it will not yield even when a powerful clamp such as that described and illustrated at figure one, is applied. Then it becomes necessary to make use of a well-known principle of physics, viz., to *expand* the outer ring or commutator and to *contract* the inner metal member within the ring, or in this case the shaft. If we expand both ordinarily, we will not gain very much toward loosening the commutator gript on the shaft, but owing to the different coefficients of expansion of the steel shaft and the commonly used brass commutator shell, we would gain something in most cases, even tho the shaft is not cooled by special means. There are two usual methods of heating the commutator,—the first being to use a Bunsen gas burner, and the



Practical Shop Wrinkles for the Young Electrical Machinist.

other a comprest air gas blow-pipe, which every electrical repair shop is fitted with. The mica and copper composing the Commutator will stand a lot of heat and the Electrical Machinist warms up the commutator by applying heat directly to it, in order to expand it, where he deems it necessary. Of course, it should not be heated red hot or anything like that, but simply heated up only until it is hot enough to make water sizzle when a drop or two is applied to the commutator. The expansion of the commutator and a relatively large contraction of the shaft can be greatly enhanced or augmented by applying rags soaked in ice water to the shaft during the heating of the commutator and at the time the clamp is applied in an effort to remove it from the shaft. On large commutators the heat is maintained from a blow-pipe, etc., while the clamp presses are being applied in order to remove the commutator. At figure 2, there is shown an outline sketch of the comprest air and gas blow-pipe. These blow-pipes are often home-made, or can be obtained at any machinist's supply house. The blow-pipe comprises two distinct and separate tubes usually made of brass as shown, there being a valve placed at the lower end of each tube, by which the amount of gas and air can be regulated. Flexible rubber hose connects the two blow-pipe tubes respectively with the gas main and air pipe line or blower. The gas used is ordinary illuminating gas, and a small, simple form of air blower such as the cam type is satisfactory for the purpose. The blower is invariably driven by a small electric motor or else it may be belted to the line shaft. A 1/6 to 1/8 horse power motor is sufficient for driving a small single-stage blower feeding a 1½ inch pipe line to which four of these blow-pipes are attached. The air pressure required is only a few pounds, four to five pounds being about right.

Sometimes the Commutator Has to Be Heated as Shown, and the Shaft Cooled, in Order to Force the Commutator Into Place.

Utilizing a Compression Clamp Rig for Forcing Commutator Into Position on Armature Shaft.

REPLACING COMMUTATORS.

Some form of clamp is necessary and usually employed in replacing commutators on the armature shaft. One method of applying pressure with a clamp is shown at Figure 3. Here the two-part spliced clamp or else a solid plate with a hole thru the center, big enough to fit over the shaft, is placed against the commutator while a second plate member is applied over the front end of the shaft. Now, when the wrench is applied to the nuts on the two bolts, pressure is applied in such a way as to force the commutator on to the shaft. Right here it should be pointed out that great care should be exercised before re-

HOW-TO-MAKE-IT

This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

FIRST PRIZE, $3.00

HOW TO MAKE AN ELECTRIC "MOVIE" MACHINE.

The condensing lens as shown in sketch comprises two plano convex lenses which can be bought at any optician's or second-hand shop cheaply. The focusing lenses are

Every Experimenter Will Enjoy Making a "Movie" Machine. This One Uses Standard Films.

two anastigmat types of a speed about f:4.5. They are each enclosed in a tube made of tin, one tube sliding in and out of the other to obtain proper focusing on the screen. These lenses can be bought all ready in the tubes or at an optician's store.

Standard film is proposed for use with this machine and since it is 1¾" wide, the film gate will have to be a little wider. The take up boxes for the film will have to be large enough to hold a coil of film 18" x 3". A strong box should be used since the film is quite heavy. The camera part will have to be necessarily larger to accommodate a small motor, lighting system and cogs and gears. A roller should be put in the lower left hand corner of the upper box to prevent the film from unwinding too rapidly. Tin should be put on the edges of the machine where the film is pulled over, or else a worn film is sure to be the result. By looking in theatrical papers you can obtain the name of a concern who sells films. The gate should be fitted with an intermittent stop motion permitting each picture to stop for a fraction of a second.

Contributed by FRANCIS E. ZIESSE.

SECOND PRIZE, $2.00

TABLE LAMP FROM TELEPHONE STAND.

A certain SPERRY had a "Sis" that always wanted something new for her Xmas. SPERRY, being an intelligent and polite gentleman, would never refuse. So this Xmas he's going to give her a cute table lamp. Here's how he went to it:

SPERRY gets into his shop, or rather, laboratory, and conducts a search. He finds a good-looking desk telephone (that is devoid of every bit but the stand)—a nickel-plated (⅜") pull-chain socket, a nickel-plated socket cap, a length of (⅜") pipe, a crowfoot for it, and some strong metal wire.

He then follows this routine: The pipe (D) (threaded) is slipt thru the stand (A) and screwed into a crowfoot (E), the crowfoot being fastened with screws to the base of the stand. The socket cap (B) is screwed to the top end of the threaded pipe, until the stand is made tight. There should be a little projection of the pipe—about ¼" above the cap (B), so that the socket (C) can be screwed to this. The shade holder is made of metal wire, or, of anything SPERRY happens to find at hand to suit him. The only trouble for SPERRY is to get the shade—it must be bought. The rinktum is then shined up and polished to a luster, and (the price tag attached) presented to "Sis."

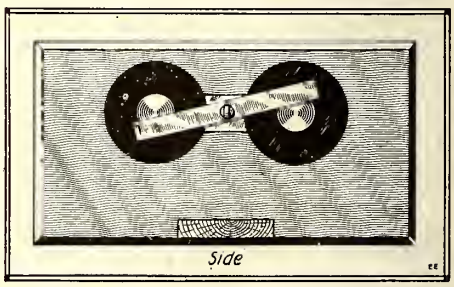
Table or Boudoir Lamp Which Anyone Can Make from an Old Telephone Desk Stand or Similar Pedestal, Together With a Few Pieces of Wire and Some Colored Silk. Old Rose Silk Outside and Blue Inside Gives a Wonderful Color Effect.



THIRD PRIZE, $1.00

A TELEGRAPH-SOUNDER ENGINE.

The following article explains how to make a simple electric engine from a telegraph sounder, a steel rod and a few pieces of wood:

Side View of Small Battery Motor Constructed From Discarded Telegraph Sounder

Top View of Telegraph Sounder Engine Without Upright or Top Bearing.

The wooden part consists of a base of 3 x 4 inches and upright 5 x 1 inches mounted at one end of the base, with a bracket 3 x 1 inches to hold the upper bearing screw. Mount the magnets and yoke on the base and make a slight indentation with a drill or center punch in the exact center of the yoke to form a bearing for the shaft.

The shaft consists of a mechanical toy rod about 4 inches long. File each end to a point and also file two flat surfaces on opposite sides of the rod, about 1 inch from the upper end. The iron armature should just clear the top of the magnets, and is fastened to the rod with solder or friction only. The brush is formed from a piece of copper wire fastened to the upright and bent around to touch the flat surfaces on the rod. It should make contact twice in every revolution. It should be adjusted so that contact is made when the armature is farthest away from the magnets and broken when the armature is over the magnets. This engine will run at a very high speed with one dry cell.

SIMPLE STOP-COCK.

The following sketch shows clearly the construction of a simple stop-cock: A and B are glass tubes, the latter having such a diameter that it will pass into tube A. It also has one end rounded, i.e., closed, and a hole in its side about ⅝-inch from the closed end. This hole is made by directing

A New Idea of a Stop-Cock. Using Just Two Glass Tubes and a Piece of Rubber.

a pointed flame (from blowpipe) at the desired spot, till red hot, and then blowing into the open end. Fuse the edges of the hole. In operation, the small tube B is moved backward or forward, i.e., into or out of the rubber tubing. It is best to have the liquid enter B, and leave A.

Contributed by RAYMOND B. WAILES.

FREEZING "WATER" BY MAGIC.

In a small Erlenmeyer flask or beaker place 50 grams of ordinary photographers' hypo and 10 c.c. of water. Heat to boiling and allow to cool. Be very careful to see that the flask is clean and that no dirt enters during the operation.

When the solution has become cold pick up the flask, add a tiny crystal of hypo and give a quick shake. Practically instantaneously the liquid congeals into a solid mass with the liberation of a considerable quantity of heat.

To the uninitiated this is a very striking demonstration. What happens is this: Photographers' hypo is a salt containing a large quantity of chemically combined water, called water of crystallization. The heat releases this water and the salt dissolves in it together with the 10 c.c. of water added. The solution, however, is what we call supersaturated and is in an unstable state of equilibrium, such that a tiny crystal of the same salt and a quick shake will drive the salt with its water of crystallization out of solution.

The heat liberated too, illustrates the scientific fact that water or any other liquid in freezing actually gives off heat.

Contributed by FLOYD L. DARROW.

IMITATION SILVER AND PLATINUM AND OTHER WRINKLES.

Herewith are a few suggestions that may be worth something to the Wrinkles, Recipes and Formulas Department:

Imitation silver: Copper, 4 pounds; zinc 4 ounces.

Imitation platinum: Copper, 4 parts; zinc, 18 parts.

Impression metal: Bismuth, 3 pounds; lead, 1 pound; tin, 8 ounces.

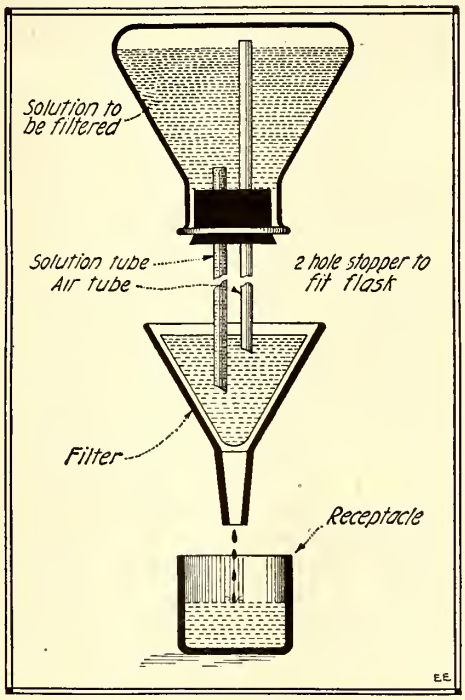
To separate silver from copper: Sulfuric acid (H_2SO_4), 1 part; nitric acid (HNO3), 1 part; water, 1 part. Boil in mixture and a little salt (sodium chlorid) it will subside.

Contributed by JOHN V. CRAIG.

IGNITING ALCOHOL OR ETHER WITH A GLASS ROD

In the bottom of a tumbler place a half teaspoonful of potassium permanganate and moisten with an equal quantity of water. On a glass plate pour a little alcohol or ether.

Now cover the potassium permanganate with *strong* sulphuric acid. A vigorous action is immediately set up. Upon thrusting the end of glass rod into the sputtering mixture and touching it to the alcohol or ether spontaneous combustion immediately occurs.



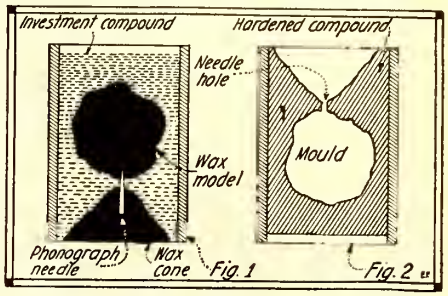
The potassium permanganate and sulphuric acid liberate ozone, a very concentrated form of oxygen, and resulting rapid oxidation quickly ignites the inflammable liquid.

If desired gasoline may be substituted for the alcohol and ether.

Contributed by FLOYD L. DARROW.

AN AUTOMATIC FILTER.

When filtering solutions which filter slowly it is very tiresome to keep refilling the funnel. The filter shown in the present drawing saves this trouble. As soon as the solution gets below a certain level in the filter, air is allowed to pass thru the air tube until the filter is filled, when the solution stops the flow of air. The air tube should be about one-half inch below the top of the filter; the length of the



An Automatic Filter Which Once Started Will Run Without Attention Until the Last Drop Is Filtered.

solution tube does not matter. When properly adjusted this filter will refill regularly until the flask is empty.

Contributed by MORRIS TUTTLE.

MAKING SMALL BRASS CASTINGS.

Make a model of the desired size and shape from paraffin wax. Procure a piece of iron pipe about 2½ inches long and of a sufficient inside diameter to admit the model, with at least ⅛ inch clearance at all points. Now make a cone ot paraffin about ⅜ of an inch high and the base of a diameter a trifle larger than the inside diameter of the pipe. Into the vertex of this wax cone force a phonograph needle,

To Make Small Castings Without Much Trouble Will Be Welcomed by Every Experimenter.

blunt end first, so that there is ¼ inch of the point projecting from the wax. Then heat the cone around the edges and force it into one end of the pipe, with the vertex in (Fig. 1). The wax will harden and hold the cone in place.

From the open end of the pipe insert the wax model and stick it on the sharp point of the needle (Fig. 1). Procure some of the investment compound used by dentists in making gold inlays. Mix this with water until the mixture has the consistency of heavy cream. Take a small camel's-hair brush and paint the model with this. Then add a little more powder, so that the mixture thickens a trifle, but yet is not so thick that it will not run freely. Fill the pipe with the paste in this state (Fig. 1), and lay the whole on a wire screen far enough above the flame of a Bunsen burner so that the wax will not melt. Leave it for at least one hour, then lower it to a point about one inch above the flame. When the wax cone has melted and run out, pull out the phonograph needle with a pair of pliers, and let the melted wax of the model run out the hole left by the needle. Remove from the flame and invert. Pour the melted brass into the depression left by the cone, and it will run into the mould thru the needle hole. Allow it to cool, wash out the investment compound, and you will have a perfect reproduction in brass of the wax model.

Contributed by RODNEY H. GOTT.

MAKING A FUSE.

Prepare a saturated solution of potassium nitrate by dissolving a considerable quantity of the salt in a cup of hot water. While still hot place in the solution a long cotton string and strips of porous paper, as blotting paper. When they have become saturated remove and allow to dry thoroughly. Ignite either the string or the paper and the combustion will be identical with that of a fuse.

Try one on the following mixture: mix equal quantities of magnesium dust and potassium nitrate powder and place in a heap on asbestos paper or a piece of tin plate. In the top of the heap insert one of the fuses and ignite. An intensely bright light results.

Powdered potassium chlorate is even better than the nitrate for this demonstration.

Contributed by FLOYD L. DARROW.

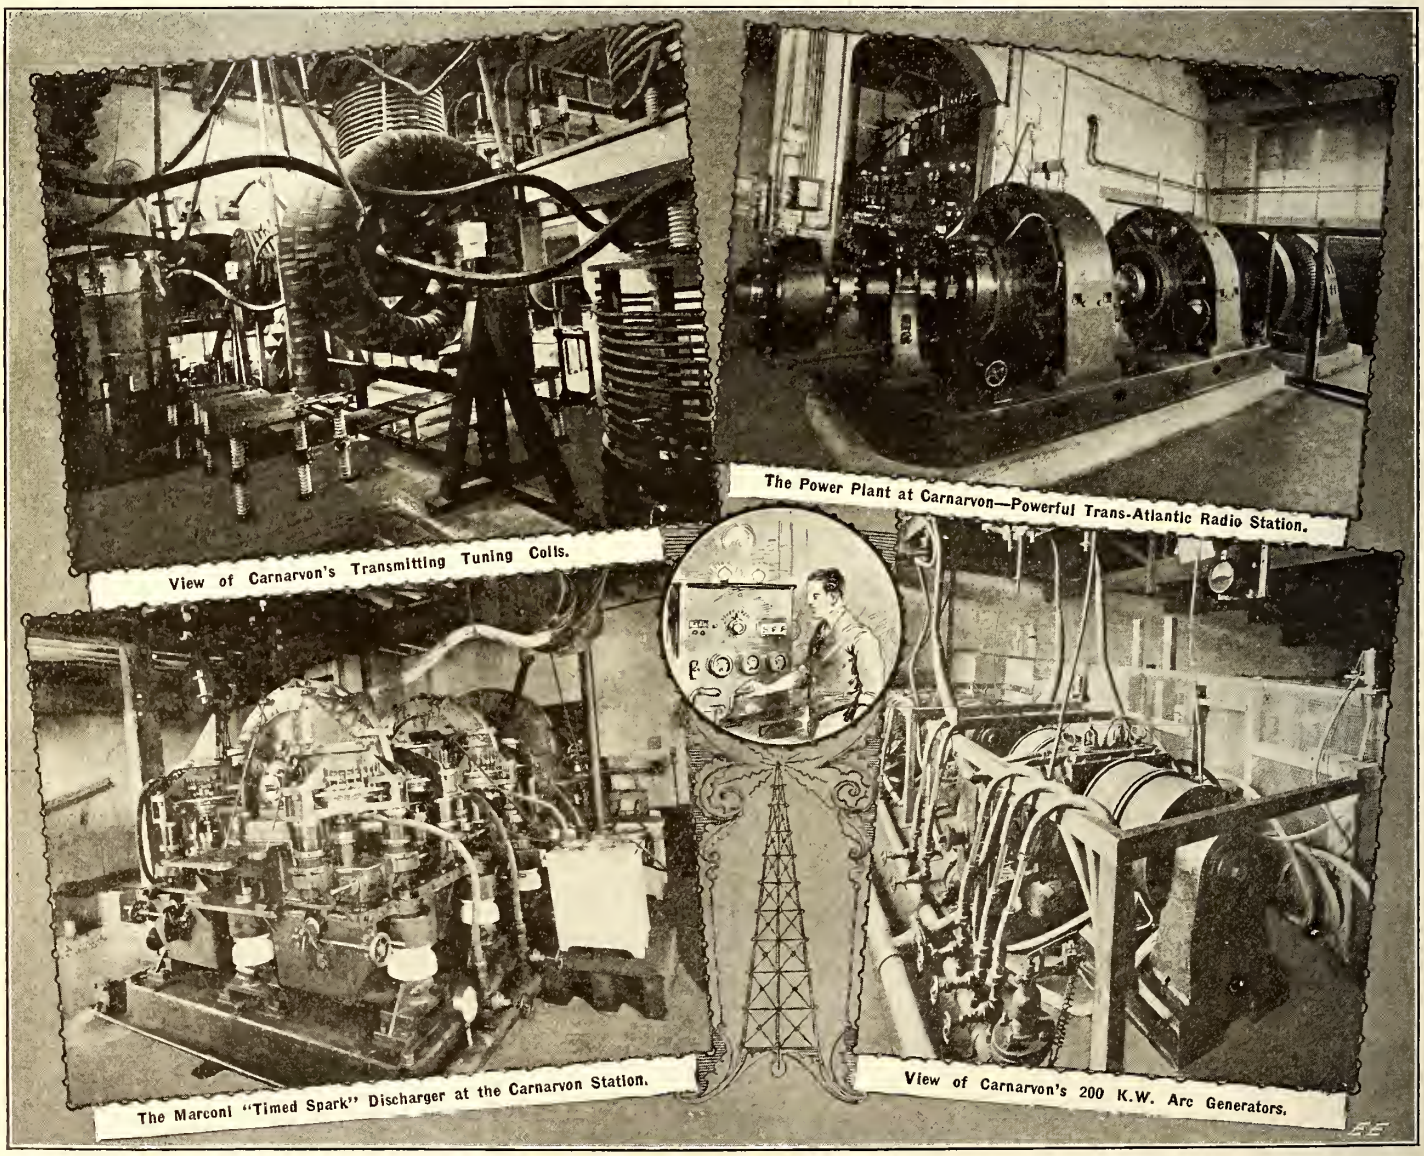
RADIO DEPARTMENT

Carnarvon Radio Station



THE Carnarvon Wireless Station is situated at Ceunant, Llanrug, five miles from the historic town of Carnarvon. Built on the site of Cefn Du, 800 feet above the sea level, it commands a magnificent view of the Menai Straits, and on very clear days, of the Wicklow Hills. To the eastward, along the line of the aerial the ground rises about 1 in 10 to the top of the hill which is 1,450 feet high. The last set of masts supporting the aerial is 1,100 feet above the sea level and at this point a fine view of the Snowdon Range is seen, the Snowdon Peak being about six miles distant.

The aerial is of the Marconi directional type, so arranged that the maximum radiation is in the direction of New Brunswick, New Jersey, with which station commercial service will shortly be carried on. The wires, of which there are 20, are of 7/18 silicon-bronze, the breaking strain of which is 1,300 pounds. Each wire is 3,600 feet long and is separately hung by insulators from steel triatics supported by steel masts 400 feet high. There are 10 of these masts supporting the four triatics which have an average length of 500 feet, the distances between the triatics being 900 feet. Owing to the greater strain at the ends of the aerial three masts are provided to support the end triatics (which are split into two), two masts being provided for each of the inner triatics. The natural wave length of the aerial is 5,600 meters, and adjustable inductances to carry 300 amperes are provided for increasing this wave length to 14,000 meters. The effective capacity of the aerial at the latter wave length is .04 mfd and its resistance 2.1 ohms.

The electrical energy used for the wireless plant, heating and lighting, is obtained from the North Wales Power and Traction Co.'s Hydroelectric Station at Cwm-Dyli which is about two miles on the east side of Snowdon. It is of interest to note that here is one of the few places in the British Isles where we are able to use "white coal" or the natural energy of falling water, for this power station utilizes the waters of Llyn Llydaw which are led thru pipes to the water turbines 1,000 feet below the level of the lake. The turbines are direct coupled, the 3-phase alternators generating at 10,000 volts. Two aluminum power lines each of 500 k. w. capacity carry the current from the power station to the Marconi station, one being a line for the exclusive use of the latter, the other being the branch of a line supplying one of the slate quarries and used as a spare.

At the wireless station two 500 k.w.

Modern American Radio Apparatus

AMERICA'S accomplishments in radio work both in the field of telegraphy and telephony were many and varied. One of the striking technical results of the war that will probably have far reaching peace-time results is the development of Transatlantic radio communication into an accurate and dependable system that can be counted on every day of the year and almost every hour of the day.

The demands that are now being made on this system of communication can be shown by the recently announced policy of the government to send all government department dispatches by radio to relieve the congested cables.

Now that the bar of secrecy has been lifted it is possible to announce that during the last year the greater part of the government's dispatches were transmitted by a new radio system developed by the General Electric Company. The company equipt the high powered radio station at New Brunswick, N. J., with its newly developed apparatus for Transatlantic telegraphy and telephony and placed it at the disposal of the government for official dispatches early in 1918, to meet the urgent demand for communication. The continuous and reliable service by this station has since been favorably commented on from distant parts of the world and has caused the government to place orders with this concern for two transmitting sets.

It is a matter of historic interest to record that it was the New Brunswick radio station that directed the first message to Germany after America's participation in the war. It will be remembered that it was in this message that President Wilson demanded the abdication of the Kaiser. That series of history-making messages which followed one another in such rapid succession and finally led to the speedy conclusion of the armistice were also sent from the New Brunswick station.

This new system of radio communication is known as the Alexanderson system and includes very marked improvements in all four stages which are common in all radio systems. These stages are, first, the generation of high frequency electric oscillations; second, the modulation of these oscillations into the dots and dashes of the telegraph code, or into the modulation of the human voice; third, the radiation of these electric oscillations in the form of waves, which travel with the velocity of light over the surface of the earth, and the fourth stage is the reception or detection of these waves by suitable instruments.

Calculation of Tree Wavelengths

By A. N. Tenna, V. T., Q. R. S., H. F., K. W., A. C.

Proprietor of Tony's Fruit Stand

NOW you see it's all plain, Jim, just take your wavemeter and set it right under this oak tree and have your buzzer to excite the tree and —zingo—"The Wavelength." Of course, great errors occur in the wavemeter method, so I have devised a method of calculating mathematically the wavelength of trees, bushes, acres of trees, etc.

I have found also, that trees with fruit have a greater capacity than those without, and rosebushes without roses have greater resistance and less capacity—of course, this is all clear when you take into consideration the fact that trees with half the leaves dead (in the month of October) have less capacity. From this we see that the leaves length of any tree depends upon the season. For instance, a tree in June was found to have a wavelength of 650 meters, while in October only 450 meters and the same tree in December but 150 meters. Therefore you will have to have an automatic wavelength changing device inside your station to add inductance in the loading coil according to the changes in the thermometer.

Wavelength of Pear Tree.

A tree with 6,000,687,564,765,543,409 leaves and 72 large branches, 64 medium sized branches and 20 very thin branches had a wavelength of 750 meters. Now this same tree with four large branches chopped off gave a reading of 690—a recount of the leaves gave us—6,000,687,564,235,001,202 leaves. The counting of the leaves of course was the smallest part of the work. (Naturally) The formula for calculating the wavelength of a pear tree and found to jibe with the wavemeter readings, is:

$$\text{W. L. equals} \frac{H \times NL \times NF}{\text{Number of branches.}}$$

Where: H—Average height.
NL—Actual number of leaves.
and NP—Number of pears on the tree.

This has been found to vary with the season; for instance, this same tree without leaves or fruit with the same number of branches and height will naturally give you a lower wavelength as is evident from the above formula. In other words, the wavelengths fall off as the leaves and fruit fall. Simple eh?

Some people think this Tree Wireless is a joke; well, if they want to find it out just begin counting the leaves on any tree —and they will be convinced—that it's no joke.

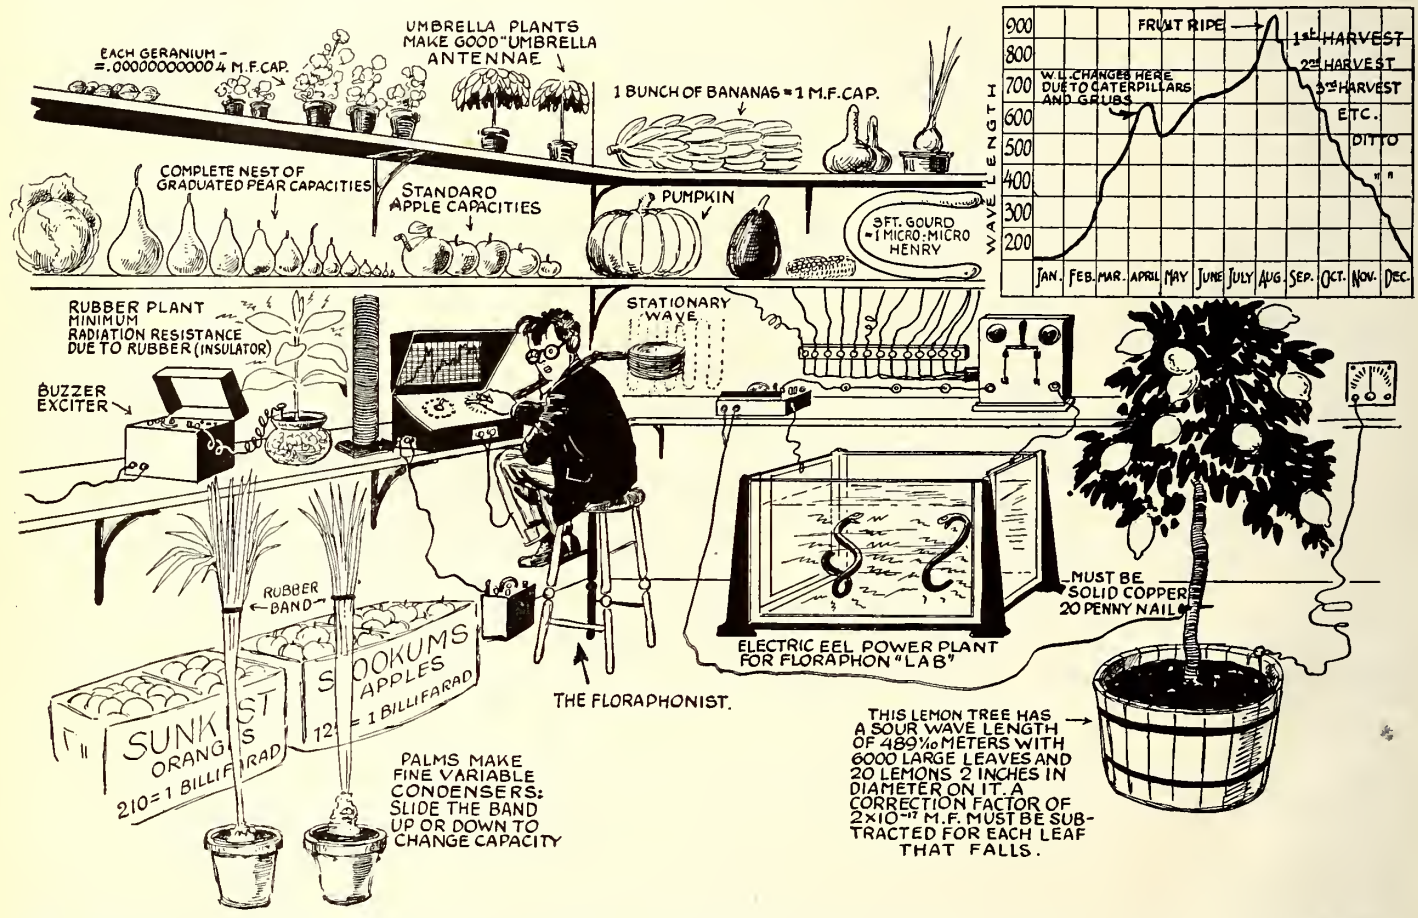
Capacity of Same Pear Tree.

The formula for the capacity of the tree is as follows:

$$\text{Capacity equals} \frac{\text{Wavelength found from above.}}{(tl \times NL) \times (\text{area of } P \times NP) - H}$$

Where; tl—Thickness of the leaves.
NL—Total number of leaves.
P—Pears.
NP—Number of pears and H the height of tree.

Below is given a graph of the wavelength of trees for the various seasons—this is for pear trees 35 feet high.



H. F. Resistance of The Tree

About the most suitable formula devised for the calculation of high frequency resistance of tree antennae is as follows:

$$\text{H.F.R. equals} \frac{drLB \times drMB \times drSB}{\div dr \text{ of trunk of tree}} \times \frac{NP}{\text{resistance of one leaf} \times NL}$$

Where; dr—Direct resistance.
drLB—Direct resistance of large branches.
drMB—Direct resistance of medium size branches.
drSB—Direct resistance of small branches.
NL—Number of leaves.
NP—Number of pears.

(Translated from the Hertzian Wave Nut-book by E. T. Jones.)

Well, Papa Squier Started Something When He Wished This "Tree Wireless" on Us. Here Is a Typical View of a Young and Enthusiastic "Floraphonist" Busily Engaged in His Frost-Proof "Lab.," Doping Out the Natural Wavelength of a Healthy Rubber Plant. It's a Man's-Size Job to Calculate the Wavelength of a Tree, Especially on a Windy Day, When the Leaves and Fruit May Be Blown off in Considerable Numbers. Each Leaf and Pear or Apple Can Be Compensated for in the Calculations, However, Once the Micro-Farad Capacity and Micro-Micro Henry Inductance, Values for Each Are Determined and Known. If Anyone Can Successfully Compute the Wavelength of a Healthy Young Pear or Plum Tree in Full Fruitage, He Should Certainly Be Awarded the "Nobel" Prize in Physics—We Said It,—"If" He Can Do It. We'll Wager He Will Need a Dozen "Einsteins" Before He's Thru. And Then the Wind Comes Along and Spoils All the Calculations. Gads, Tho!!!

www.americanradiohistory.com

Radio Guides Ships Thru Fog

"YOUR naval communication service, especially in its radio compass stations and their activities, is a great institution and a distinct boon to seamen. It ought to be maintained permanently," said Captain W. F. Wood, D.S.C., master of the steamship *Lancastrian* of the Leland line, recently, as he described what the U. S. Naval radio-compass service had done for him on his latest entry into New York Harbor. Consulting his log from time to time for the sake of accuracy, Captain Wood said:

"We were bound in from Antwerp to New York on the afternoon of October 3rd and had expected to make the Nantucket lightship by six o'clock. At 5:50, however, we ran into a dense fog. I slowed the engines to half speed and kept heaving the lead, which registered from thirty-six to twenty-five fathoms. We got the latter sounding at eight o'clock. This gave me a good line of soundings to compare with the chart, but we could not yet hear the foghorn aboard the lightship. At about half-past seven o'clock I had the radio officer sound our signal and call up the radio-compass station on Fire Island, the signal letters for which are N. A. H. The message we sent by wireless to Fire Island read:—'What is my true bearing?' It was signed, 'Wood, Master.'"

Photo New York Herald

Sandy Hook Got Captain Wood's Appeal at a Distance of Sixty Miles. Mantoloking Was Even Further Away. These Stations and Also That at Fire Island, by Their Land Lines Into New York, Reported the Bearings of the Lancastrian From Their Respective Positions. The Central Station, Within Ten Minutes Then Sent All Three Bearings by Radio to the Leland Line Ship and Her Master's Mind Was at Ease.

RADIO COMPASS LOCATION GIVEN IN TEN MINUTES.

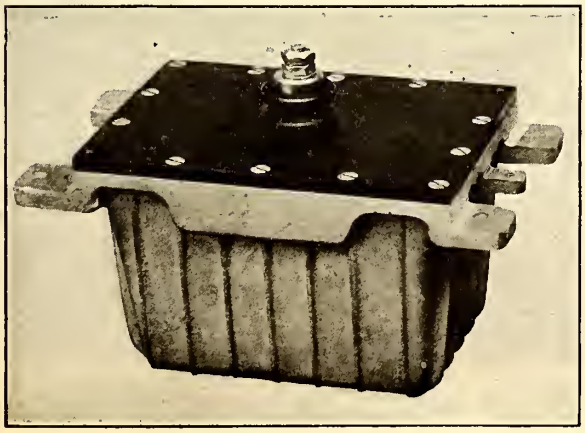
"I was standing in the radio room at the time, looking over the shoulder of the operator, who kept sounding our letter code signal on his transmitter. Within ten minutes after we had asked for our true bearing from Fire Island the following reply came crackling back to us:—

"'Your true bearing at 7:39 P. M., from Fire Island, 109 degrees; Sandy Hook, 87; Mantoloking, 65.'

"This radiogram was dated from the *central compass control station* of the Naval Communication Service, at No. 44 Whitehall street, New York. When I wrote my message of inquiry and handed it to our Marconi operator I handed him along with it a slip of paper on which I had written my own estimate, by dead reckoning, of our position at that time. I had figured it to be a bearing of 108 degrees from Fire Island. When, as I looked over the shoulder of the receiving operator, I saw him write down, 'From Fire Island, 109,' I was pleased that I had estimated our position within one degree.

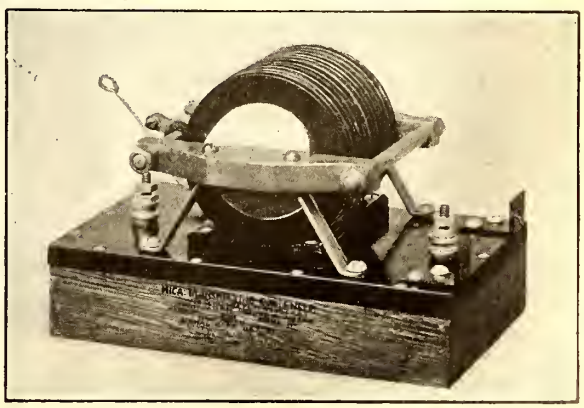
"Imagine my delight and surprise when, right on the heels of this bearing, came the additional readings for our direction from Sandy Hook and also from Mantoloking, N. J. It was then a matter of only a few moments to project these three lines upon the chart, and the point at which they *intersected* was, of course, our precise position at 7:39 P. M.

"So we carried on then with entire confidence, tho the fog continued dense. At ten o'clock I hauled my course to the northward and at 10:40 o'clock the fog lifted and revealed the Fire Island light abeam, exactly where it ought to be to prove the precisely accurate information flashed to us out there in the murk three hours earlier from the central compass control station in New York City.



"There is not the slightest doubt of the inestimable value of these radio position finders. We have nothing of the sort installed as yet in England, but I hope we soon shall have them. The Admiralty, however, has instructed all masters concerning their use on this side and has emphasized their value."

Thus does the field of the "Radio Compass" expand daily almost.



Mica Condensers for Radio Sets

A new mica condenser for radio equipments is now being made which the manufacturer states is in use by the United States and Allied Governments and many of the large companies manufacturing radio apparatus. The maker calls attention to the fact that since its invention in 1745 the Leyden jar has been used in practically its original style, without any radical improvements or changes. Practically every radio equipment is used to its capacity, and up to the time this new mica insulated condenser was invented Leyden jars were used especially for high potentials. When in operation the radio apparatus thus equipt was not safe and reliable, as the Leyden jar would crack and break down after a continued use for an hour or so making the apparatus inoperative.

Wherever metal containers are not suitable the condensers can be mounted in wooden or other insulating boxes, or the metal case can be insulated from the condenser itself and the condenser terminals mounted independently on two insulated posts.

A New Mica Condenser for Radio Equipments Which the Maker States It Is Practically Impossible to Break Down Even When Used for High Potentials.

"Locating Submarines by Audion Syphoning"

By Edward T. Jones, A.M.I.R.E.

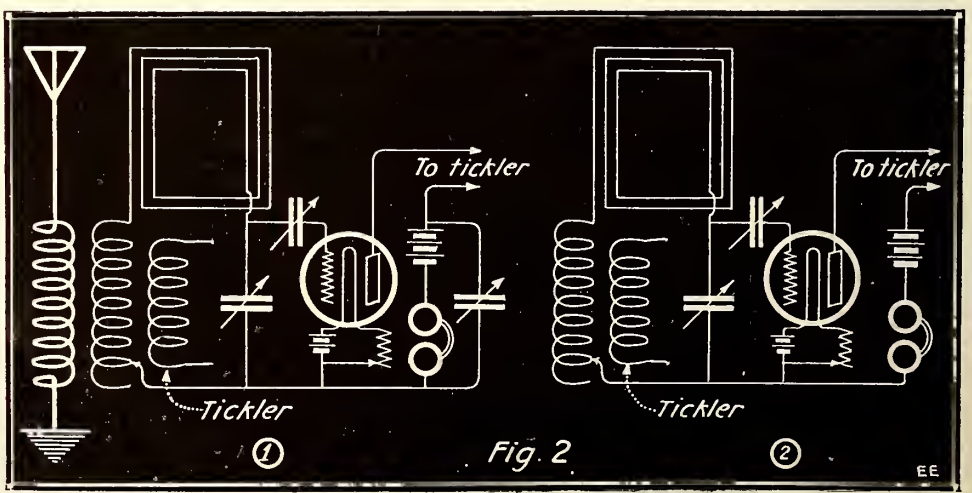
PRACTICALLY every one familiar with the present day types of audion circuits employing the feed back systems realizes the fact that if two such receivers in close proximity are tuned to the same wavelength "syphon-effects" of considerable magnitude are produced, and the oscillations emitted by one tube are picked up by the other receiver and vice versa.

Two Audion Receiving Sets Arranged Some Distance Apart Have, Under Actual Tests By the Author, Shown That When Both Are Tuned to the Same Wave Length, That Station No. 1 Can Hear the Note of the Oscillating Audion At Station No. 2, and Vice Versa. This Effect is Termed "Syphoning".

Recently, the H-2 (U. S. submarine) successfully demonstrated the ability of underwater craft to transmit and receive while submerged. The H-2 submerged and communicated with airplanes and vessels of the fleet. This naturally proves that during wartime a submarine can easily keep in touch with the ships and shore stations, and receive its radio compass locations at various intervals. However, it is to be expected that this system will come into general use on all the submarines of the foreign Navies, and that during wartime they will endeavor to exercise the use of such a system freely. We may then consider an enemy submarine as having submerged after having sighted its adversary; it then naturally maintains silence in respect to its transmitting apparatus, and continues to listen in for what the destroyers and other vessels may have to say. The fact is, that the vessel while endeavoring to maintain silence is defeating its own endeavors, for while listening in, the receiving bulb is actually *transmitting*, and if any of the destroyers tune their receiving apparatus to the same setting which the submarine is listening in on there will result the syphoning effect described previously. Should the destroyer be equipt with a direction finding apparatus it can without any difficulty run down this undersea craft without the latter knowing what is happening. This is only one of the many uses this previously dubbed nuisance can be put to.

POSSIBILITIES OF LOCAL COMMERCIAL STATION SYPHONING AMATEURS.

Since the general use of audions and their associated circuits was adopted, it has been heard from numerous sources that Amateurs who have copied a certain station one night could not receive this same station the following night. This further lends aid to my beliefs and as the reader shall understand from what follows, it was due to the fact that *the "Large Commercial Station" in that particular vicinity was syphoning the smaller stations* and the following night the effect was not present because the "Controlling" station was not listening on that same wavelength and no syphon effect took place; naturally the short range of the smaller Amateur installation did not permit it to copy signals from the extraordinary distances recorded the night previous. In figure 1 two receiving sets of the feedback type are shown and are separated in this instance fifty feet apart. Both sets are tuned to the same wavelength (say 1000 meters) and the two sets are then in resonance. Number One can hear the true clear note of the oscillating audion at station Two, and vice versa; this is caused by the receiver also acting as a transmitter and if a key is arranged in the circuit to vary either the inductance or capacity, intelligent signals can be transmitted between the two. This effect has been termed "syphoning" and is very pronounced at stations where the receiving apparatus are very near to each other.



I have personally carried out experiments at distances up to two thousand yards and with suitable receiving apparatus informed the receiving operator the correct wavelength he was listening in on. Of course, as mentioned before, this depended upon the receiving operator having his bulb oscillating, and likewise my own, in order to pick up the undamped oscillations being emitted by his receiving apparatus.

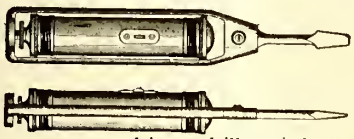
Furthermore, I have, without an antenna connected to my receiver and same maintained in a state of oscillation, been syphoned by a large receiving station, when I was located some five hundred feet from the antenna and receiving apparatus. Now the MAIN FEATURE OF THIS PARTICULAR INCIDENT IS THAT THE SYPHONING EFFECT (WAVE) ACTED AS THE CARRIER OF THE SIGNALS BEING RECEIVED FROM THE OVERHEAD ANTENNA CONNECTED TO THE RECEIVING STATION SOME FIVE HUNDRED FEET FROM ME. This prompts me to believe that many of the Amateurs in and about a city where there is a large Commercial or Naval plant should not put too much faith in their own receiving apparatus in respect to the remarkable distances covered with the same; for it may be that they are being syphoned by the local station which has the apparatus to easily cover the distance.

Another fact which I may mention here is that, when a station is in the act of syphoning another, it tends to reduce the strength of signals received at that station, and tends to rob it of some of the signal's strength. It may be that the total is proportionately divided between the two, three or four, whichever may be the case.

ELIMINATION OF STATIC BY SYPHON METHOD.

I have also found thru my extensive experiments and investigations into the possibilities of this phenomena that when syphon waves act as the carrier of signals from the main receiver to another receiver installed some several hundred feet away, the static which is so pronounced in the first instance is hardly perceptible at the second receiving apparatus, although the signals have not undergone a great degree of weakening. It is my contention, that if a receiver, say number one in figure 2 had a coil of fairly large dimensions inserted in the secondary circuit so that this syphon wave could be directed to one certain point (where the second receiving apparatus is installed) that a maximum of the signal would be received there, in a greater proportion than the static. While I have no good theory to offer at present for this statement, it has proven so in actual tests and therefore there does not seem to be very much need for lengthy explanations.

"Static" is Reduced When the Signals are "Syphoned" from the Main Receiving Station to a Second Receiving Set, Says the Author. He Suggests the Use of Two Loop Aerials as Shown, to Transfer the Energy to the Second Receptor.



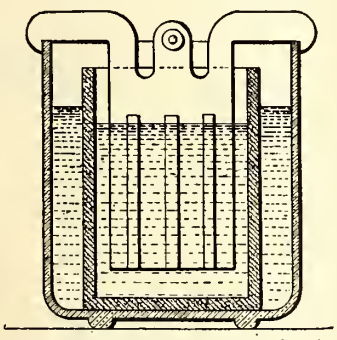
www.americanradiohistory.com

LATEST PATENTS

Illuminative Tool.

(No. 1,309,363, issued to Edward J. Meinke.)

We have seen illuminative pens and pencils, now comes the illuminative tool. This patent, recently granted, consists of a device which will hold various instruments such

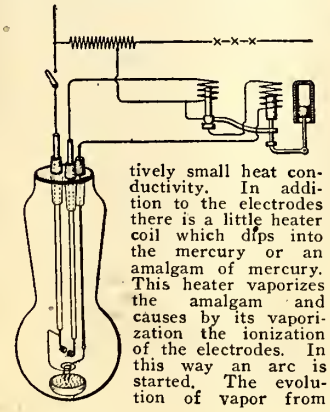


as a screw-driver, drills, gimlets, augers, chisels and the like, in the form of a handle or a frame, so that any well-known standard electric flashlight can be mounted therein. Hammering on the frame will not injure the flashlight, which can be removed if necessary, and a new battery inserted.

Primary Electric Cell.

(No. 1,310,695, issued to Harry E. Evans.)

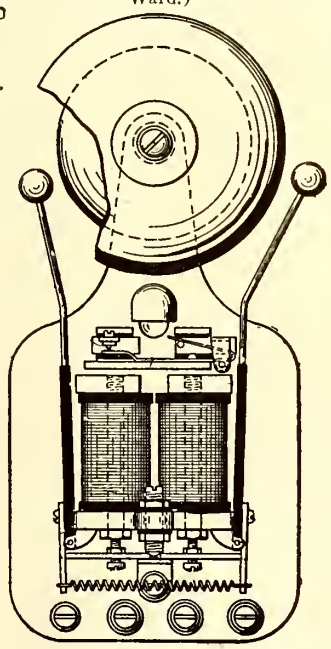
Generally, in primary electric cells employing two fluids, the electrolyte and depolarizing fluid, a porous cap was heretofore necessary in order to separate the two liquids or else the gravity method had to be used. In this idea, however, a new use is given to the carbon inasmuch as it acts not only as the positive pole of the battery, but also as the porous cup separating the electrolyte placed within its recess, from the depolarizer outside. The zinc being suspended in the carbon cup. In this manner the cell is not only simplified, but cheapened, and the internal resist-



ance caused by porous cups in the past is greatly reduced.

Enclosed Electric Arc.

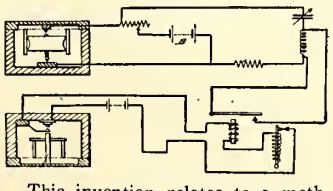
(No. 1,310,067, issued to Philip K. Devers, Jr.)



This relates to enclosed arc lamps in which an arc is operated between electrodes of refractory materials. The entire arc is enclosed in a chamber which has a constriction in its center and is filled with a gas at a pressure slightly above atmospheric. The gas contained within the globe has rela-

tively small heat conductivity. In addition to the electrodes there is a little heater coil which dips into the mercury or an amalgam of mercury. This heater vaporizes the amalgam and causes by its vaporization the ionization of the electrodes. In this way an arc is started. The evolution of vapor from the mercury or amalgam displaces the nitrogen or other gas into the upper chamber, and hence increases the efficiency of the lamp by supplying an atmosphere of vapor between the electrodes.

Novel Electric Bell.

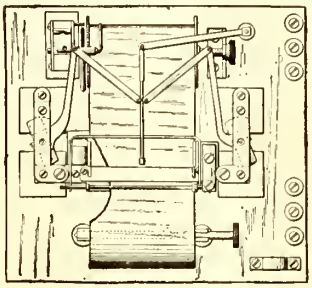


(No. 1,310,813, issued to Albert M. Ward.)

This idea comprises two bells, one over the other, with respective hammers to operate either of them. Each hammer may be attracted when an outside circuit is closed, energizing one of the coils. The make-and-break in this case is at the lower end of the bell in the form of a set screw. A winding is placed on both cores in such a manner that the third circuit in the form of a buzzer may likewise be operated. Inasmuch as this third circuit is of a much higher frequency than that at which the bells can operate, no noticeable effect is perceived, and the hammers do not actuate, altho the buzzer vibrates and the cores themselves are energized.

Acoustic Actuating Mechanism.

(No. 1,310,568, issued to A. C. Heap and O. B. Field.)

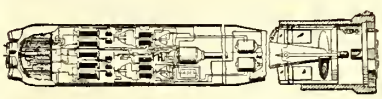


This invention relates to a method of detecting sound waves or pulses transmitted thru water and is attached to the surface of an under water mine, or submerged body, and either serves to operate a signaling device or cause the mine to explode. It only operates when it receives sound waves or impulses of a certain strength, and according to its inventors does not go off even if heavy explosive charges are detonated in its vicinity. A "dancing contact" is used, which responds to the sound waves, the entire case being filled with some liquid, such as oil. When sound waves of a certain pitch are received, the resistance between the electrodes varies, and the potential difference at the terminals of the condenser is varied, thus allowing a pulsating current to pass thru the device.

Telautographic Apparatus.

(No. 1,312,596, issued to George S. Tiffany.)

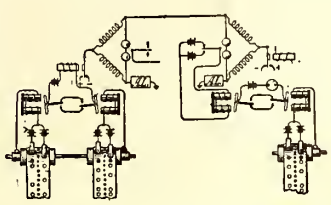
With this telautograph apparatus writing movements of the receiving pen are kept in unison with



the transmitting tracer under which there is a system of tracer lines, affected by the movements of the sending pen. In this way, more or less, current is allowed to pass, and the movements of the receiving pen are affected by the magnetic coils, which are excited to a variable extent during the transmitting operation.

Sound Controlled Dirigible Torpedo.

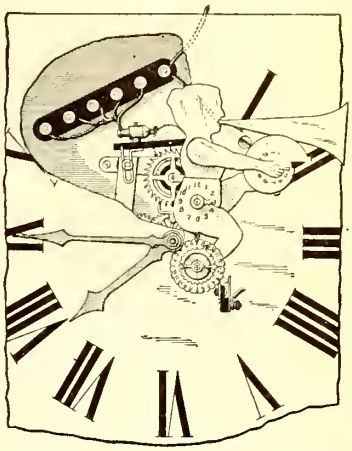
(No. 1,312,510, issued to George Baker.)



This invention seems very plausible. It consists of a torpedo which is discharged from a torpedo tube automatically; when it reaches the vicinity of some enemy craft the propelling mechanism is set into motion. The torpedo on becoming active, guides itself directly towards the enemy ship, due to the sound waves set up by the vessel. A plurality of microphones are arranged to the various circuits, so that when the sound, which comes in stronger at one microphone than at another, will affect the steering rudder in such manner until both sounds are of same intensity. The elevating rudder is likewise controlled in similar manner.

Secret Signaling System.

(No. 1,312,574, issued to Ralph E. Pierce.)

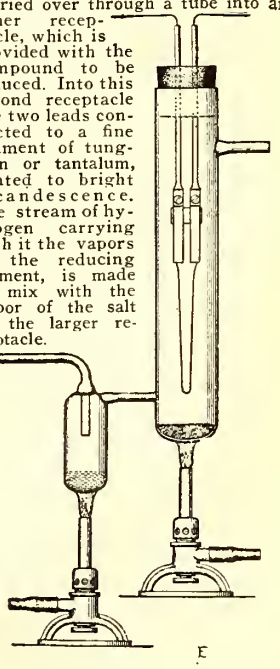


Many patents have been issued which have attempted to send secret messages by alternating or breaking up the current impulses into unintelligible signals by means of ciphering switches, all of which have some good and some bad features. A device which promises to become very popular is this one granted recently. It implies two systems of tapes which are run on a drum, the said tapes being perforated so that extra impulses may be sent, and the regular dashes or dots broken up by the action of relays operated by the tapes. At the receiving end another tape travels thru a like apparatus causing some signals to be inserted and others removed from the original message as transmitted over the line, as can easily be noted in the accompanying diagram. In this way, absolute secrecy is obtained by use of the key for ciphering and deciphering. Synchronizing devices are employed to control the speed of these keys.

An Automatic Sign.

(No. 1,313,757, issued to Samuel C. Swindler.)

This patent consists of a figure carrying a relatively stationary leg, a pivoted leg and a pivot body and is arranged in front of a dial. The pivoted body swings backward and forward during vertical movement of the plate. There is a spiral cam rotatively mounted between the arms carried by the body and which is provided with numerals, so that it may be moved under the indicating finger. In this manner the operator can regulate the duration of the operation of the sign or other



electric device controlled by the five or more circuits. For controlling another set of lamps another dial is pivoted on the body and still another at the foot. In this way a plurality of electric circuits may be operated.

Producing Pure Elements.

(No. 1,306,568, issued to Ezechiel Weintraub.)

This invention relates to a method of isolation of difficultly reducible elements, such as uranium, which were always very difficult to reduce. The reducing metal (sodium) is contained within a smaller receptacle, and it is heated and purified by a stream of hydrogen which enters at the inlet. When it is vaporized it is carried over through a tube into another receptacle, which is provided with the compound to be reduced. Into this second receptacle are two leads connected to a fine filament of tungsten or tantalum, heated to bright incandescence. The stream of hydrogen carrying with it the vapors of the reducing element, is made to mix with the vapor of the salt in the larger receptacle.

www.americanradiohistory.com

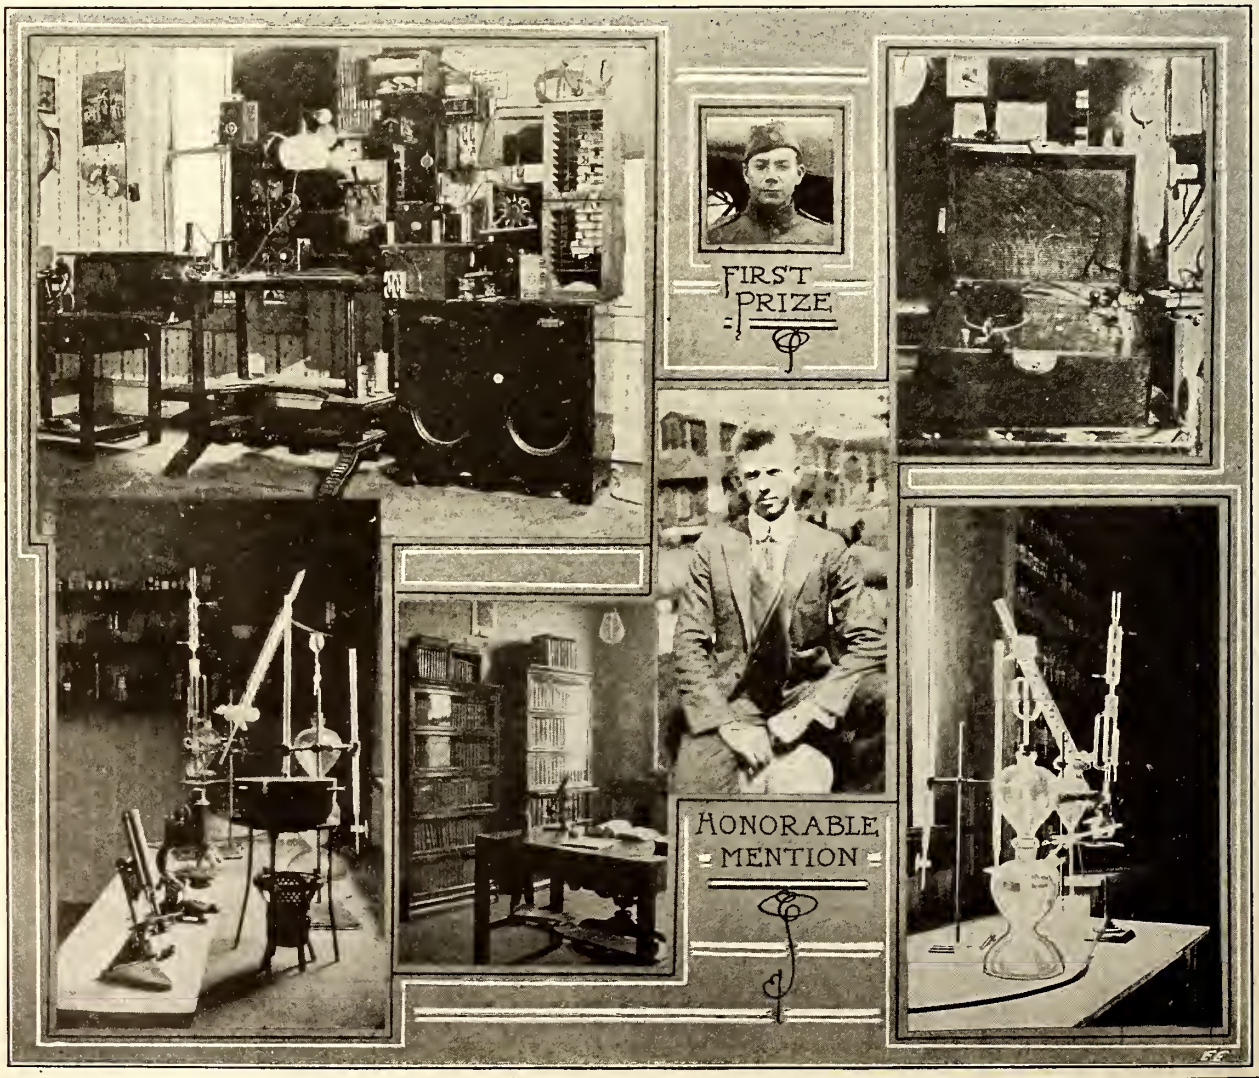
WITH the AMATEURS

Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $5.00 each month for the best photo or photos and $2.00 to each "Honorable Mention." Address the Editor, "With the Amateurs" Dept.

The Editors desire to call to the attention of all owners of "Electrical and Chemical Laboratories" the fact that hereafter the MONTHLY PRIZE WILL BE $5.00 CASH, instead of $3.00. ALSO $2.00 CASH WILL BE PAID TO EACH "HONORABLE MENTION" ENTRY PUBLISHT. We have not received any "Laboratory Photographs" of late. So "go to it" and send us your photo, together with that of your laboratory. If they are particularly good we may list some new and bigger prizes. So get busy, Boys!!! It's up to you. Here's a way to earn some greatly wanted laboratory apparatus at no cost whatever. Don't be afraid to send in too many photos, Boys.

"Amateur Electrical Laboratory" Contest

THIS MONTH'S $5.00 PRIZE WINNER— CHARLES AMBROSE YOCUM

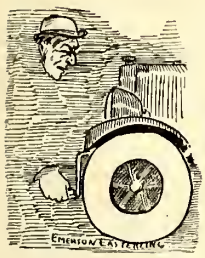


HEREWITH are a few photographs of my "Electrical Laboratory." I have a one-half kilowatt step-up transformer, a Tesla coil giving a six-inch spark, a one-inch spark coil, a water-power motor running a generator, a few small motors, rotary gap, 18" by 8" loading coil with 36 taps, step-down transformer, Brandes head set, 20 plate glass sending condenser, two mineral detectors, loose coupler of the navy style, telephone transmitter on swinging arm (in the middle of the switch-board), used for a speaking arc, which is also used on my telephone by utilizing a double-throw switch. I have electric meters, so I can always know how much power the apparatus consumes. There are two antennae, one 200-foot, two-wire, used for receiving, and one four-wire, 120 feet long for sending. I also possess a carbon rheostat, Murdock oscillation transformer, Murdock wireless key, with a shunt device under key, which shorts the detector when the key is pressed.

I have a good range in sending and with an Audion can receive about 2000 to 3000 miles. On top of the step-up transformer is seen a small box; it contains a small receiving and sending apparatus capable of transmitting one-half mile and receiving ten miles.—Charles Ambrose Yocum, 438 Fairview St., Pottsville, Pa.

HONORABLE MENTION—B. O. SHIFLETT—$2.00 PRIZE PAID EACH "HONORABLE MENTION"

MY "laboratory" is in a large, well-aired, spacious room on the second floor on a corner facing northeast and southeast. While it is equipt chiefly for chemical and microscopical work, yet it has five electric light connections or sockets for 110-volt A-C. There are numerous pieces of electrical apparatus, such as induction coils, telegraph apparatus, small motors, transformers, static devices, etc. I have spent a great deal of my time in the study of phonographs, cameras, telescopes and microscopes—trying to make improvements on phonographic devices; and in the field of lenses, making adaptations of different forms to certain kinds of conditions, such as the projection of "microphotographs" and "microphotography." One of the pictures shows one corner, in which is a lavatory, to the right of which is a work table, covered with some equipment set-up, burettes, Leibig still, Soxhlet extractor, Kipp's gas generator, separatory funnel, water-bath, Bunsen burner and alcohol lamp and two high-powered microscopes. The other photos show one end of the chemical cabinet, the top of which contains shelves filled with chemicals and reagents, the bottom being filled with apparatus.



I have been reading the ELECTRICAL EXPERIMENTER ever since it first began.—B. O. Shiflett, 138 So. 55th St., Birmingham, Ala.

Science in Slang

By EMERSON EASTERLING

"IN the Fritzey again!" howled the chauffeur.

The benzine go-cart had just exhibited its muline instincts — or tendency toward inertia as far as locomotation was concerned.

The azurely, effluviated auto-engineer wandered into the depths of the unknown that lies beneath the hood and Punk turned to Jazz with:

"Say, Stazz Jokes, will you be so kind as to bust loose and put us ignorant honyots wise to the hidden mystery that most everyone knows about—but I don't——that makes the buses commence up the street without the herder pouncing out and doing the Henry Ford at the bow end of the land craft? I know how to jump on the self-beginner and how to keep the gas operated thumper rattling, after I do the fatal stunt —but what I crave is the *why* and the *wherefore*—dost thou getteth me, Sir Lunchalot?"

"The person spoken to doth," returned Jazz.

The story then runs something like this

"Once upon a time—in the first gray days of modern mechanical history, a boob sat at a pile of junk—we'll not give the guy away— waxing sore and emitting moisture under the hat. Ye olde inventor was working on a conglomeration of metal that was to furnish power by the expansion, or rather the concussion or pressure exerted from a series of explosions that were to take place in an enclosed chamber. But the question was to make the explosions in a true classical manner.

Juicing the Jazz Wagon

"Some score of bewildered brothers in the game had tried many means of bringing the probability into an honest possibility. But our hero—"

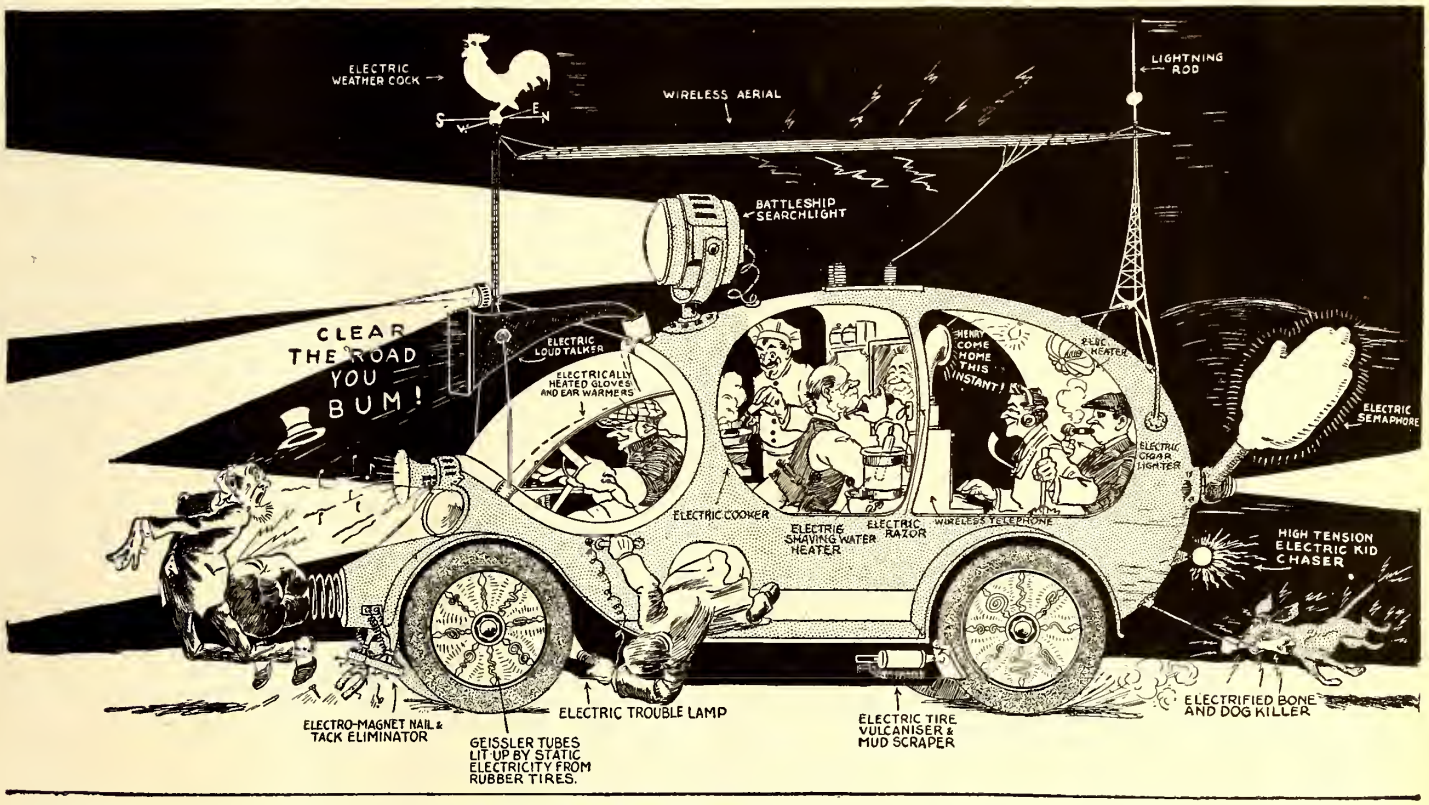
"You mean villian!" This from the besmeared driver who was—you know—up fore.

"But our ———," continued Stokes, "was working on another wise hunch. His graft was to harness the Goddess Electra along with the God. . . . (Editor, please insert here the name of some political enem . The writer is no political authority. Besides we might not agree. I'll take the blame of your choice—if blame falls. Enclosed in parenthesis is *not* intended for print.)"

"(Political enemy)?" wondered—out loud —Mr. Vote, our artist friend from Portland, "Why do you use him for some contribution God? What is he supposed to be god of?"

"Gas—along with hot air," smiled back Stokes.

"As I was about to say," Stokes went on, "our what-you-may-call-him, as he sat dripping over the model of his brain baby, thinking and sweating, doped out the spark ignition for gas engines. Before that the bums on the works had been using flint lock contraptions, flame, and everything.



"The spark stunt proved to be *the* thing in the game. As time shapened out the ends —like Shakie averred divinity would do —spark plugs came into existence. If you care to see how far the inventors have wandered in the field, just meander into a spark plug emporium and gaze over the assortment. Every one is claimed to be a little better in some way or other for some purpose or other than the rest.

"Some manufacturers are not satisfied with one spark plug and jab in a couple—this is in the larger types of stationary engines. For the automobile engines *one* is a-plenty—at least *at a time*.

"To get down to the information of the situation: The thing is run like this: A source of juice, say a bank of batteries—a battery to be explicit, furnishes the V plus A for the induction—or spark—coil. The voltage—that's the capital V—up to a point where it is not hampered by a short air or gas gap, flashes right across and ignites the inflammable mixture in the cylinder chamber and does the same thing in a mechanical way that a lot of similar things do in a political way.

"Of course, the guy that uses the engine don't want the spark shooting across the gap steady, or at random, so the makers have devised all sorts of do-funny things they call timers and—you know, those cute lil trade names. All serve the same purpose—that of making the necessary arrangements to have the spark blaze away at the psychological, or rather the physiological moment. The revolving of the revolving parts of the motor cause the circuit to be opened and closed. As the engine speeds up it is more efficient to have the ignition take place a fraction of a second sooner than in the case of slow running or hard pulling. For this purpose there is installed on most cars the spark advance, or adjuster, with which we are all familiar.

If Your Flivver Has a Well Stocked Juice-Box Don't Be Bashful—But Go the Limit. This Being the Electrical Age—or Rage—Let's All Be Comfy. Take a Squint At the Above Portrait, But Don't Crack Your Lip Laughing. The Fact Is, There's Nothing Phoney About This 21st Century Buzz-Wagon. Step This Way, Boys, Right Into Any Automobile Confectionary Store. They Will Sell You All Your Electrical Rinktums—and Lots Besides. We Would Have Stuck a Few More Gross Onto Our Flivvernacular, Only the Artist Went Bluey and Struck for Less Art and More Pay.

www.americanradiohistory.com

THE ORACLE

The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be publisht. Rules under which questions will be answered:

1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., **must** be on separate sheets. Questions addrest to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of **25 cents** is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

ROGERS GROUND ANTENNAE.

(1030) H. I. Middleton, Hendersonville, N. C., asks several questions in reference to Rogers Underground Antennae:

Q. 1. If bare wires can be used as underground antennae (as per article in June, 1919 EXPERIMENTER), why can't waterpipes, etc., which are available and already buried, be used?

Q. 2. If a bare wire is used for underground antennae, how and why should it be connected to the regular "Ground" wire which diagrams in June article call for?

Q. 3. In what order of efficiency will the following styles of antennae rank, viz: Regular Tower Antennae, Tree Antennae, Underground Antennae?

Q. 4. Will the Tree Antennae and the Underground Antennae require specially constructed or sensitive receiving instruments (audion, etc.), or will they work just as well with the usual Amateur Receiving Sets?

A. 1. With reference to the Rogers underground antenna, and as to the reason why ordinary waterpipes, etc., cannot be used for aerials, would say that such piping systems buried in the ground have yielded very good results in some cases for the reception of radio signals, tho usually they do not correspond in efficiency to a well-laid Rogers antenna. Also in the case of the latter, there is an added advantage of high conductivity in the copper conductors as compared to ordinary waterpipes, and, contrary to the average opinion, common water is not a good conductor, but a very poor one, with a consequent high resistance.

A. 2. With respect to the connection of a bare wire Rogers antenna thru the receiving apparatus and then to the usual ground connection, would say that the Editor of the "Oracle" has personally heard signals coming in with a high audibility, using the antenna only, with no connection to the usual ground. But when the ground is also used in connection with one of these buried antennae, the signals come in somewhat louder. The whole philosophy of the Rogers underground aërial and its operation is, it would seem, based on the simple fact that the copper wires buried in the ground, whether bare or insulated, are many times higher in conductivity than the ordinary earth, and therefore due to this conductivity an appreciable radio current is induced and interpreted thru these conductors.

A. 3. The probable ratio of antenna efficiency would be (a) regular elevated antenna, (b) underground antenna, (c) tree antenna. The underground antenna does not always show as high an efficiency as some of the large elevated aërials in use at some of the Government stations, but it invariably has the advantage of the elevated antenna during periods when there is an appreciable amount of static, and signals can be copied on the underground aërial thru thunderstorms without the least danger, or without any interference from static.

A. 4. We cannot say as to the sensitivity required in the radio receiving instruments to be used with tree antennae as developed by Major General Squier, but would presume that any ordinary audion receiving set would give good results. The usual apparatus employing an audion detector may be used with great success with the Rogers underground antenna, and when the writer visited Mr. Rogers' laboratory he was using but one detector and amplifier, namely, an *audiotron* bulb. This bulb was connected up so as to oscillate when desired, in order to receive the undamped wave stations.

WANTED!!!

"ODD PHOTOS" AT $1.00 EACH

Here's what we want! What have you got?

ELECTRICAL PHOTOS—
New photos of Lightning; new and unusual Electrical Apparatus and Machinery; Electric Signs; Electric Autos; Electric Clocks.

SCIENTIFIC PHOTOS—
New Scientific Apparatus; Results; Effects; Motion Pictures; Stunts.

OPTICAL PHOTOS—
Peculiar stunts obtained with various lens arrangements; odd film effects caused by unusual conditions; novel micro-photographic subjects.

ASTRONOMICAL PHOTOS—
New eclipse photos; star and moon effects caught by the camera; comets; shooting stars; progressive moon studies; moon and star photos.

FREAK PHOTOS—
Odd double and triple exposure effects; novel and striking effects due to unusual exposures.

MECHANICAL PHOTOS—
Electrical and Mechanical apparatus of unusual news interest.

RADIO PHOTOS—
New stations, both commercial, government, and private. Owners of private or amateur stations will find a special contest for these photos on another page of this issue.

And don't send us plate or film "negatives"; send unmounted or mounted "prints", preferably a light and dark one. Enclose stamps if photos are to be returned and place a piece of cardboard in the envelope with them to prevent mutilation.

Address photos to—Editor "Odd Photos", Electrical Experimenter, 233 Fulton Street, New York City.

You will find an interesting article on the tuning of underground antennae to optimum wave lengths, by J. Stanley Brown, in the "Radio Amateur News" for July, 1919.

DATA ON FIVE-COIL LOOSE COUPLER.

(1031) M. R. Smith, Winnipeg, Man., Can., writes the "Oracle":

Q. 1. What are the dimensions and what size wire is used in the construction of the "Five-Coil Loose Coupler" shown on page 74 of the May issue of your excellent magazine, which is used by Samuel D. Cohen in his "New Regenerative Vacuum Tube Circuits"?

A. 1. We are pleased to give herewith information you request on the five-coil loose coupler.

L_1, 10 inches long, 7½ inches in diameter, wound with No. 20 silk-covered wire.

L_2, 8¾ inches long, diameter 6⅛ inches, wound with No. 26 silk-covered wire.

L_3, 8¾ inches long, diameter 5½ inches, wound with No. 20 silk-covered wire.

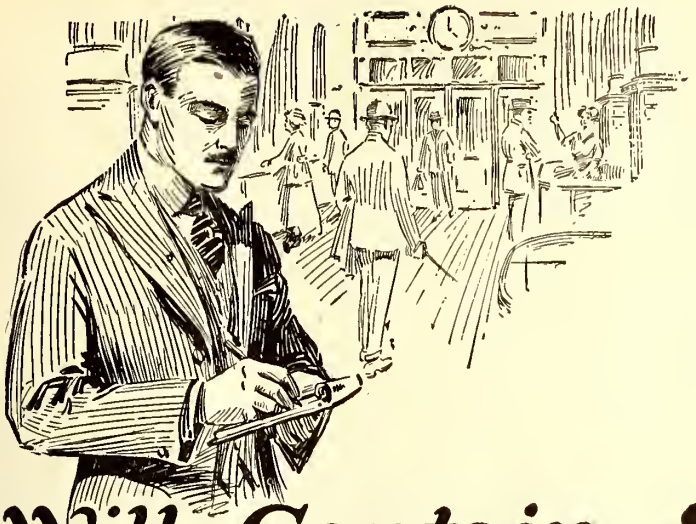
L_4, 4 inches long, diameter 7½ inches, wound with No. 20 silk-covered wire.

L_5, 4½ inches long, diameter 5½ inches, wound with No. 20 silk-covered wire.

PHAROAH'S SERPENTS.

(1032) E. F. Rightsell, La Grange, N. C., inquires:

Q. 1. Can you give me the formula for making the fireworks novelty called Pharoah's Serpents? It is a small pill or cube which when lighted will burn and the ashes will extend outward in the shape of a snake.



A. 1. The formula for making Pharoah's serpents, altho very efficient, is not generally used in the house, inasmuch as when these chemicals are combined to form the serpents they cause a strong odor of burning sulfur.

The following formula, however, may be adapted to both indoor and outdoor entertainments:

Potassium Chromat.....2 parts
Potassium Nitrat.....1 part
White Powdered Sugar.....2 parts

Powder each ingredient except the sugar very carefully. Then spread the powders on a piece of paper, and by carefully working with a spatula insure a thoro mixture of the ingredients. Moisten with a little alcohol and work into a paste. Now form into pellets about the size of a pea, or, in fact, any size desired, and allow to dry. These should be very carefully covered with a layer of tin-foil or tin-foil wrapping and placed in a large box, so that accidental friction will be almost impossible. Do not use a box with a slide cover, as friction when the cover is removed might cause harmful results.

www.americanradiohistory.com

Will Captain Smith return to Floorwalking?

There are thousands of men like Captain Smith who, before the war, were occupying relatively unimportant positions in the business world. Then, in a few months after the call to colors, they were holding commissions in the army. Millions of others found their way from positions in all walks of life into the various camps, where intensive training quickly turned a nation of business men into the world's finest fighting machine. It almost seemed incredible — but what this array of business men and workers did as "their bit" is now history. What took Germany forty years to prepare for was done in a few months by America. This record was made possible only by INTENSIVE TRAINING.

Though Captain Smith may return to his old job of floorwalker, it will be only for a short while — time enough to complete a course of intensive training in some line or other that will make him mentally fit for a better paid and more responsible position. He knows that intensive training will do this for him just as surely as it qualified him for a commission in the army.

Intensive training made him a leader of men. It enabled him to give orders instead of taking them. It enabled him to think, act and reason for himself and do the thinking for those under him—often a matter of life and death. No! Captain Smith couldn't be content in his old job, because he knows how to get a better one.

The War's Great Lesson

Every man who stepped from his job in civil life into an intensive training camp has learned a valuable lesson—a lesson that will make him a better business man if he but has the will to win. These men have witnessed the wonders of intensive training—have seen the metamorphosis in their own individual lives as well as in those of others, and it is but natural to assume that, if intensive training in military matters performed such wonders, it must have the same beneficial effect when applied to business. The history of business and of business successes points unerringly to the assistance rendered by intensive training.

Since the armistice was signed, and more particularly since the American troops began to arrive home, there has been a noticeable increase in the number of enrollments for intensive business training in all lines of endeavor taught by the American School. Thousands of men who were simply "getting by" instead of "getting on" before they joined the colors, have learned a lesson and they are not going to be content with the poorly paid jobs they held in the past. This fact is proved by the great increase in students who are availing themselves of American School training. In a few months these students who are now applying intensive training as a solution of "how to get on," will be able to qualify for the goal they have in mind. The spare time hours they devote to this training will bring them rich rewards in the form of bigger pay checks, better positions and more congenial work. The result of such training cannot be otherwise, for trained men are the scarcest commodity on the market.

After seeing what a few months of intensive training did for him from a military standpoint, he, and thousands like him, are going to avail themselves of the same method as a means of self-betterment in business life. There's proof below that it's the only way to secure promotion and much better pay.

An Investment Without an Equal

If you think for a moment that there is another investment that can equal the time and small amount of money spent in intensive training — get out your pencil and do some figuring.

If a course of intensive training in your chosen line costs you from $50 to $100 — and your spare time — how much would that money earn for you if invested in stock? From three to ten dollars per year would be the limit, wouldn't it?

The same amount invested in intensive training will double, treble or multiply your earning power several times, because it makes you a better business man and makes those who employ you aware of that fact. There's no sentiment in determining salaries. You get paid for what you can do—and that depends solely on what you know.

Your spare time does not earn you anything NOW — so you can't charge anything to a course of intensive business training but the actual cost of the course. If the result of this training only increased your earning power by ten dollars a week — and that is a conservative figure — you would net FIVE HUNDRED AND TWENTY DOLLARS a year from a small investment of cash and spare time. That is a small gain when compared with actual returns reported by American School students, but small as it is it serves to prove that there is no other investment in the world that pays so well as a trained brain.

Thousands Bettered by American School Training

It has been the privilege of the American School, a fully chartered educational institution, to prepare thousands of ambitious people for better positions in all trades and professions. For nearly a quarter-century it has been advocating intensive training and, today, there are thousands to testify to its efficacy—thousands who are now enjoying healthy incomes and congenial work as a result of the spare time they devoted to American School training. The same measure of success can be yours. Proof of scores of these successes will gladly be mailed you on request.

A School That Is Known by Its Guarantee

The American School believes that education, like merchandise, should be sold on a "make good" basis. Doing business strictly by mail demands some guarantee as a protection to the student. That is the belief of the American School — and it is on the basis of SATISFACTION OR MONEY REFUNDED that a student enrolls. All risk on the part of the student is eliminated. At any time during the first year of your enrollment we guarantee to refund your money in full if, after the completion of ten examinations, you notify the School that you are not satisfied with your course. Ten examinations will prove to you whether or not you are getting practical, money-making training. You are the judge.

Don't Dodge a Better Job

Whether you get a better position and better pay is up to you and you alone. The American School can help you get the position you want — just as it has helped its thousands of students. It will not obligate you to investigate what this training means to you. A Free Bulletin will be mailed you on receipt of the coupon. No agents will call on you — and it might prove the best thing you ever did. Check and mail the coupon while this matter is before you.

DETROIT

The Auto Center is the Logical Place To

LEARN AUTO AND TRACTOR BUSINESS

Training for Head and Hand

Young Men of today are fortunate to live in the age of the Auto and Tractor Business. It is the greatest business in the world. Never before has there been such a wonderful future for ambitious men.

Big Demand For Trained Auto Men

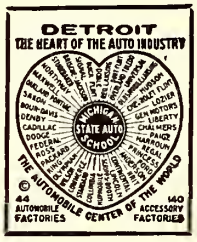
Think of it!—Six million automobiles in use and thousands more being sold daily. Factories are rushed to the limit. Trained automobile men are wanted everywhere. The demand exceeds the supply. That's the business you can learn here at our school,—and such is the opportunity that awaits the trained automobile man.

Earn $100 to $400 Monthly

It is not at all difficult for a trained man to earn those salaries. Hundreds of our graduates are doing even better than that. Auto Factories, Garages, Service Stations and Tractor Factories are continually calling on us for graduates to fill responsible positions. Many of our graduates go into business for themselves. There are thousands of places where good garages and the services of competent, trained men are needed. These opportunities are unlimited.

Money-Back Garantee

We guarantee to qualify you for a position as chauffeur, repair man, tester, demonstrator, auto electrician, garage man, automobile dealer, or tractor mechanic and operator, paying from $100 to $400 monthly or refund your money.



Complete Tractor Course Included

Complete instruction on the care, repair and maintenance of tractors is also included in our regular Auto Course. Tractor manufacturers give full co-operation. International, Moline and Emerson-Brantingham Co.'s have placed machines with us for the benefit of our students.

Brazing-Welding and Tire Repairing Taught in Separate Courses. Big Money Earned by Trained Competent Men in These Lines.

Big Factories Endorse Our School—In fact they assisted in the arrangement of our present Course. They know our equipment and our methods and heartily recommend our School.

Free Catalog—Gives complete information with views of school and equipment, also actual letters from satisfied graduates. Write for it. Better still, jump train and come as hundreds do. Our guarantee protects you.

MICHIGAN STATE AUTO SCHOOL

"Most Progressive Auto School in America"—"In the Heart of the Auto Industry"

Auto Building, 672 Woodward Avenue DETROIT, MICH., U. S. A.

POWER!

O! Boy! but my car runs fine with the ALSOP ALL-SPARK I have no more spark-plug troubles

EQUIP YOUR CAR AT ONCE WITH THE

"ALSOP-ALL-SPARK"

SAFE — SIMPLE — SURE

It eliminates the cost of new plugs, by causing old, cracked, carbonized and oil soaked plugs to give powerful sparks, which retards carbon, saves gas, develops greater power, and insures continued driving without misfires.

Control is from a handsome dial on dashboard, so that a low voltage hot spark can be used for starting.

NOTE:—This device does not contain **DANGEROUS EXPOSED SPARK GAPS**, which may **SET YOUR CAR AFIRE** and make your engine **HARD TO START.**

Controlled from a handsome dial on dashboard.
PRICE: 4 cylinder type $7.50 with money-back Guarantee

WRITE for our great Catalogue of GOVERNMENT TESTS.

DEALERS—AGENTS—SALESMEN—WANTED

ALL-SPARK IGNITION CO., Inc. - 13 Water St., New York

"The Eastern" is a Large Achromatic Telescope

MADE UPON NEW SCIENTIFIC PRINCIPLES.

Positively such a good Telescope was never sold for this price before. **Eastern Telescopes** are made by one of the largest manufacturers of telescopes in America; we control entire production; measure closed 9 inchss and open over 3 feet in 4 sections. They are nicely brass bound, with scientifically ground lenses. **Guaranteed by the maker.** Every sojourner in the country or at the seaside resorts should certainly secure one of these instruments, and no farmer should be without one. The scenery just now is beautiful, a Telescope will aid you in taking views. Objects are brought to view with astonishing clearness. Sent by mail or express, safely packed, prepaid, for only **99 cents.** Our new Catalogue of Watches, etc., sent with each order. This is a grand offer and you should not miss it. **We warrant** each telescope just as represented or money refunded. Send **99 cents** by Registered Letter, Post Office Money Order, Express Money Order, or Bank Draft payable to our order, or your newsdealer or store-keeper will order one for you. Whether consumer or dealer, send cash with order. **To dealers 6 for Four Dollars.**

EASTERN NOVELTY CO., 67: 172 E. 93d STREET, NEW YORK.

The Electrical Machinist

By H. Winfield Secor

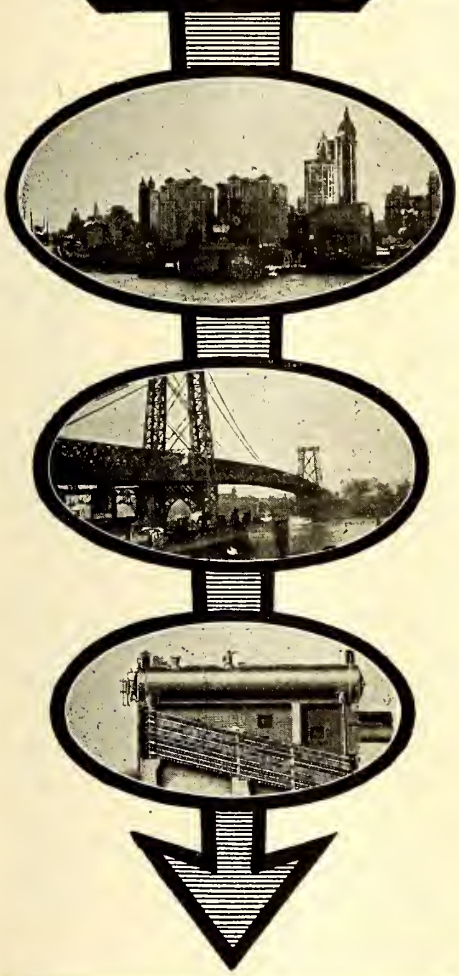
(*Continued from page 775*)

moving any commutator, to note and record its exact position on the shaft; a center punch mark should be made on the armature drum or core, and another corresponding mark on one of the commutator segments. Thus, when the commutator is being replaced these two marks should be lined up. This is very important from an electrical standpoint, and it also is the best from a mechanical standpoint for obvious reasons.

Small commutators are frequently driven into place on the armature shaft by means of a piece of pipe which fits over the shaft, and then this pipe is hit with a heavy hammer or sledge, driving the commutator on in this fashion. Where the commutator does not make an extra tight fit on the shaft this method is quick, it may be said, but it is very poor practise, except when applied by an experienced mechanic who can judge when this process is requiring too heavy a blow. On small armatures there is a danger of bending the shaft. It is best to upend the armature and shaft in a vertical position when attempting to drive on a commutator in this fashion with a sledge and a piece of pipe. The commutator may rest on a piece of fiber or in some cases an iron plate is used, but the latter is liable to damage the end of the shaft.

When a shaft becomes bent, for one reason or another, one of the best methods of straightening it, is to place it between centers on a lathe. Small shafts can be easily straightened without applying any heat, but large shafts two or three inches in diameter and more, should have heat applied to them before attempting to bend them straight. The first thing to know is the actual position of the bend, and pressure should be applied on the opposite side of the shaft or armature drum from which the bend springs. Pressure may be applied in several ways. In some cases, a lever or a piece of plank is used on top of some blocking on the lathe bed, while in other cases, pressure may be applied by means of the lathe tool carriage, utilizing the slowest hand-feed possible on the carriage. Considerable pressure can be obtained in this way, but it is not advisable for any large work, as it is liable to strain the lathe machinery and either break or bend some of the gearing and connecting shafts on the tool-carriage.

MISCELLANEOUS COMMUTATOR CONSTRUCTION HINTS.



At figure 4 are illustrated several practical hints in commutator construction. At A, there is shown a method of building up cone-shape mica rings used in insulating the ends of the commutator barrel or drum. These rings are usually built of *shellacked mica,* a standard form of this material in the electrical trade, and which comes in the form of sheets of various thicknesses and sizes. This shellacked mica sheet is first cut out in segments or other shapes of predetermined dimensions, such that when they are heated above a Bunsen flame, they may readily be bent to the exact size and form of the cone required. In completing such a ring, the segments are overlapped as shown by the dotted and full lines in Fig. A. The segments are shellacked as they are built up in the cone form. A wooden form of the proper taper may be turned up for the purpose, or else the commutator shell itself may be used for the purpose. Cement mica is widely used in commutator work, but mostly where flat position of insulation, such as commutator segments, are required.

(*Continued on page 790*)

Be a Draftsman
Raise Your Income

Every Big Construction Job
Must Pass Through the Drafting Room

Do you realize what that means in the way of opportunity with big pay for Draftsmen? Think of the enormous volume of building operations now going forward all over the country with the return of peace—the big engineering, construction and manufacturing projects that must every one first go through the drafting room before the plans are ready for the workmen.

Never before in this country was there such a demand for skilled draftsmen—and this condition is true of European countries in which the destruction of war calls for vast re-building programs requiring the services of an army of draftsmen. All this world-wide demand means great prosperity for men who become trained in draftsmanship.

$25 to $100 a Week

All you need is training to be ready to accept a call that should mean $25 to $100 a week easily earned. You have the same opportunity to secure the valuable training in spare time at home or by personal attendance from the Chicago Technical College that many other men had who are now holding fine positions and earning big pay through their knowledge of draftsmanship.

Act Promptly—Now

The longer you wait, the longer you will postpone the time when you will begin to draw a tempting salary as an Expert Draftsman. Manufacturers, Architects, Contractors, Engineers, Builders, Railroads and other big employers of trained draftsmen are ready with the work—when **you** are qualified to handle it.

Come to the College or Train at Home

Whether you decide to take one of the resident courses or to study in spare time at home you will have the personal direction of practical engineers, builders and architects, who give you the benefit of their vast experience and the successful methods they use in their own work. No time wasted. Every minute counts under men like these—every one a specialist!

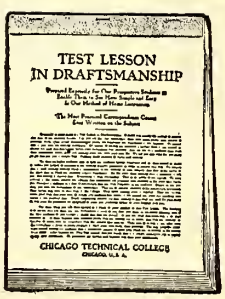
We train hundreds of men by the most modern methods and see them quickly succeed, because we give them a technical preparation that not only makes proficient draftsmen of them, but also enables them to fill higher executive positions in big construction enterprises. There is no limit to your progress after you have equipped yourself with what the Chicago "Tech" can give you.

Drawing Outfit

No Extra Charge

Every student of the Chicago "Tech" Home Study Course in Draftsmanship receives the drawing outfit—set of instruments in case, drawing board, T square, triangles scale, curve, drawing paper, pencils, etc., or a cash credit in case he already has an outfit. These instruments are of the same make and sizes as used by high salaried experts in drafting rooms of factories, shops, railroads, etc. You use them while learning—then take them right into your practical work.

Easy Payment



Chicago "Tech" training costs you little compared to the great benefits conferred, and payment of tuition fees may be made in easy installments, if desired. This splendid training will soon enable you to pay for the course from extra earnings.

Below, in the coupon, we list our principal courses. Just mark X in the ( ) to show which subject interests you and we will send you full information free. **Mail Coupon or write today.**

Free!

Drafting Lesson

The Chicago "Tech" method is the quickest, easiest way to become a skilled draftsman in spare time, without interfering with your present position. But we don't ask you to decide until you know how well qualified you are for this prosperous profession.

Other institutions ask you to pay first—and then find out later what their instruction means to you. We send the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything. And see for yourself just what Chicago "Tech" offers you in training which will bring a ready market for your services and open opportunities which are closed to the untrained man.

Send Coupon

CHICAGO TECHNICAL COLLEGE
CHICAGO, U. S. A.

AUTOMOBILE AND GAS ENGINE COURSE

All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Splendid opportunities open now.

Learn All This in Spare Time

All about the Principles of the Automobile; Gasoline Engines; Power Plants and Transmissions; Carburetors and Fuel Supply Systems; Lubrication and Cooling; Batteries; Magneto Ignition; Starting and Lighting Systems.

Know How To Fix Troubles

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men. Write—Send the coupon and get catalog and all information now.

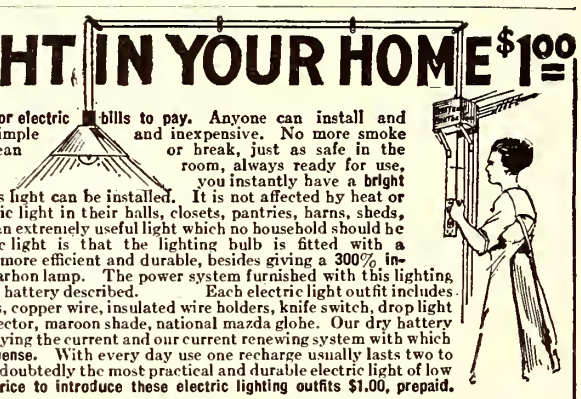
KIDPHONE

TRADE MARK

Boys! Girls!! Grown-Ups!!!

The "Kidphone" is sold as a toy, but it is more than a toy—it is a practical, durable, superior telephone. Although it is much smaller and weighs much less (receiver weighs ¼ oz.), it talks better than the one you're used to. The idea of operation is different. It is based upon the correct theory of voice transmission, introducing to America for the first time a far-reaching, scientific principle, only recently perfected. Can be used for all sorts of purposes—in the house, in the play-room, on "Scout" duty, in games, etc.



Ingenious! Instructive! Fascinating!

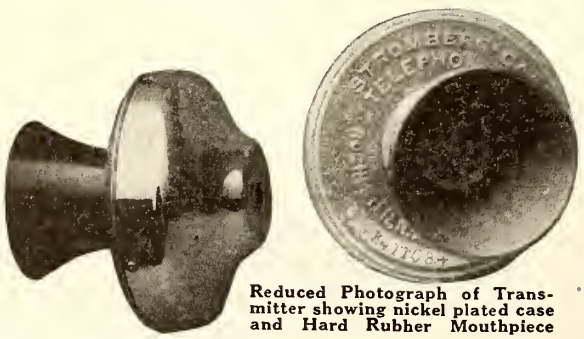
AN ALL YEAR 'ROUND CHRISTMAS PRESENT

Price $10 at your electrical dealer's, department store, or from us direct.

AMERICAN THERMOPHONE COMPANY—Department C
114-116 Bedford Street, Boston, Mass.

ELECTRIC LIGHT IN YOUR HOME $1.00

The latest electric light, no batteries to buy or electric bills to pay. Anyone can install and maintain this midget electric light. Safe, simple and inexpensive. No more smoke and smell, no wicks or oil, no chimneys to clean or break, just as safe in the barn, garage and clothes closet as in any open room, always ready for use, day or night. A touch on the switch and you instantly have a **bright electric light.** No matter where you live this light can be installed. It is not affected by heat or cold. Many homes have installed this electric light in their halls, closets, pantries, barns, sheds, cellars, garages, etc., with good results. It is an extremely useful light which no household should be without. The reason for this bright electric light is that the lighting bulb is fitted with a drawn Tungsten filament wire which is much more efficient and durable, besides giving a **300% increase in light** as compared with the ordinary carbon lamp. The power system furnished with this lighting outfit is somewhat similar to the electric power battery described. Each electric light outfit includes the following: Complete directions and plans, copper wire, insulated wire holders, knife switch, drop light fixture with socket, friction tape, battery protector, maroon shade, national mazda globe. Our dry battery compound, which assists in renewing and supplying the current and our current renewing system with which you can **renew the current at home without expense.** With every day use one recharge usually lasts two to three weeks. This electric lighting outfit is undoubtedly the most practical and durable electric light of low cost and long service ever devised. **Special price to introduce these electric lighting outfits $1.00, prepaid.** Outside the U. S. $1.25.



NOTICE

With the above Electric Light System it is possible for anyone to have their Christmas tree electrically illuminated, doing away with candles, oil lamps and danger of fire. It will assure you a brighter appearing Christmas tree. With this system, 8 to 16 lamps can be electrically illuminated. This system will be furnished free with the above Electric Light Outfit. Order at once direct from ad. Prompt and safe delivery guaranteed for 10c extra.

A. B. C. PRODUCTS CO., Johnson and 13th Sts., Chicago

SPECIAL SALE!

We have on hand 2,000 Carbon Grain Transmitters as per photograph. They are first-class instruments and may be used for all kind of experiments, especially for wireless telephone sets, where a heavy current is to be passed through. Slightly used, but in perfect working order. Money refunded if not satisfied. A real bargain. Order one or more today.

Reduced Photograph of Transmitter showing nickel plated case and Hard Rubber Mouthpiece

$1.00 ONLY

Diameter, 3¼ ins.

THE ELECTRO IMPORTING CO., 231 Fulton St., NEW YORK

The Electrical Machinist

By H. Winfield Secor

(*Continued from page* 788)

In small commutators the segment insulators are usually made of pure mica punched out by a large motor-driven punch-press. It is usual in practise to make up a commutator gage stick as shown at Fig. 4—F. The mica punchings are assembled in the saw slits cut in this stick, the saw used in making the slits being of the exact thickness of the mica segment desired. One large motor concern uses wooden sticks, but they can of course be made up of other material. Several rubber bands are used in assembling small commutators as the mica and copper segments are put into place. At C, there is shown the method of scribing out the exact shape of mica segment for large commutators by laying the copper segment on the mica. At D and E, there are shown respectively, the use of a steel snap-gage having a slot of predetermined width and also the use of the *micrometer* for gaging the thickness of mica segment in thousandths of an inch or mils. In tightening up commutators some form of compression is generally employed, such as that shown at B. This is a wrought iron ring, several of which may be used on long commutators, and steel set screws are threaded thru the ring all around its perifery. These set screws may be spaced about two segments apart, and under the screws and over the commutator segments there is placed a thin band of iron or copper. The segments are thus tightened up and at the same time the lock nut on the end of the commutator is successively and periodically tightened. The commutator must in any case be just as tight as you can possibly make it, within reason of course, before any attempt is made to place it in the lathe and machine its surface, or otherwise there will be commutator segments in every corner of the shop, before many cuts have been taken.

(*To Be Continued*)

MAGAZINICALLY SPEAKING.

An *American, Country Gentleman,* wanting some *Variety* in his *Life,* and desirous of becoming an *Electrical Experimenter,* purchased at the *House Beautiful* a copy of *Popular Mechanics,* which contained many *Popular Current Events.* The *Engineering* in this *Journal* enabled him to become a good *Judge* of *Aircraft,* and consequently his *Outlook* for a *Success* was due to the *Modern Methods* taught by this *System.*

This *Craftsman,* having read some *Live Stories* in the *Scientific American* about the mines in San Francisco, decided to make a *Motoring* trip to the *Cosmopolitan* City. On arriving at the western city he did not heed the *Call* of the *Mining* center, but visited the *Motion Picture* studios, where he became acquainted with the *Photoplay.* The splendid atmosphere in this *Town* aided him to improve his *Physical Culture. Every Week* he would take a *Yachting* trip on the *Pacific* and enjoy the beautiful *Sunset.* One evening while a *Spectator* of a new *Film* at a leading *Theater* he met a young lady of *Fashion.* The next *Day* while at the town *Post* waiting for his *Mail* he again met the young woman. He liked her very much and soon became the *Woman's Companion.* They were soon married and went to live at the *Countryside.* The couple lived very happily and while the young woman was engaged in *Good Housekeeping,* the old gent sang extracts from *Musical America.*—*Art Mayers in the "Everett Herald."*

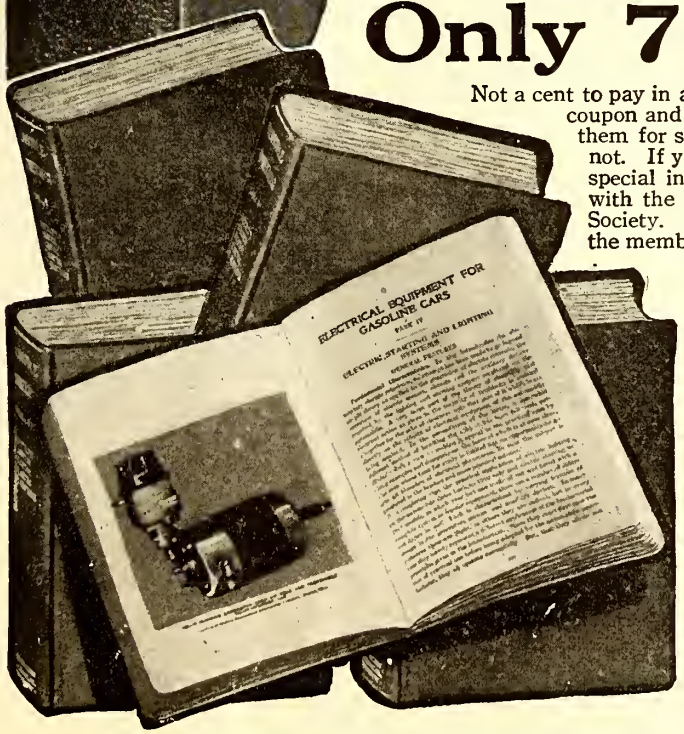
Take Your Choice of These Big Paying Jobs

THOUSANDS of men like you are wanted to fill these big-paying jobs in the automobile engineering field. Thousands of places are open, too, for chauffeurs and garage managers. It's easy to get one of these good jobs and to prepare yourself to hold it. You don't have to go to school. You don't have to serve an apprenticeship. Spare time only is needed. These great automobile books will teach you everything you need to know. Fifteen of the greatest engineers and experts in the business wrote them in simple language that anybody can understand.

Auto Books

6 Volumes Shipped Free

Just off the press—the 1920 model—an up-to-the-minute six-volume library on Automobile Engineering, covering the construction, care and repair of pleasure cars, motor trucks and motorcycles. Packed full of advance information on Lighting Systems, Garage Design and Equipment, Welding and other repair methods. Contains everything that a mechanic or an engineer or a motorcyclist or the owner or prospective owner of a motor car ought to know. Anybody can understand them. Tastefully bound in American Morocco, flexible covers, gold stamped, 2650 pages and 2300 illustrations, tables, blueprints and explanatory diagrams. A library that cost thousands of dollars to compile but that comes to you free for 7 days' examination. Over 50,000 sets of previous editions have been sold.



Partial Contents

Automobile Motors; Welding; Motor Construction and Repair; Carburetors and Settings; Valves, Cooling; Lubrication; Fly-Wheels; Clutch; Transmission; Final Drive; Steering Frames; Tires; Vulcanizing; Ignition; Starting and Lighting Systems; Shop Kinks; Commercial Garage; Design and Equipment; Electrics; Storage Batteries; Care and Repair of Motorcycles; Commercial Trucks; Gas Tractors.

128 Blueprints of Electric Wiring Diagrams

Only 7c a Day!

Not a cent to pay in advance. First you see the books in you own home or shop. Just mail coupon and pay express charges when books arrive. You can read them and study them for seven whole days before you decide whether you want to keep them or not. If you like the books, send only $2 in seven days and $2 a month until the special introductory price of $19.80 has been paid. (Regular price $30.) Along with the set goes a year's consulting membership in the American Technical Society. (Regular price $12.) This part of our offer will be withdrawn when the membership is filled. Mail the coupon without delay.

Don't Send Money Now!

Don't take our word for it. **See the books without cost.** Here is a chance for you to get a real man's job with a man's size pay. Don't waste a minute in sending the coupon. **Put the coupon in the mails today. Send no money—just the coupon!**

American Technical Society, Dept. A-259, Chicago, Ill.

FREE Examination Coupon

American Technical Society, Dept. A-259, Chicago

Please send me the 6-volume set of Automobile Engineering for 7 days' examination, shipping charges collect. If I decide to buy, I will send $2 within 7 days and the balance at $2 a month until the $19.80 has been paid. Then you send me a receipt showing that the $30 set of books and the $12 Consulting Membership are mine and fully paid for. If I think I can get along without the books after 7 days' trial, I will notify you to send for them at your expense. [*Please fill out all lines.*]

DEPENDABLE KNAPP ELECTRIC SPECIALTIES

Motors and Electrical Specialties Are Best

Knapp Goods have stood the test for 29 years. No detail in construction has been spared to make them the best that money can buy. The complete Knapp line includes Toy and Power Motors, Generators and Dynamos. Specialties and Novelties that amuse and instruct. Fans, Rheostats, Compasses, etc. And Knapp prices are always lowest. Always insist on Knapp Goods.

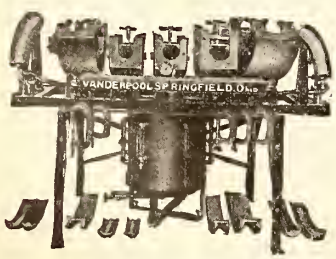
KNAPP DYNAMO MOTOR

Will electroplate, charge storage batteries, run lamps, motors, train of cars, induction coils,—in fact, the number of experiments it can be used for is unlimited. Runs on 4 to 6 Volts or can be connected to run on 110 Volts through a transformer.

Price, Complete, $8.00

KNAPP "LEARNELECTRICS"

A complete Electrical Laboratory, including a very valuable instruction book by H. P. Gorman, A.I.E.E. Covers all subjects clearly and concisely.



Price, Complete, $3.50

Order to-day. Or your dealer can secure them for you. DESCRIPTIVE CIRCULAR and CATALOG of celebrated **KNAPP MOTORS** *and Electrical Specialties from 10c up mailed FREE on request*

KNAPP ELECTRIC & NOVELTY CO., 523 West 51st Street, New York City

MEN WITHOUT PREVIOUS EXPERIENCE CAN GET INTO A VERY PROFITABLE, FAST GROWING BUSINESS

Everyone makes money in the TIRE VULCANIZING BUSINESS. Profits 100% or more. Small investment. We are the pioneers in the manufacture of the dry cure vulcanizer.

THE VANDERPOOL VULCANIZING OUTFIT

repairs tires by the correct method. The Vanderpool Principle is endorsed by the great tire factories, also by veteran repairers after trying others. We send you FREE TIRE REPAIRING MANUAL. If others have been successful so can you be. Write today for full particulars.

WM. VANDERPOOL CO., Dept. U 19, Springfield, Mass.

WHAT THE U. S. PRODUCES.

The United States has only six per cent of the population of the world and only seven per cent of the land, and yet we produce the following percentages of the world's supply:

Of copper	60%
Of lead	40%
Of zinc	50%
Of aluminum	60%
Of oil	66%
Of corn	75%
Of cotton	60%
Of silver	40%
Of coal	52%
Of gold	20%
Of iron and steel	40%
Of automobiles	85%
Of wheat	25%

and refine 20 per cent of the copper and operate 40 per cent of the world's railroads.

The Amateur Magician

By Joseph H. Kraus, Jr.

(*Continued from page* 771)

Again no movement on the part of the bell. "Well, I'll not fool any longer. The bell doesn't know." He was interrupted again by the "yes" ring of the bell. "How strange and yet—perhaps she does know. Was it a Diamond card?"

The bell answered in the affirmative.

Scratching his head the performer as tho choosing his words with great deliberation added, "Was it a picture card?"

The bell answered *yes*. "A King?" Two rings signified that this was correct.

"Not only does the bell tell me these things, but also tells fortunes. Now, bell, suppose that you tell me how many fellows that young lady down the aisle has. Four? Thank you."

In this way a long program may be mapt out and wound up in the following manner:

"The lady in the box there; yes, the married one. How many times has she been married?"

The hammer is seen to rise once, twice, but it only rises on the third occasion, not striking as it did on the previous occasions; while the magician watches with interest the next move, counting out loud.

"Twice, and almost the third time?" this with an inflection of the voice. "Here that will do." Separating the parts as before he bows to the audience.

THE CONSTRUCTION OF THE BELL AND STAND.

The stand consists of a long nickel-plated tube mounted on a tripod of the same material, with one wire running up each of two of the three legs, said wire connected to a large magnet made by winding eight layers of number eighteen doubl cotton covered magnet wire, on an iron core which does not extend all the way up the coil; but terminates within one inch of the end, a sleeve continuing the rest of the way. The coil is eight inches long and actuated by an assistant behind the scenes, a six volt current being used as the exciting force.

The hook is made of iron, nickel-plated, like the balance of the stand. When placed in position it acts as a core to the magnet concealed in the stand.

The bell is made of an ordinary electric light globe, which is fastened into a turned piece of wood (as shown in the illustration) with plaster of Paris. Thru a small opening in the ring on top is past a piece of soft iron bar, one end of which is connected to a lever-like piece of aluminum; the far end of this lever has a decorative piece of bone attached to its free end to act as a hammer.

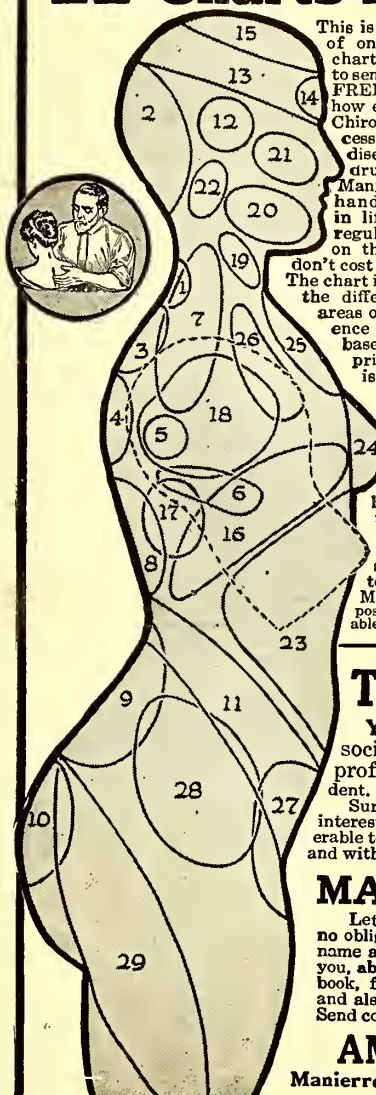
Become a Doctor of CHIROPRACTIC



Advanced Science of Spinal Adjustment

The great profession that within the past few years has taken the longest forward strides ever known in the history of drugless healing. It has called to its ranks thousands of ambitious men and women from every walk of life. Today it is calling more insistently than ever because the tide has turned strongly in favor of drugless healing.

There is today a demand for one hundred thousand Doctors of Chiropractic in this country, according to a recent statement of a man who is himself a prominent Chiropractor and has intimate knowledge of the Chiropractic situation throughout the United States.

Even if this demand remained stationary, it would require many years to fill it. But the demand is **constantly increasing** because more and more intelligent people—those who do their own thinking—are becoming convinced that Chiropractic is the common sense and really scientific way to relieve pain and disease.

22 Charts FREE!

This is a small reproduction of one of 22 magnificent charts **all of which** we want to send you ABSOLUTELY FREE, just to show you how easily you can master Chiropractic and how successfully you can treat disease by this modern drugless healing method. Many of these charts are handsomely lithographed in life-like colors. Their regular value is $31.50, but on this special offer they don't cost you a penny. The chart illustrated here shows the different pain and nerve areas of the body. The science of Chiropractic is based upon the well known principle that when there is bone pressure on a trunk nerve where it leaves the spinal column there will be pain in the area it controls; and that by relieving the pressure the pain is banished. Chiropractic teaches you how to locate nerve pressure at any point along the spinal column and how to relieve it. Mail Coupon or write a postal today for this remarkable FREE CHARTS offer.

We Teach You By Mail

or in class. Our method of home study instruction places you under the personal direction of a splendid faculty of Chiropractic experts—men who have made notable records both as practitioners and instructors. There is no need for you to leave home or give up your present position. Your instruction will be thorough, practical and in accordance with the most modern methods of drugless healing therapeutics. From the moment you enroll we will work with you wholeheartedly, our one aim being to make you successful just as we have advanced the interests of thousands of others. In the shortest time consistent with thoroughness you can graduate with the degree of D. C. (Doctor of Chiropractic) receive your diploma **FREE**, and be ready at once to open your office. Your opportunities are as great as those of other ambitious men and woman. Why, then, shouldn't you be able to do as well as Doctors of Chiropractic who are today earning incomes of from

$3000 to $5000 a Year

and even more? What, for instance, is there to prevent you from doing as well as Dr. Condoluci, one of our recent graduates, who writes us that he earned from two to three times the cost of his tuition **as a student;** that immediately upon graduation he opened an office, began making money from the very start and is now earning **upwards of $12,000 a year!**

Another recent graduate, Allen Watrous writes: "Am contemplating opening a large office with 50 stretching tables. A man who is interested will put up $25,000 to make this possible." Dr. W. H. Wedell states that his practice averages ten patients a day and that he charges $25 for 13 treatments. At that rate he's making big money. Dr. M. D. Moore reports an income of $9000 a year; Dr. L. H. Roche, $5000. Dr. Hanna over $5000 yearly. Can you ask for more convincing proof that CHIROPRACTIC is indeed a great profession—a fertile field for men and women who feel that they can and **should** make more of their lives and are earnestly seeking broader opportunities?

Yes, the success of many Chiropractors has come so quickly as to be almost startling. And yet, it is not to be wondered at when you consider the scientific accuracy of Chiropractic methods, the constantly increasing demand for Doctors of Chiropractic and the comparatively few Chiropractors that are now in the field.

The Big Opportunity You've Been Waiting For!

You are ambitious. **You** would like to make more money—increase your prestige—advance socially—be **above** and not **of** the crowd. Then why not qualify **now** for this splendid profession which offers such remarkable possibilities for making you prosperous and independent. The time of preparation is short. The study is fascinating. The cost is small and terms are easy.

Surely a life of independence in a great, dignified profession, free to come and go as you like—a profession of absorbing interest and of rich financial rewards—surely this is far preferable to remaining in the same old rut—never getting ahead and with no outlook for the future. At least **investigate.**

NEW MOTORS

FACTORY GUARANTEED - ALL SIZES - IN ORIGINAL BOXES

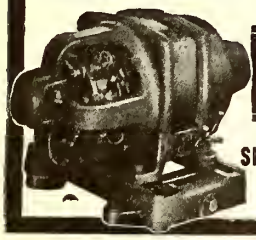
Your Opportunity To Buy New Guaranteed Electrical Apparatus of Standard Manufacture.

Single Phase Motors
110-220 volts, A. C., 60 cycle, 1800 R. P. M. with pulley

1/4 H. P., 110 volts, induction, full load start - - $24.50
1/2 H. P., 110-220 volts, induction, full load start - $38.50
1/2 H. P., 110-220 volts, repulsion, for compressor $46.50
1 H. P., 110-220 volts, repulsion, with sliding base - - $67.50
2 H. P., 110-220 volts, repulsion, sliding base $108.50
3 H. P., 110-220 volts, repulsion, sliding base $124.50
5 H. P., 110-220 volts, repulsion, sliding base $164.50

Charging Generators
Suitable for all lighting Battery Charging and Power Requirements.

6 volts, 10 amp. $16.50
15 volts, 10 amp. $21.00
40 volts, 6 amp. $24.50
110 v, 2½ amp. $24.50
40 volts, 12 amp. $38.50
110 volts, 5 amp. $38.50
40 volts, 25 amp. $58.50
110 volts, 10 amp. $58.50
Moving Picture Arc Generator $85.00



Polyphase Motors
2 and 3 phase, A.C., 220 v, 60 c. 1750 RPM., complete with base and pulley.

½ H. P. - $42.50
1 H. P. - $59.50
2 H. P. - $72.50
3 H. P. - $84.50
5 H. P. - $102.50
1 H. P., high speed, 3600 R.P.M., 220 v 2 phase only - $36.50

Battery Charging Outfits
To operate on A. C., 60 cycle, single phase voltage as specified.

110 volts, A. C., 100 watt. 24 volts, without switchboard $40.00
110 volts, A.C., 150 watts, 30 volts, with switchboard $68.50
110-220 volts, A. C., 250 watts, 24 volts, without switchboard - $75.00
220 volts, A.C., 300 watts, 30 volts, without switchboard - $85.00
110 volts, A.C., 375 watts, 30 volts, without switchboard - $85.00
220 volts, A.C., 500 watts, 40 volts, with switchboard $110.00
110 volts, A.C., 750 watts, 72 volts, without switchboard $125.00

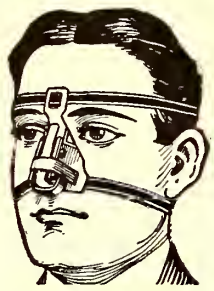
YOU HAVE A BEAUTIFUL FACE

BUT YOUR NOSE?



BEFORE

AFTER

IN THIS DAY AND AGE attention to your appearance is an absolute necessity if you expect to make the most out of life. Not only should you wish to appear as attractive as possible, for your own self-satisfaction, which is alone well worth your efforts, but you will find the world in general judging you greatly, if not wholly, by your *"looks,"* therefore it pays to "look your best" at all times.

Permit no one to see you looking otherwise; it will injure your welfare! Upon the impression you constantly make rests the failure or success of your life. Which is to be your ultimate destiny? My new *Nose-Shaper,* "TRADOS" (Model 24) corrects now ill-shaped noses without operation, quickly, safely and permanently. Is pleasant and does not interfere with one's daily occupation, being worn at night.

Write today for free booklet, which tells you how to correct ill-shaped noses without cost if not satisfactory

The Amateur Magician

By Joseph H. Kraus, Jr.

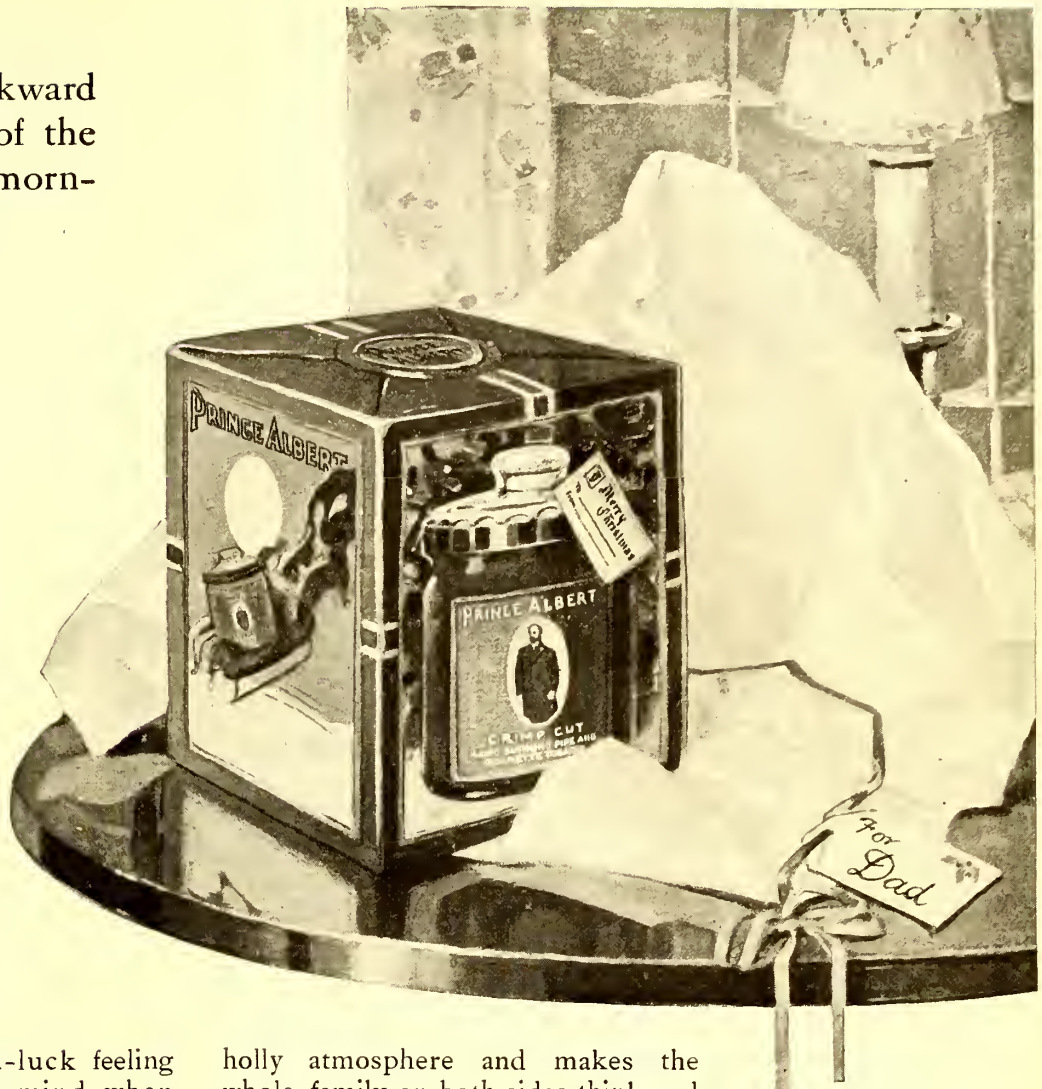
(*Continued from page 792*)

Two wires lead thru the stand and down each of two of the legs, making contact with two plates concealed by the heavy rug.

When the stand is brought forward, it is carefully placed in position so as to make contact with the two plates, the bell then being tried before proceeding with the balance of the performance. The trial is made under cover of a little phrase, asking the bell to show how it answers. A typical magician's forcing deck of cards being used, the assistant knows exactly what cards will be given out and goes thru the procedure as a regular matter of routine; pressing the key for each sound of the bell and the gong ringing at each break of the circuit.

It will be noted that when the soft iron core is attracted to the magnet, the hammer is pulled away from the bell, but on its sudden release the weight of the hammer allows it to swing downward, striking the bell just once.

A FEW TRICKS EASILY PERFORMED BY THE "FIXT PACK."



This trick originated many years ago. It never fails to produce results. The cards are fixt in an orderly manner, and this order preserved—*the deck never being shuffled.* This order is very easily learned, and it is only necessary to see one card in the deck, either the top or the bottom card, to be able—in this manner, to tell the name or the position of any card in the deck.

First—the suits are learned in the following manner: Hearts, clubs, diamonds, spades, and then the following arrangement will be found very satisfactory. The cards are separated by three numbers; that is, one, four, seven, ten, thirteen, three, six, nine, etc., in which the King is thirteen, Queen twelve, Jack eleven and the Ace is one. In arranging the cards, they will follow this manner: Ace of hearts, four of clubs, seven of diamonds, ten of spades, king of hearts, etc. In this way you can easily tell what the twelfth card in the deck will be and read the cards off without looking at them; also by giving a person a choice of any card in the deck, you will be able to discover just what that card was. For the "Q" trick, the cards are arranged in a definite manner. Any number in the circle and the number of cards in the tail changed after each performance. A person is instructed to count a certain number of cards up the tail and around the left side of the circular portion of the "Q" to suit himself. Then taking that card at which he stopt as number one, counting just as many cards, retracing his course, (except that this time he does not proceed down the tail), continues around the circular position of the "Q," stopping in a similar position, i. e. There are eight cards in the tail—the person will proceed up the tail, around the left side of the "Q," stopping at, say, the 17th card. Taking this card as number one, he proceeds backward again, stopping at the seventeenth card again. The performer instantly tells him this card before he comes back.

So much for the effect. Its mode of operation is simpler than the description of the trick and all that is necessary, is that the performer know the number of cards in the tail. Using the card from where the tail starts, as his starting point, he stops at the same card as the number of cards in the tail. In the example mentioned above, it would be the eighth card (inasmuch as there are eight cards in the tail) from your centre position, that, is, where the tail joins the "Q." A simple trial will readily convince.

TAKING awkward angles out of the early Christmas morning atmosphere!

HOW that low-on-luck feeling will peel off *his* mind when the happy-handout-happens Christmas morning; and, his keen eye sights the stage all set with the pound crystal glass humidor of Prince Albert tobacco gowned in the glories of a radiant holiday rainbow! Turkey takes to the tall timbers compared with the all-star-feast *you* spread so temptingly before his smokeappetite!

PRINCE ALBERT, for Christmas, lands on a man's tank-of-thanks like a spill-of-snow when the sleigh-bells are rusty from lack of jingles! P. A. as a *man gift* is the high-sign, the last word, the directest route to his comfort, his contentment, his smoke-happiness! It's the touch-that-lifts-the-lid; that takes the awkward angles out of the evergreen-and-holly atmosphere and makes the whole family on both sides think and talk in one language!

YOU'LL enjoy seeing *him* fuss his old jimmy pipe, all-brimful with Prince Albert! Or, *getting his* "rolling his own!" Never was such a delightful makin's cigarette as P. A. supplies. He can smoke the limit with Prince Albert *for it can't bite his tongue or parch his throat!* Our exclusive patented process fixes that! He'll just want to get thirty-six-smoke-hours out of the legal twenty-four, *that's all!*

FILL his smokecup to overflowing! Prince Albert is the glad-gift, the holiday-hunch that will hum him a smoke te-de, te-dum long, long after Christmas is but a merry memory!

PRINCE ALBERT is also sold in handsome pound and half pound tin humidors, in tidy red tins and in toppy red bags—wherever you buy tobacco.

R. J. REYNOLDS TOBACCO COMPANY
Winston-Salem, N. C.

PRINCE ALBERT

the national Christmas joy smoke

What could you do?

Once to every man comes a time when he must fight for his life or the safety of a loved one.

It may come in the dead of night in your own home, burglars for instance; or on a lonely road or deserted street after dark, or even in broad daylight at the hands of passing bullies.

Suppose it should come to you tonight, what could you do?

Can't you see that it would not be just a question of bravery or strength but rather a question of whether you know how to box, how to defend yourself against the vicious blows of your assailant, how to disarm him if he tries to use a blackjack, club, knife or pistol, how to break his grip on your throat, how to stop the kick he launches at your stomach, and finally how to cripple him by a jiu-jitsu or bone-breaking hold?

Wouldn't you like to know how to play a man's part? Wouldn't you like to learn boxing and self-defense easily and quickly *at less than half the cost* of a single term of lessons by the old method?

Marshall Stillman has developed a unique principle of teaching boxing and self-defense. Two weeks after taking the course boys of twelve and fifteen, and men up to even fifty and sixty have been able to defend themselves against bigger and stronger opponents. He teaches the fundamentals of boxing in five lessons before your own mirror, so that when you meet your first opponent you know how to hit him, what to expect in return and how to guard against it. He teaches you sixteen bone-breaking holds and releases in jiu-jitsu and standing wrestling so that you can quickly put your assailant at a disadvantage and overcome him. For instance: "When opponent tries to use blackjack or other weapon, grasp his wrist with your left hand and immediately slip your other (right) arm well up under his arm and, reaching up, grasp his weapon-hand from behind. Then with both of your hands force his forearm back, as illustrated above. You can break his arm if necessary."

And while he's teaching you these things, he develops you physically and makes your daily exercise interesting as well as beneficial.

It is the first time boxing and self-defense have been successfully taught by mail, and it is only possible because of the Marshall Stillman principle of instruction.

The complete course *specially bound for home study* includes:

5 lessons in boxing—how to hit, duck, guard, feint, clinch, and use foot work.

3 rounds of shadow boxing.

1 set of daily exercises for muscle building.

8 jiu-jitsu holds and releases.

8 holds in standing wrestling.

1 free copy of Professor Mike Donovan's famous book, "The Science of Boxing," containing all of the scientific blows and guards known to the ring, the rules of boxing, suggestions on training, diet, etc.

There are 175 illustrations in this course. The *special Introductory Price* for this in Home Study Edition is, *until further notice*, only half of our usual price—$5.00 instead of $10.00.

It is almost unbelievable that you can learn these things by mail, but we are willing to take all the risk of convincing you. We will send you the complete course on 5-day approval. If you keep it send us $5.00 in full payment; if not, return it on the 5th day. Fill out the coupon *now*.

FREE APPROVAL OFFER

Marshall Stillman Association,
461 Fourth Avenue, Suite E-12, New York.

Send on approval the Marshall Stillman Course in Boxing and Self-defense including 5 lessons in the principles of boxing, 1 set of daily exercises, 3 rounds of shadow boxing, 8 jiu-jitsu holds and releases, 8 holds in standing wrestling, and a free copy of Prof. Donovan's book "Science of Boxing." I will either return them or remit $5.00 on the 5th day after I receive them.

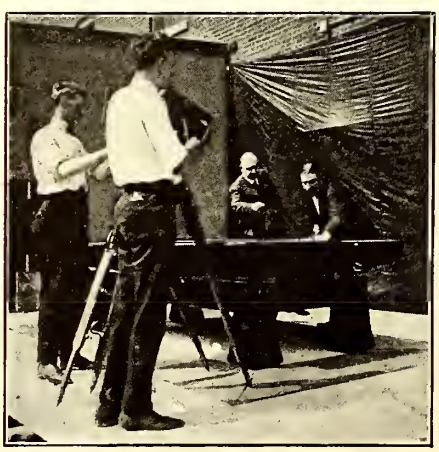
"Slow Movies" Analyze Motion

(*Continued from page 751*)



er in the light. This is so because our eyes can only perceive and analyze those movements which do not travel at a greater speed than sixteen times per second. Let us illustrate with an example: Suppose we look out thru a window at a man walking. If that man makes sixteen steps from the time he enters the left space until the time he leaves at the right margin of the window, we will be able to clearly perceive and count each one of these steps. However,

Taking a "Slow Movie" of a Motorcycle Race at 200 Pictures Per Second.

should that man travel at a greater speed than sixteen steps per second, his step movements will be blurred. Hence, when a camera takes pictures at such an extremely rapid rate, and projects them at the normal speed, it means a slowing down of the picture and the slow movement. Hence the twitch of all the muscles is instantly noticeable. If you have ever been to a theater which has exhibited a Novagraph production of diving, you will more than wonder at the gracefulness of the girl in this scene, as she executes some of the most difficult and wonderful dives. Compare these with the expert male swimmer, going thru the same dives—a striking contrast of his muscular movements with the gracefulness of the girl.

Hundreds of uses for this machine have already developed and suggested themselves. Aviators in flight have been photographed while executing tail spins, nose dives, etc. A movie of Ralph de Palma in his record-breaking Packard, moving at the rate of 130 miles per hour, produced a negative which even rendered the buttons of his uniform visible.

"Slow Movies" Permit of Accurately Analyzing Fancy Billiard Plays, Airplane Tail Spins, Etc.

HERE IT IS

Final Solution of the Vibrator Problem Absolutely Astonishing

NEWEST

and Greatest Invention

You know that Vibration means new life, power, health, beauty. You know it is Nature's way to banish pain and to give you new energy and vitality. You know all this, but do you know that the BIG problem of science has been to devise a hand vibrator that would be absolutely satisfactory in every way! That problem has vanished. We solved it. Our NEW, wonderful Vitapulser is GUARANTEED to effect ALL the astonishingly beneficial results made possible by this approved method of treatment.

THE VITAPULSER

Is practical. It requires no connection with electric wires—supplies its own power. Safe, light, compact, easy to handle and cannot get out of order. It is the modern choice of physicians and thousands of careful buyers.

EVERYONE CAN AFFORD This Marvelous Instrument

If you have not been able to afford a Vibrator on account of the high price, here is your opportunity to own one. *No income too modest to afford The Vitapulser;* sells for a fraction of price of others. Don't be dull, weak, mentally or physically depressed. Learn about the Vital Impulses; how to gain real health and Natural beauty. *The Vitapulser will make you over.* Give us a chance to prove it!

SENT ANYWHERE ON APPROVAL

for testing purposes. No obligation to buy. Write today for FREE remarkable book, "The Vital Impulse" and Special Approval offer.

Commonwealth Electric Mfg. Co.
731 Rialto Bldg., St. Louis, Mo.

Buy Clothes From Maker, Save 30%

That's one sure way to cut the cost of living. Every year thousands of men buy their suits and overcoats by mail, direct from the makers, thereby saving fully 30 per cent. of the cost, at the same time getting the same quality of cloth and workmanship they are accustomed to buy and with the added advantage of having all their clothes hand tailored to their individual measurements.

There is a successful concern in Chicago which has been making men's high-grade, made-to-measure suits by mail for over 15 years, and now has thousands of satisfied customers throughout the country. It would probably surprise the average man to go through their records and see the number of men, even in the big cities, who buy tbeir clotbes by mail from this concern.

If you send a postal card to the Ruby Tailors, Department 842, 329 South Franklin St., Chicago, Ill., they will send you free of charge tbeir latest up-to-date Fashion book, containing a number of actual samples of woolens—Fashion plates showing different styles of suits and full instructions for measuring and ordering.

Their long experience in dealing with thousands of men by mail has put them among the leaders in their line and enables them to guarantee to refund the full purchase price of any made-to-measure suit which is not perfectly satisfactory. A number of their customers annually earn substantial sums taking orders among their friends for Ruby Tailored Suits, and the concern makes a very attractive offer to men who desire to add to their income in this way, in addition to saving money on their own clothes. Lose no time in writing for their free Fashion book and complete outfit.

TALKING MACHINE Complete Outfit $5.98

With Three Double Face Emerson Records and Package of Needles

A real talking machine, not a toy. Plays real disc records just like expensive machines. It is constructed entirely of steel, with a wonderfully easy running motor. You'll like its clear, loud tone, particularly bringing out, as it does, the full charm of the music it plays. It can be adjusted to play fast or slow, soft or loud, as you prefer, but, above all, it has been so strongly constructed that it will stand lots of rough handling. A fine machine for indoors or to take with you outdoors, camping, canoeing, dancing—whenever you need music.

We include, FREE, three double faced records, your own selection, and a supply of needles. You get the machine, needles and records—all at one bargain price—**$5.98.** In ordering, select records from the following, or order your machine and select your records after complete list reaches you.

Select Your Records

I'm Forever Blowing Bubbles—**By the Campfire**—Duet	7485
Dear Old Pal of Mine—Solo—**Some Day I'll Make You Glad**—Solo	7466
If It Comes from Dixieland—**Rose of My Heart**—Tenor Solo	7497
Peter Gink—One Step—Band—**Some One Step**—One Step—Band	7472
How Ya Gonna Keep 'Em—One Step—Band—**What's That**—Fox Trot—Band	7492
How You Goin' t' Wet Your Whistle?—**St. Louis Blues**—Character Song	7477
In the Land of Beginning Again—**Oh, Promise Me**	7464

GENUINE GILLETTE

$4.59

The story is all in the headlines—this is a standard $5.00 razor, silver plated—with 12 Gillette Blades—the best money can buy. Order it either in leather case, or vest pocket pattern, at this very special price of **$4.59.**

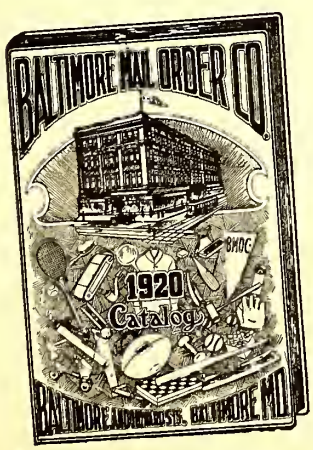
Gillette Blades

These are standard Gillette blades—**40c** in ½ dozen pack—**79c** in dozen pack.

MUSCLE BUILDERS

Attach these easily to your wall and use them regularly. Watch your muscle grow. These splendid exercisers for developing muscles have extra coil springs, with Japanned handles, cut to fit the hands. They can be adjusted readily to the floor or wall, at all angles, and will be of enormous value in developing the muscles of the chest, back and arms.

$1.49



Men's Raincoat

Guaranteed Reinproof

$7.49

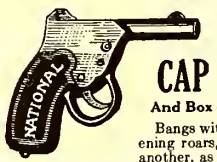
This is a sporty looking substantial raincoat at a price so reasonable no man can afford to risk getting wet, by going without one. It comes in a snug fitting model, becoming to young and old, with big patch pockets, adjustable military collar and a belt at the waist. Made of rubberized fabric, in olive drab color An unusual value.

Automatic Cigarette Case, 25c

Hands them out one at a time. The slickest thing you ever saw. Case is nickel-plated, in fancy design, strongly built to last you for years. Men find it most convenient style of cigarette case. Keeps cigarettes in good condition

HAMMERLESS REVOLVER

$10.50



Not a "Baby" but a regulation man's size. Harrington and Richardson Hammerless Revolver. Order by calibre, either size, **$10.50** special.

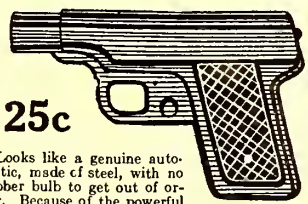
22 calibre, rim fire, 7 shot, 3-inch barrel nickel-plated, 22 short, long or S. & W cartridge.

32 calibre, centre fire, 5 shot 3-inch barrel, nickel- plated, 32 S. & W. cartridge.

38 calibre, center fire, 5 shot, 3½-inch barrel, nickel-plated, 38 S. & W. cartridge.

50 Shooter Automatic

CAP PISTOL



And Box of Ammunition

Bangs with 50 deafening roars, one after another, as quick as you can pull the trigger. **REPEATING CAPS,** to fit this pistol, come in rolls of 50 shots each at **5c** a box. Pistol alone without ammunition, **25c.**

29c

SOAK 'EM

WATER PISTOL

25c

Looks like a genuine automatic, made of steel, with no rubber bulb to get out of order. Because of the powerful air pressure of the cylinder it will squirt a large stream of water to a great distance. Can be carried in the pocket and used when the other fellow is not looking. Great for fun or self protection.

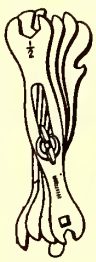
Catalog FREE With Every Order

With every order received, we will forward, FREE, a copy of our new 1920 catalogue containing many pages of valuable articles at bargain prices. Remit full amount of your order in currency, postal or express money order or 2c stamps. We prepay all postage and express charges

Satisfaction guaranteed, or money back

Handy Man Combination Pen Knife $1.69

Knife, screw driver, bottle end can opener—all in one. The handiest pocket knife a man ever had. Ideal for camping, outing and every-day convenience Made of finely tempered steel, brass lined and contains one large blade, screw driver, bottle opener and can opener. Has a stag handle, with ring for attaching to your key chain.



Jack Knife, 69c

An inexpensive, sturdy knife, built to stand constant use. Stag handle, one large and one small blade, both made from the best Wardlow English steel, with keen edges. It is lined with brass, and has nickel silver bolsters. A splendid knife at our special bargain price of **69c.**

Wrenches

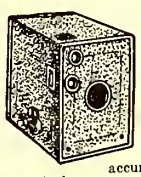
10 In 1

These wrenches come with five nickel plated end wrenches, that, with the aid of the thumb bolt in the centre will fit ten size nuts. You'll find them compact and convenient, ready for any job, when you want them. **89c Per Set.**

STURDY ELECTRIC

MOTOR

99c



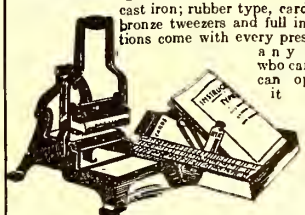
You'll find this a strong, sturdy, two terminal electric motor, just the thing for operating light running models and electrical toys. Can be run with one or more dry or wet cell batteries, depending upon the power desired.

Novelty Knife and Bottle Opener 98c

This knife is bound to appeal to the men. The handle is in the shape of a leg, with the shoe end forming a bottle opener. The two fine steel blades open easily, and fit back in the handle when not in use.

Genuine CAMERA

EASTMAN BROWNIE.



$2.86

Makes pictures 1⅝x2½ Is accurate, reliable, efficient and economical to operate. Anybody can make good pictures with it. Has the automatic shutter for snapshots and time exposures. Carefully tested lens and view finders, for vertical and horizontal exposures. These simple and reliable box cameras have stood the test of years and proved a delight to all who have used them

Complete PRINTING PRESS

$1.50

Every man and boy will find this printing press both useful and instructive. It will print cards, tags, envelopes and announcements. It is made of cast iron; rubber type, cards, ink bronze tweezers and full instructions come with every press and any child who can read can operate it

HUNTING KNIFE 60c

A great knife for hunting, camping, fishing and all sorts of outdoor work. It comes with a 4-inch heavy steel blade, finely tempered, with ebonized handle, fitted to your grasp. Every knife comes in a genuine leather sheath, with slits in the end through which to slip your belt.

Luminous WATCH

Shines in the Dark

The only cheap thing about this watch is the price, for you'll find it the all-round handiest timekeeper imaginable. It has the luminous dial that makes it easy to see the time, no matter how dark the night, and a nickel-plated case that will stand the hardest sort of usage. It is fully guaranteed, of course.

$2.75

Pocket

Flashlight 39c

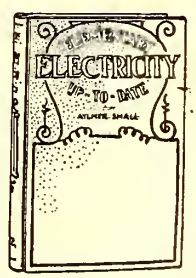
Very Special

A flashlight that fits in your vest pocket, all ready for service, when you need a good, clear light. Comes with nickel plated case, equipped with a very bright bulb and a 2-cell battery. The price of **39c** is a very special one—for this occasion.

GIANT RAY

FLASHLIGHT

Very Powerful



This is a genuine Tungsten flashlight, five inches long, with a powerful light, in a lightweight, vulcanized fibre case. It flashes on with a pressure of the button and will stay lighted by using the slide switch with which it is equipped. Carefully packed, complete for..... **99c**

HOW DID IT WORK?

This is a Portion of the Film of the Famous Rabbit Described in Our November Issue Who Stood Half a Million Volts, Never Batting an Eye-Lash. Can You Explain This Strange Film? The Editor Will Pay $20.00 for the Best Answer.

Turn to page 633 of our November issue. We told you last month how we electrified a rabbit with 500,000 volts, and how he never batted an eye-lash. Well, sir, the Gaumont Film people who got wind that we were pulling off a stunt were duly on hand with their trusted film cameras and while we made the experiment, the operator cranked away merrily. Of course, we wanted to see what the film looked like and we had our wish. The very mysterious sample slightly enlarged from the original film is printed along side here. At first we were somewhat puzzled and could not quite make it out how the long streamers after the third picture died away into a mere brush and in the fourth picture had almost entirely vanished only to bloom forth in a wonderful corona effect, showing the rabbit very plainly, in the sixth picture. In the seventh and eighth, however, nothing can be seen. Now what do you think happened?

500,000 volts at 20 kilowatts with a frequency of 200,000 was used in the film printed here, which is absolutely authentic. **We will pay $20.00 for the best answer explaining this phenomenon.** Anyone familiar with alternating current should have little trouble in solving the problem. The contest is open to all and will close promptly on February 1st, 1920. Not more than 300 words should be used. Answers will be publisht in our March issue. Address all replies to Rabbit Editor, care of this publication.

RADIO PROTECTION FOR CAMERON.

Citizens of Cameron parish are asking the government to locate a wireless station there, so that storm warnings may be given and farmers may have a chance to give whatever protection they can to their crops.

Cameron is an outpost of Louisiana for Gulf storms, and has suffered severe losses half a dozen times in the past 20 years. It has no railroads, no telegraph or telephone lines to the coast on account of the expense and difficulties of construction across the lowlands, and no method of receiving warnings.

The people of Cameron are industrious and enterprising. They have voted a heavy tax on themselves to construct roads. They have fertile lands which will produce valuable crops. As one of the storm outposts, the Weather Bureau needs to be in touch with Cameron, for the protection of the rest of the country.

Science in Slang—Juicing the Jazz Wagon

(*Continued from page* 785)

"The big idea is that when the piston reaches the proper point in the cylinder chamber the contact is made which closes the circuit that sets up a magnetic flux in the core of the coil, that attracts the vibrator arm and breaks the circuit and sets up an inductive reactive flow in the secondary, which breaks down the resistance—being the weakest place—between the points of the electrodes on the spark plug, which in turn ignites the gas in the chamber and causes the explosion that turns the motor over, that finally takes the joy rider to the court house or Police Headquarters. Whoof!

"Give 'em air boys"—this from Bender—"his carbureter leaks!"

"Such guys as Atwater-Kent have deviated from the old trodden paths and have rigged up an apparatus that is worked

(*Continued on page* 800)

AMPLIFY YOUR RADIO SIGNALS

ONE of the greatest drawbacks since the invention of wireless telegraphy is the receiving of weak signals at the receiving station. Many devices were proposed to improve this condition, but without success, on account of the mechanical difficulties encountered in these amplifying devices.

However, this was recently solved by the introduction of an exceedingly sensitive microphone transmitter, which is known to detect sound waves with great accuracy and magnify them through an intermediate telephone circuit.

By the employment of the new DETECTAGRAPH-TRANSMITTER, the amateur can amplify the radio signals to such an intensity that he can hear the signals about his station without the need of the telephone head set.

By the addition of a loud talking telephone he is able to hear the messages many feet away from the instrument. He is also able to demonstrate the operation of his wireless apparatus to his friends.

The super-sensitive DETECTAGRAPH-TRANSMITTER herewith shown is two and three-eighths inches in diameter, five-eighths of an inch thick and weighs less than three ounces. It is the most sensitive sound detecting device ever brought before the public.

The manner in which the amplifying process is attained is by attaching with tape the DETECTAGRAPH-TRANSMITTER to the regular wireless receiver as indicated in the diagram.

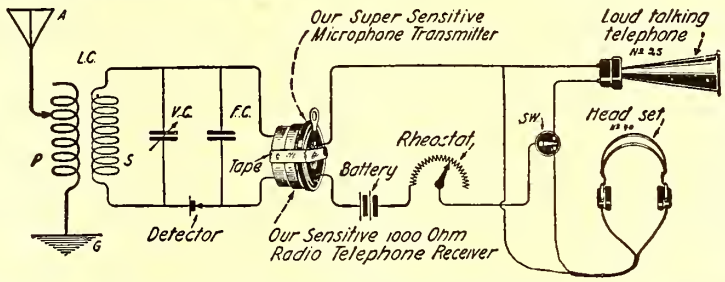
SUPER-SENSITIVE **Detectagraph** MICROPHONE DEVICES

Practical Instruments for Commercial and Scientific Purposes.

NOTICE

Although prices of raw material and labor have increased greatly in the last four years, we have continued selling our instruments at the pre-war prices, due to the fact that we had a large stock of material on hand. That material is now almost exhausted and we will be compelled to renew our stock at an increase in price, but for a limited time you can still get the benefit of the present low prices.

Our Super-Sensitive Detectagraph Transmitter. Price, $7.00 Complete



Other Uses

Not only is this instrument applicable for amplifying radio signals, but it can be used with equal satisfaction for magnifying other sounds. Phonograph music can be transmitted from one place to another by means of this instrument, and those who are afflicted with deafness will find enormous benefit by using this transmitter.

Our Special No. 25 Loud Talking Receiver Price, $4.50 Complete

It is the greatest device for building your own loud talking telephone, detectagraph and other devices. Can be used for any purpose where a sensitive detecting instrument is required.

Science in Slang—Juicing the Jazz Wagon

By Emerson Easterling

(*Continued from page 799*)

like this," continued Jazz. "The contact on the distributor touches for an instant as the movable one passes over the stationary one. This makes a closed circuit. As the circuit is broken by the parting of the contacts the same thing happens that does when the vibrator arm flops up against the core—really, it don't touch the core. That would cause it to stick. A sort of anvil stops it just before it gets there.

"Some time back some bird stumbled onto the idea: that if generators could furnish juice for other purposes, why not stick one on the bus to squirt juice into the plugs? Since then we have had generators, generators, and some more generators, good, bad, and otherwise. In the Ford, Henry incorporates in the fly-wheel an A. C. revolving field generator. He must have run short of junk when he came to this part of his endeavors.

"In the old—I don't think it is the same in the newer types—Overland the self-starter, generator, and fly-wheel is one and the same.

"It was sure some ease on the autoist when the self-commencer came around. It led to other fine features, too. For one thing the electric lights have crowded the old carbide type off the boards.

"To-day we have our gas go-cart all rigged up with an electric self-starter that is operated from a storage battery. The battery is recharged in turn by the generator—sometimes the motor-generator, single unit; sometimes the two unit, one generator to charge the battery, and a motor to start the engine. Then, the lights, horn, cigar lighter, trouble lamp, spot light, and what else the general public care to stick on the layout, are run from the battery—and from the motor when it is running."

"What is this high frequency spark stuff I heard about?" spoke up Bender.

"It is some of James E. Seeley's and Lodge Brothers' ravings. It is just the employing of high frequency currents, like Nick Tesla has fingered around with, for the spark. The advantage is that the spark energy increases with the gas pressure—opposite from that of the other type—and carbon does not bother the ignition, as the spark is of short duration and the flash is not choked up by carbon.

"But getting back to magnetos—they are alternating current generators for the ignition. There are two kinds, low and high tension. The low tension is virtually an alternating current dynamo, and the high tension is a dynamo and step-up in one. The Bosch is one of the best—and it is not *bosh* either."

At that point the engine began to purr—like an angry sewing machine. Conversation somewhat dies away—especially on the part of the chauffeur. But Stokes had gas engines on the brain:

"You know the stationary engines that spat and spit and then hit once in a while? It is an automatic spark affair that is operated by the governor that causes that. When the engine attains a certain speed the governor cut-out stops the ignition. If it wasn't for that the thing would do the Bolshevik ———"

"And don't forget the electrically gear shifted and braked cars," interrupted Bender, "The kind where an electro-magnet jerks 'er from high to me'jum, an' so fort' —an' th' electro-magnetical tire burners—"

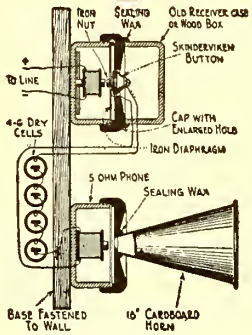
MOST SENSITIVE MICROPHONE

FOR $1.00

YOU can easily make a highly sensitive detectophone by using a Skinderviken Transmitter Button to collect the sound waves. You can build your own outfit without buying expensive equipment. Think of the fun you would have with such an instrument! It's very simple, too, and inexpensive.

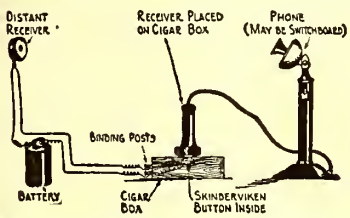


You can install an outfit in your home and hear the conversation being held all over the house. You can connect up different rooms of a hotel. *This outfit was used by secret service operatives during the War. It is being used on the stage.*

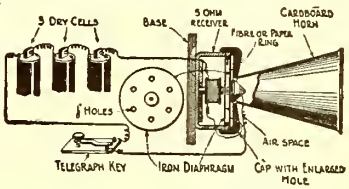
Actual size.

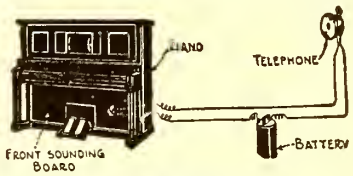
So much for its commercial adaptations! *You* can procure apparatus of the same type.

One of the main advantages of the Skinderviken Transmitter Button lies in its ultra-sensitiveness. You can place it in any position you like. It is the greatest invention in micro-phones and has won recommendations from men of high standing in the scientific world. It is being used all over the world. You can mount it most anywhere. Card board boxes, stove pipes, stiff calendars and hundreds of other places will suggest themselves to you. The buttons cannot be seen by any one in the room as they are so small and light. Only a small brass nut is exposed to the view.



Full directions for connecting up the button for use as a detectophone are given in booklet which is sent with each button.





The only instruments needed to complete a detectophone outfit, in addition to a Skinderviken Transmitter Button are a receiver, battery, and, if desired, an induction coil.

AMONG electrical experimenters the button has created a sensation. It is not uncommon to receive unsolicited letters like these: "I received transmitter button today and I wish to inform you that it works great and is *the best I have ever seen or heard of for the price.* I will certainly recommend it to my friends. I wish to thank you for your good service."

"I have been using one of these transmitter buttons, and it has proved to be worth more than its value in my experimenting." "I received one (Transmitter Button) some time ago, and they are just O. K. for experimenting." "I have been using one of these transmitter buttons for experimental work and it certainly lives up to all you say for it *and then some.*"

Mr. H. Gernsback, editor of this magazine, who is the dean of electrical experimenters, said: "In the writer's opinion, obtained by actual elaborate tests, the Skinderviken Transmitter Button is probably the most efficient device of its kind on market today, due to its simplicity and other outstanding features. Should have a great future."

The same circuit connections apply to all experiments, regardless of how the transmitter button is mounted.

The Skinderviken Transmitter Button operates on one or two dry cells. It often happens that two cells produce too much current and the sounds are deafening. We recommend either one fresh cell or two worn out cells.

We have the utmost faith in this transmitter button. We guarantee satisfactory service or we will refund the purchase price. Boys—Young and old—send in a dollar bill RIGHT NOW! You can't lose. If you're not satisfied, you receive your dollar back. Isn't that fair?

"Battery Charging is my Biggest Money Maker"

"Only about a year ago I was a small garage owner, working hard to make a bare living and just paying expenses. Then one day I read an ad about HB Battery Chargers, and sent $15, ordering my charger on ten days' trial. The HB Company let me have easy terms on the balance.

"To my surprise, the first month I took in over $100 on battery charging work alone, and made $80 PROFIT. The second month was even better, and ever since then I have made big profits every month. Today Battery Charging is *my biggest money-maker.* It pays a bigger per cent of profit than any other line in my garage. An HB Charger takes no extra help, and runs day and night without any attention. My battery work is always satisfactory, and people keep coming to me for battery work, and soon start bringing *all* their other business. Without that HB Battery Charger I never could be making the money I am now. It's the finest investment I ever made."

You too, perhaps, are a small garage owner, and making a small profit, or perhaps you are still a mechanic and working for some one else, kept from starting out for yourself because you lack capital. *Don't let that stop you!* The HB Company helps you get in business. You can get an HB Charger for only $15 cash and have almost a year in which to pay the balance on easy terms. The profits alone should easily pay all the balance and yield a big surplus besides. If you are already in the Battery recharging business without $250 clear profit each month from your charging work, it will pay you to investigate the HB proposition.

HB Battery Charging is the BIG OPPORTUNITY. With an HB Charger success comes almost immediately. You can make about 400% profit on each battery you charge. The cost is only 10c to 15c with an HB Outfit, and your customer pays 75c to $1.50 for each battery charged. Besides that handsome profit, your Battery Charging will help you build a big business in every line of garage work. If you want success, money, and the comforts of life, then do not overlook this opportunity. Get into the game and push the lines that pay you the biggest money. Hundreds of garage men are making **big money** with the HB Charger in towns no larger than yours. YOU can do as well. Mark on the coupon below the HB Battery Charger you are interested in. Fill out and mail the coupon TODAY. This is your BIG CHANCE. Let us help you start your **own** money-making business. Don't wait until tomorrow when you can start increasing your income **today.** Delay pays no dividends. **Fill out and mail this coupon NOW.**

Thomas A. Edison Speaks to You

By H. Gernsback

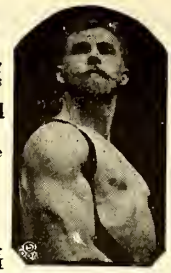
(*Continued from page* 750)

few years he has worked more in the chemical laboratory than in any of the others, which are located in different buildings about the great Edison works.

I MEET THE GREAT INVENTOR.

Together we entered the laboratory, the first impression being mostly green fumes. A half dozen of Mr. Edison's assistants were to be seen busily engaged in performing various chemical experiments under the direction of their chief. Mr. Edison himself was nowhere to be seen. Advancing to the rear of the laboratory, I finally discovered Mr. Edison sitting at a little table busily engaged in writing notes upon a yellow pad, using a small pencil. To the right of Mr. Edison on the table was a big chemical dish containing some green solution, presumably copper nitrate. The table, which was rather small, measured perhaps four feet in length by three feet in width. Mr. Edison was seated on a simple wooden chair. Altho the inventor is 73 years old at the present time, I was surprised at his vigorousness and apparent strength. The first impression at close quarters is a kindly face of ruddy complexion, from which peer two light blue-gray eyes of unusual intelligence. There is an enormous broad forehead, over which falls some silver white hair, giving the characteristic Edison curl. The jaw as well as the ears are well formed, both denoting character and a strong will. Like all great men, Edison has a big and massive nose, which denotes the thinker and philosopher. The lips are rather thin, around which a smile is constantly hovering.

Mr. Edison rose and we shook hands. I was startled somewhat, for I expected a large, hard hand. On the contrary it was as small and soft as a woman's hand, and white except for green stains upon it caused by chemicals. There is perhaps no more famous right hand in the world than Edison's. *If the world were called upon to make an inventory of what Mr. Edison's hands have actually wrought in enriching this planet, there would not be gold enough to pay him.* This is not a mere figure of speech or written in order to make this review grandiloquent. It is the unvarnished truth, as anyone with a clear mind and a pencil can easily figure out to his satisfaction. There certainly has never been one man since the dawn of history who has contributed so much to the world's progress as has Mr. Edison. While of course the mind is supreme, Mr. Edison's hands are the tools that achieved his success, and that is why I place so much stress upon this phase.



Mr. Edison spoke and welcomed me—a curiously high-pitched voice, unusual for one who has never heard it, but characteristic of the famous man.

MR. EDISON ANSWERS SOME IMPORTANT QUESTIONS.

Mr. Edison in late years has become hard of hearing, and it is necessary to speak quite loud in order that he may understand you. There being no second chair around, and Mr. Edison having seated himself again, I leaned against the laboratory table, being careful not to sit in the chemical dish, and taking other precautions not to disturb anything. After a few pleasant remarks on both sides, I immediately launched into the object of my visit, namely, to put up to Mr. Edison certain questions which had been in my mind, and which I knew would be of great interest to our rising generation and the world at large. I said to Mr. Edison:

What 15 Cents Will Bring You From the Nation's Capital

The little matter of **15 cts.** in stamps or coin will bring you the Pathfinder **13** weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its **27th** year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, briefly—here it is. Send **15c** to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us, but we are glad to invest in new friends.

Washington has become the World's capital and reading the Pathfinder is like sitting in the inner council with those who mold the world's destiny.

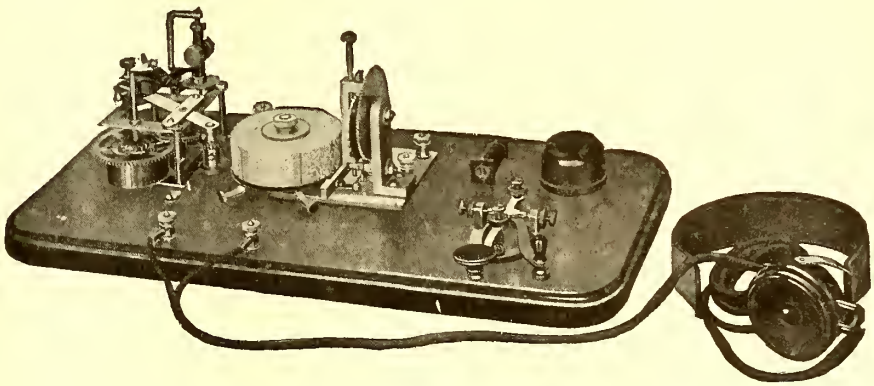
Learn Wireless At Home

The Demand for Wireless Operators Far Exceeds the Supply

The U. S. Wireless Institute will make you an operator—AT HOME—in your spare time—quickly, easily and thoroughly. No previous training or experience required. Our Home Study Course has been prepared by Radio Experts. Experts able to impart their practical and technical knowledge to *YOU* in an *easy* to *understand* way. The graded lessons mailed you will prove so fascinating that you will be eager for the next one. The instruments furnished *free,* will make it as easy to learn the Code as it was to learn to talk. *All you will have to do,* is to listen.

BIG SALARIES



Wireless operators receive excellent salaries ranging from $125 to $200 a month and it is only a stepping stone to better positions. There is practically no limit to your earning power. Men who but yesterday were Wireless Operators are now holding positions as Radio Engineers, Radio Inspectors, Radio Salesmen at salaries up to $5000 a year.

Travel The World Over

A Wireless Operator can visit all parts of the world and receive fine pay and maintenance at the same time. Do you prefer a steady position without travel? There are many opportunities at the numerous land stations or with the Commercial Wireless or with the Steamship Companies.

FREE Instruments and Text Books

We furnish free to all students, during the course, *the wonderful receiving and sending set exactly as produced in the illustration.* This set is not loaned but *given* to all students completing the Course.

This wonderful Set for learning the Code furnished free with our Course

The Transmitter shown is the celebrated *Omnigraph* used by several Departments of the U. S. Government and by the leading Universities, Colleges, Technical and Telegraph Schools throughout the U. S. and Canada. Start the *Omnigraph,* place the phone to your ear and this remarkable invention will send you Wireless Messages, the same as though you were receiving them, through the air, from a Wireless Station hundreds of miles away.

When you apply for your license, the U. S. Government will test you with the *Omnigraph*—the same model *Omnigraph* as we furnish to our students. Ask any U. S. Radio Inspector to verify this.

FREE Post-Graduate Course

A one month's Post-Graduate Course, if you so desire, at one of the largest Wireless Schools in N. Y. City. New York—the Wonder City—the largest port in the World and the Headquarters of every leading Wireless and Steamship Company.

Easy Payments

A small payment down will enroll you. We will make the payments so easy that anyone ambitious to enter the fastest growing profession—Wireless—may do so.

Send For FREE Booklet

Without obligating you in any way, send for our booklet "How to become an Expert Wireless Operator"—it is free. Mail the coupon below, or postal or letter—*but do it to-day.*

U. S. WIRELESS INSTITUTE
Dept. 51, 258 Broadway, New York City.

Send me free of charge, your booklet "How to become an Expert Wireless Operator," containing full particulars of your Course including your *Free Instrument offer.*

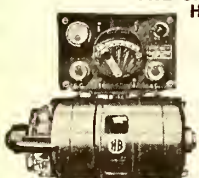
BATTERY (HB) CHARGING PAYS BIG PROFITS

YOU CAN MAKE $100 to $350 EXTRA PROFIT EVERY MONTH

You can have from $100 to $350 profit monthly from charging batteries, in connection with your present business, by establishing a battery service recharging station. Users of HB Charging Equipment are earning big profits every month with almost no extra effort.

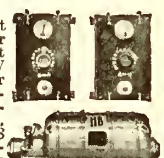


Practically every car today is equipped with storage batteries, which require recharging outside the car at least every two months. Ford cars are now being equipped with electrical starters and storage batteries. **Now** is the time to get into this work. Build up a profitable and ever-growing business.

You can readily handle a battery charging business, as no special electrical or mechanical knowledge is required. You can get an HB Charger in any size to suit your requirements, insuring maximum profits for you, whether the outfit is large or small.

An HB Battery Charger for Every Size Business

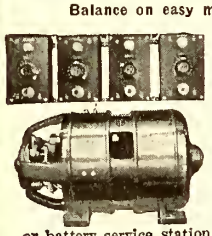
All HB Chargers are sturdy, dependable and absolutely reliable. Built of practically wearproof materials. Nothing to burn out, no expensive renewals or repairs. Plain, honest, profit-producing service 24 hours a day. No electrical or mechanical knowledge required to install or operate. No attention except occasional oiling. Uses power from your lighting lines. Big, quick, clean profits, easily made.



CHOOSE THE SIZE YOU NEED

HB 500-Watt Charger

Recharges 1 to 8 6-volt batteries or their equivalent at a time. Charger is 27 in. long, 26 in. high, weighs 280 lbs. Furnished complete with clear, black, electrical slate switchboard, with mountings of ammeter, field rheostat, voltage lamp, two controlling switches. A big money-maker for a small battery business.



$15 Cash, Balance on easy monthly terms

HB 16-Battery Charger

Recharges 1 to 16 6-volt batteries at once or their equivalent in 12 or 24-volt batteries. Motor 1 KW capacity. Operates on 2 or 3 phase current only. Furnished complete with 2 independent charging panels, each with a capacity of 8 batteries. A splendid machine for any live, energetic garage owner wishing to get big profits.

Small cash payment
Balance on easy monthly terms

HB 32-Battery Charger

Recharges 1 to 32 6-volt batteries or equivalent at a time. Motor 2 KW capacity. Operates on any current. Four separate charging lines, each capable of charging up to 8 batteries. Permits individual attention to batteries on charge. Ideal equipment for big garage or battery service station. Will make as high as $250 to $450 a month Clear Profit.

Small cash payment
Balance on easy monthly terms

Sold on Trial Under HB Absolute Money-Back Guarantee

All HB Equipment is sold under our absolute guarantee of complete satisfaction. You run no risks. If not satisfied after using any HB Equipment 10 days, you may return it and receive all you pay us. The HB monthly payment plan is an additional guarantee.

Select the Charger You Need. Check the Coupon Below. Do it Now!

Mark on this coupon the HB Charger you are interested in. Tear it out and mail TO-DAY. This is your BIG CHANCE. Let us help you start your own money-making business. Be the first in your town to have an HB Charger. Don't delay. Act now.

Thomas A. Edison Speaks to You

By H. Gernsback

(*Continued from page* 802)

"Do you believe that the young man who embarks on his electrical studies today, has the same chances and opportunities which you had at the beginning of your career?"

Mr. Edison was very emphatic when he replied: "He has far greater opportunities than I had—infinitely more. There is absolutely no comparison to be made, for the world has grown larger, and therefore the opportunities have multiplied."

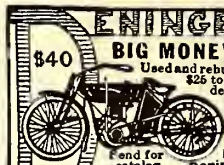
This prompted my second question: "In what branch of electricity, in your opinion, can the young man of today accomplish most—where is he most desired?"

Mr. Edison looked squarely at me and said: "There are thousands of men wanted in every branch of electrical engineering and hundreds of new branches based on new discoveries are being created continuously. The field is being enlarged every day and keeps growing. It would be difficult to pick out any one branch, since all are still in their infancy, and all have wonderful futures."

My next question was: "What training should the young man undergo? Should he acquire practical experience first in the shop or laboratory; or should he take a correspondence course or go to college; or all two or three?"

After a few seconds reflection, Mr. Edison replied: "I think one of the correspondence schools at Scranton, Pa., is the more available for most young men. After passing an examination, I think he should specialize in one branch and study it real hard. Then he should get busy and get a position. Any boy can be a success, providing he is willing to pay the price, which is continuous hard work. The trouble with a large number of young men today who are given positions is that they refuse to pay the price, and thus become a drag on the industry. Our young men today do not wish to work as much and as hard as they did when I was a boy. They want shorter hours and more pay, and too many amusements, the same as all workmen do; but I think this condition will be rectified when people come to their senses. It certainly cannot last."

"BE SURE YOUR IDEA WORKS, BEFORE PATENTING IT," SAYS MR. EDISON.



"Mr. Edison, what constructive advice can you give to our young and rising inventors? Is it worth while to patent every idea, or only certain ideas? How can the young inventor differentiate between good ones and bad?"

After a few seconds of meditation Mr. Edison answered: "I suggest that if the young inventor has an idea he had better reduce it to actual practise and be sure that it *works* before applying for a patent. Ideas are easy, but working them into commercial shape is generally a long, tedious and expensive job. After successful operation and the results warrant it, a search of the United States Patent Office should be made to learn if it has not been previously invented or patented by others. Here is where the young inventor will have his greatest disappointment. He will find many a time and, as a matter of fact, in a majority of cases, that the idea has been patented already in one form or another. But disappointments show the salt of the inventor. Only by such disappointments can he triumph finally."

This brought about my next question: "You have patented over one thousand inventions, Mr. Edison. How many of these have been actually worked?"

"The Baby" Double Action Hammerless Revolver

A HANDSOME AND MOST EFFECTIVE WEAPON

$6.50

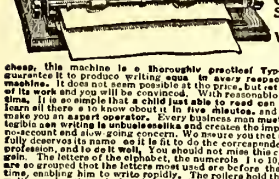
Measures but 4¼ inches long

Takes regular .22 calibre cartridges

The new Baby Double Action Hammerless Revolver has been produced to meet the ever increasing demand for a revolver that would combine small size and light weight with the essential features of Efficiency and Practicability. It is small in size, yet is just as effective and serviceable as the most expensive weapon you can buy. Every lady should have a revolver and should know how to use it, and there is no safer or better one made than this. A great feature is its safety action that guards against accidental discharge, making it quite safe for young men and ladies. The illustration gives an idea of its appearance, but it must be seen and used to be thoroughly appreciated. The ammunition used is the standard .22-calibre (short) cartridge obtainable anywhere, or you may obtain the cartridges from us (cartridges can be shipped only by express). The revolver fires six shots in one loading. The operation of the charging mechanism is extremely rapid and absolutely reliable, as well aimed shots can be fired in as many seconds. The revolver is very well constructed, with finest nickel plated fluted barrel of cylinder, and it weighs only 4½ ounces. The Price of the Baby Revolver is only $6.50, sent by mail postpaid to any address.

SHARPEN-M-ALL SAFETY RAZOR STROPPER

SHARPENS EVERY KIND OF SAFETY RAZOR BLADE



Sharpens the Gillette and Durham Duplex both edges at one time

ALSO SHARPENS THE GEM JUNIOR, EVER READY, KEEN-KUTTER, MARR CROSS, CLARK, AUTOSTROP, STAR CRUSTEEL, AND ALL OTHERS

By using the SHARPEN-M-ALL STROPPER, you will not only get BETTER SHAVES, but you will SAVE MONEY on blades, as you will be able to get from 150 to 200 shaves from one blade, and the last shave will be as good as the first. The construction is simple and will last a lifetime. There are no parts that can possibly get out of order. Any novice can use it but as well as the most expert barber. It is operated by simply turning the lever or handle as shown in the illustration. It has two spiral rollers that travel from heel to point as they are rotated, giving the CORRECT DIAGONAL STROKE. There are no screws, adjustments, or any kind of tinkering necessary to operate the machine. The rollers are made of a material that STROP AND HONE in the same time. The rollers turn only one way, so there is no fear of damaging the blade or the stropper. The SHARPEN-M-ALL is furnished in handsome case, 6x2½x1½ in. with three holders and full instructions. The weight of the complete machine is but eight ounces. Price, only $1.50, postpaid.

Price, $1.50 postpaid.

SIMPLEX TYPEWRITER ONLY $2.50

Cheap But Good. So Simple a Child Can Use It. We Guarentee the Writing.

Though so marvelously cheap, this machine is a thoroughly practical Typewriter. We positively guarantee it to produce writing equa to every respect to that of any $1.00 machine. It does not seem possible at this price, but write us and send you a specimen of its work and you will be convinced. With reasonable care it will last a lifetime. It is so simple that a child just able to read can write with it. You can learn all there is to know about it in five minutes, and an hour's practice will make you an expert operator. Every business man must have a typewriter. It doubles any writing is valuable and creates the impression that the firm is a no-account and slow going concern. We assure you that the Practical Typewriter fully deserves its name as it is fit to do the correspondence of any business or profession, and to do it well. You should not miss this chance of securing a bargain. The letters of the alphabet, the numerals 1 to 10, and punctuation marks are so grouped that the letters most used are before the operator most of the time, enabling him to write rapidly. The rollers hold the paper in positi n while writing and at the end of each line a slight turn of the roller moves the racket which makes a click and forces the paper forword, giving the proper line spacing, so that the lines are all an equal distance from each other, so desirable in letter writing. Each typewriter packed in a stone box, with full printed instructions for use. Price complete. $2.50 sent by mail postpaid.

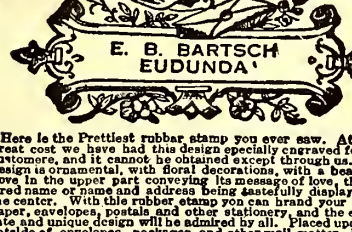
THE EXPO WATCH CAMERA

The most wonderful and ingenious Camera made

It is but little larger than a watch, which it closely resembles. You can carry the Expo about in your pocket and take pictures without any one being the wiser.

One Cent a Picture

The Expo loads in daylight with 25 Exposure Films, costing 25c; thus the picture taking part of a whole day's outing may be had for the nominal sum of 25c—One cent a picture. 10 Exposure Films also obtainable. It is simplicity itself to operate. Takes pictures through the stem, where the Rapid Fire Lens is located. The photos (5/8 x 7/8) may be enlarged to any size.



Price $3.00

QUICK AS A FLASH Time and Instantaneous shutters; weighs but 8 ounces, nickel plated. Endorsed by amateurs and professionals the world over. Thoroughly practical—printing and developing of films just the same as ordinary cameras—is daily use by the police, newspaper reporters, and the general public. Many important beats have been secured with the Watch Camera by enterprising reporters. Produces clear, sharp negatives indoors or outdoors equal to any camera on the market, else or price noteithtsteading.

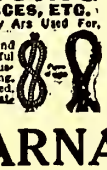
Leather Pocket Carrying Case, 35c

This Pretty WITH PAD RUBBER STAMP AND INK, 75c



Here is the Prettiest rubber stamp you ever saw. At very great cost we have had this design specially engraved for our customers, and it cannot be obtained except through us. The design is ornamental, with floral decorations, with a beautiful dove in the upper part conveying its message of love, the desired name or name and address being tastefully displayed in the center. With this rubber stamp you can brand your letter paper, envelopes and postals and other stationery, and the elaborate and unique design will be admired by all. Placed upon the outside of envelopes, packages and other mail matter, it ensures their return to the sender in the event of non-delivery for any reason. It looks very pretty stamped on books, music, photographs, etc. With each stamp we include a self-inking stamp pad and a bottle of ink for re-inking the pad, and the PRICE of the COMPLETE OUTFIT, in box, is ONLY 75 CENTS, POSTPAID.

NEW BOOK ON ROPE SPLICING

USEFUL KNOTS, HITCHES, SPLICES, ETC.

How Different Knots Are Made and What They Are Used For. Knots to Use and Knots to Avoid.

A most practical handbook giving complete and simple direction for making all the most useful knots, hitches, splices, etc. Over 100 illustrations. All about wire rope attachments, lashing, blocks, tackles, etc. 37 Heraldic Knots illustrated. Of great value to mechanics, riggers, campers, boatmen. Price 200 p. pd.

Boys, you can have Movies at your own home with this latest model MOVING PICTURE MACHINE

Uses Standard Films same as the larger machines. Very easily managed. Simply turn the handle. Good Variety of Films always obtainable

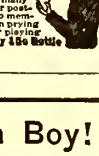
PRICE Complete ONLY $3.00 Postage 15c. extra Including Film.

Extra Films, 15c each postpaid

THIS IS A GENUINE MOVING PICTURE MACHINE and the motion pictures are clear, sharp and distinct. The Moving Picture Machine is finely constructed, and carefully put together by skilled workmen. It is made of Russian Metal, has a beautiful finish, and is operated by a finely constructed mechanism. The projecting lenses are carefully ground and adjusted, triple polished, standard double extra reflector, throwing a ray of light many feet, and enlarging the picture on the screen up to three or four feet in area. The light is produced by a safety carbide generator, such as is used on the largest automobiles. This throws a dazzling white light on the screen.

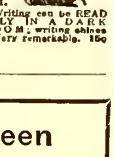
It is a solidly constructed and durable Moving Picture Machine. The mechanism is exceedingly simple and is readily operated by the most inexperienced. The pictures shown by this marvelous Moving Picture Machine are not the common, crude and lifeless Magic Lantern variety, but are life-like photographic reproductions of actual scenes, places, and people which never tire the audiences. This Moving Picture Machine has caused a rousing enthusiasm wherever it was used.

ANARCHIST BOMBS



Consists of a little glass vial, containing in liquid form a chemical which will produce a most horrible odor. One dropped in a room full of people will cause more consternation than a Hungarian revolution. The smell will entirely disappear in a short time. 3 Boxes for 25c, shipped by express only with a Dollar's worth of other merchandise.

ITCHING POWDER



This is another good practical joke; the intense discomfiture of your victims to everyone but themselves is thoroughly enjoyable. All that is necessary to start the ball rolling is to deposit a little of the powder on a person's hand and the powder can be relied upon to do the rest. The result is a vigorous scratch, then some more scratch, and still some more. 3 Boxes for 25c. Sent only by express. (Must order at least One Dollar's worth of other merchandise.)

INVISIBLE INK

The most confidential messages can be written with this ink, and the writing MAKES NO MARK. Cannot be seen unless you know the secret. Invaluable for many reasons. Keep your poetry and other private memorandums away from prying eyes. Great fun for playing practical jokes. Only 15c Bottle

LOVE LETTER INK

Writing written with this remarkable ink vanishes entirely in a few weeks (sooner if desired), leaving the paper QUITE BLANK. 15c p. pd.

LUMINOUS INK Writing can be READ ONLY IN A DARK ROOM; writing shines like fire. Quite invisible at daytime. Very remarkable. 15c bottle; 3 for 40c postpaid.

Oh Boy! Have You Seen LITTLE EGYPT

THE ORIGINAL ORIENTAL DANCER AND THE WONDERFUL

SHADOW DANCER

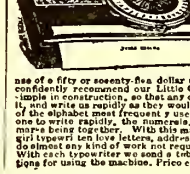
If not, do not fail to send for these, it will be money well spent. In fact, we would go as far as to guarantee you more fun in showing these two novelties to your friends than you have had in a long time.

They Will Dance For A Life-Time

Price 30 cents each or both for 50c Postpaid

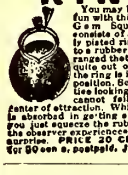
LOADED CIGARETTES

Just Like Ordinary Cigarettes, Sell Each Seal Blanket



A box containing ten apparently genuine Cigarettes. They look like cigarettes which explodes when about one-third smoked.

They appear so real, and afford so good a smoke (while they last) that the victim is taken entirely by surprise. A great laugh producer and entirely harmless. Price, box of 5 cents, postpaid.



THE "LITTLE GIANT" TYPEWRITER

A First Class Writing Machine For $1.25

A per ect little typewriter for $1.25. There are thousands of persons who would like to use a typewriter but whose needs and business is such that they cannot the expense at sched to the purchase and use of a machine. To such persons we confidently recommend our Little Giant. It is strongly made, but simple in construction, so that any one can quickly learn to operate it, and write as rapidly as they would with pen and ink. The letters of the alphabet are frequent y used being so grouped as to enable one to write rapidly, the numerals, 1 to 10, and the punctuation marks being together. With this machine you can send your best girl typed ten love letters, address envelopes, make out bills, and do almost any kind of work not requiring a large expensive machine. With each typewriter we send a tube of ink and full printed instructions for using the machine. Price complete $1.25 by mail postpaid.

SQUIRT RING

You may have a lot of fun with this Sparkling Gem Squirt Ring. It consists of a handsome plated ring, attached to a rubber ball, so arranged that the latter is quite out of view when the ring is in the proper position. Such an attractive looking ring as this cannot fail to be the center of attraction. While the victim is admiring the ring a few moments, you just squeeze the rubber ball and the observer experiences a very great surprise. PRICE 10 CENTS, postpaid. 3 for 25c. 6 for 50 cents, postpaid. 3 for 25c. 6 for 50

MULTIPLYING BILLIARD BALLS.

The Best Feat of its Kind

The trick is as effective as it is surprising. The performer hands around the ball for examination, and immediately it is returned to him he seizes it by the tips of his thumbs and fingers and a second ball mysteriously appears. These are held a full view of the audience by the tips of the fingers of the left hand, and seen while being placed in position, another ball unexpectedly makes its appearance. Finally the magician appears by sufferance from some kind of cream and yet another ball is the result. The feat can then be reversed, the balls disappearing one after another until none remains. If is a very interesting trick that is quite easily performed by following the directions that accompany the apparatus. Price, 25 CENTS.

The CONJURER'S CASKET

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM

50c

It is great fun mystifying your friends. Get this Conjurer's Cabinet, and you will be the cleverest fellow in your district. It contains the apparatus for seven first-rate tricks, including The Disappearing Rose, that, when placed on the lapel of your coat, vanishes from sight at will; the Magic Vase and Ball Trick a Wooden Ball is placed inside, and upon replacing the lid has disappeared and is found in someone's pocket; The Magic Knot with which you can apparently cut your finger almost in two; the Wonderful Card Trick (a card is placed in an envelope, and when opened an entirely different card altogether is found); The Disappearing Coin Box (a coin is placed in the little wooden barrel, and when opened again, is found to have vanished entirely, or can be made to change into a coin of another denomination); The famous Mesmerized Penny that defies the law of gravitation (suspends from the palm of the hand, nose, cheek, wall, clothing, etc.); The Glass Goblet and Vanishing Coin Trick (a coin is dropped into a glass of water, and when the water is poured out the coin has vanished). With the seven tricks described above we send full printed instructions for performing each trick, so that anyone can readily perform all the tricks to the great amusement of their friends or the public. Any boy of ordinary intelligence with this Cabinet of Tricks in his possession, can give a parlor entertainment not inferior to some regular magicians. Besides the tricks contained in the Cabinet, there are twenty-two other feats and illusions fully explained with full printed instructions, for which you can easily make or procure the necessary apparatus. Among them are The Moose in a Pack of Cards, The Drawn Card, The Hat Trick, To Knock a Tumbler Through a Table, One Cent Rubbed into Two, To Find the Number Thought of, Mysterious Wedding Ring etc. We also send the secret of performing three wonderful stage tricks, as follows: The Act of Cremating a Woman, Walking on the Ceiling of a Room, and the Disappearing Lady, together with an article of legerdemain and valuable hints to amateur conjurer. PRICE COMPLETE ONLY 50 CENTS.

Genuine Original Photographs

If you are a lover of the beautiful in art, here is just what you have long wanted for your den or bedroom. For a short time we will make a special introductory offer as follows:

Send 25c and we will send you three Genuine Original Photographs as shown in this ad, size 4x6 in., all ready for mounting and framing, and our beautiful illustrated catalog. After seeing samples you will want more.

We guarantee all our photographs are original and are made in our own studio and can not be purchased elsewhere.

Thomas A. Edison Speaks to You

By H. Gernsback

(*Continued from page* 804)

MR. EDISON HAS 1400 PATENTS.

Mr. Edison thought for a while—"Of the fourteen hundred patents which I have obtained, about four hundred were actually worked. This figure may be taken as proportionate for inventors. It is seldom that an inventor makes a success of his first invention. Usually he finds that altho he obtains a patent, for some reason or other the idea did not prove to be successful commercially, or could not be exploited otherwise. I have made it a rule in my later years, not to patent anything for which I knew there was no actual demand. Merely collecting patents is a waste of time, money and energy."

This answer of Mr. Edison's was of more than passing interest to me, and at the spur of the moment, I sang out: "Which is your pet invention?"

Mr. Edison smiled broadly, and it seemed to give him much pleasure when he said: "My pet invention I think is the phonograph first—and moving pictures second. Somehow or other these two inventions have taken hold of me more than my other ones, as I have probably spent more time upon them than upon any of the others." This naturally brought me to the next question, which was. "Are your inventions perfected first in your mind or perfected in your models? Or by actual experiments?"

Without hesitation Mr. Edison continued: "I always start out with a definite idea of accomplishing a certain result. I collect all the data possible, both scientific, commercial and otherwise. I then proceed to sketch out every possible and probable way of attaining results and carry it to success by experimenting. In other words, first plan—then act. I usually find that the first model is not at all what I had in mind when I conceived the idea first. Any inventor knows this of course. I have found it necessary for this reason to build many models, and only in the exceptional case is the first model a success."

MR. EDISON TELLS WHAT WORLD MOST NEEDS.

Knowing that Mr. Edison was perhaps one of the greatest authorities on what the world needs most to-day, I asked him: "What inventions does the world need most to-day?"

Becoming reflective, Mr. Edison thought for a few seconds and answered: "Automatic machinery, and systems for the quantity production of one-family houses so cheaply that every man can possess his own home. These two are the world's greatest and most pressing problems today. Take a city like New York, for instance. Conditions there are indescribable. There are too many people in New York at present, and but little new building can be done there. I am in great favor of a law being passed that no additional factories should be built in the city of New York after 1925. This would mean that the housing as well as transportation facilities would not be continually overtaxed as they are now. In other words, the city should be forced to spread out either towards Long Island or to the north."

At this juncture I mentioned to Mr. Edison a plan that was advanced some years ago, whereby it was advocated to build the so-called road house, i. e., a city running thru the country by having a single line of houses built one next to the other with a subway underneath. This would give us a city as well as country at the same time. There would be a sidewalk and roads on each side of the house running continuously without interruption and paralleling the houses.

DEAFNESS IS MISERY

I know because I was Deaf and had Head Noises for over 30 years. My invisible Antiseptic Ear Drums restored my hearing and stopped Head Noises, and will do it for you. They are Tiny Megaphones. Cannot be seen when worn. Effective when Deafness is caused by Catarrh or by Perforated, Partially or Wholly Destroyed Natural Drums. Easy to put in, easy to take out. Are "Unseen Comforts." Inexpensive. Write for Booklet and my sworn statement of how I recovered my hearing.

A. O. LEONARD
Suite 369, 70 5th Avenue - - New York City

www.americanradiohistory.com

"I do not think this idea is very practical," vouchsafed Mr. Edison. "I think it would be too expensive and would make the traveling distances uncomfortable."

While discussing the printers' strike, which just then had started in New York, paralyzing the entire printing industry, I put the question: "What known substitute is there for white print paper when our raw materials give out during the next twenty-five years?"

Mr. Edison's answer was surprising: "Print paper will never give out as long as wood grows in the Amazon and Congo river basins. It is simply a matter of transportation, and that, I believe, will soon be solved, as soon as the world is upon a peace basis once more."

I have always had a pet idea on the subject of *cold light*, so I ventured my next question. "Over 99 per cent of the energy is lost today in useless heat in our incandescent lamps. How near are we to 'cold light,' and do you think it will be invented at all?"

"I think we are slowly advancing in increasing the efficiency of light production," replied the inventor. "Any moment a discovery is liable to be made that will advance the efficiency of our present lighting methods enormously. The time is surely coming when 'cold light' will be a matter of fact. What shape this invention will take, it is impossible to predict today."

"On which of our dormant and unworked sources of energy should our coming generation work most intensely, Mr. Edison?" I asked. "In your mind, is the exploitation of the following sources of energy chimerical or are they within the realm of possibility from the standpoint of modern electrical engineering:

Power derived from the earth's internal heat.

Power derived from the earth's atmosphere.

Power derived from the tides.

Power derived from the sun's heat."

"UTILIZE EARTH'S NATURAL VOLCANIC HEAT," SAYS MR. EDISON.

"Volcanic power to the extent of 5,000 H.P. is utilized already in Italy, and 20,000 H.P. more is being arranged for," explained Mr. Edison. "Italy probably has more in her volcanic regions to work all her machinery and heat every house, carry on every metallurgical process and in fact make coal unnecessary in that country. My impression is that in Nevada and the Yellowstone region there is available volcanic energy greater than that given by all the coal mined in the United States. 'As to solar energy' we are getting there step by step. It is a long and weary road we have to travel, but we are making it slowly. I am an urgent advocate of water power. We are using already too much coal without adequate returns. Water power in the United States is not at all developed as it should be, and I see a great future in its proper development. I have advocated many times that the coal should be burnt at the mine instead of shipt by cars over long hauls. Electric power can be sent much cheaper thru electric wires than over the railroads; in other words, first hauling the coal which is then burnt at the destination."

This prompted my next question: "What are your ideas, Mr. Edison, as to atomic energy?"

Mr. Edison smiled broadly and, with a twinkle in his eye, said: "You know, Mr. Gernsback, I am an inventor, and as such I do not concern myself overmuch with philosophical research, and altho I have my own ideas on atomic energy I am not at present making them public."

My next question was: "What shall America do to prevent Germany from flooding the world with its cheap goods, and winning the war commercially twenty years hence?"

Learn Mechanical Drafting

Earn $35 to $100 a Week

"Get into the profession of big pay and Rapid Advancement with the help of the school that has started hundreds on the Road to Success. I am ready to help you." Roy C. Claflin, President, Columbia School of Drafting.

Learn at Home in Spare Time

You don't have to stop work or leave home in order to become a trained Draftsman. Through our practical Home Study Training we teach you in your own home, and enable you to qualify as a practical Draftsman.

No Previous Training Required

Owing to the comprehensive nature of our course, you need no previous training in the subject. Though you have never done any kind of drawing before, you can become a thorough Draftsman by following our instructions.

Can Learn in Short Time by Our Methods

The reason for this is that we eliminate unnecessary theoretical work and concentrate upon the PRACTICAL problems such as confront the professional Draftsman. We do not require you to spend months of your time on "preliminary" work, but start you on REAL DRAFTING at once. That is one reason why our students "make good" so readily.

Our Graduates Get to the Top

The universal success of our graduates as Professional Draftsmen, many of whom have advanced rapidly to positions of Chief Draftsmen, is evidence of the REAL VALUE of the training given by the COLUMBIA SCHOOL OF DRAFTING. Large numbers of our students have secured excellent positions even before completing their courses. We gladly cooperate with our students and graduates in securing desirable positions, which has been easy for us owing to the many demands upon us to supply our "product" for these positions.

Draftsmen Get $35 to $100 a Week

Our graduates have shown their ability to reach high salaries RAPIDLY, owing to their practical training. They secure excellent salaries AT THE START, as high as $2,000 a year. The usual pay of Draftsmen is $35 to $100 a week.

The Demand is Greater Than the Supply

The demand for properly trained Draftsmen has always been greater than the supply, but this is more so today than ever before, owing to greatly increased construction and mechanical development. The Draftsman is an essential connecting link in all engineering work. This great demand is indicated by the long lists of want ads for Draftsmen in the daily papers, especially those of industrial centers.

Specialists in Mechanical Drafting

The COLUMBIA SCHOOL OF DRAFTING not only trains Draftsmen by mail but also maintains a large local institution of the highest standing. For many years it has been the leader in SPECIALIZING on the teaching of DRAFTING. This is an obvious advantage over teaching Drafting only as a side issue.

Drawing Outfit Furnished

We supply all our students with a drafting outfit for use throughout the course. There is no extra charge for this, and it becomes your personal property when the course has been paid for in full.

Book of Particulars Sent FREE

If you are interested in becoming a practical Draftsman through the thorough training of the COLUMBIA SCHOOL OF DRAFTING, whereby you can enter a Profession in which your services will always be in demand, you are invited to write us for our free book of particulars, which describes our school and methods. For your convenience you can fill out and

University Extension Conservatory, 6113 Siegel-Myers Bldg., Chicago

Here, too, Mr. Edison's reply was surprising as well as illuminating: Germany never has and never will flood the United States with cheap goods or undersell us if we make up our minds to beat her at that game. Out of thousands of articles, she is only efficient in two, to wit: chemical dyes and toys. This is due to our indifference to going into these lines of manufacture. I am happy to note, however, that American manufacturers are beginning to see the light, and are protecting themselves adequately."

We then discust various other subjects, and it soon became apparent that Mr. Edison thought that every prophet is honored save in his own country. Mr. Edison was of the opinion that before the war, and particularly during the war, American inventors had not received their due credit, most of the fame having gone across the water. Mr. Edison felt particularly strong about a recent patent decision, where the honors of the vacuum tube used for radio purposes went to an English inventor. It is an incontrovertible fact that the "Edison effect" was known years before the Fleming valve was discovered, having been publisht in American and foreign scientific papers. Mr. Edison was certainly right in his contention that the honors for the invention of the vacuum tube should go to America, and there seems to be no doubt as to this.

My final question to Mr. Edison was, "What is your hobby, and how do you relax from your work?"

GREAT INVENTOR'S HOBBY IS "EXPERIMENTING."

"Just now my hobby is 'experimenting.' I like experimenting better than anything that I know of. As for my relaxation, I like to camp out in the mountains, which I do every summer. This makes me fit for another winter's hard work."

Mr. Meadowcroft by this time was beginning to look at his watch, which I took for a gentle hint, and shaking hands with Mr. Edison, I took my leave.

While shaking hands I was again imprest with Mr. Edison's hand, and I subsequently made a special request of Mr. Meadowcroft to let me have a photograph of the great inventor's hands for publication. I was much astonished to learn that no photograph of Mr. Edison's hands existed, none having ever been taken, the inventor feeling rather sensitive about this. I had seen many sketches of Mr. Edison's hands, but I only then remembered never having seen an actual photograph. It took several weeks to secure permission from Mr. Edison, but finally the photograph of his hands was taken, and it is here presented to the readers of the ELECTRICAL EXPERIMENTER for the first time.

I also made another discovery, namely, that there was no oil painting in existence of Mr. Edison. True, several of these had been made by certain artists after Mr. Edison had patiently sat for them, but he was more or less displeased with the result, and on one occasion did not hesitate to put his foot thru one of them. After securing Mr. Edison's permission, I charged Mr. Howard V. Brown with the delicate mission of making an oil painting of the famous man. It is reproduced on the front cover of this magazine in full colors. It is the only oil painting in existence of Mr. Edison today, and the inventor, who inspected it, was very much pleased with it, declaring it a perfect likeness.

As I past out of the laboratory I caught a last glimpse of Mr. Edison. He had risen from his chair, making his way to a little room containing delicate scales and apparatus. The tall, white-haired figure, somewhat stooped under its 73 years' load, clad in a duster, bespotted with chemicals, slowly faded out of view into the adjoining room.

Submarines to Salvage Sunken Ships

(*Continued from page* 745)

light projectors, which would be of inestimable service to the divers, while they were engaged on the wreck and also a better supply of air can be supplied them owing to the shorter hose necessary. If it is not desired to submerge the pontoons for this part of the preliminary work in the salvaging operation, it would be economical and feasible to provide a small submarine which can sink to the level at which the wreck was lying, and by providing special air-locks on the submergible, divers can walk right out on the watery bed. It may be mentioned here, that in such a case, and provided the divers do not have to stay away from the submergible too long at one time, that they would not have to be tied fast to it with a rubber air-hose, for there is now available an independent oxygen and air-diving apparatus which can be carried on the diver's back.

HOW THE DIVER GETS OUT UNDER WATER

An interesting problem here arises, and that is—how are we going to get the divers in and out of the pontoon-submersible or any form of sub-sea craft when it is closed and under the surface of the waves? The illustration herewith illustrates one form of air-lock chamber which can be employed for the purpose. With the arrangement delineated the operation of getting out of a submarine by means of this air-lock is as follows:—the diver dons his costume in the inside pontoon quarters, where the crew is lodged. He then passes thru the right-hand water-proof door, into an air-lock chamber, which chamber has its outer door closed, rendering it dry. The cabin compartment door is closed, and the sea-cocks opened and the water allowed to rush into the air-lock chamber. The diver adjusts his oxygen apparatus and prepares to pass thru the outer door when the chamber has become full of water, this door then opening easily. As he passes out into the stair-well, he locates the usual air-hose terminal by means of a red electric light marking its position, and connects it to a valve on the top of his helmet. He tries the air, and ascertaining that everything is all right, he proceeds to climb up the iron ladder to the deck of the pontoon. He is then ready to descend down a steel cable to the scene of the wreck. The air-hose, as he descends, unwinds from a reel placed in a water-tight compartment underneath the stair-well in the manner here illustrated. And here is the way the divers can come back into the pontoon for lunch. They climb up the steel cable or ladder which is sometimes used, and once they arrive in the stair-well in the pontoon, they disconnect the air-hose and the water is prevented from entering the diver's suit by means of automatic valves in the helmets. The diver then walks into the air-lock chamber and closes the outer door. By

Yo Can Do It In Your Spare Time

The Dollar Value of Draftsmanship

THERE are no "slack periods" for the trained draftsman—no limitations to his earning power—no drawbacks to his advancement to bigger things. Why? Because the manufacturer, builder, architect and engineer must have working blueprints before they can build factories, skyscrapers, railroads, machinery and homes. Drafting also has a positive dollar value to those engaged in all branches of engineering, because it qualifies them to direct those who can't make plans and read blueprints.

Be a Master Draftsman

Whether you want to be a professional draftsman, or add drafting to your knowledge of engineering, the American School course, specially prepared by noted experts for home study, will give you just the training you need. Drafting is the A B C of all engineering work. As you learn the practical working principles of Mathematics, Mechanics and Drawing, the broader field of engineering opens up to you. You are ready for a bigger job and better pay.

Read This Guarantee —Then Act!

"We guarantee at any time during the first year of your enrollment to refund the entire amount paid if, immediately upon the completion of ten examinations, you notify the School that you are not satisfied with your Course."

J. H. ELLIS, P. O. Box 882, Milwaukee, Wisconsin

WHY NOT "BEAT" RECEPTION OF INSECTS' SOUNDS?

It is fairly well known that the human ear is sensitive only to waves of frequencies between about 30 and 25,000, and that therefore sounds produced by air disturbances at higher or lower frequencies are inaudible to us, tho in certain cases the physical effect of the vibration can be felt. The ear, as a detector, may be said to have "flat" tuning, being operative only over a limited range. Bats and certain insects are said to emit sounds which are much too high pitched for us to be sensible of them, and an English writer puts forward the suggestion that by means of employing the well-known "beat" method of wireless telegraphy this disability may be overcome. To entomologists this experiment should prove of considerable interest, but for ourselves, having "chicken-keeping" neighbors, we have no desire to eavesdrop on beetles and butterflies. Providence obviously intended us to be deaf to certain noises—and we presume to agree with the proposition.—*Wireless World.*

Statisticians say that ninety per cent. of all the electricity supplied by central generating stations is alternating current.

40 M. P. H. PONY DIRIGIBLE COMING.

The advent of a new kind of aircraft called the "Pony Dirigible" was announced recently at Cleveland, Ohio, at the reception given for the special commission of the Aero Club of America and the Aerial League of America which is organizing the first aerial derby around the world.

Mr. Upson said an Akron company was about to put on the market a small two-passenger dirigible balloon equipt with a forty-horse power engine which will attain a speed of forty miles an hour and will be so easy to pilot that anybody can do so on short instruction.

Mysteries of Stage-craft

By H. Winfield Secor

(*Continued from page 752*)

one of the three platforms can be moved either into or out of its position before the foot-lights.

WATER, SNOW AND RAIN EFFECTS.

The "Disappearing Divers" have long proven a complete mystery to most patrons of theaters such as the New York Hippodrome. In such productions, as the reader probably is aware, a considerable mystery is evolved by having several people (sometimes as many as 20 or 30) dive into a large water-filled tank and they disappear completely, not coming up again for a space of twenty minutes or more. There are several ways of accomplishing this trick, and two of them which have been successfully adopted are illustrated herewith at figure 4. The first is that utilizing *diving bells.* These diving bells, one or more of which may be used as required, according to the size of the tank, are made of steel and must be air-tight. They act on the same principle that when you place a drinking glass or cup into a basin of water, the water will not rise all the way up in the glass, due to the compression of air within the glass. Thus, when the divers plunge into the water, they are enabled to see the position of the bell, owing to the fact that it has electric lights inside of it, which lights up the water at the bottom of the tank, and indicates the hulk of the diving bell very plainly. When they reach the bottom of the tank, they swim towards the bell and pull themselves up inside of it, under the rim. Comprest air is forced into the bell thru a pipe in order to keep the

The Day After Christmas

ONE GIFT stands out above all others—the one you can use at once for good, hard play. Jump on it on Christmas morning, and you'll know it's Christmas. And the next day, and on through boyhood, Auto-Wheel is your most dependable friend. Always ready for fun or work. It coasts faster than others, and is easier to pull with a load.

The Auto-Wheel has real roller bearings, and the steel tires and axles make it strong and long-wearing.

TWO TYPES

There's the Auto-Wheel Coaster—the old reliable—a marvel for coasting and general use. And there's the Auto-Wheel Convertible Roadster—two wagons in one. One minute a hox-wagon, the next the snappiest roadster you ever saw. Put the Auto-Wheel on your Christmas list. The other fellows want it too. Form your Auto-Wheel Coaster Club when you get your wagons. We'll send a cap for each member, and a special cap for the Captain.

Felt Pennant FREE—Also Auto-Wheel Booklet. Just send us names of three local coaster dealers, telling which handles Auto-Wheel.

www.americanradiohistory.com

water at as low a level as possible within it, and where a number of swimmers have to remain in the bell for any appreciable time, proper air outlet and inlet pipes have to be provided, so that an exchange of air is made possible within the bell chamber. For a shorter period, and when not many people breathe the air within the bell, they can get along without fresh air being supplied. With fresh air under pressure being pumped into the bell, some of the air and its products, such as carbon dioxide gas, will bubble out thru the water and thus help to refresh the atmosphere within it. Mirrors are arranged inside the bell so that the fair swimmers may adjust their hair and clothes.

Another stunt for accomplishing the "Disappearing Diver" trick is that employing one or more tubes leading out from the tank to a place on the rear of the stage. The position of the tube running into the tank is either known to the swimmers, or in large tanks they are lighted up by blind bullseyes or lamps, which only the divers can see, and by holding their breath for a few seconds, they manage to swim for the tube-opening as soon as they dive into the water, up thru which they crawl by means of ribs on the wall of the tube, to the stage floor level. As is well known, the water in the tube will not rise higher than it is in the tank. When it is time for the divers to appear, they pass down thru the tube and, Wonder of Wonders! they come popping right out of the water as fresh as a daisy. In the case of the diving bell, they simply hold their breath, slip out from under the bell, and swim to the surface of the tank. In one of these productions a Viking ship slowly rose to the surface of the water on which the swimmers, about 20 in number, stood, as the deck eventually cleared the water. Truly a wonderful spectacle! To produce this astonishing display, the ship has wheels running on an inclined track up to the surface of the water. A gripping tackle is provided at the bottom of the tank to pull the ship up at the desired moment. The masts which are quite high are made telescopic and these are raised under the control of one of the men in the diving bells. Then, when the masts have been raised about half-way out of the water, all of the swimmers pop out from under the diving bells, holding their breath and stand on the deck of the good ship "Viking". The captain of this mysterious craft pulls the lever releasing the clutches, and the ship rapidly rises to the surface, the heads of those standing on the deck appearing thru the water first, the water running from their clothes and shoulders as they emerge from the watery depths.

At figure 5 is shown an interesting snow scene in the production of "Way Down East", the play that has successfully "held the boards" for many years. The snow in practically every show is produced in the form of small bits of cut up white paper. The "snow" is spilled down from the fly gallery 40 feet above the stage, or in some cases, it is simply thrown from the stage floor level by some other means. At figure 5 it is shown being dumped from trays along the fly galleries and as it reached a point several feet above the stage floor, it was caught by the breeze from powerful electric fans placed between the wings on either side of the stage, which caused it to be blown out on the stage in a very realistic manner. At the same time the "wind" noise is caused by the whirring of the fans.

A very realistic rain and river scene with real water was produced several years ago in a traveling or road production, with which the writer had some experience—in fact he had the pleasure of "controlling the rain," and that is some pleasure, "Believe me, Xantippe!" Well, to cut short the suspense, the rain was made by simply having a pipe extend across the front of

A Home and Income
For You in Sunny Florida

Be Independent- Own a Grapefruit and Orange Grove—A Truck or Poultry Farm. Increase Your Income

You Can Start a Grove Today Under Our New Plan

Develop a profit-earning fruit farm without leaving your present position—provide for your future. A small payment now and a few dollars invested each month should reap large and increasing dividends from year to year. You can now secure the land you want on payments as low as **$1 per acre per month.** A profit-producing fruit grove is a permanent investment and provides protection against old age.

THE RIGHT LAND IN THE RIGHT LOCATION AT THE RIGHT PRICE

We Have It—Any Size Farm

From 10 to 640 acres or more. These splendid lands are suburban to Tampa, the metropolis of South Florida. Here you find the most healthful, the most delightful climate in North America. For eight years we have been right here helping develop Hillsboro—the banner agricultural County of Florida, and we are still here to serve you and to help you obtain the farm you want. Whether it's ten or twenty acres, for a Fruit Grove, Poultry or Truck Farm, or from 80 to 640 acres for General Farming, Cattle and Hog Raising, we can give it to you on very easy payments extending over 2 or 3 years' time to suit purchaser.

Groves Developed for Non-Residents

If you want to remain in your present position for a few years we can develop a grapefruit and orange grove for you. When you are ready we will clear your land, furnish fruit trees, plant and care for your grove until you are ready to look after it.

We Raise Our Own Guaranteed Citrus Trees in Our Own Nurseries

This insures every purchaser the best fruit trees that can be grown. This also insures a successful grove. We can save you money on planting and caring for your grove.

Fill out and mail us the coupon today and receive our large descriptive book FREE!

NORTH TAMPA LAND COMPANY
C. E. THOMAS, Pres.
Suite 3021, Mallers Bldg. Chicago

$300.00 to $500.00 Per Acre Profit

May be made growing truck. This is not an unusual return for truck farmers in the Famous Tampa district. All kinds of vegetables can be grown. Big prices are paid for early potatoes, Winter cabbage, Bermuda onions, tomatoes, celery and dozens of other vegetables during the Winter and early Spring, when the north is covered with ice and snow. Strawberries, Melons, and other small fruits also yield large profits.

Poultry a Big Money-Maker

Hillsboro County is without question, one of the most favored locations in the United States for poultry raising. Tampa affords an unlimited market for chickens, eggs and ducks. Commission houses right here in Tampa City do a tremendous export business in poultry and eggs and the local demand is also very large. This insures a steady cash market at good prices.

Stock Raising and General Farming

We also have lands especially adapted to general farming, Long Staple Cotton Corn, and Live Stock. Hog and cattle raising has never been so profitable before. High prices for all meat and pork products must continue—Florida stock raisers should make big money for many years to come.

Write for Facts About Sunny Florida

IT COSTS YOU NOTHING TO LET US PROVE TO YOU that we have the land you want—in the location you want—at a price you can afford to pay and on the easiest terms you can imagine. Let us show you.

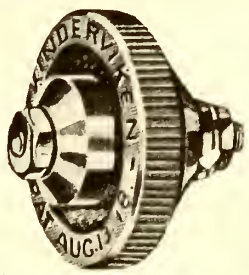
the stage, and which pipe was perforated with several dozen small holes. This rain-making pipe was then connected with a hose to a water pipe at one of the fly galleries, where the person controlling the rain is standing. When he gets the cue from the stage manager, to "let 'er go", he immediately opens the valve and the water descends from the openings, dropping to the tank or rubber apron below, in the form of "sure enough, honest-to-goodness" rain! This forms a sheet of rain and for most purposes gives a very satisfactory effect.

This show had a most exciting water scene, and the method for staging it was one of the most wonderful that the writer has ever come in contact with. The production carried a large flexible rubber tank, the full length of the stage and about one foot deep, which would thus hold enough water to float row-boats or a small launch. In the center of the tank there was a deeper pocket, measuring about 10x7 feet which projected down into a wooden frame under the stage, and into which the hero proceeded to dive in the second act in order to save the beautiful blonde heroine. If the "villiun" had felt real interest in, or had been jealous of the affection of the hero for the heroine "off stage", he could move the "phoney" canvas-covered "rock", and if our hero dived he would then make a miscalculation and end by dropping into one foot of water, instead of ten. With this improvised and somewhat shallow tank of water, a very exciting melodrama was "put-on"; the scenery was hung over the sides of the tank so that just the water line appeared to the audience, and in fact no part of the tank whatever. A band of counterfeiters floated up the river in a launch, while the police boat, chasing them, fired several dozen revolver shots thru a phoney machine gun. It was some exciting plot and very realistic.

SUN, MOON AND STAR EFFECTS ON THE STAGE.

In the "Garden of Allah", one of the most pretentious scenic productions put on in New York in several years, there was a very realistic *desert sand storm.* Real sand was used in producing this storm scene and as shown in figure 7, the sand was caused to be blown upward, and then caused in turn to whirl in eddies by means of electric blowers placed at the proper points about the stage. These electric blowers were camouflaged under small stage props, which were colored and arranged to fade in with the sand of the desert. The twinkling stars were created by a large number of tiny electric lights being hung against a dark blue background, the various circuits of lamps being rapidly switched on and off by an automatic flasher. As the lights were staggered and placed in an irregular formation, and as the lights in different levels were alternately illuminated and extinguished, no regular coherence of effect could be gathered and the audience was thus charmed with the display.

At figure 8 is shown an arrangement in use for producing the best type of moon or sun-rise, or also the setting of the moon or sun. In the ordinary production no attention is paid to the well known fact that the moon or sun is always larger when down near the horizon, growing smaller in diameter as it mounts to the heavens. The moon effect, for instance, is produced in the following manner:—a powerful lamp, such as 1,000-watt incandescent gas-filled bulb, is placed in a light-tight box. In the front of this box there is arranged a slide in which colored screens can be placed to give a yellow or other tint to the light, and across this opening there is mounted an iris diafram, similar to that used in camera shutters. This diafram is fitted with a lever extended from the side of the box, and from which a cord depends downward. The box is now carefully elevated by means of a rope, or two ropes, such as will allow



www.americanradiohistory.com

it to be pulled upward in a slow manner. At the same time the operator controlling the moon-rise slowly closes the iris diafram, causing the "moon" to gradually grow small as it mounts up from the horizon painted on the scene.

Figure 9 shows how *open fire place* effects have been produced as well as *blazing fire* from other stage mountings. It is seldom that a real fire is used on the stage, both because it is not necessary and also because it is somewhat dangerous where there is so much canvas scenery about, altho these are fire-proofed as best they can be. The *flame* of such fires is produced by thin red silk ribbon or else by pieces of red silk. An electric blower or fan is so placed as to blow these silk strands and cause them to resemble a flame, especially when lighted from behind or beneath by means of red lamps. Figure 9 shows also how windows in small houses, appearing in the back of the settings in certain scenes, are lighted up. In a recent Belasco production, "Dark Rosaleen", all such stage effects as this are very carefully worked out so as to produce an exact and true scenic setting. The electric lamps for lighting up the windows are shielded by a canvas flap in the manner shown, so that no light flashes up above the frame of the house or reflects back onto the scenery, which would, of course, spoil the scene. The windows are made of celluloid or similar material, either colored or painted. Where scenery glass is required, and unless some desperado is to do the "business" of jumping thru a window to the accompaniment of crashing glass, then ordinary window screening is used. In one of these large windows containing about 20 openings, it was surprising to note how well this screen resembled glass, and moreover it had been painted around the edges so as to give the effect of a long accumulation of dust and dirt. Flags are often used in spectacular productions, dramas, etc., and of course the best effect is created by having the flag wave. This is usually done by placing an electric fan near the flag and just behind a piece of scenery so that the fan is out of sight with respect to the audience.

MISCELLANEOUS STAGE TRICKS.

Some of the more elaborate stage productions carry with them a portable electric switch-board of their own, as shown at Fig. 10. One of these switch-boards which the writer recently saw, contained a whole battery of dimmers (rheostats) for controlling the lamps of various border and spot lights—this portable switch-board rolling about on wheels, and being connected to the electric supply mains by means of a flexible rubber covered cable. At Fig. 10, there is also shown the three stage revolving spot-light platform which is used in some of the spectacular productions produced on large stages. The spot-light operators are located on the different stages

TEETH DECAY IN BETWEEN

No matter how much you brush them on the OUTSIDE

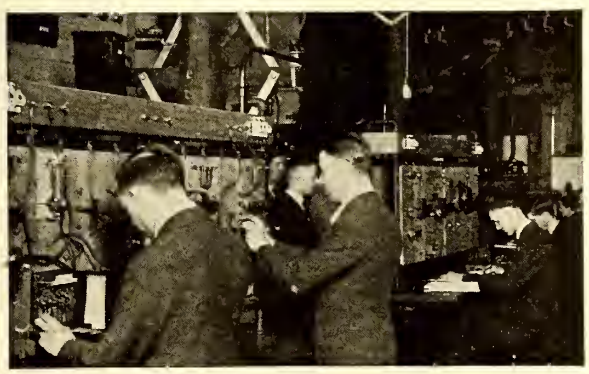
Dentists place 75% of all fillings between teeth where food particles decompose, cause bad breath and tooth decay.

We all *must use* FLOSS. But NEVER *by hand.* That's awkward, wasteful and dangerous—harmful as toothpicks.

Use new safety floss guide just invented called FLOSSY. Carries a spool of the best flat pure medicated silk floss. *Always* sanitary. Approved by dentists everywhere as the *only* device to clean BETWEEN the teeth. Slides the silk naturally, easily and *safely*. Beautifully moulded. Ivory finish. Costs only **50c** complete. Will keep your teeth safely clean a lifetime. To remove stains from the surface of your teeth easily,

Use LIQUID TOOTHWHITE. Wonderful liquid. Harmless. Full size bottle **75c.** Both of the above for **$1.00;** refunded if not *perfectly* satisfied. Special sample bottle **25c.** Stamps accepted. Send your order TODAY. **TOOTHWHITE LABORATORIES, Dept. 45, EVANSTON, ILL.**

LEARN WIRELESS TELEGRAPHY



Fascinating and Educational Work—Big Salaries—Prepare Now

The United States Shipping Board is making heavy demands upon us for **Dodge-trained** wireless operators. Travel all over the world, secure, free, unsurpassed living accommodations and earn a big salary.

We Also Teach Morse (Wire) Telegraphy and Railway Accounting

School established 45 years. Endorsed by wireless, railway and telegraph officials. Low rates. Students can earn living expenses while attending school. **Catalog Free. Write Today.**

Dodge's Telegraph and Wireless Institute 26th St., Valparaiso, Indiana

A Practical Electrical Education

in the splendidly equipped laboratories and shops of the School of Engineering of Milwaukee, combined with the advanced methods of instruction as taught by this school's faculty of 55 experts will fit you to become a *trained* master electrician in *one year.*

New Facilities - Greater Accommodations

are at the disposal of students beginning the new Winter Term at this school, together with a wide range of specialized technical and electrical studies.

Institute of Electrotechnics

Junior Division (18 mo.) for graduates of 8th grade. Senior Division (18 mo.) for students with 7 high school credits. Prepares for entering College of Electrical Engineering or to assume well paying, responsible positions in the electrical field, immediately upon graduation. A strong faculty of practical men assures the student of a thorough and useful training.

School of Electrical and Mechanical Drafting

A one year course, covering all the essentials and details of standard drafting room practice. Trains the student to assume positions of importance immediately upon completing this course.

6 Months Armature Winding

and Motor Generator course. Short but thorough, taking up the practical study of this high grade, remunerative trade.

Automotive Electrotechnics

A 6 months short course and a more extensive 2 year course in automobile, marine and airplane starting, lighting and ignition. The repair and maintenance of gas engines of all types is likewise taken up. An up-to-the-minute thoroughly modern and practical department.

Extension Department

Home Study courses in electricity, drafting, mathematics, English and wireless telegraphy.

New Term Opens Jan. 2nd, 1920

Athletics, R. O. T. C. (optional). Amusements of all kinds, students Fraternity House with room and board at cost. Send NOW for latest bulletins and full information FREE. Mention age, education and course of interest.

YOU MUST GET STRONG

Don't think you can't do it, no matter how weak and watery blooded you may be now. Don't let constipation poison your system, dyspepsia upset your digestion, neuralgia put your nerves on edge, or any other chronic ailment make your life a burden. **You don't have to.** You can free yourself from these physical and mental handicaps, develop your body, strengthen your vital organs and BUILD YOURSELF UP into a strong, vigorous, MAN again, if you will only face the facts and take proper steps to remedy them.

STRONGFORT
The Perfect Man

The Simple, Safe, Sure Way

There's only one way out for the weak, sickly man and that is NATURE'S WAY. Nature is the greatest curative power in the world; every reputable medical man will admit it. Give Nature half a chance, by living life as it ought to be lived, and she will banish your ailments, redden your blood, put good solid beef on your bones, oil up your internal machinery and make you a two-fisted, healthy happy member of society again.

STRONGFORTISM

Strongfortism is a simple, plain system of strengthening your vital organs and developing your body and brain in Nature's own way, as I have learned it in my lifetime of study and experience. No patent medicines or dope of any kind in the Strongfort way. No complicated gymnastic apparatus. No castiron, rigid routine of tiring exercises. Strongfortism is living life in the way to get the greatest enjoyment out of it, and you can practice it in the privacy of your own bedchamber if you like.

I KNOW I can improve you, so as to become normal in every respect if you will follow my directions for a few months. I GUARANTEE IT. Send for my FREE BOOK, **"Promotion and Conservation of Health, Strength and Mental Energy."** It will tell you all about Strongfortism; how it has built up and is building up weak, ailing men in every part of the world; how YOU can build yourself up and regain your health and strength and confidence and enthusiasm. DON'T PUT IT OFF. You can't afford to be without that book, whatever your condition. If you are weak it will show you HOW TO GET STRONG. If you are strong already, it will show you how to stay so.

IT'S FREE. Enclose three 2c stamps for postage and packing and I will mail you a copy at once.

LIONEL STRONGFORT *Physical and Health Specialist*
1103 Strongfort Institute, NEWARK, N. J.

Ten Reasons
WHY YOU SHOULD BECOME A

DOCTOR OF CHIROPRACTIC

1. Because Chiropractic is the foremost drugless profession of the day.
2. Because Chiropractic brings results quicker and with greater frequency than any other healing method now known.
3. Because Chiropractors invariably enjoy greater financial prosperity than practitioners of any other method.
4. Because YOU cannot hope to achieve economic independence and the feeling of security that you desire by working for others.
5. Because YOU thereby become one of the pioneers of a profession than which there is none more promising today.
6. Because Chiropractic is in line with evolution of Science, and is in accord with natural laws.
7. Because Chiropractors are gradually winning universal recognition thru their achievements.
8. Because the Chiropractic field is absolutely unhampered by competition.
9. Because the demand for Chiropractors is nationwide, and is growing with tremendous strides.
10. Because YOU owe it to YOURSELF and to society to be of maximum benefit to both, potentially and actually.

Do not accept our word for the above.
Write for Booklet X and details, or call personally.
Second fall class registers Nov. 1-15.

1416 Broadway **New York Ctiy**

of the platform which has a total height of thirty feet or more. Flexible rubber covered cables supply current to the spot-lights from the stage floor pocket. Arc lamps for stage spot lights are rapidly going into disfavor and the new 500- and 1,000-watt gas-filled tungsten lamps are taking their place. At Fig. 11, there is shown a motor-driven scene raising and lowering mechanism installed in one of the New York theaters. All large theaters today have what is known as a grid-iron, and fly gallery above the stage, the height of the grid-iron being about 80 feet above the stage floor. Large drops, ceilings of rooms, house roofs, and all such scenic effects are hoisted by means of ropes and suspended from the grid-iron, so that they hang about 40 feet above the stage, and just over the particular setting which happens to be in use. Sometimes 40 or 50 scenes may be seen hanging from the grid-iron and above the Actor's heads. In the usual theater, these scenes are correctly balanced by heavy iron weights, so that they can be raised and lowered by one man, without undue exertion. At this particular theater, however, an electric motor drives the shaft which runs along one side of the fly gallery. The ropes coming down from the various pulleys up on the grid-iron, and by means of which the scenes are raised, pass down to this motor driven shaft, each rope being secured to a suitable winding drum. By means of a clutch attached to each rope hoisting drum, it is possible to quickly raise or lower any scene desired, the electric motor doing all the work. By throwing in several clutches at once, as many as four or five scenes can be raised simultaneously. When the scene is raised to its proper height and in order to prevent breaking the ropes and dropping the scene, an automatic electric cut-off is fitted to the hoisting ropes which stops the motor if the scene is raised too far up.

SCENE PAINTING

Little is known regarding the life of the *Scene Painter*. Painting scenery is a profession by itself, and naturally the first requisite is that the scene painter shall be an artist. Also, to be successful, he should be an engineer, an architect, and a thoro student of electric lighting effects, especially with respect to colors. The brilliant colors which are sometimes seen in stage productions are very flat and commonplace looking when seen in daylight. All of these things the scene painter must take into consideration constantly, while he is painting the scene.

Figure 12 shows a scene painting bridge at a large New York playhouse. The colors are made up in large quantities in dishes and bowls placed on long tables along the bridge,—this bridge being 40 feet above the stage floor and having no rails on it. The canvas on which the scene is to be painted is mounted on a large and fairly heavy wooden frame, which is swung on ropes from the grid-iron 40 feet above the bridge. By means of ropes on either end of the bridge, the scene painters can raise or lower the canvas as desired. Large scenes measure about 85 feet long by 40 feet high. All of the scenes, no matter of what building or other view they may represent, are invariably laid out on the canvas with chalk lines and scaled off from a miniature scene, in much the same manner as a house builder constructs a house from the architect's plans. Room scenes where elaborate sets are used, are sometimes provided with heavy wooden doors and framed windows; these are also constructed at first in miniature, even down to the tables and chairs and the vases and clock on the mantle. These parts are scaled off and constructed to exact detail and size by the stage carpenters from the scenic artist's master model. These models are generally but a few feet in length and some of the miniature views, from which back

SELENIUM CELLS

THE

Construction, Care and Use of Selenium Cells with Special Reference to the Fritts Cell

By THOMAS W. BENSON

The lack of definite information relative to the construction of Selenium Cells has led the writer to record the results of some of his experiments and to fully describe the apparatus as developed by him.

CONTENTS OF CHAPTERS

www.americanradiohistory.com

drop scenes like the one shown at Fig. 12, are painted, are no larger than an 8x10 inch photo. Photos are often used to paint scenes from or to help the artist in depicting correctly certain foreign views, such as Chinese buildings, et cetera.

Stage scenes are painted in strips, i.e., when several painters are working upon the bridge, they all work across the canvas at an average height of say 6 feet. After this 6 foot strip across the canvas has been painted, the frame is lowered this amount, and a new six foot strip across the scene is painted, and so on, until the whole canvas is finished.

A new departure in scene painting is that involving the use of a large *air brush* which is shown at Fig. 12. One of the most successful scenic artists who was the first to make use of the air-brush in painting scenes on such a large scale as this, is Mr. D. M. Aiken of New York. The beautiful and truly magnificent color effects known only to the air-brush artist, have been available for a number of years in connection with small photograph retouching; and now that these wonderously beautiful color creations are available to the stage scene painter, we can expect to see some extraordinarily entrancing stage settings.

New York Electrical Show

(*Continued on page 761*)

brush at the front of it, which was rubbing the soap suds and water thru the rug faster than Aunt Jemima ever thought of doing it in her palmiest house-cleaning days. The gentleman in charge of this exhibit asked us to come right up and inspect the operation, and we did. The rug was quite dirty where the machine had started, but the path over which it had slowly past and washed, as well as dried, was astonishingly clean. Now, thanks to this invention, rugs and carpets in large hotels, theaters and dwelling houses can be cleaned right on the floor *without removal.*

All kinds of electrical kitchen utensils were exhibited, some of them in actual operation, from electric toaster up to gigantic five horse power dough mixers in the electric bakery, which cuff and swatted the 100-pound batch or bread dough, as if it had been only as big as a finished loaf of bread. The bread was baked in this bakery in electric ovens and served with "current" jelly to the hungry crowd. The bread was good, we tried it, and we did not feel any ill effects from the "current" jelly, altho we did expect a shock or two. See Figure 5. The new electric reflection heaters, composed of a small electrically heated coil placed in the focus of a copper reflector, were displayed at many spots. You can feel the blast of heat reflected from these, even when the heaters are at a distance of 10 to 15 feet, whenever you pass one of these heaters. Shown at Fig. 6.

One of the electric washing machines of particular efficiency, and which appeared to be extraordinarily "full of pep," is that illustrated at Fig. 7. This was called the "Locomotive" Washer. The glass tank rushed back and forth with startling velocity, forcing the hot soapy water *thru the clothes* with a natural pressure and in a way which would not injure them.

Passing on, we finally arrived at the corner where the electrical "Docs" held forth. The air in this region was surcharged with high tension electricity as the powerful Coolidge X-ray tubes shot forth their penetrating rays, while now and then a crashing spark jumped across a one-foot gap on the transformer exciting the tube, not to mention the crashing of several dozen small high-frequency machines, which were being

"Don't tell me you never had a chance!

"Four years ago you and I worked at the same bench. We were *both* discontented. Remember the noon we saw the International Correspondence Schools' advertisement? That woke me up. I realized that to get ahead I needed special training, and I decided to let the I. C. S. help me. When I marked the coupon I asked you to sign with me. You said, 'Aw, forget it!'

"I made the most of my opportunity and have been climbing ever since. You had the same chance I had, but you turned it down. No, Jim, you can't expect more money until you've trained yourself to handle bigger work."

There are lots of "Jims" in the world—in stores, factories, offices, everywhere. Are *you* one of them? Wake up! Every time you see an I. C. S. coupon your chance is staring you in the face. Don't turn it down.

Right now over one hundred thousand men are preparing themselves for bigger jobs and better pay through I. C. S. courses.

You can join them and get in line for promotion. Mark and mail this coupon, and find out how.

demonstrated by experts for the benefit of a "long-suffering" public. This exhibit also included electric lamp heat baths in the form of cabinets of various shapes and sizes fitted with mirrors and several dozen high candle-power lamps inside of them, as well as nifty, small-size X-ray outfits for dentists. You know, now-a-days, they say a patient knows as much about his tooth as a dentist does, unless the "Doc" has an honest-to-goodness X-ray machine and can examine the "interior" of your roots and jaw bone to see whether or not you have any tumors or abcesses sprouting there. So, this year, more than ever before, everybody that was up on the technique of modern denistry, was particularly interested in this display. One of the special tooth-jerkers' X-ray tooth analyzers, is illustrated at Fig. 9.

WIRELESS HOLDS SWAY AT THE ELECTRICAL SHOW.

At one corner of the radio exhibit we ran into the latest thing in wireless, the radio-goniometer or wireless direction finder. See Fig. 10. This comprises a coil of several turns of wire mounted on a pivoted frame, so that the coil can be turned around to any degree of the compass. The shaft is fitted with a pointer and scale, so that the exact point of the compass to which it points can at once be determined. Thousands of these devices were used during the war to locate enemy wireless stations, when the latter were fired on by our artillery, sometimes when they were many miles away and out of sight. Wireless telephony was demonstrated at the Electrical Show, also, as shown at Fig. 15. Audion bulbs were used in practically all of the wireless instruments exhibited both for transmitting and receiving. A new and interesting "direct current" wireless transmitter, giving a musical note without a rotary converter, was demonstrated.

As before mentioned, a complete electric dairy was exhibited, with several choice cows which were milked with an electric vacuum milker several times a day, for the edification of the cityites, who occasionally manifest the idea that our lacteal products come from so lowly a source as the country roadside milkweed. Some extremely interesting and clever "coin-in-the-slot" dispensing machines were exhibited. The company supplying these machines have made them as nearly human and fool-proof as possible. Not only do these machines dispense everything imaginable—from a "cootie-proof" hair brush to a theater ticket to see a Mary Pickford six-reeler, but they are fitted with one of the most marvelous scientific coin rejectors ever conceived. They are guaranteed to refund your money unless you feed them with guaranteed solid U. S. coin, and this coin must not have any holes in it; no smoothed out edges and no figures or designs missing. Also, the weight must be right, the composition must be right, and the size must be correct. Apparently, this machine has got the eagle-eyed bank cashier backed off the map when it comes to telling a "counterfeit" from a "real" coin. See Fig. 12.

Electric sirens were exhibited (see Fig. 13) in various sizes, some of which can be heard for several miles, and which are used with great success by fire departments. Many electric devices and attachments were shown to aid the seamstress and tailor and a new line of cloth-cutting machines were demonstrated. One of these machines, in the hands of an experienced operator, will cut thru a hundred thicknesses of cloth at once. One style has a motor operated steel wheel which does the cutting, while another larger type has a knife shaped like a razor blade which is oscillated vertically several hundred times per minute. See Fig. 14.

Electric auto trucks operated with powerful storage batteries were exhibited and caused much comment among those who were interested in transportation and freight haulage problems. See Fig. 16.

Get an Ideal Model Aeroplane for Christmas!

Building and Flying Ideal Model Aeroplanes is real sport because Ideal Models are accurate, scale-reduction duplicates of real Aeroplanes. They look like the machines they are copies of; have parts and fittings like real ones, and rise from the ground or water by their own power and fly in the air. Build one. Learn about aeroplanes, how they are built and how they fly. Ideal Model Aeroplane Construction Outfits make building easy. They contain all parts, fittings, materials, plans drawn to scale and full building and flying instructions. You make and assemble the parts like a real Aeroplane mechanic.

You Can Build and Fly Accurate, Scale-Models of These Famous Aeroplanes

You can get a Complete Construction Outfit to build an absolute duplicate, scale-reduction Model of any of these well-known machines:

NC-4 (Naval-Curtiss Seaplane). The first 'plane to fly across the Atlantic Ocean. 4½ ft. Model. Shown above.
DeHAVILLAND Battle 'Plane (DeH-4). The fighting 'plane used by the American Aces in the World War. 3 ft. Model. Shown below.
Curtiss Military Tractor. The 'plane used to train our Aviators. 3 ft. Model.
Bleriot Monoplane. The first aeroplane to cross the English Channel. 3 ft. Model.
Nieuport Monoplane. A famous French 'plane used in the War. 3 ft. Model.
Taube Monoplane. The early German dove-like machine. 3 ft. Model.
Cecil Peali Racer. A racing-type aeroplane with a record for distance flights.

Ideal Model Aeroplane Construction Outfits for building any of the above Aeroplanes are sold by Leading Toy, Sporting Goods and Department Stores. Ask for them at your store. Be sure you get IDEAL Model Aeroplanes because they are the only ones that are true copies of actual Aeroplanes.

Send for the Ideal Aeroplane Book Tells all about Ideal Aeroplanes and Flying Toys; gives complete descriptions and prices; contains list of stores where you can get them. Get this book, sure. 48 pages. Sent Postpaid for 10c in stamps.

Swing 4 in., 11 in. between centers, 17 in. total length. Shipping weight 13 lbs. Bed of lathe is machined. Workmanship first-class. Equipped with wood turning chuck. Can be fitted with 3 in. face plate and drill chuck as special equipment. Order one today. Price $5.00 cash with order. SYPHER MFG. CO., DEPT. C TOLEDO, OHIO

COPPER AERIAL WIRE

We have just received several thousand pounds of No. 14 pure copper aerial wire which we are selling for 40c per pound. This wire runs 80 feet to the pound and is guaranteed to be satisfactory by us. Postage and insurance must accompany all orders, otherwise they will be shipped by express collect.

We are listing a few more of our exceptional bargains below:

Telephone Relays—with six contacts and dust proof cover—shipping weight, 2 lbs.....each $1.50
Powerful Horseshoe Magnets—made of high grade Norwegian iron 5 inches high—shipping weight, 2 lbs. .....each .30
Condensers—½, 7/10, 1, 1½ and 2 Micro Farads—all types contained in indestructible metal case—shipping weight, 2 lbs.....each .50
Resistance Coils—wound to 4500 ohms resistance with German silver wire—shipping weight, 1 lb. .....each .40
Induction Coils—primary one ohm, secondary 55 ohms—shipping weight, 1 lb.....each .50
Telephone Receivers—standard 75 ohm bi-polar, complete with cord—shipping weight, 2 lbs., each .....each .80
Dry Cells—slightly used—shipping weight, per doz., 26 lbs.....per doz. 1.25
Small Complete Telephones—ready for mounting on your wall—work on two dry cells—shipping weight, 4 lbs.....each 3.00
Telephone Ringers—630 ohms—shipping weight 2 lbs. .....each .80

Send 5c for our illustrated catalogue showing many other items at our bargain prices.

ELECTRICAL SPECIALTY COMPANY

SMITH & SMITH PUBLISHING CO.
Dept. B. 1524 LOWRIE ST., N.S., PITTSBURGH, PA.

www.americanradiohistory.com

In this Department we publish such matter as is o interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries addrest to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

Automatic Non-Leak Oil Can.

(356) L. Scales, Tusla, Okla., asks our advice on an automatic self-closing spout for oil cans. When the bottom is prest, a rod fastened to it opens and closes a plug or valve in the tip of the spout.

A. We have looked over your drawing carefully, showing your suggestion for an automatic oil can, and it would seem to have several good merits, particularly from the fact that no oil can leak out of the can when it may happen to be knocked over or upset. There is only one weak point which you probably have or can overcome in the design or manufacture of this oil can, and that is the small metal bar or pear-shaped plug at the spout of the nozzle, which has to be screwed on to the light rod secured to the bottom. It would seem that after the can had been used for a while, that the wear and tear on the thread, etc., would lower the efficiency of the device, causing it to leak oil when upset, in spite of the attempt made to overcome this objection.

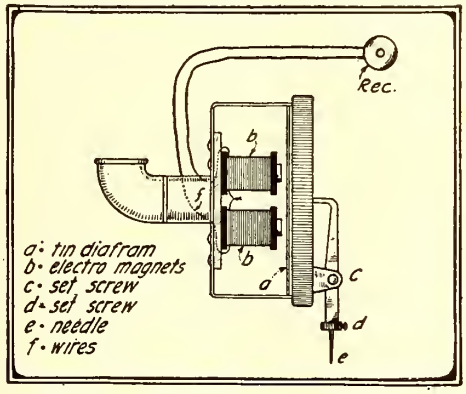
If you can, however, overcome this weak point and provide a sufficiently heavy rod to make the oil can reliable and suitable for constant usage, we believe you have a very good device and one worth applying for a patent on.

Thermometer.

(357) John Schmidt, Long Island, N. Y., writes: "Having read in the current issue of ELECTRICAL EXPERIMENTER of the patent advice you give to readers, I submit to you the following: I have perfected a thermometer constructed by winding a spring made from a certain metal called by some thermostatic steel. The spring is wound, one coil on top of the other, similar to a watch main-spring. A shaft of a predetermined height is soldered to the spring. Next a bearing is fastened to a case of suitable size for the shaft to lay into (the top bearing is merely a hole drilled into the dial of the instrument). The dial is properly calibrated, with which I am thoroly familiar. As you will notice by the sample which I sent you, one side of the metal is nickel, which makes it expand with heat and contract with cold, which in turn rotates the shaft to the end of which a pointer is fastened. This determines the correct temperature of the room into which it is hung. I have constructed a model which has stood up with any mercury thermometer that I hung along side of it. To my knowledge there is not another instrument built along these lines. Please advise if a patent can be obtained on this invention."

A. To our mind this is a very good idea, and we are inclined to think that a patent can be obtained on this invention. Providing a large temperature range can be had on such a thermometer, we should think that it would be quite a practical instrument and one that would commend itself readily to the public.

Protected Switch.



(358) Onni Koskin, Dollar Bay, Mich., says: "It is claimed that a large share of the accidents from electric shock are caused by open knife switches. I think that this could be prevented by insulating all the exposed metal parts, except the contacts with some material such as the enamel used on some electric wires. I would like to know if this idea could be patented."

A. Switches of this kind are in use now. For this reason we do not think that you could obtain a patent.

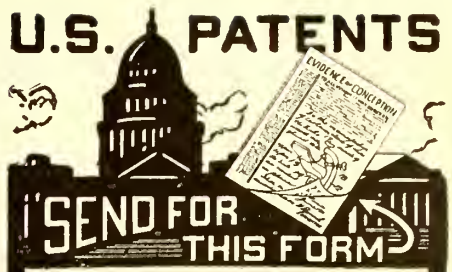
Electric Recorder and Reproducer.

(359) Marion W. Taylor, Buechel, Ky., submits an idea, shown in the illustration, which works as follows: The recorder and reproducer works as a telephone receiver. A person speaking in a transmitter connected to this instrument causes the vibrator or diafram to vibrate, thus making the impression upon the record. Then, when run over the second time the same will be reproduced in a pair of receivers, this being done by having a direct current between recorder and phones, so that when the diafram vibrates it breaks the lines of magnetic force producing sounds. He wishes to know if this is a patentable feature and if we think that the idea is valuable.

A. This seems to us as a good idea, and we think a patent can be obtained on it, altho we do not see the exact use of the instrument, but, of course, there may be some uses for it, such as for transmitting phonograph music at a distance, etc. You seem to think that it is necessary to have a battery in connection with this device, but this is not necessary, providing the electro-magnets have a steel horseshoe magnet. Then, in that case, no battery is required, as the music or words

from the phonograph would be transmitted "electro-magnetically"; the same as when you take two receivers and connect them together without a battery. This arrangement, as is well known, will then "talk." The coils, however, must be mounted on soft iron pole-pieces, not on the steel magnet frame proper. These pole-pieces or cores are then securely clamped to the steel magnet.

Wireless Device.



(360) W. J. B., Philadelphia, Pa., sends in a description of a design of a new system for wireless telegraphy, and would like to know if a patent could be obtained upon it and, particularly as it requires no aerial, what its advantages are. Several other pertinent questions are asked.

A. We have carefully looked over this invention, but we fail to see how it could possibly work, as no circuit is provided for the secondary discharge of the spark gap; hence we feel certain that it could never work successfully.

Scale Dividers.

(361) Elmer Knitter, Cleveland, Ohio., writes: "I submit herewith a sketch of an idea on which I would like to have your opinion along such

U.S. PATENTS

Don't Lose Your Rights

Before disclosing your invention to anyone send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception" sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

lines as you publish in the ELECTRICAL EXPERIMENTER. The idea contains a provision of a scale on dividers, calipers and similar instruments so as to obtain quicker measurements than we do now, for the simple reason that it does away with the slow method now in use. I would like to know if this device could be patented."

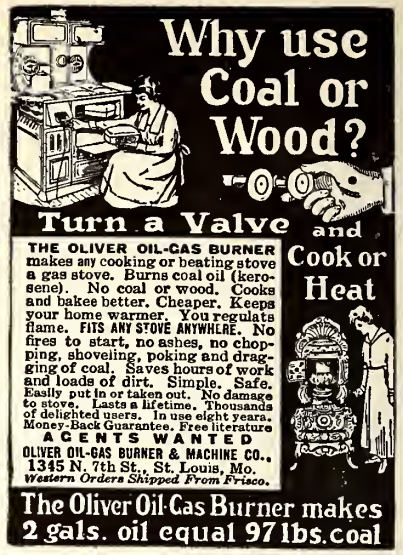
A. This seems like a good idea, altho we think we have seen a similar device once before. Of course, it would be necessary to make the calibrations so that the scale would read in inches for the distance at the end of the dividers, but this, of course, is a mere detail. Our advice is to have a search made in the Patent Office for patentability.

"Perpetual Motion."

(362) Werner Kretschmer, Demarest, N. J., submits a scheme whereby a motor is connected to dynamo with a belt and with wires attached to the brushes. It is first started by an outside source of current, such as a storage battery. The motor then works the dynamo thru the belt and a current is generated in the dynamo. Then the outside circuit is broken and the dynamo supplies the current to run the motor, which, in turn, runs the dynamo. If there is nothing fundamentally wrong with this plan, the apparatus would work indefinitely. Of course, some energy would be lost thru friction and other resistance, but I see no reason why that could not be overcome by using a powerful, yet easy-running dynamo. If this plan were possible, I believe it would do a great deal toward making the electric automobile more of a success. Only a weak current would be needed to start the action.

A. This scheme is just as feasible as lifting oneself up in the air by one's own boot straps. This idea is a favorite one among young inventors, and it crops up every once in a while. The idea, however, is entirely fallacious, as you cannot possibly obtain energy for nothing. Too much energy is lost in friction and other losses, making it impossible for such a scheme to come even near working.

Fly Swatter.



(363) John F. Carlson, Irwin, Pa., sends us a sketch of a new fly swatter, which is made of a piece of screen with a soft rubber frame molded around the edge to protect scratching the furniture, etc. The wooden handle could be cemented into the rubber. He would like to know if a patent can be obtained on this article, and if there is such a swatter on the market.

A. There is nothing new whatsoever in this invention, and you can buy such swatters in many stores handling household goods. They sell for about fifteen or twenty-five cents. It is quite an old idea.

Ignition Device.

(364) Clyde Stewart, Beldenville, Wis., says: "I submit herewith a drawing of a supposed ignition outfit. The drawing is almost self-explanatory. The secondary coil, which could be similar to the one used on wireless spark coils is fastened firmly to the cam shaft C. The magnets N S are, of course, rotating all the time the engine is in operation. When the engine is on the compression stroke the cam shaft moves up, carrying the coil with it. On account of the magnetic field set up by the rotating magnets a high tension current would be set up in the coil. I am rather in doubt as to how much current could be produced, but I should think if the secondary were larger than most secondaries on gas engine coils enough current could be induced. The device could also be applied to automobile engines by means of a special device, which I have. The question of timing the discharge could be solved by moving either the coil or magnets. Do you think the device would work? Could a patent be obtained on such a device?"

A. This seems to us a good idea, altho it should be tried out first in practise. We are also afraid that more magnets than shown will have to be used in order to get a sufficiently strong spark. We also are afraid that unless the magnets are very powerful little current will be realized. When it is considered that even a small spark coil takes as much as five or six amperes it will be realized that in order to get sufficient electro-magnetic flux the permanent magnet would have to be exceedingly powerful.

Submarines to Salvage Sunken Ships

(*Continued from page* 809)

means of a push button he gives the signal to the crew and comprest air is admitted to this chamber which forces or blows out all the water in it. Owing to the high air pressure, about 150 pounds to the square inch, a large opening can be used for blowing out the water, as with this heavy air pressure the water can be kept out of the chamber even with the valves left open to the sea. If this high air pressure was left passing into the chamber, once the water has been blown out of it, however, and then the inner compartment door opened, the diver would be quite likely forcibly ejected into the pontoon quarters. A better procedure is to close the sea-cocks as soon as all the water is blown out of the chamber. The comprest air would then be shut off, and allowed to lower itself to atmospheric pressure, or a pressure corresponding to that within the pontoon, if a higher one than normal happened to be in use at the time. The inner or right-hand door can then be opened, and the diver can pass into the regular quarters, remove his ponderous suit with its 100 pound, lead weighted shoes, undo his massive steel helmet, and sit down to a bowl of steaming clam chowder.

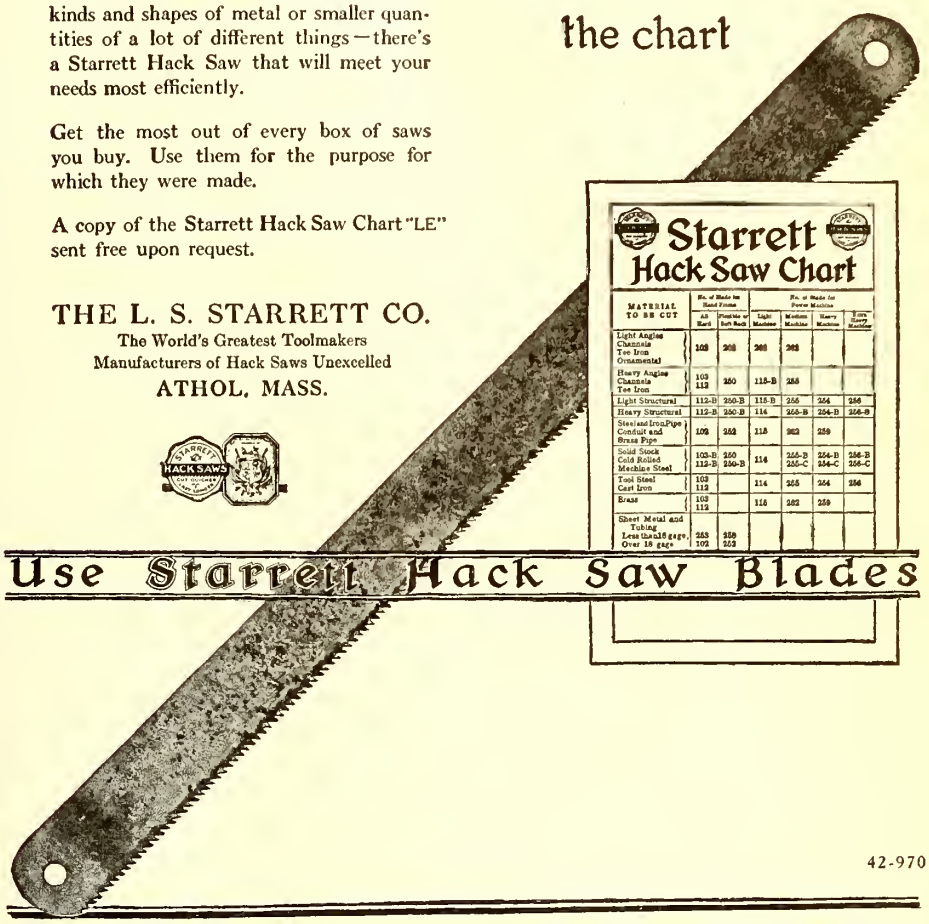
HOW SUNKEN SHIPS ARE RAISED.

Assuming that a large number of steel cables have been past around the wreck and that the time has come to attempt to raise it, the action is as follows:—When it is time to begin the raising operations, the pontoon sections are submerged to a reasonable depth and when everything is ready and the signal given by means of under-water sound telegraph or otherwise, the water is blown out of the submerged tanks of the pontoon and their buoyancy is re-established. Providing they have sufficient lifting power to raise the sunken ship, then they will slowly begin to rise, bringing up the wreck with them. In a great many locations advantage is taken of the rise and fall of the tide where such salvaging operations are undertaken and when the wreck has been raised a certain amount above the bed of the harbor or bay, the pontoons or vessels supporting the wreck by means of cables and so forth, steam toward the shore, so as to lodge the wreck on the sand in a more shallow location. The pontoons are submerged when they are favored by the low tide of the day, and they then draw up all cables tight. By submerging during this period for a certain depth they can then raise the wreck for another appreciable amount, and as the submarines can propel themselves along at a speed of several miles per hour, they can carry the wreck still further into more shallow water, etc., etc. Such a device as this would at least be a great help in salvaging operations, in conjunction with regular salvaging vessels and derricks, to say the least.

In some cases a sunken ship could be caused to almost (and in some cases) actually float itself by pumping comprèst air into the hull of the wreck. Naturally, it is necessary to effectually close up any holes in the particular sections of the hull which are to be blown out by air and this is the work of the expert divers.

A competent English authority says that English central station managers realize that lighting is fast becoming the small end of the electric central station's income, and power and appliances are to be the main sources of revenue in the future.

To cut down the cost per cut



Follow the Chart

Make your hack sawing just as efficient as any other machine tool operation. Choose your blade according to your work. You can't cut cold-rolled and heavy angle iron with the same blade without a waste. Whether you are cutting by power or by hand, big quantities of a comparatively few kinds and shapes of metal or smaller quantities of a lot of different things—there's a Starrett Hack Saw that will meet your needs most efficiently.

Get the most out of every box of saws you buy. Use them for the purpose for which they were made.

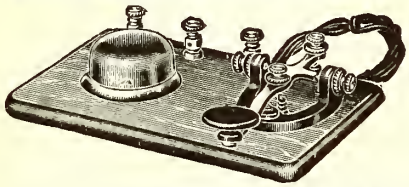
Mesco Radio Buzzer

With Shunt Resistance —
U. S. Navy and U. S. Army Standard

THE Radio Officers of the NC Planes, after testing all other buzzers, decided to use the "Mesco" on their radio equipment. The R-34 was equipped with two Mesco Radio Buzzers.



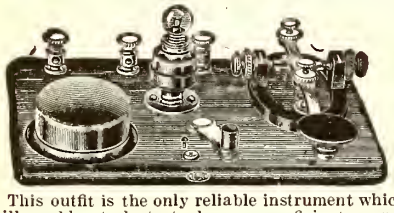
Why? Because of its reliability and constancy in operation; greater output efficiency; ease of adjustment; unaffected by extreme variations in weather conditions; exposed wires eliminated.

Sparking is almost entirely eliminated, so that the energy lost in light and heat in the operation of other buzzers is here conserved and radiated in the form of oscillating energy.

This buzzer maintains a constant note and is recommended as an exciter for checking wavemeters where pure note and ample energy are required.

List No. 55, Mesco Radio Buzzer
Price $2.05

MESCO WIRELESS PRACTICE SET



The Practice Set comprises a regular telegraph key without circuit breaker, a special high pitch buzzer, one cell Red Seal Dry Battery, and four feet of green silk covered flexible cord.

The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

List No.		Price
342	Telegraph Practice Set, with Battery and cord	$3.24

Weighs 4 lbs. packed.
Price does not include postage.

MESCO Combination Practice Set for Learning the Mo. and Cont. Visual and Audible Codes

This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord.....$4.05
Weighs 4 lbs. packed. Price does not include postage.

We carry a Large and Complete Line of Standard Wireless Material Recognized by Experts as such with Competent Experienced Wireless Attendants in Charge.

Airplane Super-Charger for High Flying

By Charles M. Ripley

(*Continued from page 757*)

curiosity on land—how much more of a wonder it becomes four miles up in the sky!

It was confidently predicted by Major Schroeder in an interview, that the *airplane supercharger* will effect wonderful commercial development in aerial transportation, and for two reasons:

Due to the higher speeds possible at the upper levels, one can make the New York-Chicago trip without a stop; and owing to the fact that flights can now be made with full power above the storm zone—seldom over 4 or 5 miles high at most—schedules can be maintained regularly, regardless of weather conditions.

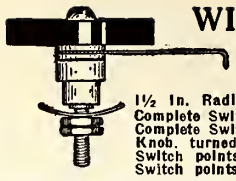
Special propellers are being developed to greatly exceed all previous altitude performances.

In making his flight, Major Schroeder had his plane equipt with an extra long propeller designed to obtain better efficiency with the rarefied air encountered at 18,000 ft. altitude. The speed of the plane at this altitude without the supercharger was 92 to 96 miles per hour, tried on separate flights using several different types of propellers.

Popular Astronomy

By Isabel M. Lewis, M.A.

Is the Moon Dead?



(*Continued from page 768*)

delicate clefts or rills, also in the appearance of dark spots from time to time and the darkening of the floor of craters as the altitude of the sun increases which cannot be shadow effects since at lunar mid-day when the darkening is most pronounced there are no lunar shadows.

The only plausible explanation of this periodic darkening during the lunar day is that it is due to the growth of some form of vegetation.

One of the most interesting and most convincing evidences of change in lunar markings is associated with the noted Ariadaeus and Hyginus cleft system which we note particularly since it is so well shown in the accompanying photograph taken at the Mt. Wilson Observatory. These two clefts in the lunar surface can be seen just above the northern edge of the photograph. The Ariadaeus cleft or rill originates well over to the west at the small crater Ariadaeus faintly visible in the lunar shadows and runs first north east then north to the edge of the photo. It will be observed that it cuts directly thru all craters and ridges in its path, a peculiar characteristic of all clefts. A careful examination of the photo will show that it is connected with the coarse Hyginus cleft to the south east (so named because it passes in its course directly thru the depression known as Hyginus, four miles in diameter) by a much fainter canal-like cleft. It is this connecting cleft that has shown evidence of change. Gruithuisen, a diligent lunar observer, detected this connecting cleft in the early part of the nineteenth century and noted that at times it appeared perfectly straight and at other times very irregular altho observed under the same conditions of phase and definition. Lohrmann and Mädler who later observed this region frequently never saw a trace of it. It was rediscov-

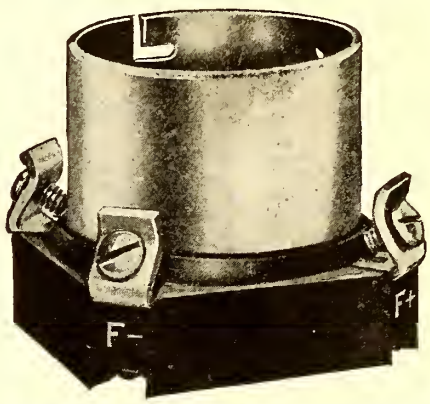
THE HEART OF THE WIRELESS

Fleming Pat. No. 803684
De Forest Pat. Nos. 841387-879532

An Amateur Station Without a Vacuum Tube is Years Behind the Times

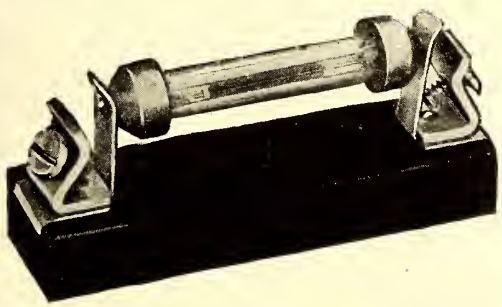
MARCONI V.T.

$7.00 each



Under agreements recently effected the Marconi V. T. is the only vacuum tube, or audion, which may be sold to amateurs, laboratories, schools of instruction and experimenters.

The approximate operating life of the MARCONI V. T. is 1,500 hours.



FEDERAL-AUDIO FREQUENCY TRANSFORMER

Designed for use with the Marconi V. T.

$7.10

Standardized Socket $1.50 additional

Standard Resistance, Complete $1.00

The Marconi Resistance, connected in the circuit between the grid and the filament of the Marconi V. T., is made in the following standard sizes:

½ megohm, 1 megohm, 2 megohms, 4 megohms, 6 megohms.

Resistances of any special fractional values up to 6 megohms can be supplied.

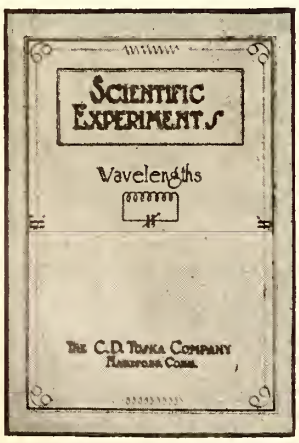
THE BEST



Yes, the best and only the best is cheapest in the end. Then why not apply this rule when taking a course in wireless? Our correspondence course is simple, easy to master, up to date and consists of 15 lesson books prepared by our expert theory instructors. All practice and transmitting apparatus for mastering the code is furnished free.

We Operate the One Big

radio school of the world, and this correspondence course is an extension of our activities, a Post Graduate Course in our Washington School being given you free, if you desire. You see we are not *A RADIO SCHOOL,* but actually and absolutely *THE RADIO SCHOOL*—the top one, the biggest one—the one that *HAS BEEN* and *IS* turning out the *WINNERS* every week. You can't compare us with any other school, because we are head and shoulders above all—the very top. You get the idea? You can't get a better or higher course, we are the final—the finish. Act now. Get a grip on yourself—take the big important step. Settle your career today. Our new catalogue, just out of press, will tell you how. Send for it.

IS THE MOON A DEAD WORLD?

(*Continued from page* 820)

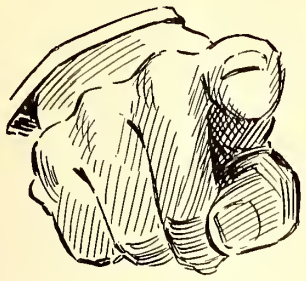
ered by Schmidt in 1862. Klein, later, saw this cleft very clearly at times and again looked for it in vain under similar observing conditions. Elger found it an easy object with a 4-inch telescope. The latter observer, a noted selenographer who has also observed changes in the appearance of other clefts queries whether these are not instances of recent change difficult to "explain away." He says in part—"The more the study of minute detail is extended the stronger becomes the evidence that in spite of the absence of an appreciable atmosphere there may be something resembling low-lying exhalations from some parts of the surface which from time to time are sufficiently dense to obscure or even obliterate the region beneath them." Of the nature of the lunar clefts or rills he feels we are "supremely ignorant." They are generally regarded as huge cracks in the surface due to shrinking and contraction of the moon.

A most interesting rill system, partly traceable in this same photograph, is known as the Triesnecker system. It can be found to the southeast of the Hyginus cleft and west and north of the conspicuous ring-plain Triesnecker which can be seen about an inch above and a little east of the northern rim of the photograph.

Photographs fail to show the great complexity of this remarkable system. In studying all the intricate detail of the lunar markings the human eye is vastly superior to the photographic plate. Moreover, all these minute details are only revealed piece-meal, as it were. A cleft or rill that is very distinct under a low sun will usually disappear entirely under high illuminators.

The best time to study the details of the lunar surface is therefore *not* at or near the time of full moon, but when the object in question is illuminated by a low sun.

Changes of tint in the interior of the Hyginus cleft were noticed by Klein. At some points the reflected sunlight was decidedly yellowish, at others white as if the cliffs were snow covered.



Tho on the whole the lunar atmosphere is comparatively rare it is by no means impossible that certain dense and heavy gases may exist locally in considerable quantities, in fact that carbon dioxide and water vapor so essential to the growth of organisms may occur within the lunar cracks, crevices and numberless pits and depressions in even greater quantities than they are found in the earth's atmosphere of which they form a relatively small proportion, the amount of carbon dioxide in the earth's atmosphere at sea level being only three hundredths of one per cent.

If certain forms of life do exist on the moon it is certain they would be found on the low-lying maria and within the gigantic cracks of the lunar surface and all of its pits and depressions rather than upon the high snow-covered plains and ramparts of the southwest quadrant.

That a sort of vegetation may exist in the deeper seas is not so improbable. Elger noted a decided sepia color in the Mare Foecunditatis and within certain ring-plains and craters and many observers have recorded that some of the seas are darker than others and that all show local changes of tone. Networks of streaks intermingled with dark spots and minute brilliant points of light have been observed on the maria under good atmospheric conditions and many have noted in addition that certain of the "seas" appear yellowish or green.

Do You Want A Complete, Compact Receiver at a Reasonably Low Price?

Here is an Outfit with Eight Distinct Features You Will Appreciate.

DE FOREST TUNER
Type T-200—$77.50
Wave Length
150 to 25,000 Meters

DE FOREST
Combination Audion-Ultra Audion and One-Step Amplifier, $73.50
(Type P-300)

1—That will respond to any and all wave lengths.
2—That is more flexible in coupling than any other system.
3—That has a lower distributed capacity, far less high frequency resistance and decrement values than any other type.
4—That eliminates cumbersome switches, inefficient taps and losses from dead ends.
5—That employs Vernier variable air condensers of unusual design, eliminating capacity effects due to operator's body.
6—That makes signals come in always louder and clearer than other types.
7—That cannot be surpassed in general efficiency, workmanship and beauty at any price.
8—That possesses the decided advantage of minimum table space. The Tuner measures 13⅜" x 12½" x 8". The P-300 measures 12½" x 9⅜" x 7¾".

DE FOREST Agencies are located in all Principal Cities. Ask your regular Electrical Dealer to get you DE FOREST Apparatus.

A 64-page Radio Manual containing circuits and many useful facts about Radio work and the best Apparatus will be mailed to you for 10 cents in stamps.

No longer is it necessary for you to have two or three expensive, cumbersome tuners cluttering up your operating table, when working all wave lengths.

Ask yourself when you buy your receiver, does it cover any and all wave lengths? Does it possess the other advantages of minimum table space and convenience in coupling embodied in ours? Do the electrical principles employed equal the Genuine DE FOREST "Honey Comb" Coil System of tuning? Then, compare prices!

The DE FOREST Company enjoys the distinction of being the first to inaugurate this unique tuning system which has met with such rapid favor, and you, the progressive Radio Experimenter, should take this opportunity to be among the first to install it in your laboratory. Find out more about it now. Write to

"AMRAD" Induction Coil
(100 Watt)
$28.50

Makes DC as good as AC

For radio stations depending upon farm lighting current, storage battery or dry cells for power, the

"AMRAD" Induction Coil

works as consistently as a transformer

Essentially the same as the coil used overseas during the great war, the AMRAD Induction Coil—as designed for amateur use — overcomes successfully all the difficulties experienced with other induction coils.

Built throughout on a high standard of workmanship, the AMRAD Induction Coil is guaranteed to give entire satisfaction.

Ask your dealer today to show you the AMRAD Induction Coil. If he does not have it, order from us direct, but send us his name and address.

Other AMRAD high grade radio specialties are:

AMRAD QUENCHED GAP
a commercial gap that lowers decrement and gives three to four times your present antenna energy. Strongly approved by your government inspector. Does not require a 500-cycle generator $17.50

AMRAD DETECTOR STAND
a rugged, accurate and reliable standby, invaluable for use alone or as an auxiliary to vacuum tubes. Duplex stand with selecting switch $4.50
Single stand, $2.50

For laboratory use these AMRAD products are standard:

MICA DECADE CONDENSER
Capacity .0999 mfds., thoroughly tested and accurate.

VARIABLE AIR CONDENSER
An exceptionally high type of air condenser with Vernier scale and automatic looking device.

VARIOMETER
An instrument of extremely fine workmanship and unusually wide range.

"TRANSMIT" "RECEIVE" SWITCH
A new type switch of extreme utility for radio work.

Folders describing any and all of the AMRAD products will be sent on request. If your dealer does not carry AMRAD goods, order direct from us, but send us his name and address.

Popular Astronomy

By Isabel M. Lewis, M. A.

IS THE MOON A DEAD WORLD?

(*Continued from page 822*)

The Mare Crisium containing about 70,000 square miles and considered to be the deepest of all the seas appears a light green under certain conditions. The central part of the Mare Humorum which is well shown in the accompanying photo taken by Ritchey with the 40-inch Yerkes refractor (see just south of the center of the eastern edge of the photo with the conspicuous ring-plain Gassendi on its border) has been described as a dusky green under good seeing conditions. This "sea" contains 50,000 square miles and is therefore about equal in area to New York State.

A class of lunar objects apparently very subject to change are the crater-cones that appear so frequently on the floors and walls of ring-plains and craters. Under high illumination they usually appear as white spots and the fact that they are associated with light streaks on the floors of craters seems to imply that they are volcanic vents. The lunar observer Klein firmly believed them to be volcanic and more recent observations substantiate this belief.

In October, 1916, Maggini observed reddish shadows spreading over part of the floors and walls of the crater Plato hiding temporarily one of the minute craters that dot the floor of this crater.

If active volcanic vents do exist on the moon we have here a source of supply of carbon dioxide and water vapor for the growth of lunar organisms in low-lying regions.

The blanketing effect of the carbon dioxide and water-vapor in our own atmosphere is well known and would tend there as well as here to mitigate the extremes of heat and cold at low levels.

A most interesting region of the lunar surface is to be found just north of the Hyginus cleft (see Mt. Wilson photo near center of the north edge). Here a mysterious black spot was discovered in 1877 by Klein which he described as a dark depression without a rim and one which he was sure he had never seen before tho he had scanned this region frequently during his twelve years of lunar observations. This spot was later observed by others under various solar altitudes appearing to many as "an ill-defined object with a somewhat nebulous border." In its vicinity lie two small craters and several low ridges. Whether this is really a new lunar marking is uncertain tho the evidence of change seems very strong.

Prof. W. H. Pickering, one of the chief selenographers of the present day, has recorded frequently many observations of lunar changes and his photographic atlas of the moon is well known. His observations are in accord with those of a number of other selenographers in indicating that activity upon the surface of the moon has not entirely ceased and that in fact our satellite may support certain forms of vegetation and even presumably of animal life in low lying regions where a comparatively dense gaseous medium whose chief components are carbonic acid gas and water vapor may well be found.

The high plateaus in the south west quadrant of the moon and the walls and peaks of the walled plains, ring-plains and craters that are massed there in the greatest profusion, most all observers are agreed, owe their dazzling brilliancy to a perpetual mantle of snow. The same dazzling whiteness also exists in the north and south polar regions of the moon.

On the whole, we may say that evidence that the moon is not an absolutely cold

www.americanradiohistory.com

and lifeless world is accumulating from many sources.

The most powerful telescope and the best seeing conditions are necessary to settle many of the questions of suspected changes as they are associated largely with the more minute markings.

Yet there are markings wherein changes are suspected that lie well within reach of very moderate instruments.

A four inch refractor or a six or eight inch reflector will show a number of lunar features not yet recorded on lunar maps.

There are many excellent and valuable lunar maps, in fact, the surface of the moon has been more carefully and accurately mapped than certain terrestrial regions, and there are in addition excellent photographic atlases obtainable so that the amateur who wishes to become acquainted with our nearest neighbor in space will find much helpful and valuable material at his disposal and if he pursues this line of study systematically and carefully he may find that his observations are of real scientific value.

The unsolved problems of the moon are many and perplexing and the true nature of its rays and rills, its craters and its maria still remains very uncertain in spite of many conflicting theories and so a wide field of investigation lies open to all.

QUESTIONS AND ANSWERS.

Question 1. Are the Pleiades the center of our stellar galaxy?

Answer 1. There is absolutely no foundation for this belief.

The Pleiades form what is known as a "loose moving star cluster" that cannot be, at the most, more than a few hundred light years from the solar system.

According to the recent investigations of Shapley the center of our galaxy lies, most likely, among the star clouds of Sagittarius at a distance of more than sixty thousand light years from the earth.

Question 2. Is the sidereal universe fathomless?

Answer 2. So far nothing is known to the contrary. We have as yet no reason to believe that the most powerful telescopes have penetrated to the limits of the universe and even if we were able to say definitely that we had reached the limit of our own particular sidereal system and that all the stars, star clusters and nebulae visible in our telescopes were units in one vast organization we would still be in doubt whether other systems might not lie beyond the confines of our own hidden from our view by some absorbing medium.

Question 3. What are "irresolvable" nebulae?

Answer 3. In small telescopes nebulae and star clusters cannot be distinguished from each other. As the magnifying power of telescopes increased it was found that many formations that had been formerly believed to be nebulae could be "resolved" by powerful telescopes into star clusters. Some astronomers then jumped to the conclusion that all nebulae could be resolved into star clusters in sufficiently powerful telescopes.

When spectroscopy was applied to astronomical research and the light of the irresolvable nebulae was analyzed, it was evident that some of these formations were truly gaseous and so never could be resolved into star clusters. The term irresolvable nebulae therefore has no special meaning at the present time when nebulae are classified as gaseous or continuous according to the type of spectrum they show. The continuous type to which the spiral nebulae belong might still be considered irresolvable to a certain extent since they have never been resolved into the stellar components of which they doubtless largely consist. Their true nature and relation to the stellar system is not yet definitely known.

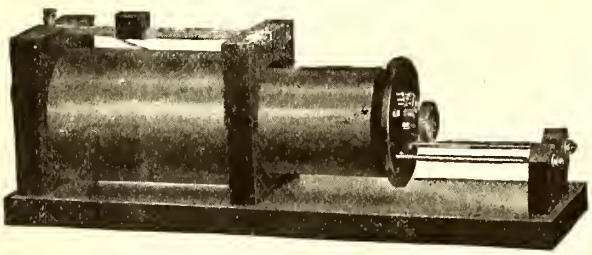
DUCK'S New Big 264-Page Wireless and Electrical Catalog Just Out—Now Ready

It is mailed for 12c in stamps or coin which may be deducted on first order of $1.00. Catalog not sent otherwise.

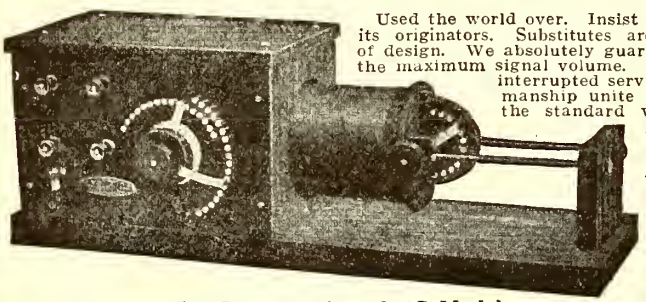


We regard this catalog as our greatest effort. It embraces everything in wireless worth while. 172 pages with no waste space devoted exclusively to wireless instruments. Your amateur friend will tell you that there never has been any wireless catalog to take the place of catalog of this company and above all that you can absolutely depend on our goods. There is no need for any other catalog when you have this big catalog.

A big improvement over our former model. Primary divided into four sections, with three dead end switches, greatly improving selectivity.

Secondary divided into three sections, with two dead end switches, eliminating harmonics. The change in the construction of the guide rod support makes it possible to obtain a looser coupling. It is a wonderful improvement over our old model both in performance and appearance. Only $23.50.

NEW MODEL 5BB. NAVY TYPE RECEIVING TRANSFORMER



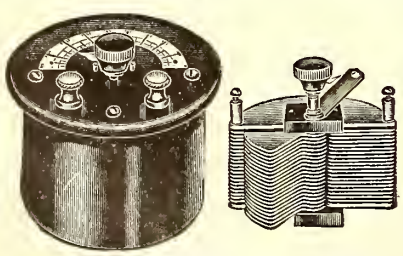
The secondary on our new type Arlington is divided into two sections with one dead end switch eliminating dead end effect and harmonic and giving greater selectivity. The end support similar to that on our Navy type permitting a looser coupling. It is a beautifully finished instrument and will be sold by us at the same price as the old model. $9.00.

OUR IMPROVED ARLINGTON RECEIVING TRANSFORMER

THE WILLIAM B. DUCK CO., 230-232 Superior St., Toledo, Ohio

TRACO QUALITY

RECEIVING TRANSFORMERS



Used the world over. Insist on the genuine, built by its originators. Substitutes are expensive, irrespective of design. We absolutely guarantee our tuners to give the maximum signal volume. Delicate refinement, uninterrupted service and high class workmanship unite to make TRACO tuners the standard whereby all others are judged. If you Dealer does not handle them, order direct from us.

Rohlfs Flies 34,610 ft.—New World's Record

(*Continued from page 760*)

never perfected until recently, and which practically *doubles the efficiency of an airplane engine at high altitudes.*

"In the future," said Chance M. Vought, Chairman of the American Flying Club Contest Committee, "airplanes equipt with these super-compressors will be able to attain heights hitherto regarded as impracticable; levels at which are found constant trade winds. These winds at various high levels can be found following courses suitable to almost any international trade route and can thus be utilized to tremendous advantage in aerial commerce. The airplanes equipt with this super-charger device will fly at greater speed at high altitudes than is now possible, and will have almost the same performance of speed and climbing power as at around sea level. Among the technical experts this invention is called 'a constant power device.'

"The Lepere biplane, equipt with a Liberty motor, which Major Schroeder used in the altitude flight, has a horizontal speed at sea level of 136 miles an hour. At an altitude of more than 20,000 feet this speed, owing to the rarity of the atmosphere and the decreased engine power, falls to 105 miles an hour. Equipt with the supercharger device, the horizontal speed at 28,250 feet was maintained at more than 130 miles, or almost equal to the best possible at sea level. Major Schroeder found the compressor consumed only 5 or 10 per cent of the engine's horse power, while at 15,000 feet altitude it added 40 per cent to the power-plant's effectiveness. At 20,000 feet, 48 per cent was added and at 28,000 feet, 60 per cent was gained.

"The super-compressor is a device to utilize the waste exhaust gases of the engine itself to operate a small centrifugal air-blower which forces an air stream into the engine at a constant pressure about equal to the normal suction of the motor at sea-level pressure and thus maintains engine functioning approximately the same as under the best conditions at sea level.

"Major Schroeder and his passenger wore electrically-heated clothing and oxygen helmets. The record shows that the temperature at 28,250 feet was minus 29 degrees centigrade.

Carnarvon Radio Station

(*Continued from page 778*)

transformers connected to each power line transform the current down from 10,000 volts to 440 volts at which power it appears on the main switchboard.

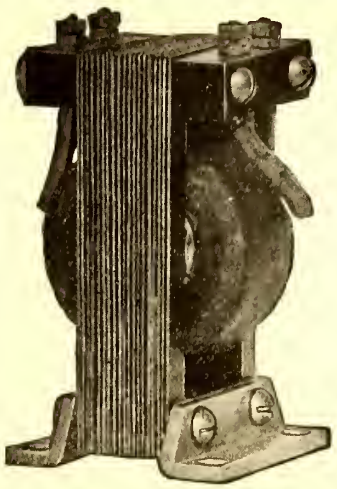
The main switchboard is of the Ferranti type and consists of 12 panels. From the feeder panel cables are taken to the main switch panel on which is mounted a hand-operated oil switch provided with *no volt* and *overload time limit* releases, a voltmeter, ammeter, kilowatt meter, power factor meter and frequency meter. The remaining panels on the board are equipt with switches and gear for the control of the motors driving the high tension direct current generators, the motors driving the alternator sets, the motors driving the low tension D.C. auxiliary machines, the high tension alternators, direct current motors, and of all the lighting, heating and various other circuits.

There are three distinct types of transmitters installed (1) the synchronous alternating current sets; (2) Marconi

www.americanradiohistory.com

"timed-spark" continuous wave machinc; (3) the arcs.

The synchronous A.C. sets are in duplicate and are of 300 k.w. capacity, each consisting of a 450 B.H.P. 440 volt 3-phase asynchronous motor driving a 300-k.w. single phase alternator, the working voltage of which is 1,750 volts. An extension of the alternator shaft drives the disc discharger thru an insulating coupling. The primary condenser bank has a capacity of 2.5 mfds and is charged by step-up transformers, the field of which can be adjusted so that the studs on the disc discharge the condenser at each peak of the alternation.



The timed spark continuous wave transmitter has two distinct primary circuits tuned to the same frequency and coupled to the aerial circuit. The condensers of these primary circuits are charged by 5,000 volt D.C. dynamos and discharged alternately by means of a special form of disc discharger so arranged that the trains of oscillations produced in the acrial by the successive discharges of the two condenser banks take place in phase with one another. This timing of the discharges is controlled by a trigger circuit which at a given instant ionises the gap between the studs and electrodes of the main circuits and enables them to discharge, special adjustments being provided for determining the moment of discharge. Signaling is effected by making and breaking the charging current of the trigger circuit, and as this current is only .5 amp. a very high rate of working is possible.

One of these transmitters of 300 k.w. capacity, capable of working at 200 words per minute, is already installed at the station and a duplicate set is in course of erection.

The 200 k.w. arcs are of the horizontal type and are fed thru choking coils and starting resistance from an 800 volt D.C. dynamo. The field of the arcs is separately excited from an auxiliary 110 volt D.C. dynamo which also supplies current for the pump motors, cathode motors, and spirit relays. Methylated spirit is automatically fed into the arc chamber which, with its lid, anode and cathode, is water cooled, a relay being provided in the water circuit to cut off the current to the arc should the water supply fail.

A special receiving station at Towyn is intended for all the receiving and operating work, and is provided with apparatus for duplexing the service. At Carnarvon, however, for special war purposes, recciving apparatus has been installed with a range of from 3,000 meters to 16,000 meters. The aerial is inductively coupled to an intermediate circuit which in its turn is coupled to an amplifying and self-heterodyning valve circuit. By means of magnifiers in the telephone circuit arrangements are made for either automatic reception at high speed, or to enable the operator to receive without wearing telephones. The signaling key for operating by hand is placed in the receiving room, where there is also a Wheatstone automatic transmitter capable of working at a speed of 200 words per minute. For this high speed working high tension signaling switches worked by a Creed comprest air engine is used for slow transmission. Galvanometer type signaling switches are provided, but both types can be operated from relays, either by the hand key or by the Wheatstone transmitter.

Altho the Carnarvon station is primarily intended to work to America it has successfully communicated with Sydney, Australia, thus proving that it is powerful enough to cope with any distance up to the limit of possible long-distance transmission on the earth, it being understood that modern receiving apparatus is employed at the Antipodes.—*Photos courtesy Marconi's Wireless Telegraph Company, Ltd.*

Vacuum Tube Socket
(Type Triode F)

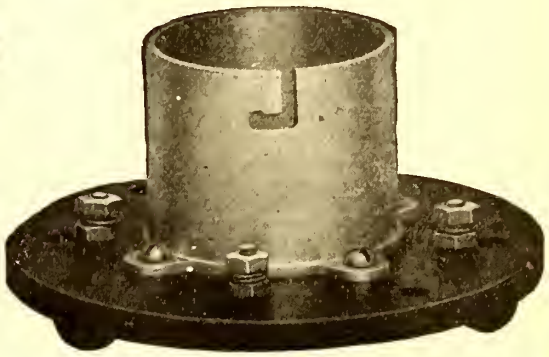
The base of this socket is bakelite dilecto and will not crack and break like the moulded material of the usual socket.

Contact springs are stamped with identifying letters. Base is provided with three rubber feet and four countersunk holes for panel mounting.

Price $1.25 postpaid

AUDIO FREQUENCY TRANSFORMER

Type P



This transformer provides a maximum of low frequency amplification and is superior to all others. It may be used with the Marconi and all standard vacuum tubes.

Permits reliable daylight reception from European stations.

Establishes new amateur long distance records.

Renders remarkable amplification of all signals.

Attention AMATEURS

You may want to purchase a coil, a transformer, a pair of phones, a battery or one of the many pieces of apparatus necessary to properly operate your set. What do you do? You write for catalogues—the result is you have a mass of data and just can't make up your mind what to buy and who to buy it from.

Our advice is DON'T BUY IT until you secure some expert's opinion on the piece of apparatus just suited to your needs.

Because we are partial to no particular manufacturer of wireless apparatus and because years of study and sales has enabled us to select wireless products with discrimination, we offer you absolutely without charge, the benefit of our FREE INFORMATION BUREAU which is maintained solely for the purpose of guiding the experimenter in the choice of apparatus which will, in our expert opinion, serve him best.

Of course we sell apparatus and there again our knowledge manifests itself because we carry the products of over 70 of the leading manufacturers of American made apparatus—therefore you are assured that what you buy is the attainment of modern efficiency in apparatus production.

We wish to strongly emphasize the fact that whether you buy of us or not, we want to help you in your problems, and the cost to you is but a two-cent stamp. Write to-day for our catalogue.

NATIONAL RADIO SUPPLY CO.,
"The Nation's Clearing House," Dept. 103, 14th and U Sts., Washington, D. C.

Wireless Amateurs, Dealers and Manufacturers!

Have You Seen the

"DEPENDABLE"

Line of Radio Instruments and Complete Sets?

We manufacture a large line of **DEPENDABLE** apparatus—not the cheap mail order variety, yet our prices are low. Tuners, Couplers, Detectors, Fixed and Variable Condensers, Loading Coils, etc., also Binding Posts, Switch Points, Switch Levers, etc., etc.

DORON BROS. ELECTRICAL CO. Hamilton, Ohio

Modern American Radio Apparatus

(*Continued from page 779*)

In this new system the machine that generates these electrical oscillations is known as the *Alexanderson alternator* which has the advantage of giving a *pure wave* by virtue of which messages sent by different stations do not interfere with one another. There is just as much improvement in this new system over the older method as there is between the modern balanced telephone line and the old single-wire telephone on which the cross talk of neighbors could be overheard.

A new device known as the magnetic amplifier is employed as a modulator of the electric oscillations. This new device has no moving parts and this fact, coupled with its magnetic properties, renders it so quick as to make possible the transmission of telegraph messages at the rate of several hundred words a minute and also enables the amplification of the modulations of the telephone currents into oscillations sufficiently powerful to carry the human voice across the Atlantic. In all the different radio systems the radiator is called the antenna and up to the present time the antenna has been very inefficient, the useful energy radiated amounting to from 5 to 10 per cent. In the Alexanderson system a multiple tuned antenna is an important feature and increases the radiation efficiency from 20 to 50 per cent.

The company has developed such high frequency alternators for radio work in capacities of 1, 2, 50, and 200 kilowatts. It was one of these 200 kilowatt machines that did such good work at the New Brunswick station during the war, so it is interesting to note that a unit of this size *radiates approximately 250 h.p. of energy into space when it is sending a radio message.* The peculiar advantages of this type of generator is that it gives out an undamped wave and puts such a large amount of energy into the antenna; factors which led to the rapid extension of the use of radio communication during the war, and also led to the building of so many new transmitting stations as well as the use of this means of communication for spreading propaganda.

Over and above the radio work referred to the company's radio developments were many and varied. A description of all the work done seems impractical, so to give a general idea of some of this work that had been completed or was nearing completion at the time the armistice was signed, it will be well to classify it as follows:

(a) Large size vacuum tube apparatus
(b) Medium size vacuum tube apparatus
(c) Small size vacuum tube apparatus
(d) Receiving apparatus

All these new developments were carried out under war-time conditions, at high pressure, and under numerous difficulties caused by the rapid change of requirements.

The term "vacuum tube apparatus" may need a word of explanation: it refers to that type of transmitter and receiver which makes use of the vacuum tube as an oscillator, amplifier and receiver. Such tubes are usually made of glass and generally contain three electrodes. The tube is exhausted and the Research Laboratory at Schenectady has done much notable work in producing a tube of higher voltage and greater power output than hitherto had been found possible. The physical properties of the tube, which is termed a "pliotron," are dependent upon the motions of the electrons set free from the heated filament in a nearly perfect vacuum. We shall refer at greater length further on to this subject.

www.americanradiohistory.com

Most radio apparatus, previous to the development of these tubes, employed what are commonly termed "damped waves," which means that for a portion of the time there was no activity. With the vacuum tube undamped waves are used in which there is no period of inactivity; this results in a higher efficiency.

In pre-war days the advantages of the undamped oscillations were well recognized and apparatus of this description had largely displaced the older damped apparatus on the score of greater efficiency, the ability to use the lower voltage, small size, and also because of certain advantages in reception; but this new type of apparatus had not been used to any large extent in the smaller radio outfits.

The war-time requirements of both the army and the navy were of a very special nature and called for a great number of small sized, short range radio sets of light weight and small cubic capacity; these features being particularly valuable in aircraft outfits. To meet these requirements, the vacuum tube apparatus was developed and was applied in several unique ways to the aircraft service, particularly in its application to telephonic communications. All sets developed by the company were arranged for telephonic communication on the continuous wave and telegraphic communication on both continuous and "chopt" wave.

Aircraft are of various sizes and therefore several different types of apparatus were designed to meet the differing requirements, but finally the design settled down to three types, each particularly suitable for a certain class of airplane. Thus the large size vacuum apparatus was primarily intended for bombing planes, flying boats, and balloons; the medium size for such craft as seaplanes and biplanes; and the small size for the smallest class of flying machines, which usually carry only one aviator.

SMOKE IT BEFORE YOU PAY FOR IT

Order on your Business Stationery

To introduce this new and better way to make a pipe we make this extraordinary offer, we will let you smoke this pipe before you pay for it. More than 10,000 BANKERS HAVE BOUGHT BY MAIL. Genuine French Briar, solid Vulcanite mouth piece. Its simple construction makes cleaning easy. Try it. If it is not satisfactory you may return it. Price $1.50. Straight or Bent Models. You breathe, not pull through this excellent pipe and we guarantee satisfaction.

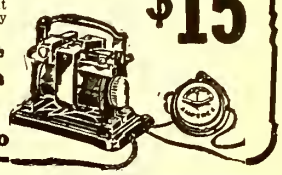
BATTERY CHARGED AT HOME

Do it yourself. Save money and keep battery at highest eF-Ficiency by getting a

NEW F-F BANTAM BATTERY BOOSTER

This 8 ampere rectifier charges any 6 volt storage battery from 100 to 130 volts 60 cycle, Alternating Current Lamp Socket and at an expense equal to burning an electric lamp for a few hours.



Simple—safe—sure acting. Infusible and long wearing carbon electrodes rectify the current. No drop in efficiency with continued use. This new size F-F rectifier already wonderfully popular—light in weight—10 lbs. complete ready for shipment—includes ammeter and battery clips. Get one and enjoy immunity from battery troubles.

Send check for prompt shipment by Express. For parcel post include postage and insurance charges.

Also F-F rectifiers of larger capacities as well as Charging Rheostats that operate from Farm Lighting Plants or Direct Current Service.

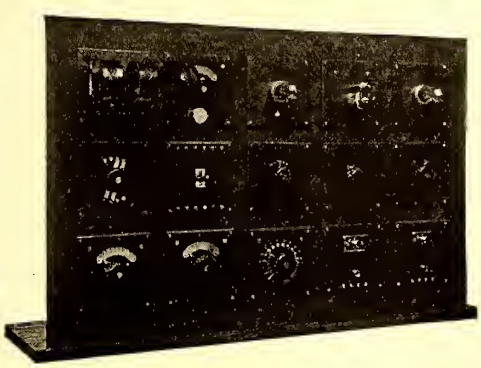
CHANGE OF PRICES

With Quantity Production and adoption of Automatically Wound Coils, we are glad to announce a Reduction in prices of our Amplifying Transformers as follows:

Type A-2 fully mounted with Aluminum Supports, Engraved Bakelite Dilecto Panel, and Nickel Plated Bind Posts.....$7.00



With Supports, but without Panel and Bind Posts $5.00

Assembled, but Unmounted.....$4.50

Although originally designed for use with VT-1 Tubes, these are now being used extensively and with excellent results with Marconi V. Ts.

ACME APPARATUS CO., 28 Windsor St., Cambridge, Mass.

DE FOREST
Unit Receiving Set
Gives You Better Apparatus at Low Cost.

This is a typical 15-Unit DeFOREST Receiving Set. Consists of a Tuner with wave length range from 150 to 25,000 meters; a Crystal and an Audion Detector, and a One-Step Amplifier. This Unit Set is the most-complete and-efficient receiving apparatus ever put out under $150.00. The entire set of Units shown above total only $133.57. They can be bought separately at their various prices.

The DE FOREST Unit Receiving Set offers the only practical system of securing accurately designed, efficient Radio apparatus without paying for expensive factory assembly and costly cabinets. You buy individual units and assemble them yourself; saving money and becoming more expert in practical work.

You can start with a few, inexpensive Units and increase as you progress, adding new Units as additions to the old. No junking of old apparatus. For the beginner, the DE FOREST Unit Receiving Set offers the most highly developed Radio instruments obtainable. And for the Amateur, Student, or Experimenter, this Unit Set holds even greater possibilities because by assembling and wiring the Units yourself you will become more expert and understand the principle of operation of the apparatus you are using. Find out more about the DE FOREST Unit Receiving Set.

Equivalent ashore from $40 to $50 a week. Graduates in all parts of the world as Inspectors, Instructors, Engineers, Operators, etc.

The oldest, largest and best equipped radio school in New England. Recommended by Marconi and Government officials. DAY AND EVENING CLASSES. START ANY MONDAY.

CORE WIRE

At Pre-war Prices, 20cts. lb.

We have been fortunate in securing thru auction several tons of guaranteed pure, double annealed **Norway Iron Core Wire** and are selling this wire to "Experimenter" readers at 20c lb.
This wire is just the thing for spark coils, transformers, etc., and it is, of course, a very much more superior product than the usual iron wire. We have only one size left:

24 INCHES LONG. Thickness about No. 21 B and S

If this size should be too long we advise cutting the wire down yourself by means of shears.
As long as the supply lasts we offer this wire as described above to our customers at the very low price of 20c a pound. Add postage or we will ship express collect. Order at once.

ELECTRO IMPORTING CO., 231 Fulton Street, New York City

The large size vacuum tube apparatus uses the largest type of pliotron that the company has developed and is adapted for use at fixt land bases for controlling the fleet movement of a large number of planes by telephone. Such sets radiate about 1½ horse power of energy and are capable of giving telephonic communication with a flying boat at a distance of at least 200 miles. Similar units were designed for installation on army tractors for field operation. These also had a range of 200 miles, and at the time the armistice was signed a number of orders were under way for radio telephone sets for this service. An aircraft unit using this large vacuum tube was designed which only weighed 70 pounds, exclusive of the storage battery.

An aircraft radio telephone unit using the medium size vacuum tube was developed, and is now being produced in large quantities. It has a telephonic range from plane to ground of a hundred and fifty miles and weighs only about 40 pounds, exclusive of the battery.

A great amount of work was done on a radio telephone set using the smallest size of vacuum tube and the weight had been brought down until the complete transmitter, exclusive of the battery, weighed only 25 pounds. This set had a range of 60 miles from the fixt station and communication was obtained over a distance of ten miles between two similar planes.

The vacuum tube, commonly called the *pliotron*, and mentioned so often in this story, deserves many chapters to cover the fascinating story of its development; particularly the truly wonderful scientific laws which govern its action and the almost unbelievable amount of work that was accomplished by this concern in supplying the needs of the army and navy with these tubes. The amount of progress that the world owes to these tubes is a source of just pride to the workers of the Research Laboratory at Schenectady where so much of the development work was done that led to their present highly developed state. But owing to there being so much that is of interest, we shall have to confine our remarks to one or two brief paragraphs.

The practical long distance telephone really owes its development to the pliotron, and the advances it has enabled to be made in wireless telegraphy are great and far reaching.

These tubes depend for their action on the emission of electrons from a heated cathode which crossing a gap arrive at the anode, thus conveying an electric current across the gap. The ability to produce high power tubes depends on many factors, but the most important is to obtain a very high degree of vacuum.

As soon as America entered the war and the requirements of the government were learned, two lamp factories were started on the wholesale production of the vacuum tube and provided equipment to turn out 20,000 per week. This concern supplied the army and navy with many thousands of pliotrons for the airplane and seaplane service and many hundreds of the complete wireless outfits already described.

Men talking across the broad expanse of the Atlantic ocean without a wire is romantic enough of itself, but what of an "Ace" with his radio set controlling the fleet action of a mighty host of flying battleships engaged in deadly battle miles up in the air.

It seems fanciful, but it is real that today we send men miles up into the air to obtain meteorological information of distant points and have the information telephoned back to us on earth. These are indeed messages from the ethereal blue.—*Photos courtesy General Electric Co.*

Ships Guided by Electrified Cable

(Continued from page 746)

to the experts of the navy who have tested it, and recommended its use, is fool-proof and as reliable as the telephone. It will work in all conditions of water and weather and no amount of electricity in the air or power of the wireless can affect it in any way.

Earl C. Hanson, who is only 28, has been granted basic patents on the system. During the war he donated to the government all his inventions.

Gen. Pershing directed Col. John H. Parker to secure the use of the device for communications in the first battle lines and trenches, and only the signing of the armistice prevented its universal use in the American Expeditionary Forces, it is said.

The cost of installation will be much less than the installation of lighthouses, buoys, lightships, and other fog signals, with the added advantage that the system works without interruption from storms or fogs or other atmospheric conditions, claims the inventor.

It is difficult to estimate the economical saving that will be brought about by the universal installation of the Hanson system, which is applicable to any type of harbor. It may be considered as a refining feature of the *radio compass* which was developed under the direction of Capt. S. C. Hooper, of the radio division, bureau of steam engineering, Navy Department. R. H. Marriott, expert radio aid of the Navy Department, has conducted tests using the audio system for guiding ships in tests on the Pacific Coast with gratifying results.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912, of Electrical Experimenter, publisht monthly at New York, N. Y., for October 1, 1919.

State of New York, County of New York—ss.

Before me, a Notary Public in and for the State and county aforesaid, personally appeared Hugo Gernsback, who, having been duly sworn according to law, deposes and says that he is the Editor of the Electrical Experimenter, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations:

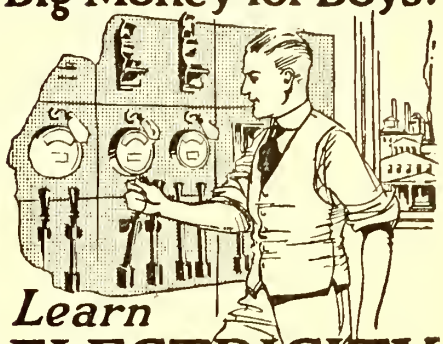
1. That the names and addresses of the publisher, editor, managing editor and business managers are: Publisher, The Experimenter Publishing Co., 233 Fulton St., New York City; Editor, Hugo Gernsback, 233 Fulton St., New York City; Managing Editor, H. W. Secor, 233 Fulton St., New York City; Business Manager, R. W. DeMott, 233 Fulton St., New York City.

2. That the owners are: Experimenter Publishing Co., 233 Fulton St., New York City; Hugo Gernsback, 233 Fulton St., New York City; Sidney Gernsback, 233 Fulton St., New York City; H. W. Secor, 233 Fulton St., New York City.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company, but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is —(Required only of daily publications.)



(SEAL.) H. GERNSBACK.

Sworn to and subscribed before me this 9th day of Oct., 1919.

BEATRICE K. OWEN.

(My commission expires Mar. 30th, 1921.)

Big Money for Boys!

Learn ELECTRICITY

There is a wonderful opportunity right now for boys who like electricity. Boys who are ambitious and will train themselves in spare time can step into positions just as soon as they are ready. Good salaries are offered to start with splendid chances for rapid promotion.

For 28 years the International Correspondence Schools have been training boys for success in electricity and over 200 other subjects. They will help you prepare right at home for a position in the line of electrical work you like best—or in any other work that appeals to you. Thousands of boys, through I. C. S. training, have stepped into fine jobs, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least, and it will bring you information that will start you on a successful career. This is your chance. Don't let it slip by Mark and mail this coupon *now*.

TEAR OUT HERE

WIRELESS MEN:

The Second Edition of

THE CONSOLIDATED RADIO CALL BOOK

will be out January 15

Meets a timely and urgent necessity among radio and steamship companies, professional and amateur radio operators, and those having need of authentic and practical information on radio calls; radio, telegraph and cable rates, special signals and general radio procedure.

All Amateur Calls Now Listed

In addition every vessel and land station in the world is represented and listed alphabetically, according to names of vessels or land stations, and according to call letters; Revision of American coastal stations under U. S. Naval control, and their new calls.

That new and great aid to navigation—the radio compass—is explained and is a unique feature of this publication, that will be of special value to masters of merchant vessels. This book contains all calls listed in the new book to be published by the Department of Commerce.

Price, $1.00 Prepaid

Cash, money order or check. Act quickly as after supplying Commercial Wireless Companies with copies already ordered, individual orders will be filled in order of receipt.

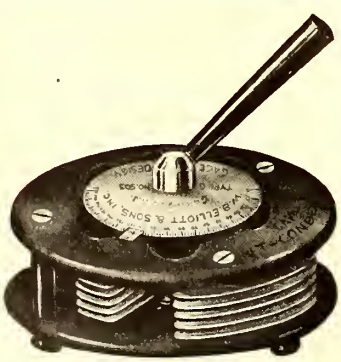
CONSOLIDATED RADIO CALL BOOK CO., Inc., 41 Park Row, New York City

This book will also contain the advertisements of practically every leading company in the radio field.

Special Sale of U. S. Army Air Service Hot-Wire Ammeters

Imagine the increase in transmitting range one of these highly efficient Roller-Smith Hot-Wire Ammeters will bring you. A sharp wave, with maximum energy on one hump under all weather conditions; rapid adjustment to various wavelengths; increase or reduction of energy to work a certain station,—these are some of the advantages that can be yours.

Regularly $13 Our Special Price, $7



These Ammeters are of the flush type and were made for the U. S. Army Air Service for use on fighting planes. With the Armistice came a cancellation of contracts and these Ammeters, which had successfully passed the exacting Government tests, were returned to the manufacturers. Each is in perfect condition, packed in its original carton and ready for immediate shipment.

The scale reading is: 0-2.5 Amperes.

Shunt giving double or triple this range, 75c extra.

By buying the entire surplus we are able to sell these Ammeters at less than the Government paid for them in lots of one thousand. Better order one today as they are going fast. Remit by check or money order. Dealers write us, we have an attractive proposition for you.

A. H. GREBE & CO., 70 Van Wyck Blvd., Richmond Hill, N. Y.

VT CONDENSER
TYPE G
CAPACITY .0003 MFDS.
PRICE $2.75

VACUUM TUBE CONDENSER

For Oscillating Circuits

This condenser has been especially designed for us by E. G. Gage, well known in Radio circles for many years as a designer of Government Radio Apparatus. For oscillating circuits it will be found particularly valuable owing to the following features:

Adjustable constant pressure bearings giving smooth adjustment with light touch.
Angular handle which prevents body capacity.
Adaptability to panel mounting.

FOR RADIO OPERATORS.

An S. O. S. call for radio operators has been sent out by the United States Shipping Board.

All Shipping Board vessels carry one or two wireless operators. During the war many radio operators were trained. Any who desire employment, Shipping Board officials recently stated, have only to secure a radio operator's license, which is issued by the Department of Commerce after passing the required examination.

Under the new wage scale of the Shipping Board the first operator, who is in charge on vessels where two operators are employed, is paid $125 per month and the second operator $100 per month, *in addition to all expenses.* The radio operator is considered an officer and is provided superior accommodations.

All radio men who are qualified radio operators and who desire to be considered for the service should communicate with the Radio Department Division of Operators, United States Shipping Board, Washington, D. C.

Did the Romans Have Wireless?

(*Continued from page* 747)

Solaro, 1,980 feet. Signals were probably not sent from here, but from the eastern headland. The Pharos was about 1,000 feet above sea level. A line drawn from the Pharos to Monte Circeo, on the Campanian coast, just grazes the Island of Ischia; but the line of sight would be well above the island, as the summit of Circeo is 1,775 feet.

"A suggested line of stations with no range more than 44 miles long is submitted to those of a speculative turn of mind. (See illustration herewith.) Rome to Monte Cavo, in the Alban Mountains, 18 miles; thence to Monte Circeo, 39 miles; thence to Monte Massico, 44 miles; thence to Capri, 44 miles. A Pompeian fresco of quite recent discovery shows Monte Cavo as being very conspicuous when viewed from the Palatine Hill. The clear summit is boldly visible. Perhaps the Palatine Hill was the 'sending' station in Rome."

Sound and Flash Ranging in the A. E. F.

By Prof. Augustus Trowbridge

(*Continued from page* 759)

A survey by means of sound is based on the assumption that sound travels from the gun in a spherical wave at a known rate (about 1100 feet per second) in still air at a given temperature; an increase in temperature increases this rate by a known amount; if the air is not still but blowing with a known speed in a known direction the apparent speed of sound under these conditions may be calculated. If the *time of arrival* of the sound of a gun is measured at three surveyed points on the ground, the position of the gun can be calculated as will be evident from the accompanying diagram in which G is the gun, P_1, P_2 and P_3 any three surveyed points within the friendly lines at which instruments are placed capable of indicating electrically on a recorder at a central station the times of arrival (t_1, t_2 and t_3) at them, of the sound of the enemy gun.

These Up-to-Date Books Will Save You Money

No 5—WIRELESS CONSTRUCTION AND INSTALLATION FOR BEGINNERS describes in detail with working drawings, how to make simple but efficient sending and receiving sets at lowest possible cost. 73 pages. 66 illustrations.

No. 3—LESSONS in WIRELESS TELEGRAPHY should be owned by every amateur. 35 clear lessons covering all principles from aerials to end losses and audions, so you can understand how they work.

No. 6—EXPERIMENTAL WIRELESS CONSTRUCTION with working drawings and detailed instructions for building spark coils, transformers, tuners, couplers, condensers, detectors, etc. (More advanced than No. 5 book.)

HOME MADE ELECTRICAL APPARATUS (in 3 parts), with details and working drawings, taken from real apparatus. Vol. 1—Static machines, batteries, storage cells, rectifiers etc., etc. Vol. 2—Voltmeters, ammeters, telegraph and telephone instruments, shocking coils, spark coils, experiments, etc. Vol. 3—Dynamos, motors, electric engines, miniature lighting, wireless, Tesla coils, electroplating, etc.

Complete Radio Outfits

Learn wireless telegraphy with real radio outfits that receive messages up to 1,000 miles and send them from three to five miles. Complete sending sets contain spark coils, condensers, spark gap and oscillation transformer. Radio receiving sets composed of loose coupler, Radio or Audion detector, telephone receivers, insulator and ground wires. Authoritative book on wireless and instructions in each set give the wireless code and tell you how to rig up your outfit. These are radio outfits of the most approved type. Write to-day for complete catalog.

Sending and Receiving Outfits

One of our complete sending and receiving sets is shown at the left. It has a very sensitive receiving outfit of the most modern type and a sending set, with aerial switch and key, that conforms to Government regulations in every way. We'll send you sets direct if your dealer hasn't them. Price $5 to $65 (Canada $7.50 to $97.50).

The A. C. Gilbert Company

If the sound arrives at P_1 at time t_1 and at P_2 at time t_2, then the interval t_2-t_1 must be the time necessary for the sound to travel the distance r_2 where $r_2 = V(t_2 - t_1)$ if V is the velocity of sound in still air at some standard temperature. Also $r_3 = V(t_3 - t_2)$. One can of course reverse the above reasoning if the intervals $(t_2 - t_1)$ and $(t_3 - t_1)$ be known, by drawing circles of radii r_2 and r_3 around P_2 and P_3 respectively and drawing tangent to these circles and through the point P_1 a third circle $P_1 Q_1$, at the center of which the gun must lie if there be no wind or temperature corrections; if these have to be made a slight and calculable shifting of the point G results.

The method just described would be an entirely correct graphical one to employ in calculating a gun's position from the observed time intervals, but it was found too slow and slightly too inexact for practical use, and therefore *plotting boards* were prepared by a method involving the principle of that just described but which permitted the use of strings in place of lines drawn on the board; also in practice six instruments P_1, P_2, P_3, P_4, P_5, P_6, were used instead of the three theoretically necessary in order to insure greater accuracy and to allow of work being carried on while one or two of the instruments might be temporarily out of order because of the electrical connections to "central" being cut by shell fire.

One of the accompanying illustrations gives an idea of the character of the photographic records from which sound ranging locations were made; the six horizontal lines between the two rows of perforations are the records of the six instruments P_1 — P_6; the heavy short vertical lines, the rather faint long lines and the very faint long lines are respectively half-seconds, tenth seconds and hundredth seconds recorded by the means of a very accurate tuning fork. When the sound of a gun reaches the instrument P_1 (for example) the top element of the record shows a "nick" in the line, and as the sound reaches the other instruments "nicks" appear in the corresponding lines and the time intervals $t_2 - t_1$, etc., may be quickly read off by counting the number of tenth and hundredth seconds between the "nicks."

An idea may be formed of the accuracy of sound ranging locations from the accompanying diagram in which the actual gun positions are plotted from a survey made after the position had been captured by our troops; this survey was made by army topographic officers who were not themselves interested in proving or disproving the accuracy of sound ranging. The surveyed gun positions are marked with a small square. The locations made by the sound rangers had been rated when reported to the artillery according to the actual probable error as follows: A location reported "P" (none in the case of this battery) was probably accurate to within fifty yards; a "Q" location (marked with a small circle) accurate to within a hundred yards; an "R" location, 150 yards and a "RR" location, 200 yards, marked respectively as dots and crosses. Had the estimate of probable accuracy been correct, all the crosses should have been *outside* the outer oval figure; all the dots should have been between the outermost and the next oval; the circles should have been in the next region, etc. It will be seen that the estimate of accuracy was much too conservative. The triangle marks the average of all the sound ranging locations on this battery and is less than 20 yards in error. The scale of the drawing is such that the large square represents a square kilometer. The sound ranging instruments were about eight kilometers (five miles) distant from the battery.

Sound ranging was also used to direct the fire of the friendly artillery on invisible

One of the Greatest Achievements of Science and Invention.

Hammond
MULTIPLEX

"Many Typewriters In One"

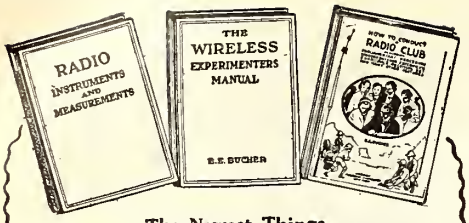
For the Mathematician, Engineer, Chemist, Astronomer, Surveyor, Navigator—there is no typewriter like the Multiplex Hammond! The Multiplex does many things that *no other typewriter* can do!

The Mathematical Multiplex contains the characters and signs used for writing in higher and lower mathematics, and for engineering, mechanics, etc., as well as for all the ordinary work that can be done on any typewriter. Just note these fine styles of Multiplex type—

TWO STYLES OF TYPE, or *two to five different languages,* carried on the machine AT ONCE. "JUST TURN THE KNOB" and change *instantly* from Roman Type, to *Italics,* or Miniature Roman, or our Beautiful Script Type, or from English to Greek, Russian, German, French, etc. *Any other type or language can be substituted in a few seconds.*

The above gives a slight idea of the versatility of the Multiplex which has literally revolutionized typewriting—has changed it from monotonous commercial work to the beauty of fine printing and engraving.

WRITE FOR FREE BOOKLET showing the many languages and type sets of the Multiplex—there's a type for every profession, every business, every science, including technical signs and symbols and chemical keyboard.



Fill out the Coupon and mail to us *now*—before you turn this page and possibly forget. You incur no obligation.

Also—an Aluminum PORTABLE Model
For Traveling—for home. Weighs about 11-lbs. Full capacity. Ask for special folder.

The Newest Things
IN WIRELESS
Are in These Three Books
Just Off The Press

RADIO INSTRUMENTS AND MEASUREMENTS
Every amateur should have this book as it answers the questions you want to ask and covers all phases of the subject matter indicated by its title.
Cloth Bound, 320 Pages. Price $1.25

THE WIRELESS EXPERIMENTERS' MANUAL
By E. E. Bucher
Mr. Bucher's latest book. The only one that comprehensively covers all phases of wireless work, including the latest practices in both Radio Telegraphy and Telephony. Most complete text book on these subjects yet published.
Cloth Bound, Approximately 300 Pages. Price $1.75

HOW TO CONDUCT A RADIO CLUB
By E. E. Bucher
One of the most popular wireless books ever published. Covers parliamentary procedure, indoor and outdoor experiments, 5,000-mile receiving sets, use of vacuum tubes and many other subjects.
Paper Cover, 148 Pages. Price 50c

THE WIRELESS AGE
A monthly magazine that will keep you posted on the up-to-the-minute things in wireless communication. Official organ of the National Amateur Wireless Association.
Price Per Year $2.00

SPECIAL COMBINATION PRICE
All Four for Only $4.50

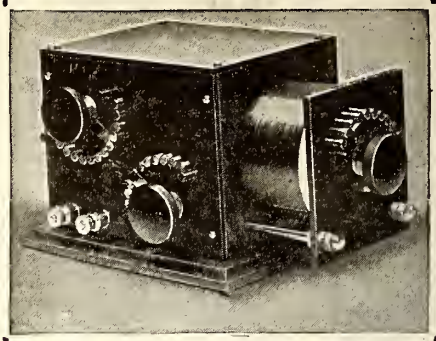
They work on any aerial or loop. Wiring diagrams on bottom. Coils machine wound and set in wax. No delicate tuning. Foreign orders solicited. Catalog free. Agents and dealers wanted. Price $15 delivered to you.

TRESCO, Davenport, Iowa

THE MIDGET SLIDE RULE will solve any problem in addition, subtraction, multiplication, division and proportion. A Log-Log Scale gives any root or power of any quantity. Gives Logarithms, Sines, Tangents, Cosines, Cotangents and the decimal equivalents of fractions to six figures. It is grease and water proof and will give years of service. This rule is not to be compared with the paper utility rules which sell for $1.00 and are put together with paper fasteners. It is accurate, simple to operate and comparison shows that it is undoubtedly the fastest and most complete rule made. Our refund guarantee protects you from loss or disappointment. An instruction book 16 pages, 12 illustrations, is sent with each rule. Diameter of rule 4 in. Made in two models: Metal (white coated steel), $1.00; White Celluloid, $1.25. Leather Case 50c extra. Send for catalogue of Slide Rules. Your money back if you are not satisfied. **Gilson Slide Rule Co., Niles, Mich.**

targets; the method was similar to that employed for the location of the enemy guns but with the difference that it was the report of the burst of the friendly artillery's shells that was recorded instead of the report of the enemy gun. When the target was an enemy gun which had recently fired and been located by the sound rangers, the accuracy obtained in ranging the friendly artillery was extremely great, since no uncertain wind and temperature corrections had to be applied, as the effect of wind and temperature on the records of enemy gun and the shells of the friendly artillery was the same and therefor could be disregarded.

An idea may be gained of the *amount* of artillery information supplied by the flash and sound ranging sections from the following extract taken from the report of the artillery information officer of one of the American corps. This officer had at the time as sources of information three American sound ranging sections, two American and three French flash ranging sections (later three American and two French flash ranging sections) aviation and observation balloons. During a period of three weeks of rapid advance, 425 separate locations of enemy batteries were made; of these the two American flash sections reported 63 per cent; the three French flash sections reported 16 per cent, and the three American sound sections reported 21 per cent. In a period of two weeks, when the advance had been temporarily checked by the enemy, the total number of locations was 392, and the percentages were: From the three American flash sections 38 per cent; from the two French flash sections 8 per cent and from the three American sound sections 54 per cent. In another and very active sector the figures were: During a period of three days' preparation for an advance, sound locations 22, flash 22; balloons, 0, aviation, 0. During a period of sixteen days of rapid advance; sound 4, flash 46, balloons 30, aviation 15. During a period of four days of stabilization; sound 6, flash 34, balloons 13, aviation 15. These figures are fairly characteristic. During preparations for an advance, both the sound and flash sections are very useful sources of information. During rapid advance the sound rangers do not get into action as often as the flash, because of the greater technical difficulties. During this period the major part of the information comes from the aerial observation.



American flash and sound ranging sections were operating on the front from March, 1918, until the armistice and always in sufficient numbers to cover the sectors held by American troops, except for a portion of the front of the Argonne offensive when the line was moving extremely rapidly. The work of the officers and men of the 74th Engineers engaged in this service was of a very high order, and their untiring watchfulness was often the indirect means of saving the lives of countless of their fellow soldiers by affording the information needed to silence the fire of the enemy guns.

SOUND AND FLASH RANGING IN THE A. E. F.
[Editorial Notes.]

No microphones were used by the A. E. F. in sound ranging. Also no earth-borne vibrations used.

The Bureau of Standards made exhaustive tests for several years, not to mention hundreds of tests conducted by the U. S. Army Corps of Engineers, which have demonstrated that it is not practicable to endeavor to use sound wave transmission thru the earth. This is so for one basic reason, viz.: That the velocity of sound varies for each different kind of earth, such as damp earth, wet earth, dry earth, rock, sand, chalk, etc.

What was used, then, in the A. E. F., when the U. S. Army Corps of Engineers who took charge of all this work during the war on the whole American front (every yard of which was fully protected by this apparatus for accurately locating the German guns from the time that the first American troops went into action) until the close of the war? No sound vibrations thru the earth, to begin with, and no microphones.

When Colonel Trowbridge arrived in France, he was given charge of this work for the A. E. F., and was appointed to the staff of Gen. Pershing at Headquarters. Very shortly, and in conjunction with some laboratory work which has been carried on in the Palmer Physical Laboratory at Princeton University, an entirely new method of "Sound Ranging" was developed. In the first place, sound vibrations as transmitted thru the *air* were used in contra-distinction to the sound waves originally used, which were transmitted thru the *earth*. A new sound translating device was constructed for the purpose, which yielded wonderful results. This instrument comprises nothing else than a series of fine, electrically heated wires, forming a *grid*. This grid of fine wires which were heated red hot by a strong current transmitted from the central station of a given sound-ranging sector, was suddenly cooled *by the blast of the onrushing sound wave* transmitted thru the air whenever a German gun was fired, even though it was four to five miles away.

To begin with, the velocity of sound wave propagation was constant to a very close degree, and this insured the success of the new system from the start. When the sound wave reached the location of the thermal sound detector, several of which were installed on well charted locations, there was caused a variation in the air at this point.

To intensify this effect, the next step was to place the grid device, which was a small affair, on to some acoustic resonating chamber which would be affected in a more or less pronounced manner so as to reinforce pneumatically the local effect of the air wave variation when it arrived.

At first, English "whiskey jugs" were used, and the grid thermal detector was clamped to the top of the jug. When the sound wave arrived in the vicinity of these jug detectors, a puff of air would rush into the jug, and out again, thus causing a variation in the heating of the wire and this partial cooling and change in the heating would change the resistance of the line, and cause the recording apparatus at the central station to register a "wiggle" on a rapidly moving photographic paper strip such as here shown, which corresponds to the enemy gun or guns. Later, several important and unique features in connection with this very interesting sound detector, were observed and put into effect. Due to the fact that the soldiers used to smash the jugs repeatedly in an effort to see whether there was any whiskey inside, researches were quickly made, and finally gasoline and kerosene cans came into use. The grid was now clamped on the opening of the can, and presently it was discovered that in order to render the device more quickly damped in its operation, and to give but one deflection on the record, that this quality could be effected by simply punching some small holes around the can, so that the opening where the air enters the can when the sound wave arrives, did not tend to keep vibrating; but due to the air escaping thru the small holes, it would damp out quickly.

The only really special apparatus required, was the recording instrument which comprised an Einthoven string galvanometer provided with six strings or wires

Go to School at Home!

HIGH SCHOOL COURSE IN TWO YEARS

YOU ARE BADLY HANDICAPPED if you lack High School training. You cannot attain business or social prominence. You are barred from a successful business career, from the leading professions, from well-paid civil service jobs, from teaching and college entrance. In fact, employers of practically all worth-while positions demand High School training. You can't hope to succeed in the face of this handicap. But you can remove it. Let the American School help you.

FIT YOURSELF FOR A BIG FUTURE This Course, which has been prepared by some of America's leading professors, will broaden your mind, and make you keen, alert and capable. It is complete, simplified and up-to-date. It covers all subjects given in a resident school and *meets all requirements* of a High School training. From the first lesson to the last you are carefully examined and coached.

USE SPARE TIME ONLY

Most people *idle* away *fifty* hours a week. Probably you do. Use only one-fifth of your wasted hours for study and you can remove your present handicap within *two years*. You will enjoy the lessons and the knowledge you will gain will well repay the time spent in study.

TAKE 10 LESSONS FREE So that you may see for yourself how thorough and complete our training is. We invite you to take *ten lessons* in the High School Course—or any Course of specialized training in the Coupon below—before deciding whether you wish to continue. If you are not then satisfied you are not out one cent. *We absolutely guarantee satisfaction.* On that basis you owe it to yourself to make this test.

Check and mail the coupon NOW for full particulars and Free Bulletin.

tightly suspended in a very powerful magnetic field. These galvanometers were built by a large American telephone concern under rush orders from France. Time division marks on the charts on which the records were made, were produced by a clever revolving toothed disc driven synchronously in front of the beam of light from a 24 C.P., 6 volt, battery lamp, and projected on to the photographic paper strip. All of this apparatus was straightway provided. This photographic recorder carries a large roll of sensitized paper strip, and when set in motion a large drum carries the paper around in front of the shutter, exposes it, cuts the exposed section off, puts it thru a developing and fixing solution and turns it out on the receiving tray—all of these operations taking place in about *three-quarters of a minute!* So much for this recording apparatus at present.

The next point of interest leads us to the front line trenches and their vicinity, where sound ranging posts were stationed. The observers were sometimes stationed in dugouts *in advance* of the front line trenches. Each observer had a switch or key, and a telephone of course. Whenever he saw or heard the enemy's gun fired, he immediately prest his key, which operated a series of relays connected by means of wires running back to the recording station of that particular sound ranging section. One of the relays closed the grid current circuit thru the hot wire grid on the whiskey jugs or gasoline cans, which were sprinkled over the field in the vicinity of the front line trenches. Another relay started the recording apparatus in motion. The incandescent lamp burned all the time in front of the galvanometer telescope. Thus, it is shown that by the time the sound wave arrived from the gun fired, which may have been anywhere from two to eight miles away, the apparatus was in full operation and ready to record the "bursts." The method of arranging the various sound wave detectors along the arc of a circle is described in the article by Prof. Trowbridge.

The American type of air wave "sound detectors," were arranged of course to deflect the rain and other elements. The proper current was maintained thru each hot wire grid in the following manner. When the grid was installed, its resistance was noted as marked on a tag accompanying it. All circuits operated in the A. E. F. were full metallic (two wires), and no ground circuits were used under penalty of court martial and a possible sentence of death. This was done to prevent the enemy from intercepting any signal (telephonic or telegraphic) due to leakage from grounded circuits. The wires were No. 12 heavy rubber covered conductors.

This is the first authentic account of what a wonderful branch of military science "Sound Ranging" has become.

INDEX TO
ELECTRICAL EXPERIMENTER SCIENCE & INVENTION
FOR VOLUME 1, 2, 3, 4, 5

This index contains 24 pages and shows every article of interest that has been published since the inception of the magazine up to and including April, 1918.
It is absolutely indispensable to everybody interested in any kind of electrical research work. With it everything of importance in the advancement of electrical science during the last five years can be readily found.

THE INSTRUMENT OF QUALITY
Sonora
CLEAR AS A BELL

Semi-Permanent Silvered
PHONOGRAPH
NEEDLES

Make your records last longer and play better!

THE ordinary steel needle fits the record groove when it is new. It wears rapidly, however, and being tapered tends to shear off the sides of the groove as shown above. This results in poorer tone and shortened record life.

Sonora needles have parallel sides and as they slowly wear down they fit the groove perfectly *always keeping the record in ideal playing condition.* Sonora needles are designed for use on ALL MAKES of steel needle lateral cut records.

These Sonora needles play many times, are more convenient, save constant needle changing and mellow the tone. These needles give the maximum of satisfaction and are the most economical ultimately.

FREE! A sample needle will be given FREE so that you can prove its merit for yourself. Write for yours today.

The "Finer Workings" of Static Electricity

By Frederick Von Lichtenow

(*Continued from page* 774)

maximum value. The charge thus gained is then applied to the pith ball hanging from its insulating support, which was made use of in the preceding experiment (pith ball to be first neutralized, of course), with the result that the light body will be strongly repelled by the El-cover. This shows, that the former is fully charged. (It will retain the charge for quite a while!)

A sheet of glass, about 1/16 thick, of a somewhat smaller size than the hard rubber plate, is then placed between the latter and the metal cover (Fig. 2) and the charging process gone thru as before. The spark discharges will in this case, naturally, be of a weaker nature, but the polarity of the sparks will in both cases be the same, that is +, which is manifest thru the repulsive action upon the charged pith ball.

Simple as the experiment itself is, its underlying principle is of a more complicated character. There seems to exist only one tangible explanation for the whole action, which, broadly speaking, touches upon the condenser principle in *a modified form.* It is well to observe, that the glass, not being a conductor, will not take a charge directly applied, but will hold such of opposite sign (+) to that of the charging body (—) on its face next to the same *as long as it is in contact with the latter,* while this induced charge, on the other hand, superinduces such of, again, opposite polarity (—) upon the upper surface of the glass sheet.

What finally becomes of both these induced Electro-static charges remains an open question, since the glass plate can not be tested for its respective former polarities after being removed from the charging body; and so this particular problem winds up in a case of *"Spurlos Versenkt"!* The fact remains, that, in the above connection, a negative charge is found upon the glass's upper side and is retained there (it is never repelled there as it would on a conductor!) gradually diminishing in value with that upon the hard rubber plate.

For the sake of the uninitiated or some "Doubting Thomas" and to emphasize the fallacy of another possible (on their part) version of the principle action, I may state here, that in the above case the original charge *does not penetrate,* unchanged in sign and simply lessened in power *thru the sheet of glass,* for this fact alone would be sufficient to eliminate the use of glass for a condenser—as well as insulating—purposes and, for that matter, would have done so long ago.

The diagram in Fig. 2A. shows the distribution of the electrostatic charges upon the various parts of the apparatus, while the latter are in electrical contact with one another.

EXPERIMENT NO. 3.

(Inductive Action Upon Neutral Body)

This experiment, although again simple in its conduction, "Teaches a lot", as it demonstrates the inductive action of an electro-static charge upon a *neutral* object, from start to finish, in a very clear manner.

In order to make such a clear demonstration possible, a neutral insulating body (sheet of glass or hard rubber) is needed in conjunction with the other necessary instruments; electrophorus, insulating stand, and suspended pith ball, with which alone the very fine inductive action can be worked out only to a certain, limited extent.

The addition of the *sheet of glass* is *essential, because it "slows down," as well*

(*Continued on page* 839)

DRAFTING

Learn at Home!

Employers everywhere are looking for skilled draftsmen. They are offering splendid salaries, and good positions are always open.

No line offers greater opportunity for advancement. Drafting itself not only commands good pay, but it is the first step toward success in Mechanical or Structural Engineering or Architecture.

There is an easy delightful way in which you can learn right at home in spare time. For 28 years the International Correspondence Schools have been giving men and women just the training they need for success in Drafting and more than 200 other subjects. Hundreds of thousands have stepped into good positions through I. C. S. help but never were opportunities so great as now.

Let the I. C. S. help *you.* Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least and it will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon now.

TEAR OUT HERE

"EVERYTHING FOR THE EXPERIMENTER"

A Few Interesting Things from Catalog No. 21

Treatise on Wireless Telegraphy by H. Gernsback, Editor **Electrical Experimnster** and **Radio Amateur News**—13 big pages, 3 illustrations.

The Wireless Law of 1912—all about it, what you can do and what you can't.

How to receive and send Radio messages.

How far you can send messages.

Table of wave lengths, of principal U. S. & foreign Radio high power stations.

How to receive time signals by Radio.

How to construct an amateur aerial.

How to use the test buzzer.

How to join the "Radio League of America" FREE, including application blank.

How telephone receivers are wound and built, tested and magnetized, 3 pages, 2 illustrations.

Experiments with a pony telephone receiver, with 6 illustrations.

Wireless Codes: Morse, Continental, Navy.

Experiments with spark coils, 3 pages.

How to photograph electrical discharges (sparks).

All about storage batteries, how to test them, recharging, etc.

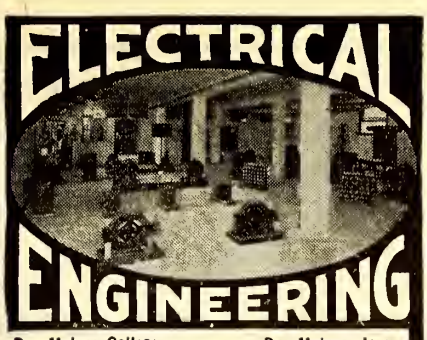
Tesla experiments, 2 pages.

How to make Selenium Cells (illustrated).

FREE with this wonderful cyclopedia—20 coupons for our 160 page Wireless Course in 20 lessons. 350 illustrations, 30 tables. Catalog explains how you can get this Course absolutely free.

"THE LIVEST CATALOG IN AMERICA"

IN this cyclopedia you will find 116 pages all about radio. One of the greatest catalogs of its kind in print.



You will find in it dozens of wireless instruments of the famous E. I. Co. make. Remember always that this company was the FIRST to make and sell wireless instruments, the first wireless outfit having been placed upon the market by them in 1904. The E. I. Co. *knows how*, because it has the experience. Others imitate but cannot equal E. I. Co. for quality and workmanship.

Other things you will find listed in this catalog: Electrolytic Interrupters, Bulldog Spark Coils, Chemical Outfits, Omnigraphs, Code Practice Sets, Telegraph Instruments, Primary Batteries, Storage Batteries, Solenoids, Hydrometers, Volt and Ammeters, Batterymeters, Electrolytic Rectifiers, Rheostats, Tesla Coils, Nickel Plating Outfits, Lighting Plants, Dynamos and Motors, Microphones, Detectiphones, Loud Talkers, High Frequency Apparatus and supplies, Heating Pads, Electro-magnets, X-ray tubes, Telephones, Magnetos, Low Tension Transformers, Books, etc., etc.

The "Finer Workings" of Static Electricity

By Frederick Von Lichtenor

(*Continued from page* 837)

as exposes (as far as this possibly can be done) *"those workings" of, the action, which ordinarily take place, but do not manifest themselves,* all of which will be more fully understood later on.

Fig. 3 indicates the respective positions of the instruments to one another, which are to be placed in line, with the insulating sheet *very close* to the neutral body. This is important as the success of the experiment depends upon this factor more than on anything else. Care must, consequently, be taken in finding the *proper* distance between the sheet of glass and the pith ball, which, generally speaking, is about equal to the thickness of the glass itself, but which has really to be found by experimentation, since this is subject to the volume of the induced charge, the size of the pith ball, the temperature of the surrounding air, etc., etc.

With the apparatus arranged as above suggested, the charged El-cover is moved slowly in the direction of the pith ball, whereupon the latter, altho separated from the cover by several inches, will be "pushed" onto the insulating sheet and cling there. At this very juncture, that is, without bringing the charged cover any closer, all action on the part of the operator should cease for a while. Thus keeping the cover in its last position, the pith ball will soon loose its hold upon the surface of the glass and swing over toward the charged cover. As the gap between both is shortened or widened by the operator, so will the light object, naturally, be more strongly attracted or allowed to swing back onto the sheet of glass, as the case may be, but *it will not cling to the latter any more.* (Under no circumstances and at no stage of this experiment should the pith ball be permitted to make contact with the Electrophorus cover, for this would destroy the principle of the inductive action with one stroke!) On getting the light object once more "under control" by shortening this gap, the opportunity offers itself for the removal of the insulating body, which is then done. After this the charged cover is also removed. An investigation will show the existence of a small charge upon the pith ball, which the latter acquired during the process and which is evidenced thru its attractive properties when in contact with any neutral object.

Although quite a few things happen in this little experiment, the explanation for the whole action is very clear and as follows: The (+) charged El-cover, on being approached to the pith ball, induces a negative charge upon the part of the latter facing it, while a charge of opposite sign is repelled to the other side of the ball. This repelled positive element does *under ordinary conditions,* that is, without the addition of the insulating sheet, *not manifest its existence.* In the above case, however, it will find a complement of negative electrons on the sheet of glass, to which, in accordance with the *law of attraction of opposite polarities,* it will attach itself. This negative element, again, is the result of the disturbance of the "electrical balance" upon the insulating body, while under the influence of the repelled positive charge (if not even under that of the original [Electrophorus cover] charge); and to enable both these weak charges to reach one another, the sheet of glass must find its place close to the pith ball, which was clearly pointed out in the foregoing. Since a second object is absolutely imperative in order to bring out this, otherwise, "lost

Hermo "Hair-Lustr"

(Keeps the Hair Dressed)

FOR MEN AND WOMEN

The hair will stay dressed after Hermo "HAIR-LUSTR" has been applied. No more mussy, untidy looking hair. Adds a charming sheen and luster, insuring the life of the hair, as well as its beauty. Dress it in any of the prevailing styles, and it will stay that way. Gives the hair that soft, glossy, well groomed appearance so becoming to the stars of the stage and screen. Guaranteed harmless and greaseless.

Two Sizes—50c and $1

$1 size three times the quantity of 50c size. SEND FOR JAR TODAY. Remit in coin, money order, or U. S. stamps, and we will send Hermo "HAIR-LUSTR," and the Hermo Booklet, "Guide to Beauty," prepaid, under plain cover, at once. Use it five days and if not entirely satisfactory, return what is left, and we will REFUND YOUR MONEY IN FULL. Once you use Hermo "HAIR-LUSTR" you will never be without it. *SEND YOUR ORDER TODAY.*

HERMO CO., 1012 E. 63rd St., Dept. 12, CHICAGO

CARNOTITE

(Radium Mineral.) The American Pitchblende found in Colorado, from which *Radium* is extracted.

A generous piece, enough to conduct experiments, such as affecting photographic plates thru opaque material (similar to X-Ray pictures), first made by Sir W. Crookes and Mme. Curie, is furnished in neat, wooden box.

URANIUM ORE (*Radio-Active*)

Containing about 35% of pure Uranium; also Radium and Vanadium. One of the most rare and interesting minerals. Twenty milligrams are furnished in glass vial protected by lead cover.

One box of *Carnotite* and one vial of *Uranium Ore* as described above 50c sent prepaid.

FORMULAS

Luminous Paint—Silver Plating Powder—Liquid Court Plaster—Soap Bubble Liquid—Straw Hat Bleach—Collapsible Tube Tooth Paste—Resilvering Mirror Liquid—Polish for Tan Shoes—Dressing for Tan Shoes—Paint to make Oil Cloth.

Benjamin N. Bogue, 761 Bogue Building, Indianapolis

action", which will now be fully understood, and since a conductor has, for obvious reasons, to be avoided, an insulating body, as the *"last* best thing", is consequently chosen.

The latter (sheet of glass in the above case) possesses qualities which tend to retard the process to a certain extent and which is clearly demonstrated, when the pith ball clings to the insulating sheet for a while. In doing so, the small amount of repelled positive charge becomes neutralized and *neutralization of a charged object in contact with an insulating body takes place very gradually,* which accounts for the "slowed down" action. The negative element induced upon the pith ball remains there, however, as at this stage of the experiment the electrophorus cover (+) is still held in its rigid position. Upon separating itself from the sheet of glass again, the ball will be evenly charged *negatively* and consequently strongly attracted by the (+) charged cover.

The minute charge found finally upon the pith ball, that is, after both sheet and cover have been removed, is acquired by the latter upon contact with the insulating body and is really not to be included in the inductive action of an electrostatic charge upon a neutral body, (altho similar conditions may prevail [for all we know] in space, where the "bigger workings" occur, and give reason for just such an action). It should, in the above case, rather be considered a "necessary evil", which finds its way into the experiment, with the operator not finding a way out of preventing it from getting in there. For with the elimination of the insulating body a successful "work-out" of the whole action is impossible, which is now quite clear; nor is it possible, while employing this very essential insulating factor, to prevent the pith ball from making contact with it, and yet observe the minute manifestation of the repelled element *by way of attraction only;* the close proximity of the two, necessitated by the very weak nature of the charge, stands against this.

If in this experiment the pith ball, after its separation from the sheet of glass, should again cling to the same, this shows that the repelled positive charge (on the ball) has *not* been completely *neutralized,* which, as pointed out in Experiment No. 1, finds its main reason in too low a potential of the Charge-source (El-cover) and, consequently, of the "counter-charges" induced upon the other instruments. The *proper* charge, neither excessively higher nor too low, for such purposes as the above, has to be found by actual experimentation.

The diagram in Fig. 3-A illustrates the experiment in its various, principal stages.

EXPERIMENT NO. 4.

(Imprisoning Charge Upon Neutral Body by Induction)

Many things, indeed, may be studied in this experiment, the main object of which is to prove the fact, that a neutral body may be put in a charged condition entirely thru the power of induction of an electrostatic element.

Depicted in Fig. No. 4 are the instruments, required for the experimental "work-out", which eliminates a further description of the same, beyond stating, that the two neutral bodies (pith balls) must hang side by side (touching one another) in the same plane and that they are suspended from *separate* silk-threads, so as to enable the operator to remove one of them, when the necessity arrives; the reason for this will be clear after a while.

The charged hard rubber plate is approached to the light objects in the manner that the plate faces only one of the balls, whereupon, at a certain distance, both of the latter (still keeping contact with one another) will be slightly attracted by the charged hard rubber sheet. Here the sheet should become "rigid," that is, not be moved any closer. After a short while the

THE GREB CO., 239 State Street, BOSTON

two bodies will separate; one will swing over toward the charge-source and attach itself to it, while the other (the one further away from the plate) evidences a *repulsive* action. The sheet of hard rubber (ebonite) and ball No. 1, are then removed together, by simply lifting the latter with the plate from its support (which is easily accomplished as long as the ball has not lost its "hold" upon the electrified sheet!) Great care must, however, be taken in doing so, not to bring these two objects any closer to the remaining ball; not to speak of permitting any contact between them. After this has been carefully done, the solitary ball will, upon test with a neutral body, be found to be in a charged condition, although in the above arrangement it never came in *direct* "touch" with the charge-source.

The explanation for the above will be found in the following: on approaching the two neutral bodies with the electrified hard rubber plate, its negative charge induces a (+) charge upon *the side* of the first ball, *which it faces,* repelling at the same time such of its own sign (—) to the other side of that ball. This repelled negative element, again, attracts the positive electrons found in the second pith ball to the part of the latter, which is in contact with ball No. 1, while a charge of opposite polarity (—) will be repelled toward its part farthest away from the charged plate. With the latter approaching gradually closer, both balls will be moderately attracted to the same (to be exact: the nearest ball is attracted, while the other one is simply pulled along!); and that they still keep together during this motion, is due to *neutralization* of their "inner charges", *which invariably manifests a "clinging action" while taking place.*

After the act of neutralization has been completed, both separate, whereupon the first ball, now left (+) charged, will be strongly attracted to the (—) electrified sheet and consequently attach itself to it, while ball No. 2, will be distinctly repelled on account of its now evenly negative polarity. At this stage of the experiment both, charge-source and ball No. 1, are removed, as was outlined before; and I may mention here, that the (in the above connection) slow process of neutralization of the (+) element induced upon that pith ball makes this "holding together"—removal possible. (This ball will finally, that is, after being neutralized, be negatively charged [higher potential of plate!] and repelled, which, however, has *no bearing in this experiment*).

The negative charge, which in the end is found imprisoned upon the remaining pith ball, is the direct result of neutralization of the induced "inner" charges between the *bodies,* with *their* immediately following *separation* and simultaneously *that* of *their "spell-bound" charges,* all happening under the influence of the inductive energy emanating from the charge-source; and, consequently, this negative charge is of a truly induced character.

Fig. 4-A, gives a clear demonstration of the principal actions which take place in this experiment.

Concerning the apparata themselves I may say, that they should be kept clean and in a dry condition, in which they always are, when in their *proper* place in a comfortably heated room. In case of excessive dampness of the atmosphere they may be placed upon a radiator for a short while, but must never be heated nor employed while in such a condition, because some of the apparatus (hard rubber sheet, for instance!) will doubtless suffer under such treatment and because thermo-(heat-) waves upon the apparatus will introduce erroneous manifestations into the experiments, which do not belong in there, thus counteracting the desired actions, if not nullifying them entirely.

(To be continued)

Voice Thrower 10c

Learn to throw your voice into a TRUNK, under the bed, out in the hall or anywhere. Lots of FUN fooling the Teacher, Janitor, Policeman, Parents, Neighbors, or Friends.

THE VENTRILO

is a little instrument that fits into the mouth out of sight. BOYS or GIRLS can use it in conjunction with the above for imitating birdsand animals. Never fails. A 32-page book on Ventriloquism sent with the Ventrilo for 10 cents.

NEW FORD JOKE BOOK 1920

All the latest jokes on the Ford auto. Hundreds of them, and all good ones. Spring a new one on your neighbors.

Large book with cover by mail, 10c

ROGEN X-RAY
Price 10 cents

HERE, BOYS, is just what you want. With this instrument you can apparently see the bones in your fingers. Think of the fun you can have with it. Sample by mail, TEN CENTS.

SKULL RING

Here is a handsome, up-to-date Ring, representing a Skull and Cross-bones. Has stones in the eyes and looks something frightful. Women won't like it, but for men or boys it is a great novelty. Sample, by mail, 15c.

Gee! What a Wad!
This is STAGE MONEY

Looks like the GENUINE STUFF. Some Green backs and some Yellow backs. Create a BIG sensation among your friends. The girls will all be after you when they see the wad. BIG roll of 15 pieces by mail, 10 cents.

ENCHANTED BARREL
The Most Wonderful Pocket Trick Made
CHANGE A CENT INTO A DIME

Ask your friend to drop a dime in the barrel. When he takes it out, Behold! It is a CENT. You make 9 cents every time you fool them. Never fails. They cannot get on to it. Sample barrel, with directions, only.... 10c

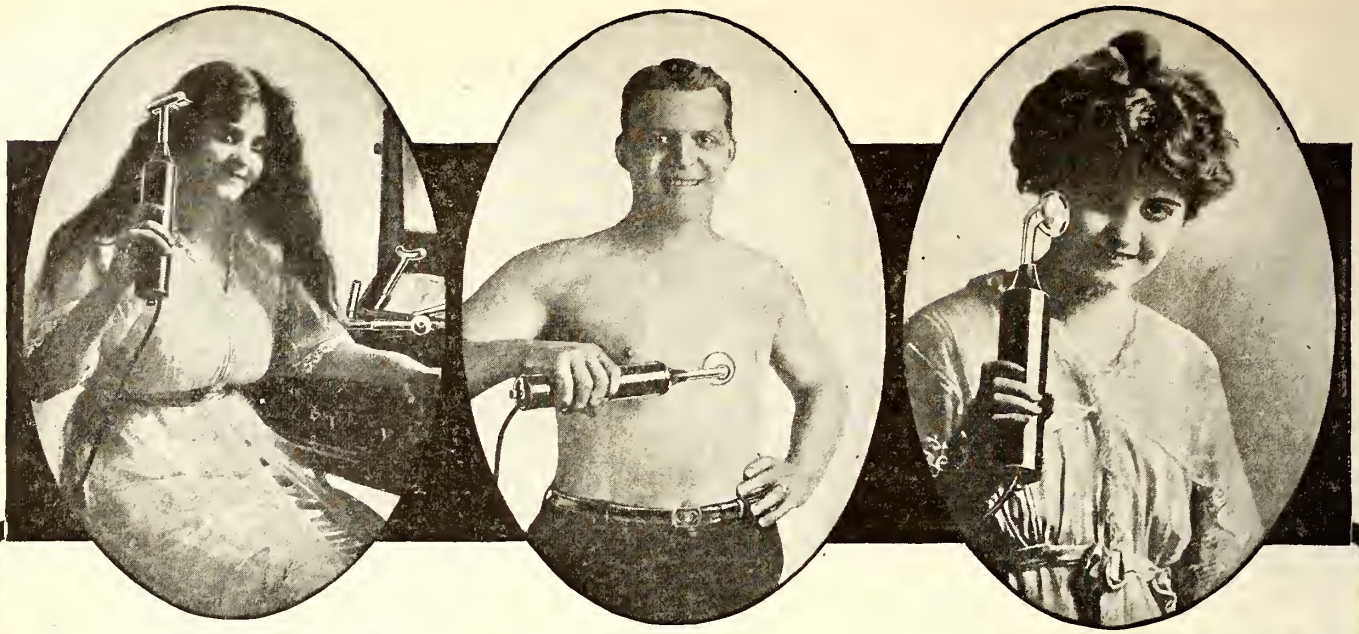
Hindoo Flower Pot Trick

You have all heard of the great Hindoo trick (making a plant grow out of a flower pot right in front of an audience). This trick has puzzled the whole world for years until an old Hindoo fakir gave it away. We send the whole outfit by mail with full instructions for 15 cents.

BIG VALUE for 10 Cts.

6 Songs, words and music; 25 Pictures Pretty Girls; 40 Ways to Make Money; 1 Magic Book; 1 Book Letter Writing; 1 Dream Book and Fortune Teller; 1 Cook Book; 1 Baseball Book, giving rules for games; 1 Toy Maker Book; Language of Flowers; 1 Morse Telegraph Alphabet; 12 Chemical Experiments; Magic Age Table; Great North Pole Game; 100 Conundrums; 5 Puzzles; 12 Games; 30 Verses for Autograph Albums. All the above by mail for 10c.

Trumpet in Handkerchief



The Trumpet in the Handkerchief has come to torment us. It is a startler. A small metal trumpet is ingeniously concealed in a handkerchief. On meeting your friends, after chatting awhile, you take out this handkerchief and blow your nose. It's like a sudden clap of thunder! The ladies scream, and your male friends will think they heard the whistle of a steam engine. You can blame the hideous noise to your having a very bad cold, and keep the fun up as long as you like.

Price, 10c, 3 for 25 cents, by mail.

Stop That Pain With Violet Rays

WHY suffer nervousness, headaches, rheumatism, skin diseases or any other ailment that keeps you from enjoying perfect health and a clear, beautiful complexion? The marvel of the age is the discovery of the curative value of electricity in treating the human system. Its mysterious, magical power has now been harnessed in its greatest curative form for human use—Violet Rays. A few minutes each day in your own home will not only relieve you of many annoying ailments, but will literally insure you an every-day vigorous, abounding health and beauty. Violet Rays penetrate every cell of the entire human system and bring almost instant relief. For blackheads, pimples, eczema, blotches and other blemishes to bodily beauty and complexion, Violet Rays produce amazing results.

Not a Vibrator

Don't confuse the VIOLETTA with Vibrating Machines. It is not a Vibrator. It does not contract the muscles or shock the nerves. Its magic rays pass completely through the body, producing "cellular massage," known to be far more beneficial than muscular massage. It leaves no soreness after use—only delightful, agreeable relief.

VIOLETTA
Violet Ray Machine

Try VIOLETTA For

Asthma	Eczema	Neuritis
Barbers' Itch	Eye Disease	Pains
Boils	Falling Hair	Paralysis
Blackheads	Hay Fever	Pimples
Catarrh	Headache	Rheumatism
Chilblains	Goitre	Skin Diseases
Colds	Insomnia	Sore Throat
Constipation	Lumbago	Sprains
Dandruff	Nervousness	Tonsilitis
Deafness	Neuralgia	Whooping Cough
Earache		

What Physicians and Users Say

Trixie Friganza, well known actress says: "Cheerfully will I add my praise for Violetta. It's the best "pain chaser" and "soother" I've had the good fortune to find. It's WONDERFUL. It cured my brother of neuritis. As for myself I use it for facial treatments and general massage. I cannot say too much for it."

Dr. Bert H. Rice, of Vinton, Iowa, says: "I have good results with the Violetta High Frequency Instrument in all cases of neuralgia. Almost instant relieve in Facial Neuralgia."

K. L. Allen, D. C., 205 Boone National Building, Boone, Iowa, says: "I have had very good results with the application of High Frequency Current in cases of Paralysis, Rheumatism and Neuritis, and think it a great help in drugless healing."

Dr. Daniels, Lisbon, North Dakota, says: "Have used the VIOLETTA in such cases as Goitre, Bronchitis, Pleurisy, Neuritis, Neuralgia, and Lumbago, and find it very beneficial. In fact, I would not be without it in my office."

Frank Borzone, Seattle, Wash., says: "I purchased the VIOLETTA for my wife who was suffering from an acute attack of Sciatica. From the very first treatment it induced peaceful rest and she is entirely well now."

These and many other ailments are relieved as if by magic. Violet Rays penetrate to every cell, tissue and nerve in the system. It soothes or stimulates, as desired. Remember, there is **NO shock or pain** in its use. Harmless and painless even to infants. Thousands of small babies have been successfully treated with it.

Get This Book—FREE!

CAMELS are unique—a real cigarette revelation! That's due to their quality and to the unusual and expert blend of choice Turkish and choice Domestic tobaccos!

YOUR enthusiasm for Camel Cigarettes will steadily increase! They will not tire your taste, no matter how liberally you smoke! And, each cigarette will just add a little more to the joy and contentment the wonderfully refreshing Camel flavor hands you so lavishly!

Once you know Camels you'll prefer their blend—and what it gives you—*the most fascinatingly mellow-mild-body ever realized in a cigarette*—to either kind of tobacco smoked straight!

You'll enjoy Camels freedom from any unpleasant cigaretty aftertaste and from any unpleasant cigaretty odor!

And, the longer you smoke Camels the more you'll appreciate that they are *made to meet your taste!*

Compare Camels with any cigarette in the world at any price—and forget coupons, premiums and gifts!

Camels are sold everywhere in scientifically sealed packages of 20 cigarettes; or ten packages (200 cigarettes) in a glassine-paper-covered carton. We strongly recommend this carton for the home or office supply or when you travel.

Regain Your Health Thru Renulife VIOLET RAY Treatments at Home

Unequaled for neuritis and rheumatism

More Than 25,000 Volts
No pain, shock or muscular contraction. Entirely harmless — powerfully effective.

This type Violet Ray Instrument is designed with light handle, easily manipulated; the most of the apparatus is contained in a case giving ample space for electric units of efficient size.

There is no "quackery" or uncertainty about *Renulife Violet Ray*. It is not claimed to be a "Cure All," but it has proved in thousands of cases a practical health-producing, revitalizing agent—powerful in restoring normal physical conditions—yet gentle, soothing and perfectly safe. *You* can treat yourself. Get full information regarding uses shown on coupon below.

Users Get Wonderful Results

(Voluntary Testimonials)

"The Renulife Violet Ray High Frequency Generator is superior in efficiency because of its perfect character and control of current, compactness and perfect insulation. The smallness and lightness of Electrode holder is also a great advantage." "The doctor told me that the trouble was hardening of the arteries. I wish I had got it a year ago. I would not be without it for all the money in the world." "I cannot recommend it too highly." "I have been using mine now for a week for Sciatica and I am highly pleased with results." "I think it is one of the best little machines that was ever invented." "I have used it with excellent results for the restoration of hair and stiff and sore rheumatic finger joints." "Am well pleased with the Generator, and the kind treatment received from your Company." "My Generator has stopped my neuritis." "Every house should have a Renulife Violet Ray High Frequency Generator, for the treatment of Neuraigia, Neuritis, Sore Throat, Kernels in Neck, Cramps, Headache, Stiff Neck, Muscular Soreness, Rheumatism, Paralysis—in short, pains of all kinds."—M. D. "I have been much relieved by the use of your Violet Ray Generator." "It is fine for Insomnia." "I find it such a help in nervousness." "I would not part with it for five times the price. It is sure a little wonder." "I am more than pleased with the Generator; the whole family are using it." "A neighbor lady was suffering from lumbago and could not move, and my wife brought over the Generator and in less than ten minutes the lady was greatly relieved." "Your Generator is just the thing for me. That tired feeling has left me, and I feel like myself again." "It has relieved me of the nervousness and also it has helped me a great deal in using it for the treatment of rheumatism."

How Renulife Benefits

Science has demonstrated a strange relation between electricity and life cells. This instrument harnesses a tremendous current of electricity and applies in the form of Violet Rays so that the body welcomes and responds to it in a marvelous manner—no pain—shock or the slightest harmful effects. A few seconds of Renulife Violet Ray gives more benefit than hours of the old time battery methods—because a thousand times as much voltage is made use of.

The irresistible, revitalizing powers of *Renulife Violet Ray* reach every nerve cell, fibre and part of body. Blood is enriched and purified by a flood of oxygen, giving added vitality and strength. Assimilation and digestion improved—functions retored to normal—extra supply of fresh blood quickly brought to area treated, removing congestion and supplying nourishment. While relieving pains and aches, the manifest results of disorders, it removes the deep seated cause, combines the benefits of electricity, vibration, exercise, stimulation and oxidation.
